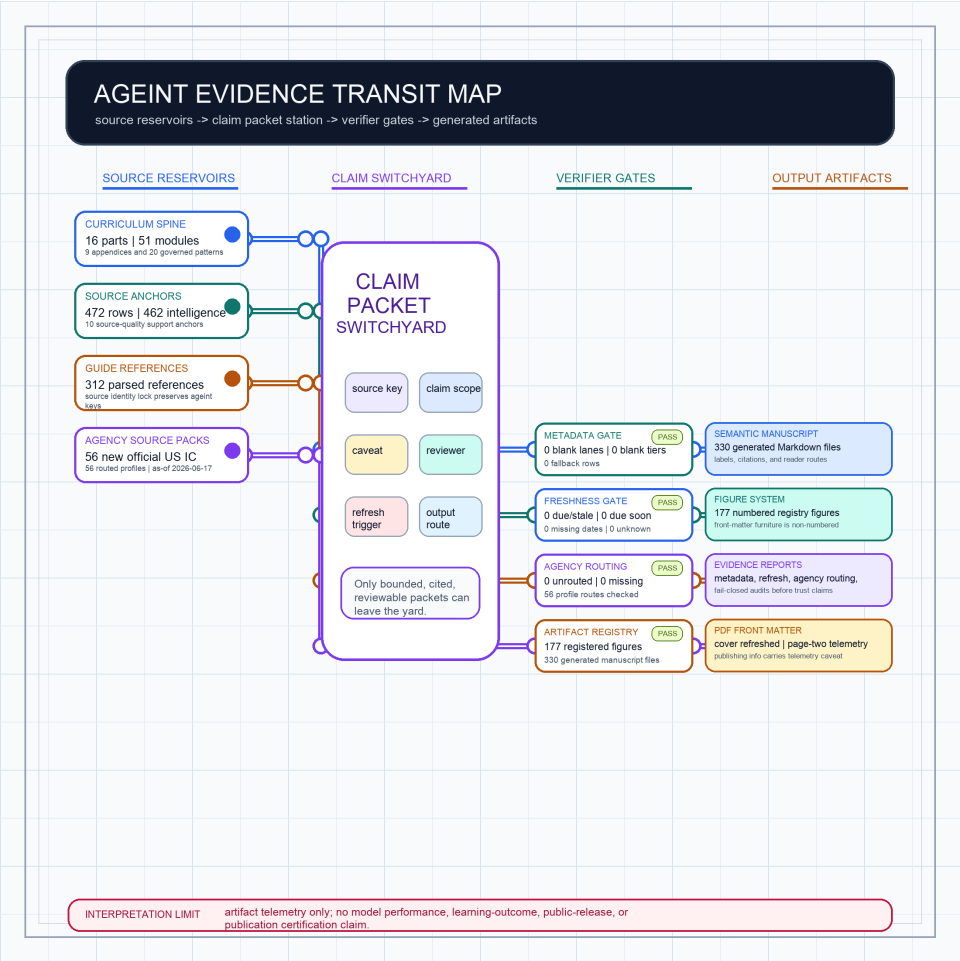
Evidence Transit Map



Source telemetry from AGEINT curriculum counts, source metadata, source freshness, agency-source routing, figure registry, and generated manuscript files. This front-matter map is artifact telemetry only: it is not a benchmark, public-release certificate, publication claim, or learning-outcome result.

This open textbook is generated from version-controlled Markdown, tested Python modules, programmatic figures, and rendered Mermaid diagrams. Corrections and improvements may be submitted via the source repository linked above.

Accessibility note: the compact PDF is optimized for dense print. Reader-profile builds, HTML output, and source Markdown can be generated from the same manuscript materials.

Contents

1 Abstract: Synthetic Analytic Tradecraft contract . . . 7
2 Curriculum Orientation: reader paths, evidence maps, and safety gates . . . 8
2.1 How to use this atlas: navigation path, evidence checks, and verifier handoff . . . 8
2.2 Synthetic Analytic Tradecraft thesis: synthetic fixtures, source discipline, and reviewable claims . . . 10
2.3 Reader paths: instructor, learner, reviewer, and maintainer handoffs . . . 12
2.4 Curriculum map: parts, modules, and source-backed route choices . . . 13
2.5 Runtime inventory: generated counts, anchors, and method appendices . . . 14
2.6 Related work and contribution boundary: adjacent literatures and AGEINT limits . . . 16
2.7 Analysis validation protocol: claim classes, evidence packets, and failure modes . . . 17
2.8 Consolidated glossary and index: terms, audit surfaces, and reader routing . . . 19
2.9 Intelligence research profiles: domain lanes, source roles, and profile routing . . . 20
2.10 Intelligence practice lenses: artifact expectations, safety checks, and review questions . . . 21
2.11 Research anchor atlas: curated sources, lanes, tiers, and claim scope . . . 22
2.12 Source lane map: provenance lanes, support strength, and refresh context . . . 98
2.13 Safe substitution matrix: defensive artifacts for risky inherited motifs . . . 108
2.14 Capstone workflow: phase sequence, artifacts, and reviewer gates . . . 109
2.15 Capstone model-answer exemplars: strong evidence packets and revision triggers . . . 110
2.16 Accessibility and UDL review: learner access, modality checks, and accommodation evidence . . . 111
2.17 Procurement and vendor oversight: tool governance, revocation, and vendor evidence . . . 112
2.18 HRIA and DPIA worksheet: rights impact, privacy review, and residual risk . . . 113
2.19 Data lineage registry: source identity, transformations, retention, and review . . . 114
2.20 Assessment integrity protocol: declared agent use, grading evidence, and human judgment . . . 115
2.21 Agent incident response drill: pause, revoke, preserve, recover, and debrief . . . 116
2.22 Role-based competency map: responsibilities, evidence owners, and assurance roles . . . 117
2.23 Adversarial assurance cycle: challenge rows, remediation owners, and retest evidence . . . 118
2.24 Model and dataset documentation card: intended use, provenance, caveats, and lifecycle . . . 119
2.25 Transparency and communication notice: purpose, safeguards, human review, and limits . . . 120
2.26 Records retention and audit trail: owners, retention rules, and deletion conditions . . . 121
2.27 Release and change-control gate: reuse approval, rollback, and change evidence . . . 122
2.28 Risk exception and acceptance memo: residual risk, owner approval, and review clock . . . 123
2.29 Learner support and accommodation plan: support rows, access barriers, and escalation . . . 124
2.30 Instructor question bank: prompts, evidence checks, and misconception probes . . . 125
2.31 Remediation backlog: issue owners, retest evidence, and closure boundaries . . . 126
2.32 Scholarship and governance stance: source posture, claim limits, and public-readiness boundary . . . 127
2.33 Verifier-first artifact evidence: build freshness, audits, and negative controls . . . 128
2.34 Orientation figures and course links: visual evidence, source flow, and navigation . . . 129
2.35 AGEINT pattern library: design-pattern rows, safe substitutions, and source identity . . . 155
2.36 Safety rail: accountable, synthetic, defensive, and evidence-bounded boundaries . . . 157
3 Method & Assurance Reference: claim evidence, safety gates, and refresh duties . . . 158
3.1 Source-construction and reporting protocol: discovery records and citation boundaries . . . 158
3.2 Claim calibration and statistical limits: artifact telemetry versus empirical evidence . . . 158
3.3 Method figures and course links: assurance visuals and navigation . . . 158
3.4 Capstone phase, artifact, and review-gate ladder: required handoff sequence . . . 158
3.5 Claim and evidence ledger: claim classes, evidence floors, and review duties . . . 158
3.6 Competency and mastery rubric: scoring dimensions and visible proof . . . 159
3.7 Refresh triggers and required actions: source, safety, and tool-change duties . . . 159
3.8 Safety boundary: accountable, synthetic, defensive, and evidence-bounded practice . . . 159
3.9 Mastery evidence standard: retained artifacts, reviewer challenge, and transfer . . . 159
4 FOUNDATIONS OF INTELLIGENCE TRADECRAFT . . . 160
4.1 FOUNDATIONS OF INTELLIGENCE TRADECRAFT learning spine and source route: unit purpose, module order, and evidence handoff . . . 160
5 The Nature of Intelligence . . . 165
5.1 Governed Intelligence Cycle and Dissemination Architecture frame for The Nature of Intelligence: source context, topic focus, and reader task . . . 165
5.2 Dissemination-and-Marking Control Lens path for The Nature of Intelligence: lesson cluster, safe artifact, and review . . . 167
5.3 The Nature of Intelligence assurance handoff: evidence, governance, refresh, and capstone . . . 172
6 Intelligence Community Architectures . . . 182
6.1 Analytic Tradecraft and Source Integrity frame for Intelligence Community Architectures: source context, topic focus, and reader task . . . 182
6.2 Dissemination-and-Marking Control Lens path for Intelligence Community Architectures: lesson cluster, safe artifact, and review . . . 184
6.3 Intelligence Community Architectures assurance handoff: evidence, governance, refresh, and capstone . . . 189
7 Tradecraft: Core Principles . . . 200
7.1 Governed Intelligence Cycle and Dissemination Architecture frame for Tradecraft: Core Principles: source context, topic focus, and reader task . . . 200
7.2 Structured-Judgment Lens path for Tradecraft: Core Principles: lesson cluster, safe artifact, and review . . . 202
7.3 Tradecraft: Core Principles assurance handoff: evidence, governance, refresh, and capstone . . . 207
8 HUMAN INTELLIGENCE (HUMINT) . . . 216
8.1 HUMAN INTELLIGENCE (HUMINT) learning spine and source route: unit purpose, module order, and evidence handoff . . . 216
9 Agent Recruitment . . . 220
9.1 Collection Management and Multi-INT Requirements Discipline frame for Agent Recruitment: source context, topic focus, and reader task . . . 220
9.2 Requirements-to-Evidence Lens path for Agent Recruitment: lesson cluster, safe artifact, and review . . . 222
9.3 Agent Recruitment assurance handoff: evidence, governance, refresh, and capstone . . . 227
10 Agent Handling and Management . . . 237
10.1 Collection Management and Multi-INT Requirements Discipline frame for Agent Handling and Management: source context, topic focus, and reader task . . . 237
10.2 Requirements-to-Evidence Lens path for Agent Handling and Management: lesson cluster, safe artifact, and review . . . 239
10.3 Agent Handling and Management assurance handoff: evidence, governance, refresh, and capstone . . . 245

11 Source Protection and CI Integration . . . 256
11.1 Collection Management and Multi-INT Requirements Discipline frame for Source Protection and CI Integration: source context, topic focus, and reader task . . . 256
11.2 Requirements-to-Evidence Lens path for Source Protection and CI Integration: lesson cluster, safe artifact, and review . . . 258
11.3 Source Protection and CI Integration assurance handoff: evidence, governance, refresh, and capstone . . . 262
12 SIGNALS INTELLIGENCE (SIGINT) . . . 271
12.1 SIGNALS INTELLIGENCE (SIGINT) learning spine and source route: unit purpose, module order, and evidence handoff . . . 271
13 SIGINT Fundamentals . . . 274
13.1 Collection Management and Multi-INT Requirements Discipline frame for SIGINT Fundamentals: source context, topic focus, and reader task . . . 274
13.2 Requirements-to-Evidence Lens path for SIGINT Fundamentals: lesson cluster, safe artifact, and review . . . 276
13.3 SIGINT Fundamentals assurance handoff: evidence, governance, refresh, and capstone . . . 280
14 Modern SIGINT and Cryptography . . . 289
14.1 Collection Management and Multi-INT Requirements Discipline frame for Modern SIGINT and Cryptography: source context, topic focus, and reader task . . . 289
14.2 Requirements-to-Evidence Lens path for Modern SIGINT and Cryptography: lesson cluster, safe artifact, and review . . . 291
14.3 Modern SIGINT and Cryptography assurance handoff: evidence, governance, refresh, and capstone . . . 296
15 OPEN SOURCE INTELLIGENCE (OSINT) . . . 307
15.1 OPEN SOURCE INTELLIGENCE (OSINT) learning spine and source route: unit purpose, module order, and evidence handoff . . . 307
16 OSINT Foundations . . . 311
16.1 Open-Source and Geospatial Intelligence Integrity frame for OSINT Foundations: source context, topic focus, and reader task . . . 311
16.2 Requirements-to-Evidence Lens path for OSINT Foundations: lesson cluster, safe artifact, and review . . . 313
16.3 OSINT Foundations assurance handoff: evidence, governance, refresh, and capstone . . . 317
17 OSINT Techniques and Tools . . . 325
17.1 Open-Source and Geospatial Intelligence Integrity frame for OSINT Techniques and Tools: source context, topic focus, and reader task . . . 325
17.2 Requirements-to-Evidence Lens path for OSINT Techniques and Tools: lesson cluster, safe artifact, and review . . . 327
17.3 OSINT Techniques and Tools assurance handoff: evidence, governance, refresh, and capstone . . . 332
18 GEOINT and Imagery Intelligence . . . 342
18.1 Open-Source and Geospatial Intelligence Integrity frame for GEOINT and Imagery Intelligence: source context, topic focus, and reader task . . . 342
18.2 Requirements-to-Evidence Lens path for GEOINT and Imagery Intelligence: lesson cluster, safe artifact, and review . . . 346
18.3 GEOINT and Imagery Intelligence assurance handoff: evidence, governance, refresh, and capstone . . . 351
19 TECHNICAL INTELLIGENCE AND CYBER OPERATIONS . . . 361
19.1 TECHNICAL INTELLIGENCE AND CYBER OPERATIONS learning spine and source route: unit purpose, module order, and evidence handoff . . . 361
20 Cyber Intelligence Fundamentals . . . 365
20.1 Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense frame for Cyber Intelligence Fundamentals: source context, topic focus, and reader task . . . 365
20.2 Defensive Cyber-Intelligence Lens path for Cyber Intelligence Fundamentals: lesson cluster, safe artifact, and review . . . 367
20.3 Cyber Intelligence Fundamentals assurance handoff: evidence, governance, refresh, and capstone . . . 373
21 Advanced Persistent Threats (APTs) . . . 385
21.1 Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense frame for Advanced Persistent Threats (APTs): source context, topic focus, and reader task . . . 385
21.2 Defensive Cyber-Intelligence Lens path for Advanced Persistent Threats (APTs): lesson cluster, safe artifact, and review . . . 387
21.3 Advanced Persistent Threats (APTs) assurance handoff: evidence, governance, refresh, and capstone . . . 391
22 Supply Chain Intelligence Attacks . . . 401
22.1 Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense frame for Supply Chain Intelligence Attacks: source context, topic focus, and reader task . . . 401
22.2 Software-Supply-Chain Assurance Lens path for Supply Chain Intelligence Attacks: lesson cluster, safe artifact, and review . . . 403
22.3 Supply Chain Intelligence Attacks assurance handoff: evidence, governance, refresh, and capstone . . . 408
23 Electronic and Emanations Intelligence . . . 419
23.1 Collection Management and Multi-INT Requirements Discipline frame for Electronic and Emanations Intelligence: source context, topic focus, and reader task . . . 419
23.2 Dissemination-and-Marking Control Lens path for Electronic and Emanations Intelligence: lesson cluster, safe artifact, and review . . . 421
23.3 Electronic and Emanations Intelligence assurance handoff: evidence, governance, refresh, and capstone . . . 425
24 IMAGERY AND FINANCIAL INTELLIGENCE . . . 435
24.1 IMAGERY AND FINANCIAL INTELLIGENCE learning spine and source route: unit purpose, module order, and evidence handoff . . . 435
25 Imagery Intelligence (IMINT) . . . 438
25.1 Open-Source and Geospatial Intelligence Integrity frame for Imagery Intelligence (IMINT): source context, topic focus, and reader task . . . 438
25.2 Requirements-to-Evidence Lens path for Imagery Intelligence (IMINT): lesson cluster, safe artifact, and review . . . 442
25.3 Imagery Intelligence (IMINT) assurance handoff: evidence, governance, refresh, and capstone . . . 446
26 Financial Intelligence (FININT) . . . 455
26.1 Financial Intelligence and Economic-Security Due Diligence frame for Financial Intelligence (FININT): source context, topic focus, and reader task . . . 455
26.2 Economic-Security Due-Diligence Lens path for Financial Intelligence (FININT): lesson cluster, safe artifact, and review . . . 457
26.3 Financial Intelligence (FININT) assurance handoff: evidence, governance, refresh, and capstone . . . 462
27 PSYCHOLOGICAL OPERATIONS AND INFLUENCE . . . 472
27.1 PSYCHOLOGICAL OPERATIONS AND INFLUENCE learning spine and source route: unit purpose, module order, and evidence handoff . . . 472
28 PSYOP and MISO Doctrine . . . 476
28.1 Cognitive Security and Influence Resilience frame for PSYOP and MISO Doctrine: source context, topic focus, and reader task . . . 476
28.2 Cognitive-Resilience Lens path for PSYOP and MISO Doctrine: lesson cluster, safe artifact, and review . . . 478
28.3 PSYOP and MISO Doctrine assurance handoff: evidence, governance, refresh, and capstone . . . 482
29 Active Measures and Disinformation . . . 492
29.1 Cognitive Security and Influence Resilience frame for Active Measures and Disinformation: source context, topic focus, and reader task . . . 492
29.2 Cognitive-Resilience Lens path for Active Measures and Disinformation: lesson cluster, safe artifact, and review . . . 494

29.3 Active Measures and Disinformation assurance handoff: evidence, governance, refresh, and capstone . . . 499
30 Social Engineering . . . 510
30.1 Cognitive Security and Influence Resilience frame for Social Engineering: source context, topic focus, and reader task . . . 510
30.2 Cognitive-Resilience Lens path for Social Engineering: lesson cluster, safe artifact, and review . . . 512
30.3 Social Engineering assurance handoff: evidence, governance, refresh, and capstone . . . 516
31 Information Warfare and Cognitive Security . . . 525
31.1 Cognitive Security and Influence Resilience frame for Information Warfare and Cognitive Security: source context, topic focus, and reader task . . . 525
31.2 Cognitive-Resilience Lens path for Information Warfare and Cognitive Security: lesson cluster, safe artifact, and review . . . 527
31.3 Information Warfare and Cognitive Security assurance handoff: evidence, governance, refresh, and capstone . . . 531
32 COUNTERINTELLIGENCE . . . 541
32.1 COUNTERINTELLIGENCE learning spine and source route: unit purpose, module order, and evidence handoff . . . 541
33 Counterintelligence Fundamentals . . . 544
33.1 Counterintelligence and Source-Integrity Defense frame for Counterintelligence Fundamentals: source context, topic focus, and reader task . . . 544
33.2 Structured-Judgment Lens path for Counterintelligence Fundamentals: lesson cluster, safe artifact, and review . . . 546
33.3 Counterintelligence Fundamentals assurance handoff: evidence, governance, refresh, and capstone . . . 551
34 Counterintelligence Against Non-State Actors . . . 561
34.1 Counterintelligence and Source-Integrity Defense frame for Counterintelligence Against Non-State Actors: source context, topic focus, and reader task . . . 561
34.2 Structured-Judgment Lens path for Counterintelligence Against Non-State Actors: lesson cluster, safe artifact, and review . . . 563
34.3 Counterintelligence Against Non-State Actors assurance handoff: evidence, governance, refresh, and capstone . . . 567
35 GRAY ZONE, HYBRID WARFARE, AND NON-STATE ACTORS . . . 576
35.1 GRAY ZONE, HYBRID WARFARE, AND NON-STATE ACTORS learning spine and source route: unit purpose, module order, and evidence handoff . . . 576
36 Gray Zone Warfare . . . 580
36.1 Counterintelligence and Source-Integrity Defense frame for Gray Zone Warfare: source context, topic focus, and reader task . . . 580
36.2 Dissemination-and-Marking Control Lens path for Gray Zone Warfare: lesson cluster, safe artifact, and review . . . 582
36.3 Gray Zone Warfare assurance handoff: evidence, governance, refresh, and capstone . . . 586
37 Non-State Actor Intelligence . . . 596
37.1 Counterintelligence and Source-Integrity Defense frame for Non-State Actor Intelligence: source context, topic focus, and reader task . . . 596
37.2 Dissemination-and-Marking Control Lens path for Non-State Actor Intelligence: lesson cluster, safe artifact, and review . . . 598
37.3 Non-State Actor Intelligence assurance handoff: evidence, governance, refresh, and capstone . . . 602
38 Irregular Warfare and Special Operations . . . 612
38.1 Counterintelligence and Source-Integrity Defense frame for Irregular Warfare and Special Operations: source context, topic focus, and reader task . . . 612
38.2 Dissemination-and-Marking Control Lens path for Irregular Warfare and Special Operations: lesson cluster, safe artifact, and review . . . 614
38.3 Irregular Warfare and Special Operations assurance handoff: evidence, governance, refresh, and capstone . . . 619
39 HISTORICAL INTELLIGENCE SERVICES . . . 630
39.1 HISTORICAL INTELLIGENCE SERVICES learning spine and source route: unit purpose, module order, and evidence handoff 630
40 Soviet and Russian Intelligence . . . 634
40.1 Historical and Declassified Intelligence Services frame for Soviet and Russian Intelligence: source context, topic focus, and reader task . . . 634
40.2 Historical Case-Translation Lens path for Soviet and Russian Intelligence: lesson cluster, safe artifact, and review . . . 636
40.3 Soviet and Russian Intelligence assurance handoff: evidence, governance, refresh, and capstone . . . 642
41 American Intelligence History . . . 654
41.1 Historical and Declassified Intelligence Services frame for American Intelligence History: source context, topic focus, and reader task . . . 654
41.2 Historical Case-Translation Lens path for American Intelligence History: lesson cluster, safe artifact, and review . . . 656
41.3 American Intelligence History assurance handoff: evidence, governance, refresh, and capstone . . . 663
42 British and Allied Intelligence . . . 676
42.1 Historical and Declassified Intelligence Services frame for British and Allied Intelligence: source context, topic focus, and reader task . . . 676
42.2 Historical Case-Translation Lens path for British and Allied Intelligence: lesson cluster, safe artifact, and review . . . 678
42.3 British and Allied Intelligence assurance handoff: evidence, governance, refresh, and capstone . . . 681
43 Israeli and Continental Services . . . 691
43.1 Historical and Declassified Intelligence Services frame for Israeli and Continental Services: source context, topic focus, and reader task . . . 691
43.2 Historical Case-Translation Lens path for Israeli and Continental Services: lesson cluster, safe artifact, and review . . . 693
43.3 Israeli and Continental Services assurance handoff: evidence, governance, refresh, and capstone . . . 697
44 AGEINT — AGENTIC INTELLIGENCE . . . 706
44.1 AGEINT — AGENTIC INTELLIGENCE learning spine and source route: unit purpose, module order, and evidence handoff 706
45 Foundations of AGEINT . . . 711
45.1 Agentic AI Governance and Tool Security frame for Foundations of AGEINT: source context, topic focus, and reader task . . . 711
45.2 Agentic Tool-Governance Lens path for Foundations of AGEINT: lesson cluster, safe artifact, and review . . . 713
45.3 Foundations of AGEINT assurance handoff: evidence, governance, refresh, and capstone . . . 719
46 AGEINT Design Patterns and Archetypes . . . 730
46.1 Agentic AI Governance and Tool Security frame for AGEINT Design Patterns and Archetypes: source context, topic focus, and reader task . . . 730
46.2 Agentic Tool-Governance Lens path for AGEINT Design Patterns and Archetypes: lesson cluster, safe artifact, and review . . . 733
46.3 AGEINT Design Patterns and Archetypes assurance handoff: evidence, governance, refresh, and capstone . . . 766
47 AGEINT Frameworks and Infrastructure . . . 789
47.1 Agentic AI Governance and Tool Security frame for AGEINT Frameworks and Infrastructure: source context, topic focus, and reader task . . . 789
47.2 Agentic Tool-Governance Lens path for AGEINT Frameworks and Infrastructure: lesson cluster, safe artifact, and review . . . 791
47.3 AGEINT Frameworks and Infrastructure assurance handoff: evidence, governance, refresh, and capstone . . . 802
48 AGEINT Security and Adversarial Considerations . . . 816
48.1 Agentic AI Governance and Tool Security frame for AGEINT Security and Adversarial Considerations: source context, topic focus, and reader task . . . 816

48.2 Defensive Cyber-Intelligence Lens path for AGEINT Security and Adversarial Considerations: lesson cluster, safe artifact, and review . . . 829
48.3 AGEINT Security and Adversarial Considerations assurance handoff: evidence, governance, refresh, and capstone . . . 838
49 Active Inference and AGEINT . . . 852
49.1 Active-Inference Theory and Governed Agent Analogy frame for Active Inference and AGEINT: source context, topic focus, and reader task . . . 852
49.2 Active-Inference Boundary Lens path for Active Inference and AGEINT: lesson cluster, safe artifact, and review . . . 855
49.3 Active Inference and AGEINT assurance handoff: evidence, governance, refresh, and capstone . . . 859
50 AGEINT Python Code Library . . . 870
50.1 Agentic AI Governance and Tool Security frame for AGEINT Python Code Library: source context, topic focus, and reader task . . . 870
50.2 Agentic Tool-Governance Lens path for AGEINT Python Code Library: lesson cluster, safe artifact, and review . . . 872
50.3 AGEINT Python Code Library assurance handoff: evidence, governance, refresh, and capstone . . . 877
51 COGNITIVE SECURITY . . . 888
51.1 COGNITIVE SECURITY learning spine and source route: unit purpose, module order, and evidence handoff . . . 888
51.2 How adversaries target cognition . . . 888
52 Cognitive Security: Foundations and Definitions . . . 894
52.1 Cognitive Security and Influence Resilience frame for Cognitive Security: Foundations and Definitions: source context, topic focus, and reader task . . . 894
52.2 Cognitive-Resilience Lens path for Cognitive Security: Foundations and Definitions: lesson cluster, safe artifact, and review . . . 896
52.3 Cognitive Security: Foundations and Definitions assurance handoff: evidence, governance, refresh, and capstone . . . 904
53 Neurocognitive Mechanisms of Cognitive Security . . . 917
53.1 Cognitive Security and Influence Resilience frame for Neurocognitive Mechanisms of Cognitive Security: source context, topic focus, and reader task . . . 917
53.2 Cognitive-Resilience Lens path for Neurocognitive Mechanisms of Cognitive Security: lesson cluster, safe artifact, and review 919
53.3 Neurocognitive Mechanisms of Cognitive Security assurance handoff: evidence, governance, refresh, and capstone . . . 925
54 Psychological Inoculation and Prebunking . . . 935
54.1 Cognitive Security and Influence Resilience frame for Psychological Inoculation and Prebunking: source context, topic focus, and reader task . . . 935
54.2 Cognitive-Resilience Lens path for Psychological Inoculation and Prebunking: lesson cluster, safe artifact, and review . . . 938
54.3 Psychological Inoculation and Prebunking assurance handoff: evidence, governance, refresh, and capstone . . . 944
55 Cognitive Security Operations . . . 955
55.1 Cognitive Security and Influence Resilience frame for Cognitive Security Operations: source context, topic focus, and reader task . . . 955
55.2 Cognitive-Resilience Lens path for Cognitive Security Operations: lesson cluster, safe artifact, and review . . . 957
55.3 Cognitive Security Operations assurance handoff: evidence, governance, refresh, and capstone . . . 962
56 EPISTEMIC RIGOR AND ANALYTIC TRADECRAFT . . . 972
56.1 EPISTEMIC RIGOR AND ANALYTIC TRADECRAFT learning spine and source route: unit purpose, module order, and evidence handoff . . . 972
56.2 The unified epistemic coherence stack . . . 972
56.3 From reliability theory to AI governance . . . 972
57 Structured Analytic Techniques (SATs) . . . 978
57.1 Analytic Tradecraft and Source Integrity frame for Structured Analytic Techniques (SATs): source context, topic focus, and reader task . . . 978
57.2 Structured-Judgment Lens path for Structured Analytic Techniques (SATs): lesson cluster, safe artifact, and review . . . 984
57.3 Structured Analytic Techniques (SATs) assurance handoff: evidence, governance, refresh, and capstone . . . 991
58 Advanced Analysis Methods . . . 1003
58.1 Analytic Tradecraft and Source Integrity frame for Advanced Analysis Methods: source context, topic focus, and reader task 1003
58.2 Structured-Judgment Lens path for Advanced Analysis Methods: lesson cluster, safe artifact, and review . . . 1008
58.3 Advanced Analysis Methods assurance handoff: evidence, governance, refresh, and capstone . . . 1012
59 PRODUCTIVITY INTELLIGENCE AND COGNITIVE PERFORMANCE . . . 1021
59.1 PRODUCTIVITY INTELLIGENCE AND COGNITIVE PERFORMANCE learning spine and source route: unit purpose, module order, and evidence handoff . . . 1021
60 The Intelligent Operator as Cognitive Athlete . . . 1025
60.1 Operator Productivity and Cognitive Performance frame for The Intelligent Operator as Cognitive Athlete: source context, topic focus, and reader task . . . 1025
60.2 Operator-Workload Hygiene Lens path for The Intelligent Operator as Cognitive Athlete: lesson cluster, safe artifact, and review . . . 1027
60.3 The Intelligent Operator as Cognitive Athlete assurance handoff: evidence, governance, refresh, and capstone . . . 1037
61 Information Architecture for Intelligence Work . . . 1052
61.1 Governed Intelligence Cycle and Dissemination Architecture frame for Information Architecture for Intelligence Work: source context, topic focus, and reader task . . . 1052
61.2 Dissemination-and-Marking Control Lens path for Information Architecture for Intelligence Work: lesson cluster, safe artifact, and review . . . 1055
61.3 Information Architecture for Intelligence Work assurance handoff: evidence, governance, refresh, and capstone . . . 1060
62 INDUSTRIAL AND CYBER-PHYSICAL INTELLIGENCE . . . 1071
62.1 INDUSTRIAL AND CYBER-PHYSICAL INTELLIGENCE learning spine and source route: unit purpose, module order, and evidence handoff . . . 1071
63 Industrial Control Systems (ICS) and Operational Technology . . . 1075
63.1 ICS/OT Cyber-Physical Defense and Tabletop Readiness frame for Industrial Control Systems (ICS) and Operational Technology: source context, topic focus, and reader task . . . 1075
63.2 Cyber-Physical Readiness Lens path for Industrial Control Systems (ICS) and Operational Technology: lesson cluster, safe artifact, and review . . . 1078

1 Abstract: Synthetic Analytic Tradecraft contract

AGEINT, or Agentic Intelligence, is a local curriculum-and-assurance atlas for teaching bounded AI-agent support inside intelligence education by making the machinery of Synthetic Analytic Tradecraft visible on the page. It converts SIST Guide TOC and Bibliography into **16 parts**, **51 modules**, **9 methods appendices**, **20 named AGEINT patterns**, and **312 parsed source-guide references** without renumbering inherited source identities, then asks the reader to inspect the same things an instructor or assurance reviewer would inspect: the part map that frames the domain, the module overview that names the learner task, the source spine that separates official, standards, scholarly, public-domain, practitioner, vendor, and provenance-only support while separating source quality from narrative fluency, the evidence packet that a student would retain, the reviewer challenge that should break a weak claim, and the validators that prevent a polished artifact from masquerading as a verified one. A learner does not enter through a slogan. The learner opens a module, sees which authority and source keys are allowed to carry the claim, reads a textbook primer that distinguishes observation from inference, confidence from probability, and source quality from fluency, works through a synthetic practice studio using classroom records, public declassified examples, owned-lab logs, toy datasets, rendered figures, or tabletop incidents, and then produces a bounded artifact with caveats, assumptions, alternatives, excluded actions, human review, rollback evidence, and refresh triggers written into the record before reuse. The method contract in Figure 19 shows that flow as a claim-to-evidence pathway rather than as an aspirational ethics statement: authority must be named before the task begins, source support must be traceable before a claim is promoted, unsafe action must be replaced by safe substitution, and agentic assistance must remain a drafting, retrieval, comparison, simulation, critique, or audit aid whose output is never treated as self-authenticating [of the Director of National Intelligence, 2015] [Agency, 2009] [Jr., 2007]. AGEINT remains synthetic in its fixtures, not in its standards: the word synthetic is therefore a control, not a downgrade. AGEINT keeps the fixture safe while keeping the standard difficult: HUMINT, SIGINT, OSINT, GEOINT and IMINT, FININT, counterintelligence, cyber threat intelligence, cognitive security, agent orchestration, active inference, source verification, public-sector governance, privacy review, and industrial-control-system defense can be discussed because the student is not handed live targets, evasion recipes, exploit instructions, manipulation playbooks, covert-action procedures, or unsafe cyber-physical steps. When a source topic could invite misuse, the module turns the risky motif into a provenance card, detection-coverage note, rights-impact worksheet, model or dataset card, source-refresh memo, release gate, risk-exception log, remediation backlog, or debrief protocol, and the exercise fails if it cannot show where authority, data boundary, tool permission, uncertainty, and review enter the workflow. The source layer is intentionally conservative: Perplexity and similar discovery tools may suggest candidates, but the manuscript cites verified official, standards, public-domain, or scholarly anchors encoded in the source corpus and rebuilt into BibTeX; Practitioner, vendor, and blog sources inherited through the source guide, plus social or other guide-inherited rows, can preserve provenance context without becoming foundational support for governance, rights, safety, empirical, statistical, or performance claims unless a stronger verified source bears the specific point. The same source posture is visible in the counts: 10 source-quality anchors cover the governing standards and assurance spine, while 462 curated intelligence research anchors span the domain lanes that route claim-bearing prose to direct evidence rather than decorative citations. A strong AGEINT artifact is therefore not an uninspected essay. It is an evidence packet that names the question, allowed inputs, excluded actions, source keys, claim type, caveats, competing explanations, confidence basis, prompt or run card, tool allowlist, data boundary, stop condition, reviewer challenge, safety boundary, refresh trigger, and human disposition. It also contains negative controls: stale citations that should be caught, weak-source-only claims that should be downgraded, figure positions or colors that should not be mistaken for quantitative evidence, overbroad statistical language that should fail, and operational substitutions that should halt until an instructor or reviewer approves a safer artifact. A reviewer can trace a finished packet in both directions: from a polished sentence back to the claim class, source family, cited anchor, caveat, and source-refresh duty, or from a source row forward to the modules, figures, tables, and exercises that rely on it. A student can see why a governance claim needs law, policy, standard, or official guidance support; why a cyber or industrial-control-system scenario must remain defensive and synthetic; why a social or cognitive-security lesson must become resilience education rather than persuasion practice; why a vendor or practitioner note can motivate a question but cannot by itself carry a public-rights or safety assertion; why a figure caption must say whether arrows are explanatory or quantitative; and why a model-generated draft is only useful after it has been constrained by authority, reviewed by a person, and attached to evidence that another person can contest. The early orientation pages, part maps, chapter landmarks, appendices, bibliography atlas, source-lane map, and generated reports are designed to make that trace visible instead of leaving it to instructor memory. They show the learner what to keep: the source keys behind each claim, the reason a safer substitute was chosen, the assumption that would change the answer, the dissent that should not be smoothed away, the review note that records who accepted residual risk, the rollback path if a source or permission changes, and the refresh trigger that turns a current claim back into a review item. They also show what the curriculum refuses to keep: unverifiable authority theater, live-target instructions, metric-looking diagrams without units or denominators, statistical decorations without empirical design, citation clusters that do not bear the sentence they decorate, and agent outputs whose provenance cannot be reconstructed. The technical build is part of that scholarship. Curriculum shards generate semantic manuscript files; cross-references use label-backed section and figure links, and display equations are typeset from source for reproducible math; citations route through Pandoc keys; figures are registry-backed PNG assets with captions, alt text, long descriptions, provenance, hashes, and visual-semantics metadata; source anchors carry explicit lane and tier fields; claim calibration audits high-risk empirical, statistical, governance, safety, visualization, artifact-readiness, and formalism language; scholarship and source-metadata reports expose review warnings instead of hiding them; PDF audits check stale output, URI targets, file actions, and banned filler language. The analysis-validation matrix in Figure 20 names which claim classes require empirical evidence, direct source-family support, negative controls, figure semantics, or rendered-artifact checks before they can be treated as ready, and that matrix is a boundary on what the manuscript can honestly say. AGEINT is not a benchmark and does not claim to measure AGEINT performance, model capability, analyst replacement, learning outcomes, operational effectiveness, public-sector impact, statistical significance, or safety performance; page counts, citation counts, figure counts, validator passes, and link audits are artifact telemetry, not empirical outcome evidence. Its strongest claim is methodological and inspectable: agentic assistance can be taught inside intelligence education when every reuse path is forced through authority, source support, safe substitution, evidence packet, negative controls, human review, rollback, and refresh triggers, and when the safest failure mode is to stop, document the unresolved condition, and ask for review. The resulting work should be read as a Synthetic Analytic Tradecraft atlas, not as a public-release certificate or a disguised operational manual: the reader can see the source key behind a sentence, the caveat behind a confidence statement, the assumption behind a scenario, the blocked use behind a tempting automation, the challenge behind a polished answer, the caption that limits a visual, the validator that rejects an overclaim, and the refresh duty that keeps current-source prose from becoming stale authority.

2 Curriculum Orientation: reader paths, evidence maps, and safety gates

AGEINT (Agentic Intelligence) is a curriculum-and-assurance atlas for teaching how AI agents can *assist* intelligence analysis without ever being trusted to run it unsupervised. It is written for three readers: an **instructor** assembling a defensible course, a **learner** building analytic habits on safe practice material, and an **assurance reviewer** checking that every claim can be traced back to a real source. Nothing here is operational — every exercise uses synthetic or public material, and every claim is built to be challenged rather than believed.

Read it as a map, not a textbook to read front to back: Section 2.4 lets you choose a domain part, Section 2.3 gives each reader a fast path, and Section 2.36 states what the atlas refuses to teach.

> **For maintainers.** This page is generated. The source templates under `manuscript/templates/` keep guide-derived values — titles, labels, counts, source spines, semantic paths, and bibliography rows — as neutral tokens; the build resolves them from `data/curriculum/` into the rendered manuscript in `output/manuscript/`. Edit the template, not the rendered output.

The rest of this orientation is a toolkit for navigating that map; the next section shows the exact path.

2.1 How to use this atlas: navigation path, evidence checks, and verifier handoff

Read AGEINT as a navigable curriculum-and-assurance atlas rather than a linear textbook or empirical evaluation report. Start with Section 2.4 and Figure 5 to choose the part, open the linked part introduction to see the module sequence, then use each chapter overview for the figures, source lane, and assessment artifact that matter for the current decision. Keep Section 80 open when checking a claim, because it preserves source identity, provenance type, source tier, and refresh context in one place.

Use the first pages as signposts, not as a preface to skip. The handoff is intentionally explicit and always moves in the same direction:

domain part -> module overview -> practice studio -> evidence contract -> governance boundary -> assessment route -> bibliography/source lane -> verifier reports.

Work the table below in order: orient, then match each claim to its evidence, then verify before trusting anything.

Step	Where to go	Why this step matters
Start here	Section 2.4, Section 2.2, and Section 2.3	Choose a domain part, name the Synthetic Analytic Tradecraft contract, and decide which reader path governs the next move.
Then check	Section 2.7, Section 2.12, and Section 80	Match the claim class to evidence, lane, citation identity, and refresh duty before treating prose or figures as support.
Before you trust	Section 2.13, Section 2.34, and Section 3	Confirm risky motifs were converted to bounded artifacts, figures carry their limits, and verifier reports agree with the rendered manuscript.
Govern and assure	Section 2.18, Section 2.23, Section 2.24, and Section 2.26	Bind rights impact, red-team challenge, documentation provenance, and retention duty to each reusable artifact before it leaves the course.

Claim classes are separated at source-selection time. Governance claims, technical and theoretical claims, empirical capability claims, and source-construction claims each need a matching evidence type; the shared method reference records the PRISMA-S-inspired source-reporting fields used when a search or discovery process supports manuscript content [Melissa L. Rethlefsen and the PRISMA-S Group, 2021].

The opening route visual turns the atlas handoff into a concrete reader choice: select the role, keep the evidence trace, and move to the next section with the right verifier question already named. See Figure 1.

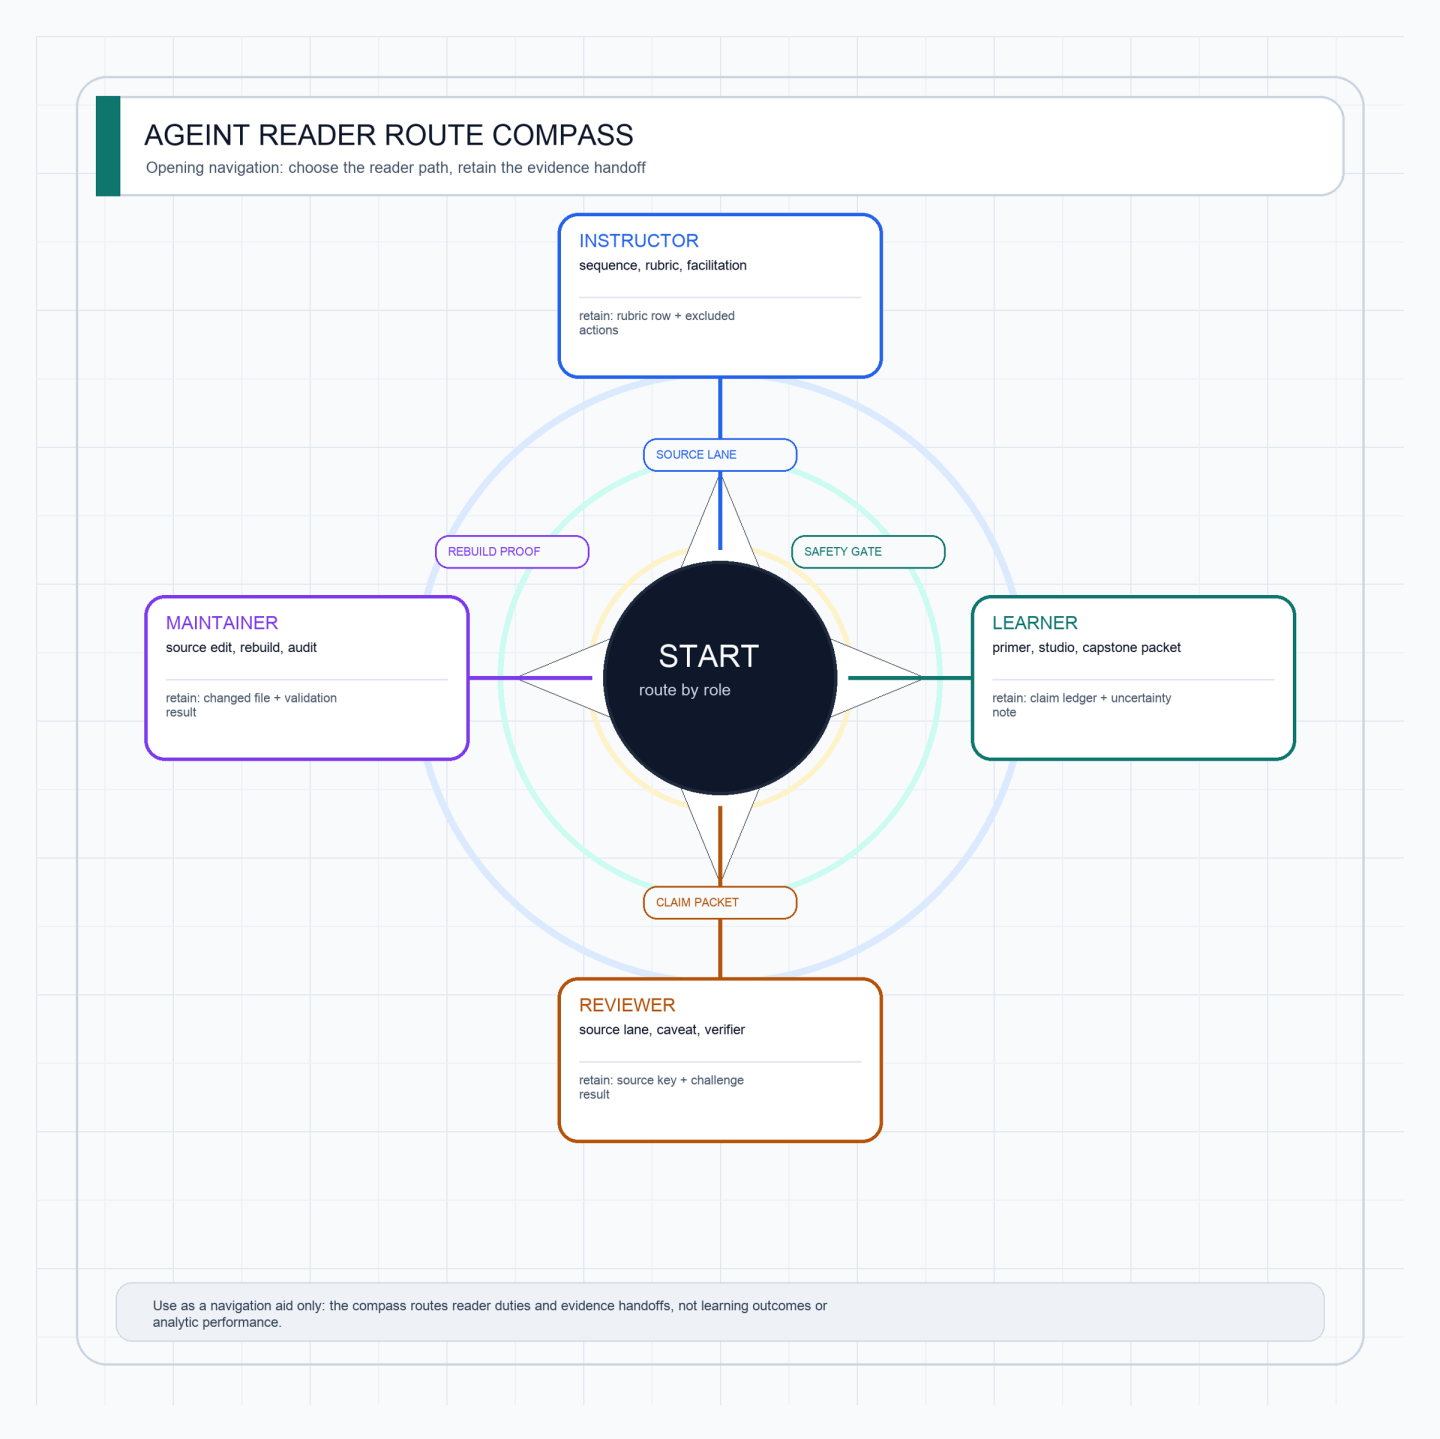

Figure 1: Opening navigation compass for the AGEINT orientation. It separates the instructor, learner, assurance reviewer, and maintainer routes and pairs each with the evidence trace that should survive the next reading move, so a reader can choose a path and know what to carry into the following section. It is navigation support, not a learning-outcome or performance claim.

2.2 Synthetic Analytic Tradecraft thesis: synthetic fixtures, source discipline, and reviewable claims

AGEINT is strongest when read as **Synthetic Analytic Tradecraft**: a governed practice for using synthetic inputs, generated artifacts, and bounded agentic assistance to make analytic reasoning inspectable before any real-world action is considered. The synthetic layer supplies safe fixtures: toy records, public declassified examples, instructor-provided evidence cards, owned-lab logs, and rendered figures. The tradecraft layer supplies the harder standard: source description, alternative hypotheses, assumption checks, probability/confidence separation, dissent, and reviewer challenge [of the Director of National Intelligence, 2015]; [Agency, 2009]; [Jr., 2007].

This framing tells you exactly what to expect — and what not to. AGEINT is not an operational manual and not a benchmark proving autonomous analytic performance. It is a source-governed workbench for producing reviewable analytic artifacts under synthetic conditions. The relevant question is whether a module can leave behind a traceable evidence packet that another analyst, instructor, or assurance reviewer can challenge: source keys, caveats, assumptions, alternatives, confidence basis, negative controls, rights constraints, and refresh triggers.

One short example makes the standard concrete. Studying a synthetic leaked-document fixture, a learner does not write *the document is authentic*. They write a packet: *source* = the synthetic tabletop fixture they were given; *claim type* = provenance assessment; *confidence* = moderate, because the metadata is internally consistent but cannot be independently checked; *alternative* = the document was fabricated to mislead; *refresh trigger* = re-open the judgment if a primary source is released. That record — not the verdict — is the deliverable AGEINT teaches.

The tradecraft figures make this claim visible, and all are assembled together in Section 2.34: the governed system map Figure 18 shows the whole governed stack; the analytic evidence ladder Figure 121 separates doctrine, reform, postmortem, empirical, and forecasting evidence; the SAT evidence boundary Figure 122 prevents universal debiasing claims; the SAT method contract Figure 19 binds source-family triangulation (the same point supported by more than one independent *kind* of source — an official standard *and* a peer-reviewed study, say, not two blog posts), synthetic fixtures, analytic field separation, negative-control testing, reviewer challenge, and artifact-evidence reporting; and the first-principles decomposition Figure 123 forces observation, inference, assumption, likelihood, confidence, dissent, and decision boundary fields to remain separate.

These four commitments are the reader-facing grouping of the six contract fields drawn in Figure 19: source-family triangulation and synthetic fixtures sit under the first two rows below, analytic-field separation and negative-control testing under the next two, and reviewer challenge and artifact-evidence reporting under the last two.

SAT commitment	How AGEINT implements it	Early audit surface
Synthetic before operational	Exercises use classroom fixtures, public or declassified examples, owned-lab traces, and tabletop records.	Section 2.36 and Section 2.13
Tradecraft before automation	Agent assistance must preserve source descriptors, alternatives, assumptions, probability/confidence boundaries, and reviewer challenge.	Figure 122 and Section 3
Evidence packet before claim	Claims need source keys, caveats, source-family triangulation, claim-calibration review, and refresh duties before reuse.	Figure 19, Figure 17, and Figure 23
Negative control before trust	Validators, rubrics, rendered PDFs, and figure registries are treated as attackable artifacts.	Figure 128 and Section 2.33

The workbench visual makes the Synthetic Analytic Tradecraft thesis inspectable by showing how safe fixtures become reviewable claim packets rather than operational instructions; it is a classroom artifact route, not evidence of field capability. See Figure 2.

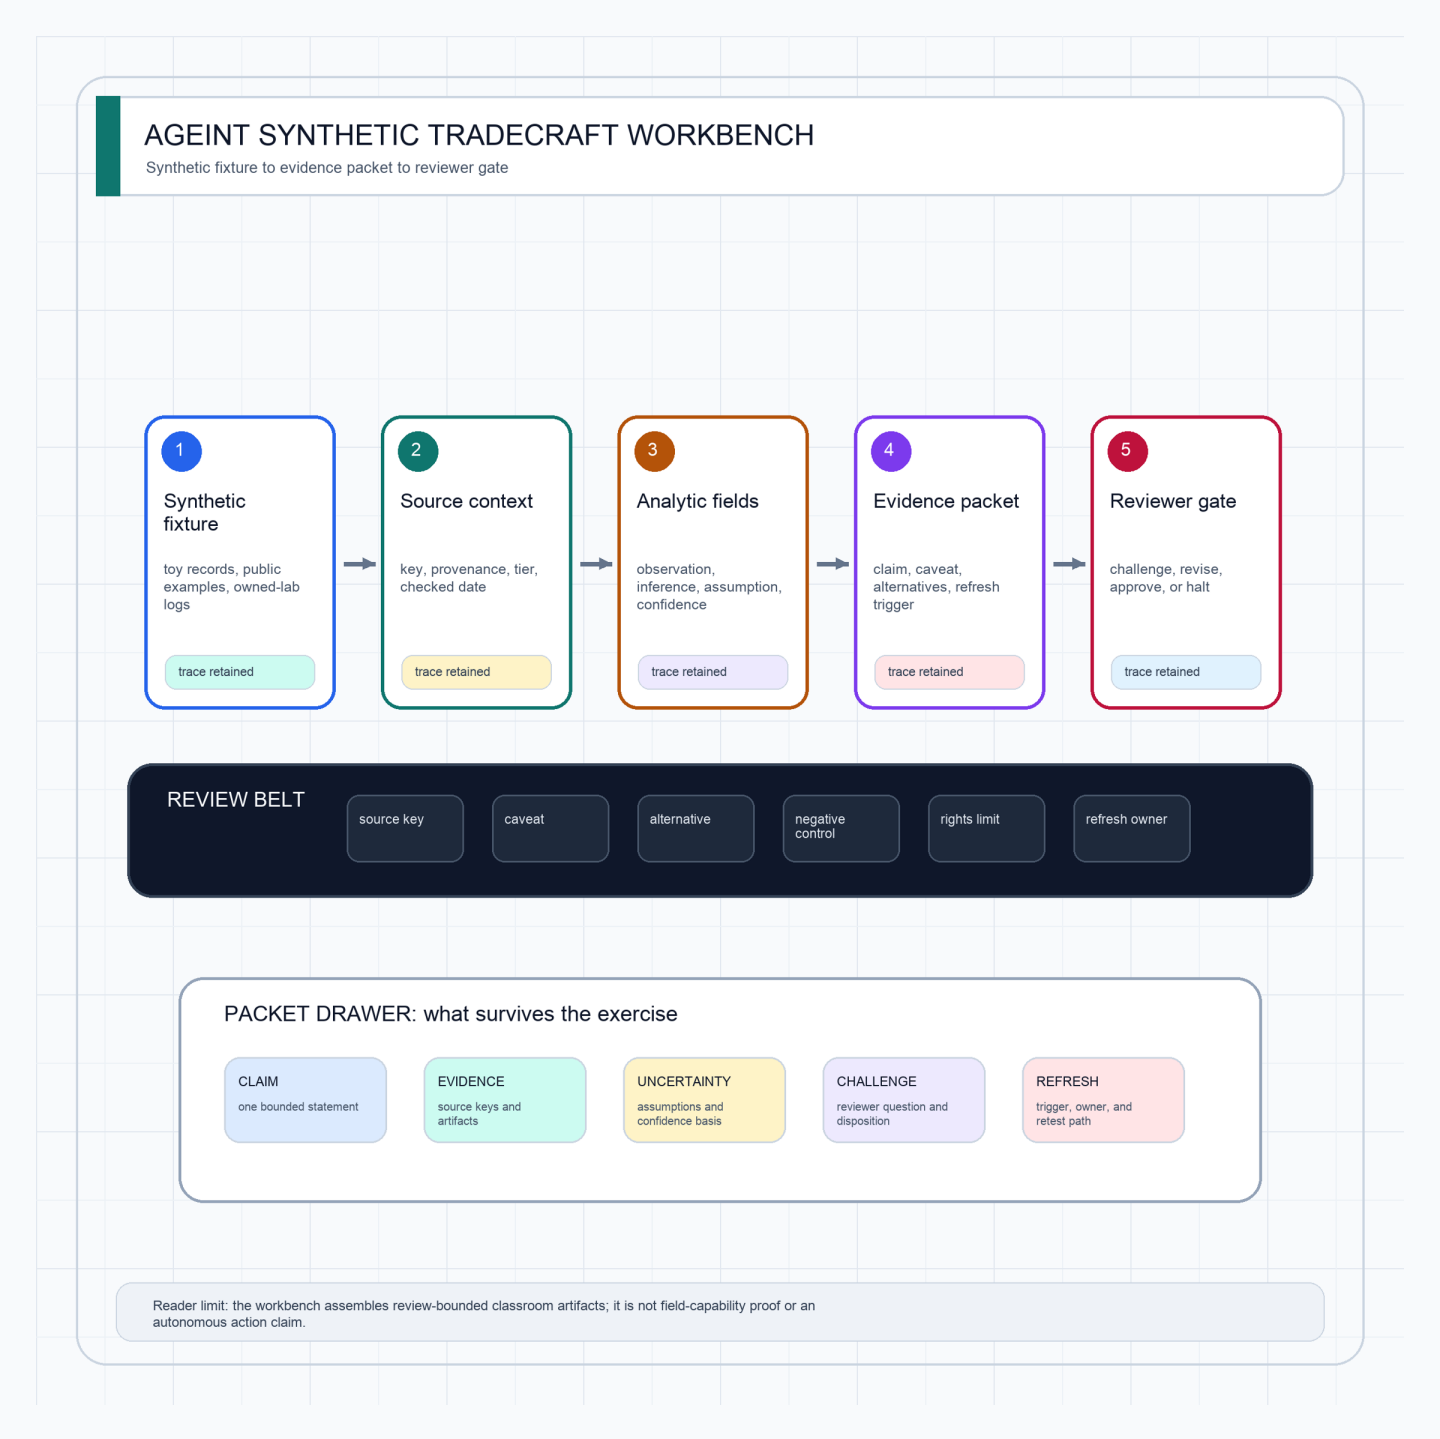

Figure 2: Workbench-style assembly line for Synthetic Analytic Tradecraft. It shows how a synthetic fixture becomes a source description, an analytic field set, a bounded claim packet, and a reviewer-gate disposition, tracing the path a classroom exercise takes from raw material to a record another analyst can challenge. It is a classroom artifact route, not an autonomous action claim or field-capability proof.

2.3 Reader paths: instructor, learner, reviewer, and maintainer handoffs

Reader	Fast path	Evidence to keep
Instructor	Pair the linked part introduction from Section 2.4 with each module's overview, practice studio, evidence contract, and governance boundary, confirm role ownership in Section 2.22, then set the assessment route from Section 2.20 before assigning a studio exercise built toward Section 2.14.	rubric row, excluded-action note, and source refresh trigger
Learner	Follow the module sequence from primer to practice studio, evidence contract, and governance boundary, then meet the assessment route in Section 2.20 before drafting a capstone packet against Section 2.14.	claim ledger entry, uncertainty note, and blocked-use statement
Assurance reviewer	Trace each material claim through Section 2.12, Section 80, Section 2.18, Section 2.34, and Section 2.33.	source key, review owner, caveat, and reproducible artifact path
Builder or maintainer	Treat generated output as an audit surface; update data, templates, manifest code, or figure specs, then rebuild and compare verifier reports.	changed source file, regeneration command, and validation result

2.4 Curriculum map: parts, modules, and source-backed route choices

Curriculum area	Part intro	Modules	Unit map	Runtime source
Foundations of Intelligence Tradecraft	Section 4	3	Figure 30	parsed source guide
Human Intelligence (HUMINT)	Section 8	3	Figure 36	parsed source guide
Signals Intelligence (SIGINT)	Section 12	2	Figure 41	parsed source guide
Open Source Intelligence (OSINT)	Section 15	3	Figure 45	parsed source guide
Technical Intelligence and Cyber Operations	Section 19	4	Figure 52	parsed source guide
Imagery and Financial Intelligence	Section 24	2	Figure 58	parsed source guide
Psychological Operations and Influence	Section 27	4	Figure 64	parsed source guide
Counterintelligence	Section 32	2	Figure 70	parsed source guide
Gray Zone, Hybrid Warfare, and Non-state Actors	Section 35	3	Figure 74	parsed source guide
Historical Intelligence Services	Section 39	4	Figure 79	parsed source guide
AGEINT — Agentic Intelligence	Section 44	6	Figure 85	parsed source guide
Cognitive Security	Section 51	4	Figure 107	parsed source guide
Epistemic Rigor and Analytic Tradecraft	Section 56	2	Figure 116	parsed source guide
Productivity Intelligence and Cognitive Performance	Section 59	2	Figure 129	parsed source guide
Industrial and Cyber-physical Intelligence	Section 62	5	Figure 134	parsed source guide
Legal, Ethical, and Oversight Frameworks	Section 68	2	Figure 143	parsed source guide

2.5 Runtime inventory: generated counts, anchors, and method appendices

These counts describe the size of the build, not its quality. They let a maintainer confirm a rebuild produced the expected inventory and let a reader gauge scope; they are not a performance, coverage, or learning-outcome claim (see Section 2.32).

Derived artifact	Runtime value
Curriculum parts	16
Curriculum modules	51
Methods appendices	9
AGEINT patterns	20
Parsed references	312
Official source-quality anchors	10
Intelligence research anchors	462
Intelligence practice lenses	14

The source constellation visual ties the runtime inventory back to the evidence families and lanes that govern source choice, caveat language, and refresh duties. See Figure 3.

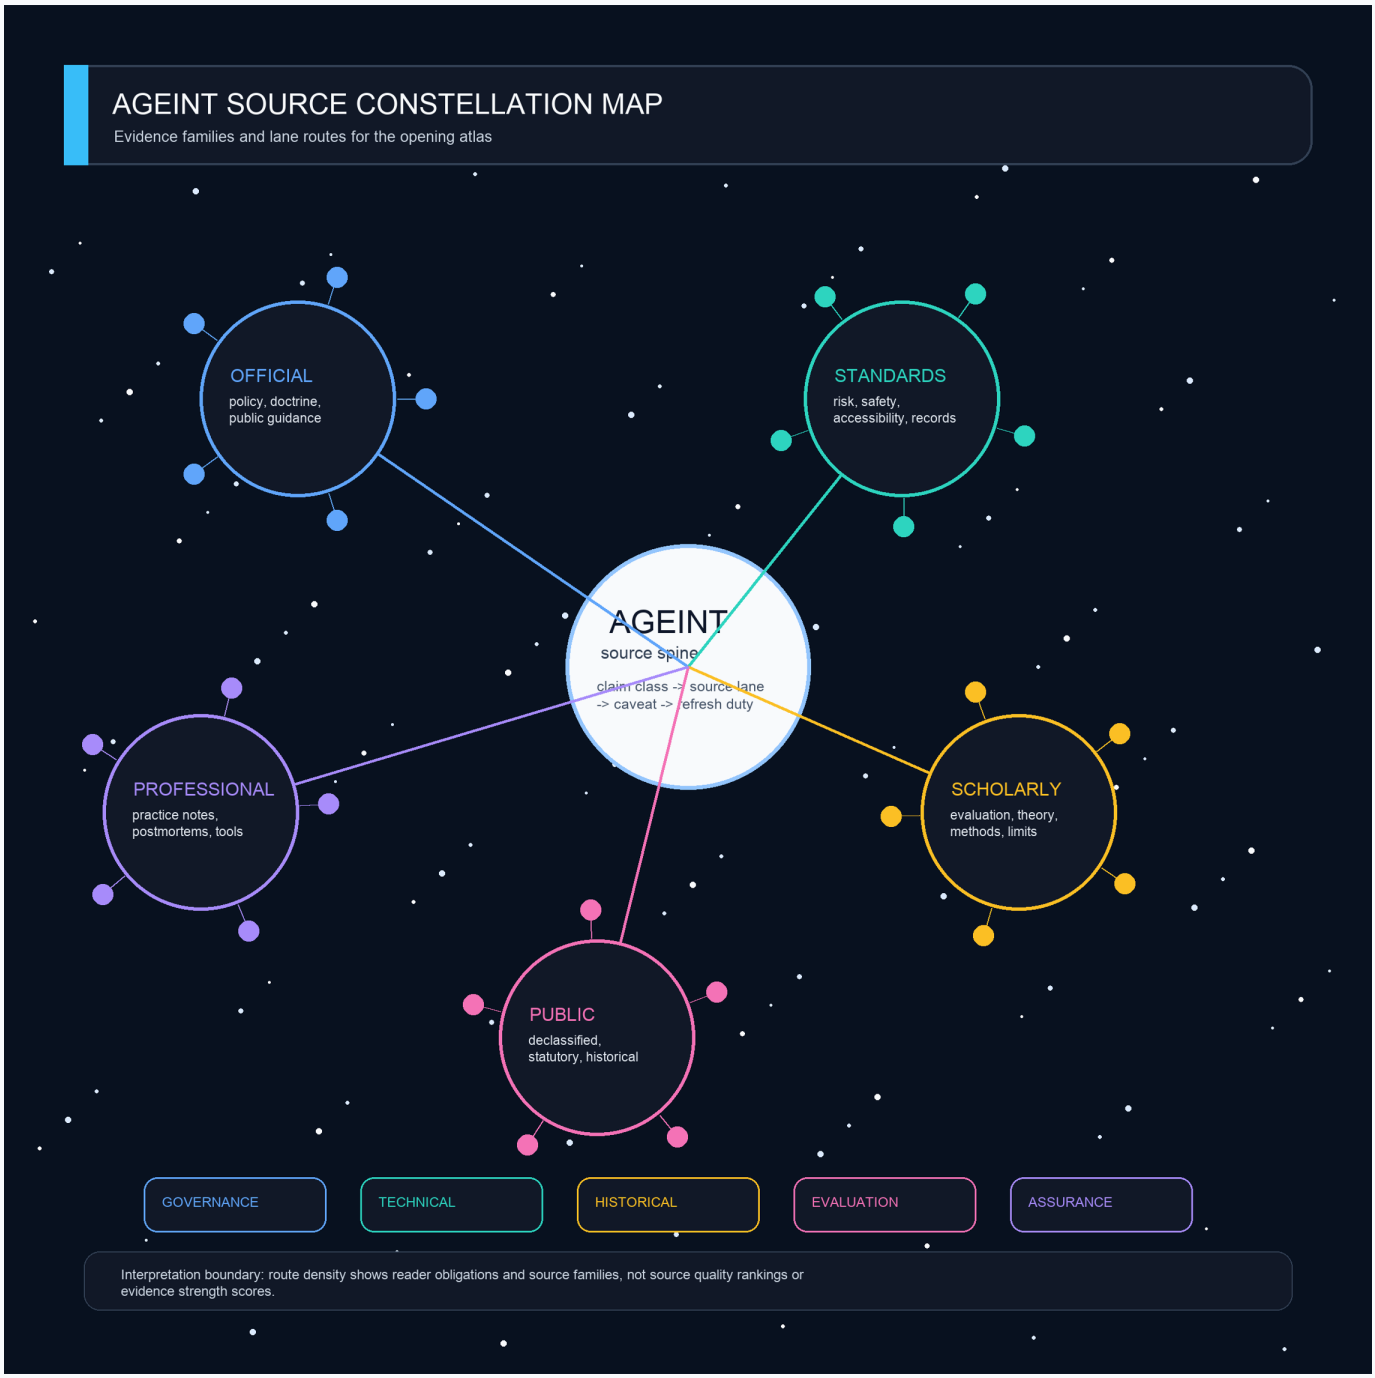

Figure 3: Source-family constellation for early orientation. It places the official, standards, scholarly, public, and professional evidence families around the AGEINT source spine so a reader can route governance, technical, historical, evaluation, and assurance claims to the lane whose evidence actually supports them. Route density shows coverage, not a ranking of source quality or evidence strength.

2.6 Related work and contribution boundary: adjacent literatures and AGEINT limits

AGEINT sits between several bodies of work rather than inside only one of them: AI risk-management guidance, generative-AI profiles, public-sector agentic-AI controls, model and dataset documentation practices, active-inference theory, agent security, and source-reporting methods [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]; [of Canada Secretariat, 2026a]; [Margaret Mitchell and Gebru, 2019]; [Timnit Gebru and Crawford, 2021]; [Mahima Pushkarna and Kjartansson, 2022]; [Friston, 2010]; [Christopher L. Buckley and Seth, 2017]; [Kai Greshake and Fritz, 2023]; [Melissa L. Rethlefsen and the PRISMA-S Group, 2021]. Its contribution is not a new agent architecture, cognitive theory, attack benchmark, or measured learning outcome. The contribution is a versioned curriculum-and-assurance framework that links source identity, claim classes, safe exercises, figures, capstone artifacts, and rebuildable review gates for bounded agentic-intelligence education.

The four-domain convergence map Figure 8 makes that boundary visible. Synthetic-intelligence support is treated as useful only when analytic tradecraft standards, OPSEC and zero-trust constraints, and cognitive-security safeguards remain separate review gates [Dylan and Stivang, 2025]; [Caballero and Jenkins, 2024]; [McMahon, 2024]; [The White House, 1988]; [of Standards and Technology, 2020b]; [Wardle and Derakhshan, 2017]; [Terp and Breuer, 2022]. The map therefore routes AI, OPSEC, and cognitive-security claims into source-backed classroom artifacts while blocking autonomous strategic-judgment claims, manipulation guidance, live-targeting workflows, and unsupported efficacy claims.

2.7 Analysis validation protocol: claim classes, evidence packets, and failure modes

The manuscript now treats analysis validation as a reader-facing method, not a private build habit. Each major claim class must name the evidence packet that would make it reviewable, the validation question a reviewer should ask, and the failure mode that would force warning or remediation. The analysis validation matrix Figure 20 is the compact visual form of that protocol: design guidance needs a source family and caveat; empirical or evaluation claims need a study, metric, or benchmark; governance claims need law, standard, or rights-impact support; figure claims need registry text, rendered pixels, and link-safe PDF output; artifact-readiness claims need fresh builds and current audits; reviewer dispositions need a task ledger and negative control.

The claim-calibration verifier adds the machine-checkable edge to that protocol Figure 23. Artifact telemetry such as citation counts, figure counts, page counts, link counts, and validator pass states is useful readiness evidence, but it is not a statistical result, learning-outcome estimate, operational-performance benchmark, or universal safety claim. The audit therefore fails unsupported proof-language, measured-performance claims, p-value or significance language, and decorative formalisms without direct support and limitation text, while allowing explicit boundary language and misconception checks that warn the reader what a source cannot establish.

Claim class	Validation question	Required evidence	Failure mode
Design guidance	Is the claim framed as proposed guidance rather than measured performance?	source-family support, caveat, and bounded conclusion	architecture prose is promoted into empirical proof
Empirical or evaluation claim	Does a cited study, metric, benchmark, or evaluation source directly support the claim?	method source, limitation note, and refresh trigger	measured language appears without direct evaluation evidence
Governance or rights claim	Which law, standard, public guidance, or rights-impact source constrains the advice?	source lane, affected group, owner, residual risk	compliance language appears as unsupported assurance
Figure or visualization claim	Does the visual carry readable text, alt text, provenance, and an inspectable source section?	registry row, PNG metadata, caption, long description	a figure works only as decoration or inaccessible evidence
Artifact readiness claim	Are manuscript, citations, figures, references, and PDF links from the same rebuild?	artifact-evidence manifest, rendered-reference audit, PDF audit	stale output or Markdown-file links certify as ready
Reviewer disposition	What would make this row pass, warn, fail, or reopen?	negative control, closure evidence, task owner	a green check hides the decision rule

The assurance cockpit visual summarizes how a reader should interpret local build telemetry: useful for routing review effort, but bounded by the generated audits that carry the authoritative pass, warn, or block state. See Figure 4.

Figure 4: Audit-tile orientation cockpit for local readiness. It groups build freshness, reference quality, source metadata, refresh posture, figure quality, and the publication-readiness boundary into reader-facing tiles that route review effort to the right verifier. The tiles are schematic orientation only; authoritative status — the pass, warn, or block state — lives in the generated audits, not in this figure.

2.8 Consolidated glossary and index: terms, audit surfaces, and reader routing

Use this compact index to route common terms to the right audit surface before reading a chapter in detail.

Term	Working meaning	Primary audit surface
Source lane	The provenance, source tier, and refresh context that govern a claim.	Section 2.12 and Section 80
Source tier	The evidence role assigned to a source: official, standards, scholarly, practitioner, vendor, historical, or source-guide context.	Section 2.11 and source annotations
Synthetic Analytic Tradecraft	The controlled use of synthetic fixtures and bounded agent support to make analytic reasoning, evidence, uncertainty, dissent, and review gates inspectable.	Section 2.2 and Figure 19
Analysis validation	The review protocol that maps claim class, validation question, evidence packet, failure mode, and disposition before a claim can be treated as ready.	Section 2.7 and Figure 20
Claim ledger	A reviewable record of claim, evidence, caveat, confidence, and owner.	Section 2.32 and Section 2.14
Safe substitution	A replacement of unsafe operational action with synthetic, public, tabletop, or governance work.	Section 2.13
Reviewer gate	A named human approval or challenge point before reuse, presentation, or tool execution.	Section 2.20 and Section 2.23
Figure registry	The reproducible map from figure label to generated asset, caption, and source section.	Section 2.34

2.9 Intelligence research profiles: domain lanes, source roles, and profile routing

Profile	Anchor count	Core contract
Governed Intelligence Cycle and Dissemination Architecture	58	requirements, data provenance, analytic judgments, markings, dissemination permissions, records obligations, and feedback remain separable artifacts
Analytic Tradecraft and Source Integrity	110	every agent output must preserve evidence, assumptions, judgments, likelihood, confidence, dissent, empirical limits, and change history as separable fields
AI Ethics, Data Governance, and Civil-Liberties Review	78	data, model, prompt, output, evaluator, accountable human, audit evidence, and retention rule are independently inspectable and versioned
Agentic AI Governance and Tool Security	106	agents, tools, credentials, memory, retrieval stores, policies, and logs remain separately inspectable and revocable components
Open-Source and Geospatial Intelligence Integrity	51	collection notes, source metadata, transformations, caveats, and analytic judgments remain separately exportable
Collection Management and Multi-INT Requirements Discipline	58	requirements, authorities, source disciplines, collection notes, retention limits, caveats, and evaluation metrics remain separable
Financial Intelligence and Economic-Security Due Diligence	37	entities, transactions, sanctions programs, red flags, supplier evidence, legal constraints, and analytic judgments remain separately reviewable
Counterintelligence and Source-Integrity Defense	55	identity, access, reporting, corroboration, caveats, and confidence are modeled independently so defensive review can happen without exposure
Cognitive Security and Influence Resilience	62	separate descriptive analysis, normative assessment, response options, and protected-audience considerations
Active-Inference Theory and Governed Agent Analogy	12	formal claim, pedagogical analogy, implementation assumption, evaluation evidence, and governance duty remain distinct fields
Historical and Declassified Intelligence Services	22	archive source, release channel, historical context, analytic lesson, oversight implication, and modern analogy remain explicitly separated
Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense	69	indicators, TTP mappings, affected assets, supplier evidence, response actions, and sharing constraints remain independently reusable
ICS/OT Cyber-Physical Defense and Tabletop Readiness	33	separate cyber indicators, engineering observations, safety impacts, operator decisions, and recovery actions
Legal, Ethical, and Oversight Architecture	74	policies, approvals, audit logs, evidence, and action permissions remain linked but independently inspectable
Operator Productivity and Cognitive Performance	3	requirements queues, workload signals, focus blocks, evidence packets, and reviewer checkpoints remain separable artifacts

2.10 Intelligence practice lenses: artifact expectations, safety checks, and review questions

Practice lens	Evidence artifact	Validation rule	Safety check
Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	verify source authority, public/classification status, CAPCO-safe vocabulary, audience need, and records disposition before reuse	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	show priority, authority, minimization, corroboration, and source quality before any claim is reused	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	confirm lawful data use, limitations, bias and accuracy testing, public-register fit, human accountability, and rights escalation	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	separate formal claim, pedagogical analogy, implementation assumption, evaluation evidence, and governance duty before reuse	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	separate raw reporting, inference, judgment, and recommendation before synthesis	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Operator-Workload Hygiene Lens	operator workload card with queue state, NASA-TLX ratings, focus plan, handoff owner, and rest boundary	separate urgency from authority, workload from quality, and personal tempo claims from measured task-switching cost	exclude live operational tempo mandates, surveillance of people, performance coercion, and unreviewed tasking under fatigue
Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	distinguish what the record shows, what remains redacted or unknown, and which governance lesson is defensibly transferable	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Economic-Security Due-Diligence Lens	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary	verify official list source, typology provenance, beneficial-ownership uncertainty, export-control relevance, and non-evasion framing	exclude sanctions evasion, laundering methods, threshold gaming, procurement bypasses, and tailored targeting of real firms
Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	verify least privilege, prompt-injection exposure, provenance, observability, stop conditions, and incident-reporting triggers	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	verify that taxonomy labels are descriptive, indicators are contextualized, incident categories are reviewable, and outputs remain detection or assurance oriented	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions
Software-Supply-Chain Assurance Lens	software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps	separate provenance evidence, social-trust signals, build controls, vulnerability claims, and attribution uncertainty	exclude exploit reproduction, maintainer targeting, backdoor mechanics, credential hunting, and live repository interference
Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	distinguish observation, attribution, impact assessment, and resilience response	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cyber-Physical Readiness Lens	tabletop packet with OT asset inventory, architecture record, consequences, injects, and debrief rubric	validate against safety, availability, engineering state, incident scope, and after-action learning	keep exercises lab-only or tabletop; exclude exploitation, process manipulation, unsafe actuation, and live-control actions
Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	confirm lawful purpose, proportionality, retention, review, and appeal or redress paths	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought

2.11 Research anchor atlas: curated sources, lanes, tiers, and claim scope

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Agency, 2009]	analytic_tradecraft	analytic_tradecraft	official_primary	2026-05-21	annual	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis.
[Agency, 2016]	analytic_tradecraft	analytic_tradecraft	official_primary	2026-05-21	annual	Defense intelligence structured-analysis primer for classroom analytic exercises.
[of the Director of National Intelligence, 2026d]	analytic_tradecraft	analytic_tradecraft	official_primary	2026-05-21	annual	Official sourcing directive for traceability, citations, source descriptors, and source summaries.
[of the Director of National Intelligence, 2026e]	analytic_tradecraft	analytic_tradecraft	official_primary	2026-05-21	annual	Official ODNI explanation of analytic objectivity, ombuds, and tradecraft standards.
[of State, 2024]	osint_geoint	osint_geoint	official_primary	2026-05-21	annual	Official strategy source for lawful OSINT governance, discovery, validation, and dissemination.
[Jr., 2007]	analytic_tradecraft	analytic_tradecraft	scholarly_or_official	2026-06-06	annual	Foundational analytic cognition source for bias, mental models, and structured reasoning.
[of the Director of National Intelligence, 2026c]	collection_management	collection_management	official_primary	2026-05-21	annual	Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation.
[of Staff, 2026]	collection_management	collection_management	official_primary	2026-05-21	annual	Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments.
[of the Army, 2020]	analytic_tradecraft	analytic_tradecraft	official_primary	2026-05-21	annual	Official Army analytic doctrine for intelligence-analysis process, structured analytic techniques, analytic design, and cognitive discipline.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Counterintelligence and Center, 2024]	counterintelligence_source_integrity	counterintelligence_source_integrity	official_primary	2026-05-21	annual	Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness.
[of the Director of National Intelligence and Agency, 2024]	osint_geoint	osint_geoint	official_primary	2026-05-21	annual	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
[Agency, 2026c]	osint_geoint	osint_geoint	official_primary	2026-05-21	annual	Official NGA strategy anchor for GEOINT readiness, warning, partnership resilience, resource stewardship, and AI integration.
[Archives and Administration, 1981]	legal_oversight	legal_oversight	official_primary	2026-05-21	annual	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection.
[Agency, 2026g]	legal_oversight	legal_oversight	official_primary	2026-05-21	annual	Official NSA public explanation of FISA oversight for signals intelligence collection governed by statutory and court-authorized controls.
[Community, 2026]	governed_intelligence_cycle	governed_intelligence_cycle	official_primary	2026-05-21	annual	Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners.
[Community, 2020b]	ai_ethics_data_governance	ai_ethics_data_governance	official_primary	2026-05-21	annual	Official IC principles for lawful, accountable, objective, human-centered, secure, resilient, and science-informed AI.
[Community, 2020a]	ai_ethics_data_governance	ai_ethics_data_governance	official_primary	2026-05-21	annual	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[of the Director of National Intelligence, 2025b]	ai_ethics_data_governance	ai_ethics_data_governance	official_primary	2026-05-21	annual	Official IC AI governance directive covering CAIO roles, oversight, interoperability, civil-liberties review, training data, and impact assessment.
[of the Director of National Intelligence, 2025a]	ai_ethics_data_governance	ai_ethics_data_governance	official_primary	2026-05-21	annual	Official IC data-management directive for data governance, data stewardship, CDO authority, interoperability, and data lifecycle management.
[of the Director of National Intelligence, 2026b]	governed_intelligence	governed_intelligence	official_primary	2026-05-21	annual	Official CAPCO register for classification and control-marking vocabulary, abbreviations, portion markings, and dissemination syntax.
[Privacy and Board, 2026]	legal_oversight	legal_oversight	official_primary	2026-05-21	annual	Official oversight-report library for privacy, civil-liberties, surveillance, watchlisting, facial-recognition, and redress analysis.
[General Services Administration et al., 2026]	ai_ethics_data_governance	ai_ethics_data_governance	official_primary	2026-05-21	annual	Official federal data-governance benchmark for data as a strategic asset, ethical governance, lifecycle practices, and learning culture.
[Agency, 2026a]	historical_declassified_sources	historical_declassified_sources	official_primary	2026-05-21	annual	Official CSI landing page for Studies in Intelligence, declassified professional reflection, analytic history, and institutional learning.
[Agency, 2026h]	historical_declassified_sources	historical_declassified_sources	official_primary	2026-05-21	annual	Official declassified historical-release library for cryptologic history, SIGINT history, COMSEC, oral histories, and historical cases.
[Office, 2026a]	historical_declassified_sources	historical_declassified_sources	official_primary	2026-05-21	annual	Official declassified satellite-reconnaissance program archive for CORONA, GAMBIT, POPPY, QUILL, and other historical technical-intelligence cases.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Archives and Administration, 2026b]	historical_declassified_sources	historical_declassified_sources	official_primary	2026-05-21	annual	Official NARA guide to CIA Record Group 263, archival provenance, record series, and declassified intelligence research pathways.
[Network, 2026a]	financial_economic_security	financial_economic_security	official_primary	2026-05-21	annual	Official FININT source for AML/CFT advisories, typology awareness, sanctions-evasion warnings, red flags, and compliance-oriented monitoring.
[of Foreign Assets Control, 2026]	financial_economic_security	financial_economic_security	official_primary	2026-05-21	annual	Official OFAC sanctions-program library for understanding legal program structure, list maintenance, and compliance-oriented economic statecraft.
[Force, 2025]	financial_economic_security	financial_economic_security	international_standard	2026-05-21	annual	Official international AML/CFT/CPF standard for risk-based controls, beneficial ownership, information sharing, supervision, and mutual evaluation.
[of Industry and Security, 2026]	financial_economic_security	financial_economic_security	official_primary	2026-05-21	annual	Official export-control enforcement source for compliance, screening, red flags, voluntary disclosures, and national-security protection of sensitive items.
[Authority, 2026]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Government framework focused on agentic AI delegation, controls, and safe deployment.
[ASD ACSC and NCSC-UK, 2026]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Joint government guidance for deploying agentic AI with identity, logging, and progressive controls.
[of Standards and Technology, 2026a]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	NIST concept paper for applying identity and authorization standards to software and AI agents.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[of Standards and Technology, 2026c]	agentic_ai_governance	agent_interoperability_standards	official_primary	2026-06-11	quarterly	Official NIST initiative for trusted, interoperable, and secure AI-agent standards, protocols, identity, and evaluation research.
[UK Department for Science et al., 2024]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Official evaluation guidance for advanced AI systems, including agent evaluations for tool use, semi-autonomy, and real-world actions.
[Project, 2026b]	agentic_ai_governance	agentic_ai_security	security_standard	2026-06-11	semiannual	OWASP GenAI Security Project resource identifying critical risks and mitigations for autonomous and agentic AI applications.
[MITRE, 2026a]	agentic_ai_governance	ai_red_team_assurance	research_standard	2026-06-11	quarterly	MITRE ATLAS is a living knowledge base for adversarial threats to AI-enabled systems, useful for defensive red-team mapping and control coverage.
[Project, 2025d]	agentic_ai_governance	agentic_ai_governance	security_standard	2026-05-21	annual	Security taxonomy for prompt injection, excessive agency, data leakage, and LLM application risks.
[of Standards and Technology, 2022d]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Official secure development framework for agent tooling, connectors, and software supply chains.
[of Standards and Technology, 2024f]	ics_ot_defense	ics_ot_defense	official_primary	2026-05-21	annual	Official cybersecurity-risk governance framework that adds the Govern function and supplies a common language for AI, OT, and enterprise risk.
[of Standards and Technology, 2022b]	ics_ot_defense	ics_ot_defense	official_primary	2026-05-21	annual	Systems-security engineering foundation for trustworthy systems in contested operational environments and related training programs.
[of Standards and Technology, 2016]	cyber_threat_intelligence	cyber_threat_intelligence	official_primary	2026-05-21	annual	Official guidance for establishing threat-information sharing goals, communities, distribution rules, and defensive use of indicators and TTPs.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[of Standards and Technology, 2025c]	cyber_threat_intelligence	cyber_threat_intelligence	official_primary	2026-05-21	annual	Official incident-response profile for preparation, detection, response, recovery, and continuous improvement under CSF 2.0.
[of Standards and Technology, 2022c]	cyber_threat_intelligence	cyber_threat_intelligence	official_primary	2026-05-21	annual	Official supply-chain risk-management guidance for identifying, assessing, and mitigating product, service, vendor, and process risks.
[Cybersecurity and Agency, 2026c]	ics_ot_defense	ics_ot_defense	official_primary	2026-05-21	annual	Official defensive ICS practice library for defense-in-depth, forensics, incident response, and remote access.
[Cybersecurity and Agency, 2026f]	ics_ot_defense	ics_ot_defense	official_primary	2026-05-21	annual	Official exercise packages for cyber, physical, ICS, ransomware, and convergence tabletop scenarios.
[of Standards and Technology, 2006]	ics_ot_defense	ics_ot_defense	official_primary	2026-05-21	annual	Official methodology for designing, conducting, and evaluating test, training, and exercise programs.
[MITRE, 2026c]	ics_ot_defense	ics_ot_defense	research_standard	2026-05-21	annual	Threat-informed defensive matrix for ICS tactics and techniques, used for coverage mapping.
[for Security Policy, 2025]	cognitive_influence_security	cognitive_influence_security	scholarly_policy	2026-05-21	annual	Policy-scholarship source for cognitive security, information literacy, critical thinking, and whole-of-society resilience.
[NSA and partners, 2025]	ics_ot_defense	ics_ot_defense	official_primary	2026-05-21	annual	Joint government guidance for AI governance, assurance, safety, and security in OT environments.
[Foundation, 2026]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Official NSF source for open AI-agent protocol ecosystems, interoperability, identity, access control, auditability, and safe message formats.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[for Disease Control and Prevention, 2026]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Official public-health guidance for scoping agentic research, human oversight, expert validation, sensitive-data avoidance, and non-replacement of professional judgment.
[of Standards and Technology, 2026f]	ai_ethics_data_governance	ai_ethics_data_governance	official_primary	2026-05-21	annual	Official AI RMF playbook for translating Govern, Map, Measure, and Manage functions into curriculum controls and review prompts.
[OECD, 2024]	ai_ethics_data_governance	ai_ethics_data_governance	international_standard	2026-05-21	annual	Official OECD principles for human-centered values, robustness, transparency, accountability, and inclusive AI growth.
[for Standardization, 2023b]	ai_ethics_data_governance	ai_ethics_data_governance	international_standard	2026-05-21	annual	International AI management-system standard for responsible AI governance, traceability, transparency, risk, and continual improvement.
[for Standardization, 2023a]	ai_ethics_data_governance	ai_ethics_data_governance	international_standard	2026-05-21	annual	International guidance for integrating AI-specific risk management into organizational activities, products, systems, and services.
[of Europe, 2024]	legal_oversight	legal_oversight	official_primary	2026-05-21	annual	Official treaty anchor for human rights, democracy, rule-of-law, risk management, accountability, and public-sector AI governance.
[Office, 2025]	privacy_ip_governance	privacy_ip_governance	official_primary	2026-05-21	annual	Official U.S. copyright policy source for generative-AI training, rights-holder impacts, transparency, licensing, and IP governance.
[of Standards and Technology, 2020b]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Official zero-trust architecture guidance for identity-centric authorization, continuous evaluation, least privilege, and policy enforcement.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[of Standards and Technology, 2025b]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Official digital-identity guidance for authentication, federation, identity proofing, and agent/tool authorization analogies.
[IETF, 2025]	agentic_ai_governance	agentic_ai_governance	internet_standard	2026-05-21	annual	Internet standards-track security guidance for OAuth deployment, token protection, redirect safety, and authorization hardening.
[IETF, 2023]	agentic_ai_governance	agentic_ai_governance	internet_standard	2026-05-21	annual	Internet standard for sender-constrained OAuth tokens, useful for agent tool-call identity and credential-binding discussions.
[of Standards and Technology, 2012]	legal_oversight	legal_oversight	official_primary	2026-05-21	annual	Official risk-assessment method for threat, vulnerability, impact, likelihood, uncertainty, and residual-risk reasoning.
[of Standards and Technology, 2018b]	legal_oversight	legal_oversight	official_primary	2026-05-21	annual	Official RMF lifecycle source for preparation, categorization, control selection, implementation, assessment, authorization, and monitoring.
[of Standards and Technology, 2011a]	cyber_threat_intelligence	cyber_threat_intelligence	official_primary	2026-05-21	annual	Official continuous-monitoring guidance for metrics, status awareness, ongoing authorization, and governance feedback loops.
[of Standards and Technology, 2011b]	legal_oversight	legal_oversight	official_primary	2026-05-21	annual	Official enterprise-risk source for mission, organization, and system tiers, risk framing, assessment, response, and monitoring.
[of Standards and Technology, 2021]	counterintelligence_source_integrity	counterintelligence_source_integrity	official_primary	2026-05-21	annual	Official enhanced security requirements for high-value CUI, source handling analogies, system integrity, and advanced persistent threat resistance.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[of Standards and Technology, 2022a]	ai_ethics_data_governance	ai_ethics_data_governance	official_primary	2026-05-21	annual	Official NIST source for AI bias concepts, socio-technical framing, measurement limits, and governance-oriented mitigation.
[Committee, 2025]	cyber_threat_intelligence	cyber_threat_intelligence	international_standard	2026-05-21	annual	OASIS CTI standard for expressing cyber threat and observable information with structured objects, relationships, sightings, and markings.
[Committee, 2021]	cyber_threat_intelligence	cyber_threat_intelligence	international_standard	2026-05-21	annual	OASIS CTI transport standard for defensive threat-intelligence exchange channels, collections, discovery, and API contracts.
[MITRE, 2026b]	cyber_threat_intelligence	cyber_threat_intelligence	research_standard	2026-05-21	annual	Threat-informed enterprise matrix for defensive TTP mapping, coverage analysis, detection engineering, and analytic normalization.
[Cybersecurity and Agency, 2026a]	ics_ot_defense	ics_ot_defense	official_primary	2026-05-21	annual	Official prioritized baseline of IT and OT cybersecurity practices for critical-infrastructure risk reduction and maturity assessment.
[Cybersecurity and Agency, 2026e]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Official secure-by-design program source for customer security outcomes, radical transparency, leadership accountability, and safer defaults.
[Cybersecurity and Agency, 2026d]	cyber_threat_intelligence	cyber_threat_intelligence	official_primary	2026-05-21	annual	Official catalog for prioritizing known exploited vulnerabilities as defensive triage inputs, not as exploitation instructions.
[Agency, 2026b]	osint_geoint	osint_geoint	official_primary	2026-05-21	annual	Official NGA source on GEOINT AI, data quality, model performance, interoperability, analyst interaction, and standards leadership.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[for Standardization, 2013]	osint_geoint	osint_geoint	international_standard	2026-05-21	annual	International geospatial data-quality standard for completeness, logical consistency, positional accuracy, temporal quality, and usability framing.
[Cybersecurity and Agency, 2026b]	cognitive_influence_security	cognitive_influence_security	official_primary	2026-05-21	annual	Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing.
[Organization, 2026c]	cognitive_influence_security	cognitive_influence_security	official_primary	2026-05-21	annual	Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure.
[OECD, 2026c]	cognitive_influence_security	cognitive_influence_security	official_primary	2026-05-21	annual	Official OECD policy source for information integrity, governance responses, public trust, and democratic resilience.
[Network, 2026b]	financial_economic_security	financial_economic_security	official_primary	2026-05-21	annual	Official FinCEN source for beneficial-ownership reporting, entity transparency, exemptions, and compliance-oriented analysis.
[of Foreign Assets Control, 2019]	financial_economic_security	financial_economic_security	official_primary	2026-05-21	annual	Official OFAC compliance framework for management commitment, risk assessment, internal controls, testing, auditing, and training.
[Force, 2021]	financial_economic_security	financial_economic_security	international_standard	2026-05-21	annual	Official FATF guidance for virtual-asset risk, VASP supervision, travel-rule compliance, and non-evasion FININT education.
[for International Settlements, 2021]	financial_economic_security	financial_economic_security	official_primary	2026-05-21	annual	Official BIS policy source for financial technology, market structure, data, network effects, regulation, privacy, and stability tradeoffs.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[of Standards and Technology, 2017]	ics_ot_defense	ics_ot_defense	official_primary	2026-05-21	annual	Official NIST cyber-physical systems framework for functions, timing, trustworthiness, interoperability, and safety-aware architecture.
[of Standards and Technology, 2018a]	ics_ot_defense	ics_ot_defense	official_primary	2026-05-21	annual	Official NCCoE practice guide for manufacturing-sector ICS integrity, monitoring, architecture, and defensive lab validation.
[Organization, 2026d]	privacy_ip_governance	privacy_ip_governance	official_primary	2026-05-21	annual	Official WIPO source for AI and IP policy, training-data rights, copyright infrastructure, transparency, attribution, and member-state dialogue.
[of Standards and Technology, 2026k]	privacy_ip_governance	privacy_ip_governance	official_primary	2026-05-21	annual	Official privacy risk-management framework for identifying and managing privacy risk, data governance, workforce roles, and enterprise controls.
[of Standards and Technology, 2020a]	legal_oversight	legal_oversight	official_primary	2026-05-21	annual	Official security and privacy control catalog for control baselines, assessment language, privacy controls, and inherited-control reasoning.
[of Standards and Technology, 2024]	legal_oversight	legal_oversight	official_primary	2026-05-21	annual	Official mapping-method source for comparing controls, regulations, frameworks, and guidance without collapsing their separate purposes.
[of Standards and Technology, 2024a]	agentic_ai_governance	agentic_ai_governance	official_primary	2026-05-21	annual	Official adversarial-ML taxonomy for defensive AI threat modeling, mitigation vocabulary, evaluation limits, and safe red-team framing.
[Commission, 2026b]	ai_conformity_compliance	ai_conformity_compliance	official_primary	2026-05-22	quarterly	Official European Commission source for AI Office responsibilities, GPAI oversight, enforcement coordination, codes of practice, and AI Act implementation.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Commission, 2026h]	ai_conformity_compliance	ai_conformity_compliance	official_primary	2026-05-22	quarterly	Official European Commission source for GPAI Code of Practice drafting, transparency, copyright, safety, security, and AI Act implementation support.
[Commission, 2026a]	ai_conformity_compliance	ai_conformity_compliance	official_primary	2026-05-22	quarterly	Official European Commission AI Act implementation page for risk tiers, prohibited practices, GPAI obligations, governance bodies, and phased application.
[for Standardization, 2025]	ai_conformity_compliance	ai_conformity_compliance	international_standard	2026-05-22	semiannual	ISO standard page for AI system impact assessment across lifecycle, stakeholder impact documentation, transparency, and accountability.
[for Standardization, 2020]	ai_conformity_compliance	ai_conformity_compliance	international_standard	2026-05-22	annual	ISO technical report page for AI trustworthiness terminology, approaches, engineering considerations, and governance vocabulary.
[Office, 2021]	ai_conformity_compliance	ai_conformity_compliance	official_primary	2026-05-22	annual	Official GAO accountability framework for AI governance, data, performance, monitoring, and accountability evidence.
[UNESCO, 2021]	human_rights_governance	human_rights_governance	international_standard	2026-05-22	annual	Official UNESCO recommendation source for human rights, fairness, transparency, accountability, education, culture, environment, and governance.

[Project, 2026c]	agentic_ai_security	secure_release_change_control	standard	2026-06-06	quarterly	Sigstore documentation overview for software signing and transparency-log backed artifact verification, used to ground tamper-evident release and provenance evidence.
[Friston, 2010]	cognitive_active_inference	cognitive_active_inference	scholarly_peer_review	2026-06-08	annual	Karl Friston's flagship review introducing the free-energy principle, showing how a variational free-energy functional provides a tractable upper bound on surprise (negative log model evidence) that the brain minimizes through perception and action.
[Friston, 2017]	cognitive_active_inference	cognitive_active_inference	scholarly_peer_review	2026-06-08	annual	Formalizes active inference as a process theory in which belief updating proceeds by gradient descent on variational free energy and policies are selected by minimizing expected free energy over a Markov decision process generative model.
[Da Costa, 2020]	cognitive_active_inference	cognitive_active_inference	scholarly_peer_review	2026-06-08	annual	A mathematical synthesis of active inference over discrete (POMDP) state-spaces, consolidating the partially observable Markov decision process model used to specify perception, planning, and action selection in agentic systems.
[Parr, 2022]	cognitive_active_inference	cognitive_active_inference	scholarly_textbook	2026-06-08	annual	The open-access MIT Press monograph giving the book-length, chapter-organized foundational treatment of active inference, from the free-energy principle to discrete and continuous generative models and their behavioral implications.

[Yao, 2023a]	agentic_ai_governance	agentic_ai_governance	scholarly_preprint	2026-06-08	annual	Introduces the interleaved reason-then-act loop in which an LLM alternates verbal reasoning traces with tool/environment actions, grounding the reason-act/tool-use pattern at the core of modern agent design.
[Shinn, 2023]	agentic_ai_governance	agentic_ai_governance	scholarly_preprint	2026-06-08	annual	Proposes agents that verbally reflect on task feedback and store reflections in episodic memory to improve on later trials, grounding the self-reflection and stop-condition pattern for iterative agents.
[Park, 2023]	agentic_ai_governance	agentic_ai_governance	scholarly_peer_review	2026-06-08	annual	Demonstrates a multi-agent sandbox of twenty-five LLM agents whose memory-stream, reflection, and planning architecture produces believable emergent social behavior, grounding the memory/planning/multi-agent-simulation pattern.
[Wei, 2022]	agentic_ai_governance	agentic_ai_governance	scholarly_preprint	2026-06-08	annual	Shows that prompting an LLM to emit intermediate reasoning steps markedly improves complex reasoning, establishing the reasoning-decomposition pattern that underlies agent planning and ReAct-style traces.
[Schick, 2023]	agentic_ai_governance	agentic_ai_governance	scholarly_preprint	2026-06-08	annual	Shows an LLM self-supervising when and how to call external APIs (calculator, search, QA, translation, calendar), grounding the tool-use / API-calling pattern for agents.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Wooldridge, 1995]	agentic_ai_governance	agentic_ai_governance	scholarly_peer_reviewed	2026-06-08	annual	Foundational survey dividing agent research into theory, architectures, and languages, providing the canonical agent definition and multi-agent-systems vocabulary that predates the LLM era.
[Wooldridge, 2009]	agentic_ai_governance	agentic_ai_governance	scholarly_textbook	2026-06-08	annual	Standard graduate textbook on multi-agent systems covering coordination, negotiation, voting, and auctions, grounding the multi-agent-coordination vocabulary used in agentic governance.
[Burkett, 2013]	counterintelligence_source_integrity	counterintelligence_source_integrity	official_primary	2026-06-08	annual	A CIA Studies in Intelligence analyst essay arguing that the traditional MICE recruitment-motivation model (Money, Ideology, Compromise, Ego) is better understood through Cialdini's influence principles reframed as RASCLS (Reciprocation, Authority, Scarcity, Commitment/Consistency, Liking, Social Proof), grounding the historical and conceptual lineage of HUMINT recruitment frameworks.
[Meissner, 2017]	counterintelligence_source_integrity	counterintelligence_source_integrity	scholarly_peer_reviewed	2026-06-08	annual	A peer-reviewed synthesis of the HIG-funded research program summarizing scores of empirical studies showing that rapport-based, non-coercive interviewing reliably outperforms accusatorial or coercive methods for eliciting accurate information, establishing the evidence base for rights-respecting elicitation.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Brimbal, 2020]	counterintelligence_source_integrity	counterintelligence_source_integrity	scholarly_integrity_review	2026-06-08	annual	An Oxford volume chapter reviewing the empirical and ethical case for rapport- and trust-based interrogation as an alternative to customary coercive practices, grounding the contrast between rapport-based and coercive elicitation and the ethics/consent governance that distinguishes them.
[Nunan, 2020]	counterintelligence_source_integrity	counterintelligence_source_integrity	scholarly_integrity_review	2026-06-08	annual	A peer-reviewed study of UK police source handlers' lived perceptions of rapport during interactions with covert human intelligence sources, grounding how rapport functions in real source-handler tradecraft and the governance of HUMINT/CHIS relationships.
[Kelly, 2013]	counterintelligence_source_integrity	counterintelligence_source_integrity	scholarly_integrity_review	2026-06-08	annual	A peer-reviewed taxonomy organizing interrogation into macro-level approaches, six meso-level domains (rapport/relationship building, context manipulation, emotion provocation, confrontation/competition, collaboration, presentation of evidence), and micro-level techniques, providing a study-grounded vocabulary for analyzing elicitation methods rather than an operational manual.

[et al., 2018]	agentic_ai_governance	ai_red_team_assurance	scholarly_report	2026-06-15	annual	Foundational public report on malicious uses of AI, encoded for defensive taxonomy, safe-substitution, and governance framing in synthetic classroom work.
[for Security and Technology, 2022]	cyber_threat_intelligence	ai_red_team_assurance	public_domain_primary	2026-06-15	annual	CSET policy-research source on adversarial machine learning and cybersecurity, used to connect AI model robustness, defensive assurance, and cyber threat-intelligence review.
[Taddeo and Floridi, 2018]	cyber_threat_intelligence	cyber_threat_intelligence	scholarly_commentary	2026-06-15	annual	Nature Comment article arguing for AI-cyber governance before escalation risks intensify, useful for high-level cyber policy and non-escalatory classroom framing.
[Project and Institute, 2024]	agentic_ai_governance	ai_enabled_analysis_publication	public_domain_primary	2026-06-15	annual	SCSP/ASPI public report on AI and human-machine teaming for intelligence analysis, routed for governance, training, and analytic-workflow boundary discussion.
[McMahon, 2024]	analytic_tradecraft	analytic_tradecraft_evidence	public_domain_primary	2026-06-15	annual	Belfer Center Intelligence Project report on how AI tools interact with analytic tradecraft standards, especially source distinction, alternatives, uncertainty, and analyst ownership.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[et al., 2019]	analytic_tradecraft	sat_evaluation_evidence	scholarly_peer_reviewed	2026-06-15	annual	Applied Cognitive Psychology article on Analysis of Competing Hypotheses in intelligence analysis, routed as empirical/SAT evidence with explicit limitations.
[et al., 2024b]	analytic_tradecraft	sat_evaluation_evidence	scholarly_peer_reviewed	2026-06-15	annual	Cognitive Research article on how task structure affects confirmation bias and alternative hypotheses, useful for designing negative controls around ACH and SAT exercises.
[The White House, 1988]	collection_management	opsec_doctrine_governance	official_primary	2026-06-15	biennial	National Security Decision Directive 298 establishing national operations security program policy, used as public historical doctrine context for defensive OPSEC governance.
[Wardle and Derakhshan, 2017]	cognitive_influence_security	cognitive_influence_security	public_domain_primary	2026-06-15	annual	Council of Europe report providing an interdisciplinary framework for information disorder, routed as terminology and source-provenance support for defensive cognitive-security lessons.
[Deng and UNIDIR, 2023]	agentic_ai_governance	model_data_provenance	public_domain_primary	2026-06-15	annual	UNIDIR primer on synthetic data for artificial intelligence and autonomous systems, used for source-quality and risk caveats around synthetic fixtures and military AI governance.
[for Strategic and Studies, 2022]	cognitive_influence_security	synthetic_media_provenance	public_domain_primary	2026-06-15	annual	CSIS public analysis on deepfake risk as a policy and security concern, routed to synthetic-media provenance and cognitive-security safeguards.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[National Security Agency et al., 2023]	cognitive_influence_security	synthetic_media_provenance	official_primary	2026-06-15	semiannual	Joint Cybersecurity Information Sheet on contextualizing deepfake threats, routed as official defensive guidance for provenance and synthetic-media risk review.
[Agency, 2017a]	cyber_threat_intelligence	cyber_threat_intelligence	official_primary	2026-06-15	annual	DARPA public program page for Active Social Engineering Defense, used as official defensive context for social-engineering resilience and automation-risk caveats.
[et al., 2015]	cognitive_active_inference	cognitive_active_inference	scholarly_peer_reviewed	2026-06-15	annual	PubMed-indexed active-inference source on epistemic value, routed as theory support for bounded analogies in the cognitive-active-inference profile.
[et al., 2017]	cognitive_active_inference	cognitive_active_inference	scholarly_peer_reviewed	2026-06-15	annual	Open-access PMC article on uncertainty, epistemics, and active inference, encoded for theory boundaries and claim-calibration around active-inference analogies.
[et al., 2022]	cognitive_active_inference	cognitive_active_inference	scholarly_peer_reviewed	2026-06-15	annual	Open-access tutorial on active inference and empirical-data applications, routed as a learner-facing formal-method source for bounded AGEINT analogies.
[et al., 2021a]	cognitive_active_inference	cognitive_active_inference	scholarly_preprint	2026-06-15	annual	Zenodo-hosted scholarly source on active inference in modeling conflict, used only for bounded theory-to-scenario analogies and caveated simulation discussion.
[Kozera, 2020]	osint_geoint	osint_geoint	scholarly_peer_reviewed	2026-06-15	annual	Security and Defence article on identifying and tracking military and security personnel through fitness-app data, routed as a privacy and source-minimization warning.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[et al., 2025b]	cyber_threat_intelligence	red_team_assurance	scholarly_peer_reviewed	2026-06-15	annual	Journal article reviewing adversarial machine learning in cybersecurity, encoded as supplemental scholarly support for defensive AI red-team assurance.
[et al., 2023b]	cognitive_influence_security	cognitive_influence_scholarly	scholarly_peer_reviewed	2026-06-15	annual	Open-access Safety and Security article on AI challenges to cognitive security and safety, routed as bounded cognitive-security risk context.
[Deppe and Schaal, 2024]	cognitive_influence_security	cognitive_influence_scholarly	scholarly_peer_reviewed	2026-06-15	annual	Open-access PMC article on a NATO ACT cognitive-warfare concept, routed for conceptual and governance framing with explicit evidence-bounded limits.
[Terp and Breuer, 2022]	cognitive_influence_security	cognitive_influence_scholarly	scholarly_peer_reviewed	2026-06-15	annual	IEEE source on the DISARM framework for disinformation and influence operations, used for defensive taxonomy and reviewable incident mapping.
[et al., 2024c]	cognitive_influence_security	cognitive_influence_scholarly	scholarly_peer_reviewed	2026-06-15	annual	IEEE article on large language models and disinformation, routed as risk-and-defense context with explicit no-generation and no-campaign boundaries.
[et al., 2025c]	cognitive_influence_security	cognitive_influence_scholarly	scholarly_peer_reviewed	2026-06-15	annual	Open-access PMC article on LLM-generated election disinformation, routed as public-impact evidence for defensive cognitive-security education.
[et al., 2023c]	cognitive_influence_security	cognitive_influence_scholarly	scholarly_peer_reviewed	2026-06-15	annual	ACL EMNLP paper on using large language models for disinformation detection, routed as defensive method evidence with explicit reliability and rights caveats.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Farid and Bohacek, 2022]	cognitive_influence_security	synthetic_media_provenance	scholarly_peer_review	2026-06-15	annual	Open-access PMC article on protecting world leaders against deepfakes, routed as identity-integrity and provenance-risk support for defensive education.
[et al., 2020]	cognitive_influence_security	cognitive_influence_security	scholarly_peer_review	2026-06-15	annual	Open-access PMC article on human cognition in social-engineering cyberattacks, routed as defensive awareness and cognitive-security evidence with operational details excluded.
[et al., 2021b]	analytic_tradecraft	analytic_cognition_and_bias	scholarly_peer_review	2026-06-15	annual	Open-access PMC article on situation awareness in intelligence scenarios, useful for analytic-cognition lessons and scenario-review vocabulary.
[et al., 2024d]	agentic_ai_governance	agent_incident_response	scholarly_preprint	2026-06-15	semiannual	arXiv preprint on AI emergency preparedness, routed to agent incident-response and publication-readiness caveats for tabletop exercises.
[et al., 2025a]	legal_oversight	agent_incident_response	scholarly_preprint	2026-06-15	semiannual	arXiv HTML source on AI incident regimes, routed as comparative governance context for incident reporting, risk exceptions, and assurance evidence.
[Cooper, 2005]	analytic_tradecraft	analytic_tradecraft_primer	official_primary	2026-06-15	annual	CIA Center for the Study of Intelligence monograph on analytic pathologies, self-correction, and intelligence-process reform.
[Janis, 1982]	analytic_tradecraft	analytic_cognition_and_bias	scholarly_book_meta	2026-06-15	annual	Scholarly book record for Janis's groupthink model used as classic context for dissent, alternatives, and group-decision failure claims.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Coulthart, 2016]	analytic_tradecraft	sat_evaluation_evidence	scholarly_peer_reviewed	2026-06-15	annual	Peer-reviewed study of why analysts use SATs, supporting adoption, training, and organizational-context claims rather than universal efficacy claims.
[Coulthart, 2017]	analytic_tradecraft	sat_evaluation_evidence	scholarly_peer_reviewed	2026-06-15	annual	Peer-reviewed evaluation of core SATs used to qualify claims about where specific techniques may or may not have evidence support.
[Tetlock, 2018]	analytic_tradecraft	sat_evaluation_evidence	scholarly_peer_reviewed	2026-06-15	annual	Peer-reviewed article arguing for a more evidence-attentive structuring of SATs and stronger links to judgment and decision-science research.
[Whitesmith, 2019]	analytic_tradecraft	sat_evaluation_evidence	scholarly_peer_reviewed	2026-06-15	annual	Peer-reviewed ACH experiment used to keep confirmation-bias and serial-position claims specific to a study design rather than a general SAT guarantee.
[Mandel, 2020]	analytic_tradecraft	sat_evaluation_evidence	scholarly_peer_reviewed	2026-06-15	annual	Open Cambridge article testing whether ACH improves coherence of probabilistic judgments from uncertain evidence.
[Dhami, 2018]	analytic_tradecraft	forecasting_calibration_and_judgment	scholarly_peer_reviewed	2026-06-15	annual	Open Judgment and Decision Making article comparing ACH, coherentization, and aggregation for intelligence analysts' probability judgments.
[Tetlock, 2015b]	analytic_tradecraft	forecasting_calibration_and_judgment	scholarly_peer_reviewed	2026-06-15	annual	Peer-reviewed decision-science article connecting intelligence analysis improvement to forecasting, probability judgment, and uncertainty communication evidence.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Council, 2011]	analytic_tradecraft	analytic_cognition_and_bias	scholarly_public_report	2026-06-15	annual	National Academies report connecting behavioral and social science to intelligence-analysis training, judgment, and organizational improvement.
[on Intelligence, 2004]	analytic_tradecraft	intelligence_failure_postmortem	official_report	2026-06-15	biennial	Official Senate report on prewar Iraq intelligence assessments used as postmortem context for assumptions, dissent, caveats, and source-confidence failures.
[Activity, 2010]	analytic_tradecraft	forecasting_calibration_and_aggregation	official_primary	2026-06-15	annual	Official IARPA ACE program page on eliciting, weighting, and combining probabilistic judgments to improve intelligence forecasts.
[Activity, 2023]	analytic_tradecraft	agentic_analytic_assistance	official_primary	2026-06-15	annual	Official IARPA REASON program page on analyst-in-the-loop evidence and reasoning support for draft analytic reports.
[Helmer, 1963]	analytic_tradecraft	forecasting_calibration_and_aggregation	scholarly_peer_reviewed	2026-06-15	annual	Classic peer-reviewed Delphi-method article used as historical method context for structured expert elicitation and iterative judgment aggregation.
[Klein, 2007]	analytic_tradecraft	analytic_method_pedagogy	professional_practice	2026-06-15	annual	Professional practice article introducing the premortem as a structured way to surface possible failure causes before commitment.
[Marrin, 2012]	analytic_tradecraft	analytic_method_pedagogy	scholarly_book_metadata	2026-06-15	annual	Routledge scholarly book on linking intelligence-analysis scholarship and practice, used for tradecraft pedagogy and evidence-uptake framing.
[Svenmarck, 2021]	analytic_tradecraft	analytic_method_pedagogy	official_research_report	2026-06-15	annual	Swedish Defence Research Agency report summary on 42 structured analytic techniques for assessment and judgement of major events.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use

[Network, FinCEN]	financial_economic_security	finint_sar_reporting	official_primary	2026-06-16	annual	Verified official primary source for finint_sar_reporting; routed to Financial Intelligence (FININT). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[of Financial Intelligence Units., 2023]	financial_economic_security	finint_international_cooperation	official_primary	2026-06-16	annual	Verified official primary source for finint_international_coopera routed to Financial Intelligence (FININT). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[on Drugs and Crime, UNODC]	financial_economic_security	finint_aml_cft_international	official_primary	2026-06-16	annual	Verified official primary source for finint_aml_cft_internationa routed to Financial Intelligence (FININT). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Schott, 2006]	financial_economic_security	finint_aml_cft_international	official_primary	2026-06-16	annual	Verified official primary source for finint_aml_cft_internationa routed to Financial Intelligence (FININT). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Counterintelligence and Center, NCSCb]	counterintelligence_security	counterintelligence_strategy	official_primary	2026-06-16	annual	Verified official primary source for counterintelli- gence_strategy; routed to Counterintelligence (fundamentals + against non-state actors). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Counterintelligence and Center, NCSCa]	counterintelligence_source_integrity	counterintelligence_strategy	official_primary	2026-06-16	annual	Verified official primary source for counterintelligence_strategy; routed to Counterintelligence (fundamentals + against non-state actors). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Pennycook and Rand., 2021]	cognitive_influence_source_integrity	disinformation_cognitive_psychology	scholarly_repository	2026-06-16	annual	Verified scholarly repository record source for disinformation_cognitive_psychology; routed to Active Measures and Disinformation; Social Engineering; Information Warfare and Cognitive Security. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Starbird and Wilson., 2019]	cognitive_influence_source_integrity	active_measures_information_operations	scholarly_repository	2026-06-16	annual	Verified scholarly repository record source for active_measures_information_operations; routed to Active Measures and Disinformation; Information Warfare and Cognitive Security; Social Engineering. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Hoffman, 2007]	cognitive_influence_source_integrity	hybrid_warfare_doctrine	scholarly_repository	2026-06-16	annual	Verified scholarly repository record source for hybrid_warfare_doctrine; routed to Gray Zone / Hybrid Warfare / Non-State Actor Intelligence / Irregular Warfare. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Mazarr, 2015]	cognitive_influence_security	gray_zone_competition_doctrine	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for gray_zone_competition_doc routed to Gray Zone / Hybrid Warfare / Non-State Actor Intelligence / Irregular Warfare. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[of Defense., 2020]	cognitive_influence_security	irregular_warfare_strategy	official_primary	2026-06-16	annual	Verified official primary source for irregular_warfare_strategy; routed to Gray Zone / Hybrid Warfare / Non-State Actor Intelligence / Irregular Warfare. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[of Staff., 2014a]	collection_management	special_operations_doctrine	official_primary	2026-06-16	annual	Verified official primary source for special_operations_doctrine; routed to Gray Zone / Hybrid Warfare / Non-State Actor Intelligence / Irregular Warfare; Counterintelligence. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Cialdini, 1984]	cognitive_influence_security	social_engineering_influence	scholarly_psychology	2026-06-16	annual	Verified scholarly book metadata source for social_engineering_influence routed to Social Engineering; Active Measures and Disinformation; Information Warfare and Cognitive Security. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[of Excellence., 2021]	cognitive_influence_security	hybrid_warfare_stratcom	official_primary	2026-06-16	annual	Verified official primary source for hybrid_warfare_stratcom; routed to Gray Zone / Hybrid Warfare / Non-State Actor Intelligence / Irregular Warfare; Active Measures and Disinformation. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[of Staff., 2013]	osint_geoint	imint_joint_intelligence_do	official_primary	2026-06-16	annual	Verified official primary source for imint_joint_intelligence_do routed to Imagery Intelligence (IMINT); Counterintelligence. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Pamment and Smith., 2022]	cognitive_influence_security	active_measures_attribution	official_primary	2026-06-16	annual	Verified official primary source for active_measures_attribution; routed to Active Measures and Disinformation; Counterintelligence; Information Warfare and Cognitive Security. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Andrew, 1990]	historical_declassified	intelligence_history_soviet	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for intelligence_history_soviet; routed to Historical Intelligence Services (Soviet/Russian); KGB organizational doctrine and operations overview. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Andrew, 1999]	historical_declassified_intelligence	history_soviet	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for intelligence_history_soviet; routed to Historical Intelligence Services (Soviet/Russian); primary-source archival history of KGB. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Andrew, 2009]	historical_declassified_intelligence	history_british_allied	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for intelligence_history_british_allied; routed to Historical Intelligence Services (British/Allied); institutional history of domestic security intelligence. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Weiner, 2007]	historical_declassified_intelligence	history_american	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for intelligence_history_american; routed to Historical Intelligence Services (American); CIA institutional failures and analytic dysfunction. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[to Study Governmental Operations with Respect to Intelligence Activities., 1976]	legal_oversight	legal_oversight_intelligence	public_domain_primary	2026-06-16	annual	Verified public domain primary source for legal_oversight_intelligence; routed to Legal Authorities and Constraints; Historical Intelligence Services (American); oversight reform history. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Tversky, 1974]	analytic_tradecraft	cognitive_bias_foundations	scholarly_repository_record	2026-06-16	annual	Verified scholarly repository record source for cognitive_bias_foundations; routed to Cognitive Security (neurocognitive mechanisms); Epistemic Rigor & Analytic Tradecraft (cognitive bias in analysis). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Kahneman, 2011]	analytic_tradecraft	cognitive_bias_foundations	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for cognitive_bias_foundations; routed to Cognitive Security (dual-process neurocognitive mechanisms); Epistemic Rigor & Analytic Tradecraft. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Lewandowsky, 2021]	cognitive_influence_security	cognitive_security_inoculation	scholarly_peer_reviewed	2026-06-16	annual	Verified scholarly peer reviewed source for cognitive_security_inoculation; routed to Cognitive Security (psychological inoculation & prebunking); Cognitive Security Operations. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Lewandowsky, 2020]	cognitive_influence_security	cognitive_security_inoculation	scholarly_repository_record	2026-06-16	annual	Verified scholarly repository record source for cognitive_security_inoculation; routed to Cognitive Security (psychological inoculation & prebunking); corrections and debunking protocol. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Pennycook, 2021]	cognitive_influence_security	cognitive_security_misinformation	scholarly_peer_reviewed	2026-06-16	annual	Verified scholarly peer reviewed source for cognitive_security_misinformatio routed to Cognitive Security (psychological inoculation & prebunking); Cognitive Security Operations (scalable interventions). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Tetlock, 2005]	analytic_tradecraft	analytic_tradecraft_forecasting	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for analytic_tradecraft_forecasting routed to Epistemic Rigor & Analytic Tradecraft (Advanced Analysis Methods); forecasting accuracy and calibration. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Tetlock, 2015a]	analytic_tradecraft	analytic_tradecraft_forecasting	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for analytic_tradecraft_forecasting routed to Epistemic Rigor & Analytic Tradecraft (Advanced Analysis Methods); Good Judgment Project findings. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Congress., 1978]	legal_oversight	legal_authorities_surveillance	official_primary	2026-06-16	annual	Verified official primary source for legal_authorities_surveillance routed to Legal Authorities and Constraints; oversight of domestic electronic surveillance. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Congress., 2001]	legal_oversight	legal_authorities_surveillance	official_primary	2026-06-16	annual	Verified official primary source for legal_authorities_surveillance routed to Legal Authorities and Constraints; post-9/11 surveillance expansion. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Congress., 2015]	legal_oversight	legal_authorities_surveillance	official_primary	2026-06-16	annual	Verified official primary source for legal_authorities_surveillance routed to Legal Authorities and Constraints; surveillance reform and civil liberties. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Reagan, 1981]	legal_oversight	legal_authorities_intelligence_collection	official_primary	2026-06-16	annual	Verified official primary source for legal_authorities_intelligence_collection routed to Legal Authorities and Constraints; EO-based authorities for IC collection. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Quinlan, 2007]	legal_oversight	ethics_of_intelligence	scholarly_repository_record	2026-06-16	annual	Verified scholarly repository record source for ethics_of_intelligence; routed to Ethics of Intelligence and Cognitive Security; just-intelligence theory. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Omand, 2010]	legal_oversight	ethics_of_intelligence	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for ethics_of_intelligence; routed to Ethics of Intelligence and Cognitive Security; legal and ethical constraints on secret intelligence; oversight principles. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Omand, 2018]	legal_oversight	ethics_of_intelligence	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for ethics_of_intelligence; routed to Ethics of Intelligence and Cognitive Security; HUMINT ethics; surveillance ethics; oversight accountability. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Russell, 2020]	agentic_ai_governance	agent_foundations	scholarly_repository_record	2026-06-16	semiannual	Verified scholarly repository record source for agent_foundations; routed to Foundations of AGEINT (agent definition, PEAS framework, rational agents); AGEINT Python Code Library. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Rao, 1995]	agentic_ai_governance	agent_foundations	scholarly_repository_record	2026-06-16	semiannual	Verified scholarly repository record source for agent_foundations; routed to Foundations of AGEINT (agent architectures); Design Patterns & Archetypes (goal-directed agent archetypes). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Vaswani, 2017]	agentic_ai_governance	llm_architecture	scholarly_preprint	2026-06-16	semiannual	Verified scholarly preprint source for llm_architecture; routed to Foundations of AGEINT (LLM substrate); LangChain/LangGraph Patterns appendix; CrewAI appendix; AutoGen/MCP appendix. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Yao, 2023b]	agentic_ai_governance	agentic_reasoning	scholarly_preprint	2026-06-16	semiannual	Verified scholarly preprint source for agentic_reasoning; routed to Foundations of AGEINT (reasoning architectures); Design Patterns & Archetypes (planning patterns); LangChain/LangGraph Patterns appendix. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Lewis, 2020]	agentic_ai_governance	agentic_memory	scholarly_preprint	2026-06-16	semiannual	Verified scholarly preprint source for agentic_memory; routed to Foundations of AGEINT (agent memory); Design Patterns & Archetypes (RAG architecture); LangChain/LangGraph Patterns appendix; AGEINT Python Code Li…. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Patil, 2023]	agentic_ai_governance	tool_use_agents	scholarly_preprint	2026-06-16	semiannual	Verified scholarly preprint source for tool_use_agents; routed to Foundations of AGEINT (tool-use patterns); AGEINT Python Code Library; LangChain/LangGraph Patterns appendix. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Qin, 2023]	agentic_ai_governance	tool_use_agents	scholarly_preprint	2026-06-16	semiannual	Verified scholarly preprint source for tool_use_agents; routed to Foundations of AGEINT (tool-use); AGEINT Python Code Library; LangChain/LangGraph Patterns appendix. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Wu, 2023]	agentic_ai_governance	multi_agent_frameworks	scholarly_preprint	2026-06-16	semiannual	Verified scholarly preprint source for multi_agent_frameworks; routed to AutoGen and MCP Patterns appendix; Frameworks & Infrastructure; CrewAI appendix (comparison context). AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[LangChain, 2025a]	agentic_ai_governance	agentic_framework_docs	professional_documentation	2026-06-16	semiannual	Verified professional documentation source for agentic_framework_docs; routed to LangChain/LangGraph Patterns appendix; AGEINT Python Code Library. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[LangChain, 2025b]	agentic_ai_governance	agentic_framework_docs	professional_documentation	2026-06-16	semiannual	Verified professional documentation source for agentic_framework_docs; routed to LangChain/LangGraph Patterns appendix; AGEINT Python Code Library; Frameworks & Infrastructure. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[CrewAI, 2025]	agentic_ai_governance	agentic_framework_docs	professional_documentation	2026-06-16	semiannual	Verified professional documentation source for agentic_framework_docs; routed to CrewAI Multi-Agent appendix; Frameworks & Infrastructure. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Liang, 2022]	agentic_ai_governance	llm_evaluation	scholarly_preprint	2026-06-16	semiannual	Verified scholarly preprint source for llm_evaluation; routed to Frameworks & Infrastructure (model evaluation); Security & Adversarial Considerations (model capability assessment); AGEINT Python Code Library. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Srivastava, 2022]	agentic_ai_governance	llm_evaluation	scholarly_preprint	2026-06-16	semiannual	Verified scholarly preprint source for llm_evaluation; routed to Frameworks & Infrastructure (model evaluation); Security & Adversarial Considerations; AGEINT Python Code Library. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Perez, 2022]	agentic_ai_security	adversarial_ai_security	scholarly_preprint	2026-06-16	semiannual	Verified scholarly preprint source for adversarial_ai_security; routed to Security & Adversarial Considerations; ATT&CK & Kill Chain Templates appendix; Cognitive Security & Inoculation appendix. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Ericsson, 1993]	education_assessment	cognitive_performance	scholarly_repository_record	2026-06-16	annual	Verified scholarly repository record source for cognitive_performance; routed to Productivity Intelligence & Cognitive Performance (cognitive athlete, deliberate practice); Instructor Capstone/Rubric/Red-Team Pack appendix. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[Cepeda, 2006]	education_assessment	cognitive_performance	scholarly_repository_record	2026-06-16	annual	Verified scholarly repository record source for cognitive_performance; routed to Productivity Intelligence & Cognitive Performance (information architecture, spaced repetition); Instructor Capstone/Rubric/Red-Team Pack appendix. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Walker, 2006]	education_assessment	cognitive_performance	scholarly_repository_record	2026-06-16	annual	Verified scholarly repository record source for cognitive_performance; routed to Productivity Intelligence & Cognitive Performance (sleep and cognition); Cognitive Security & Inoculation appendix. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Kaplan, 1989]	education_assessment	cognitive_performance	scholarly_book_metadata	2026-06-16	annual	Verified scholarly book metadata source for cognitive_performance; routed to Productivity Intelligence & Cognitive Performance (attention restoration, information architecture); Cognitive Security & Inoculation appendix. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

Anchor	Domain	Lane	Tier	Checked	Refresh	Curriculum use
[of Standards and Technology., 2024]	agentic_ai_security	cryptographic_standards	official_draft	2026-06-16	semiannual	Verified official draft source for cryptographic_standards; routed to Cryptographic Methods appendix; Security & Adversarial Considerations. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.
[Weng, 2023]	agentic_ai_governance	agentic_design_principles	professional_documentation	2026-06-16	semiannual	Verified professional documentation source for agentic_design_principles; routed to Foundations of AGEINT (agent memory, tool use, planning); Design Patterns & Archetypes. AGEINT uses it for defensive, historical, governance, or method context, not for operational execution.

2.12 Source lane map: provenance lanes, support strength, and refresh context

Source lane	Anchor count	Refresh cadence	Claim scope
accessibility_digital_inclusion	4	annual, quarterly, semiannual	4 scoped claim families
active_measures_attribution	1	annual	Supports bounded AGEINT discussion of active_measures_attribution and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
active_measures_disinformation	1	annual	Supports bounded AGEINT discussion of active_measures_disinformation and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
active_measures_information_operations	1	annual	Supports bounded AGEINT discussion of active_measures_information_operations and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
adversarial_ai_security	1	semiannual	Supports bounded AGEINT discussion of adversarial_ai_security and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
agent_foundations	2	semiannual	Supports bounded AGEINT discussion of agent_foundations and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
agent_incident_response	7	annual, quarterly, semiannual	7 scoped claim families
agent_interoperability_standards	12	annual, quarterly, semiannual	12 scoped claim families
agentic_ai_governance	21	annual	8 scoped claim families
agentic_ai_security	2	annual, semiannual	2 scoped claim families
agentic_ai_security_governance	1	quarterly	agentic AI adoption and security-governance context, not an AGEINT benchmark
agentic_analytic_assistance	1	annual	Supports bounded claims that AI-enabled reasoning systems can assist evidence discovery and reasoning review while retaining analyst responsibility.
agentic_design_principles	1	semiannual	Supports bounded AGEINT discussion of agentic_design_principles and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.

Source lane	Anchor count	Refresh cadence	Claim scope
agentic_framework_docs	3	semiannual	Supports bounded AGEINT discussion of agentic_framework_docs and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
agentic_memory	1	semiannual	Supports bounded AGEINT discussion of agentic_memory and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
agentic_reasoning	1	semiannual	Supports bounded AGEINT discussion of agentic_reasoning and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
ai_conformity_compliance	7	annual, quarterly, semiannual	7 scoped claim families
ai_enabled_analysis_boundary	9	annual, semiannual	9 scoped claim families
ai_ethics_data_governance	10	annual	curriculum grounding and source-backed synthesis
ai_red_team_assurance	14	annual, quarterly, semiannual	14 scoped claim families
algorithmic_transparency_reporting	2	quarterly	2 scoped claim families
analytic_cognition_and_bias	6	annual	6 scoped claim families
analytic_epistemology	1	annual	epistemic-framing support for calibrated claims and reviewer challengeability
analytic_method_design	3	annual	3 scoped claim families
analytic_method_pedagogy	9	annual	9 scoped claim families
analytic_outreach_governance	1	annual	analytic-outreach governance support for expert engagement and risk controls
analytic_product_dissemination	1	annual	analytic-product utility, discoverability, and dissemination-governance support
analytic_production_workflow	1	annual	workflow and analytic-production support for iterative, reviewable tradecraft artifacts
analytic_tradecraft	7	annual	2 scoped claim families
analytic_tradecraft_evidence	5	annual	5 scoped claim families
analytic_tradecraft_forecasting	2	annual	Supports bounded AGEINT discussion of analytic_tradecraft_forecasting and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
analytic_uncertainty_language	4	annual	4 scoped claim families
apt_threat_intelligence	3	semiannual	Supports bounded AGEINT discussion of apt_threat_intelligence and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
assurance_evaluation_evidence	8	annual, quarterly, semiannual	8 scoped claim families
classification_marking_governance	1	annual	classification-marking context for caveat and dissemination-boundary lessons
cognitive_active_inference	9	annual	9 scoped claim families

Source lane	Anchor count	Refresh cadence	Claim scope
cognitive_bias_foundations	2	annual	Supports bounded AGEINT discussion of cognitive_bias_foundations and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
cognitive_influence_security	13	annual	10 scoped claim families
cognitive_performance	4	annual	Supports bounded AGEINT discussion of cognitive_performance and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
cognitive_resilience_evidence	1	annual	Peer-reviewed Science Advances study testing psychological inoculation videos for improving misinformation resilience at scale, with bounded transfer from measured outcomes to curriculum claims
cognitive_security_inoculation	2	annual	Supports bounded AGEINT discussion of cognitive_security_inoculation and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
cognitive_security_misinformation	1	annual	Supports bounded AGEINT discussion of cognitive_security_misinformation and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
collection_management	2	annual	curriculum grounding and source-backed synthesis
collection_management_doctrine	1	annual	Supports bounded AGEINT discussion of collection_management_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
counterintelligence_program_governance	2	annual, quarterly	2 scoped claim families
counterintelligence_source_integrity	7	annual	6 scoped claim families
counterintelligence_strategy	2	annual	Supports bounded AGEINT discussion of counterintelligence_strategy and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
cross_border_data_spaces	4	semiannual	4 scoped claim families

Source lane	Anchor count	Refresh cadence	Claim scope
cryptographic_standards	1	semiannual	Supports bounded AGEINT discussion of cryptographic_standards and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
cryptography_standards	3	semiannual	Supports bounded AGEINT discussion of cryptography_standards and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
current_threat_baseline	1	annual	public threat-context grounding and warning-topic baseline, not operational targeting or AGEINT benchmark evidence
cyber_defense_guidance_index	1	quarterly	defensive cyber guidance index support for source routing and refresh duties
cyber_threat_intelligence	17	annual, semiannual	8 scoped claim families
dataset_documentation	2	annual	2 scoped claim families
declassified_analytic_history	2	annual	2 scoped claim families
declassified_reconnaissance_history	1	annual	declassified reconnaissance history support for historical and GEOINT source-provenance lessons
defense_osint_governance	1	annual	public OSINT governance and professionalization support, not collection procedure or live targeting guidance
disinformation_cognitive_psychology	1	annual	Supports bounded AGEINT discussion of disinformation_cognitive_psychology and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
disinformation_misinformation_science	1	annual	Supports bounded AGEINT discussion of disinformation_misinformation_science and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
economic_security_review	1	annual	economic-security and due-diligence governance support for threat-analysis framing
education_assessment	6	annual, semiannual	6 scoped claim families
ethics_of_intelligence	3	annual	Supports bounded AGEINT discussion of ethics_of_intelligence and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
financial_economic_security	8	annual	curriculum grounding and source-backed synthesis

Source lane	Anchor count	Refresh cadence	Claim scope
finint_aml_cft_international	2	annual	Supports bounded AGEINT discussion of finint_aml_cft_international and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
finint_international_cooperation	1	annual	Supports bounded AGEINT discussion of finint_international_cooperation and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
finint_sar_reporting	1	annual	Supports bounded AGEINT discussion of finint_sar_reporting and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
forecasting_calibration_evidence	6	annual	6 scoped claim families
foreign_disclosure_governance	1	annual	foreign-disclosure governance support for release-boundary and control-marking lessons
geoint_data_governance	1	annual	GEOINT data-governance and digital-transformation context for modular source substrate claims
geoint_doctrine	2	annual	Supports bounded AGEINT discussion of geoint_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
geoint_professional_doctrine	1	annual	GEOINT doctrine and geospatial-intelligence framing support
geoint_tradecraft	1	annual	Supports bounded AGEINT discussion of geoint_tradecraft and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
governed_intelligence_cycle	2	annual	curriculum grounding and source-backed synthesis
gray_zone_competition_doctrine	1	annual	Supports bounded AGEINT discussion of gray_zone_competition_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
historical_declassified_sources	4	annual	curriculum grounding and source-backed synthesis

Source lane	Anchor count	Refresh cadence	Claim scope
historical_ics_incidents	4	semiannual	Supports bounded AGEINT discussion of historical_ics_incidents and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
human_rights_governance	6	annual, semiannual	6 scoped claim families
humint_doctrine	4	annual	Supports bounded AGEINT discussion of humint_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
humint_oversight_history	1	annual	Supports bounded AGEINT discussion of humint_oversight_history and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
hybrid_warfare_doctrine	1	annual	Supports bounded AGEINT discussion of hybrid_warfare_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
hybrid_warfare_stratcom	1	annual	Supports bounded AGEINT discussion of hybrid_warfare_stratcom and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
ic_information_environment_risk	2	annual	2 scoped claim families
ic_public_transparency	7	quarterly	7 scoped claim families
ics_ot_defense	10	annual	curriculum grounding and source-backed synthesis
ics_ot_security_standards	3	semiannual	Supports bounded AGEINT discussion of ics_ot_security_standards and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
imint_joint_intelligence_doctrine	1	annual	Supports bounded AGEINT discussion of imint_joint_intelligence_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.

Source lane	Anchor count	Refresh cadence	Claim scope
information_operations_doctrine	1	annual	Supports bounded AGEINT discussion of information_operations_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
integrated_mission_management	1	annual	mission-management governance support for requirements-to-evidence substrate design
intelligence_diplomacy_governance	1	annual	governance context for intelligence diplomacy and partner-engagement boundaries
intelligence_failure_postmortem	9	annual, biennial	9 scoped claim families
intelligence_history_american	1	annual	Supports bounded AGEINT discussion of intelligence_history_american and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
intelligence_history_british_allied	1	annual	Supports bounded AGEINT discussion of intelligence_history_british_allied and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
intelligence_history_soviet	2	annual	Supports bounded AGEINT discussion of intelligence_history_soviet and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
intelligence_profession_literature	4	annual	4 scoped claim families
intelligence_writing_and_review	3	annual	3 scoped claim families
irregular_warfare_strategy	1	annual	Supports bounded AGEINT discussion of irregular_warfare_strategy and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
learner_support_accommodations	1	semiannual	learner support plans, accessibility exception documentation, alternative means, and artifact remediation
legal_authorities_intelligence_collection	1	annual	Supports bounded AGEINT discussion of legal_authorities_intelligence_collection and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.

Source lane	Anchor count	Refresh cadence	Claim scope
legal_authorities_surveillance	3	annual	Supports bounded AGEINT discussion of legal_authorities_surveillance and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
legal_oversight	9	annual	curriculum grounding and source-backed synthesis
legal_oversight_intelligence	1	annual	Supports bounded AGEINT discussion of legal_oversight_intelligence and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
llm_architecture	1	semiannual	Supports bounded AGEINT discussion of llm_architecture and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
llm_evaluation	2	semiannual	Supports bounded AGEINT discussion of llm_evaluation and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
model_card_reporting	1	annual	model documentation cards, intended-use statements, evaluation caveats, and release notes
model_data_provenance	14	annual, quarterly, semiannual	14 scoped claim families
multi_agent_frameworks	1	semiannual	Supports bounded AGEINT discussion of multi_agent_frameworks and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
national_intelligence_governance	1	annual	IC governance and national-intelligence production context
non_state_engagement_governance	1	annual	non-state engagement governance support for source, outreach, and no-tasking boundaries
opsec_doctrine_governance	1	biennial	Provides official historical OPSEC policy context for critical-information protection and public doctrine framing; not an operational OPSEC playbook.
osint_doctrine	3	annual	Supports bounded AGEINT discussion of osint_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
osint_geoint	6	annual	2 scoped claim families

Source lane	Anchor count	Refresh cadence	Claim scope
osint_methodology	1	annual	Supports bounded AGEINT discussion of osint_methodology and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
privacy_ip_governance	3	annual	curriculum grounding and source-backed synthesis
procurement_performance_monitoring	1	quarterly	AI procurement monitoring, vendor demonstrations, acquisition criteria, QASP evidence, and performance review
procurement_vendor_governance	4	annual, quarterly, semiannual	4 scoped claim families
psyop_miso_doctrine	1	annual	Supports bounded AGEINT discussion of psyop_miso_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
public_sector_agentic_ai	5	quarterly, semiannual	5 scoped claim families
public_sector_transparency	3	annual, quarterly, semiannual	3 scoped claim families
records_retention_auditability	5	annual, quarterly, semiannual	5 scoped claim families
rights_impact_privacy	4	annual, quarterly, semiannual	4 scoped claim families
risk_exception_governance	1	quarterly	risk exception governance, AI maturity plans, data traceability, public trust, and oversight capacity
sat_evaluation_evidence	13	annual	13 scoped claim families
secure_release_change_control	9	annual, quarterly, semiannual	9 scoped claim families
sigint_emanations_intelligence	1	annual	Supports bounded AGEINT discussion of sigint_emanations_intelligence and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
sigint_history	1	annual	Supports bounded AGEINT discussion of sigint_history and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
sigint_oversight_history	1	annual	Supports bounded AGEINT discussion of sigint_oversight_history and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
social_engineering_influence_psychology	1	annual	Supports bounded AGEINT discussion of social_engineering_influence_psychology and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.

Source lane	Anchor count	Refresh cadence	Claim scope
source_construction_reporting	1	annual	PRISMA-S reporting guideline for documenting literature searches, search strategies, information sources, limits, records, and reproducibility details
special_operations_doctrine	1	annual	Supports bounded AGEINT discussion of special_operations_doctrine and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
supply_chain_intelligence_attacks	3	semiannual	Supports bounded AGEINT discussion of supply_chain_intelligence_attacks and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
supply_chain_risk_governance	1	annual	supply-chain risk governance support for defensive procurement and assurance lessons
synthetic_media_provenance	4	annual, semiannual	4 scoped claim families
tearlines_and_release_governance	1	annual	tearline and release-governance support for public-facing evidence boundaries
threat_intel_sharing_standards	1	semiannual	Supports bounded AGEINT discussion of threat_intel_sharing_standards and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
tool_use_agents	2	semiannual	Supports bounded AGEINT discussion of tool_use_agents and related source evidence. It does not authorize collection tasking, exploit steps, covert-action guidance, manipulation playbooks, unsafe cyber-physical actions, or live-target procedures.
warning_intelligence	3	annual	3 scoped claim families
workforce_governance	5	annual, quarterly, semiannual	5 scoped claim families

2.13 Safe substitution matrix: defensive artifacts for risky inherited motifs

Source motif	Unsafe source motif	Safe curriculum substitute	Blocked context
AGEINT patterns	raw source motifs can imply autonomous tasking, monitoring, response, or deception	identity-preserving pattern registry plus tabletop, audit, provenance, and governance exercises	deployment, live target tasking, or external action
OSINT tools	broad scraping, exposed-service lookup, credentialed search, or identity exposure	tool-governance audit over instructor-provided records, toy inputs, and source-quality cards	live collection expansion or private-data discovery
GEOINT	facility assessment, force assessment, geolocation targeting, or pattern-of-life inference	provided imagery metadata quality audit with synthetic change examples and uncertainty notes	live facility assessment or tracking
SOC and CTI	autonomous response, exploitability claims, indicator publishing, or production-system action	fabricated-alert tabletop triage with ATT&CK mapping, severity rationale, and debrief evidence	production containment, exploitation, scanning, or blocking
HUMINT and CI	persona construction, contact handling, elicitation, deception, or source exposure	synthetic identity-and-provenance ethics audit with role-play records and review rubrics	impersonation, covert contact, or operational-security support
Cognitive influence	covert persuasion, microtargeting, audience manipulation, or intervention delivery	opt-in media-literacy lesson plan using synthetic materials and transparent prebunking labels	campaign design or audience-targeted persuasion
ICS and OT	facility monitoring, control action, safety-system interference, or cyber-physical response	owned-lab or synthetic process-safety tabletop with logs, rollback, and human approval gates	real plant operations, live devices, or unsafe control changes

2.14 Capstone workflow: phase sequence, artifacts, and reviewer gates

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

2.15 Capstone model-answer exemplars: strong evidence packets and revision triggers

These exemplars show the expected shape of a strong answer without prescribing a single conclusion. Use them as answer-key patterns for selected capstone reviews.

Capstone pattern	Model-answer evidence	What earns revision
Source-quality packet	Names the `ageintNNN` source key, source lane, direct evidence, caveat, uncertainty, and refresh trigger.	Claim cites a summary, omits the source key, or hides uncertainty.
Safe-lab packet	States the learning question, allowed inputs, excluded actions, tool allowlist, stop condition, and reviewer gate.	Uses private data, live targets, credentialed access, or an unreviewed tool path.
Assurance packet	Connects rubric score, rights impact, accessibility check, remediation owner, and debrief handoff.	Treats the score as proof, omits affected users, or leaves no owner for retest.

2.16 Accessibility and UDL review: learner access, modality checks, and accommodation evidence

Step	Artifact	Review question
Access baseline	WCAG/UDL needs note	Can every learner perceive, operate, understand, and complete the artifact without a hidden access barrier?
Learner variability	multiple-means design note	Are engagement, representation, and action or expression options available before remediation is requested?
Assistive technology	screen-reader, keyboard, contrast, caption, and plain-language check	Can the artifact be reviewed with common assistive workflows and documented alternatives?
Public-service duty	Title II or institutional-accessibility obligation note	If a public or institutional audience uses this artifact, are contractor and service-access duties visible?
Remediation evidence	defect log, owner, due date, and retest result	Are accessibility defects tracked to closure before the artifact is reused?

2.17 Procurement and vendor oversight: tool governance, revocation, and vendor evidence

Step	Artifact	Review question
Need and authority	procurement rationale and legal authority card	Is the vendor capability tied to a valid learning, governance, or defensive need?
Market and vendor transparency	vendor disclosure, subcontractor, data-use, and conflict-of-interest register	Can reviewers see who provides the tool, what data it touches, and which dependencies matter?
Evaluation criteria	weighted criteria for accessibility, privacy, security, provenance, and reversibility	Are evaluation criteria explicit before tool selection rather than rationalized afterward?
Contract controls	logging, deletion, audit, incident, accessibility, and termination clauses	Can the institution pause, audit, remediate, or exit the vendor relationship?
Lifecycle monitoring	renewal evidence, performance review, incident record, and refresh trigger	Does oversight continue after award and before classroom reuse?

2.18 HRIA and DPIA worksheet: rights impact, privacy review, and residual risk

Dimension	Prompt	Evidence
Purpose and authority	What public, educational, or defensive purpose justifies the processing or analysis?	scope card, excluded-action list, and decision owner
Data subjects and affected groups	Who could be affected directly, indirectly, or through downstream reuse?	stakeholder map, vulnerability note, and accessibility considerations
High-risk processing trigger	Does the activity involve sensitive data, profiling, automated evaluation, large-scale processing, or systematic monitoring?	DPIA trigger checklist and mitigation owner
Rights and safeguards	How are privacy, equality, expression, access, contestability, and redress protected?	rights-impact note, safeguard register, and escalation path
Residual risk and refresh	What remains uncertain, who accepts it, and what source or incident would reopen review?	residual-risk decision, review date, and source-refresh trigger

2.19 Data lineage registry: source identity, transformations, retention, and review

Object	Lineage field	Quality gate
Source citation	`ageintNNN`, title, URL, checked date, and source identity status	citation key resolves and reference identity is locked or append-only
Verified anchor	lane, tier, verification method, claim scope, stakeholder role, and assurance use	direct official, standards, public-domain, or scholarly URL was reviewed
Dataset or scenario	origin, license, sensitivity class, transformations, and retention rule	public, synthetic, owned-lab, or instructor-provided data only
Agent transcript	prompt, model context, tool allowlist, budget, reviewer, and blocked actions	no external action, live target, private data, or unsafe cyber-physical step
Final artifact	claim ledger, uncertainty note, accessibility status, rights review, and refresh owner	another reviewer can reproduce and challenge the artifact

2.20 Assessment integrity protocol: declared agent use, grading evidence, and human judgment

Control	Student evidence	Instructor check
Accountable AI use	tool-use declaration and prompt/output appendix	AI assistance is allowed, visible, bounded, and aligned with the assignment
Independent reasoning	assumptions, alternatives, uncertainty, and confidence statement	student judgment is separable from agent-generated drafting
Citation integrity	source spine, verified anchors, and claim ledger	claims are not source-laundered through agent prose
Synthetic lab boundary	allowed-inputs card, excluded actions, and stop conditions	activity remains public, benign, owned-lab, synthetic, defensive, and reversible
Feedback and revision	rubric self-score, reviewer notes, and remediation log	revision evidence addresses the actual deficiency before reuse

2.21 Agent incident response drill: pause, revoke, preserve, recover, and debrief

Phase	Drill action	Artifact
Prepare	define agent scope, tool permissions, logs, escalation roles, and stop conditions	incident play card and contact matrix
Detect	identify anomalous output, policy drift, source-laundering, data exposure, or unsafe tool request	synthetic incident ticket and evidence snapshot
Contain	pause the workflow, revoke tool access, preserve records, and route to human review	containment decision and access-change log
Recover	restore a known-safe prompt, dataset, tool profile, or rubric state	rollback note and retest result
Debrief	record root cause, learner impact, rights impact, vendor implication, and refresh trigger	post-incident memo and owner assignment

2.22 Role-based competency map: responsibilities, evidence owners, and assurance roles

Role	Competency	Evidence
Learner analyst	separate claim, evidence, uncertainty, confidence, and source quality	claim ledger and reflective memo
Instructor	facilitate safe labs, assess integrity, and preserve accessibility	rubric, UDL review, and debrief notes
Source steward	lock source identities, verify new anchors, and maintain refresh triggers	Section 2.12 and Section 80.3
Assurance reviewer	test failure modes, adversarial assumptions, tool boundaries, and incident response	red-team review, incident drill, and remediation record
Rights and procurement reviewer	evaluate privacy, accessibility, vendor, public transparency, and human-rights impacts	HRIA/DPIA worksheet and procurement oversight packet

2.23 Adversarial assurance cycle: challenge rows, remediation owners, and retest evidence

Stage	Challenge question	Artifact
Misuse case	How could the module be misread as operational, unfair, inaccessible, or overconfident?	misuse-case card and safe-substitution decision
Control challenge	Which authority, data, tool, rights, or review control would fail first?	control challenge matrix
Evidence attack	Can a claim survive source verification, provenance review, and counter-evidence?	challenged claim ledger
Incident rehearsal	What happens if an agent drifts, leaks context, fabricates support, or requests unsafe action?	synthetic incident drill and recovery note
Remediation	Which wording, workflow, source, figure, or assessment gate must change before reuse?	owner, due date, retest result, and refresh trigger

2.24 Model and dataset documentation card: intended use, provenance, caveats, and lifecycle

Field	Model card evidence	Dataset card evidence	Review gate
Intended use	accountable task, excluded uses, affected users, human reviewer, and accountable owner	Data Cards purpose statement, recommended use, prohibited reuse, stewardship owner, and affected stakeholder groups	claim is rejected if intended use, excluded use, affected users, or owner is missing
Provenance and collection	model family, version, supplier or lab, training cutoff, deployment context, and configuration hash	upstream source, collection process, annotation method, consent or authority basis, sensitivity class, and license	artifact is held if provenance, license, authority, or collection process is opaque
Composition and limits	capability boundary, known failure modes, tool permissions, context window limits, and unsupported conditions	population, sampling frame, coverage gaps, subgroup visibility, missingness, transformations, and known caveats	artifact is revised if population, coverage, or source limits are invisible
Evaluation and caveats	benchmark suite, task-specific tests, subgroup or context results, red-team findings, uncertainty notes, and failure examples	quality tests, label agreement, bias review, measurement limits, transformation log, and Data Cards answer-evaluation notes	empirical or performance claims are rejected unless test context, subgroup caveats, and uncertainty are visible
Lifecycle controls	release gate, rollback path, monitoring signal, incident threshold, refresh trigger, and model-card update owner	retention rule, access boundary, update cadence, deletion path, stewardship handoff, and dataset-card revision trigger	reuse is blocked without owner, retention, monitoring, rollback, and refresh evidence

2.25 Transparency and communication notice: purpose, safeguards, human review, and limits

Step	Artifact	Review gate
Public purpose	plain-language purpose, authority, affected service, and decision role	reader can tell why the system exists and where human judgment remains
Tool and data summary	model, data, supplier, provenance, validation, and accessibility summary	sensitive details are de-sensitized without hiding accountability fields
Impact and review	benefits, risks, safeguards, human review, appeal, and contact point	affected groups can identify recourse and oversight owners
Publication decision	publish, partially publish, delay, or hold decision with exemption rationale	non-public fields have a documented legal, security, privacy, or IP basis

2.26 Records retention and audit trail: owners, retention rules, and deletion conditions

Record	Retained fields	Audit question
Source and prompt register	source identity, prompt version, tool allowlist, reviewer, timestamp, and caveat	Can a later reviewer reconstruct the evidentiary path without private or live data?
Decision and exception log	risk owner, accepted exception, compensating control, expiry date, and approval	Is every deviation time-bound, justified, and reviewable?
Artifact retention note	output type, sensitivity, access boundary, deletion rule, and refresh trigger	Does the retention choice match the educational purpose and rights impact?
Incident and remediation record	incident signal, containment action, root cause, owner, retest result, and closure date	Can the same failure be detected and prevented in the next reuse cycle?

2.27 Release and change-control gate: reuse approval, rollback, and change evidence

Gate	Release evidence	Block condition
Scope freeze	accountable use case, excluded actions, tool profile, and data boundary	scope expands to external action, live data, or an unreviewed capability
Security and rights review	privacy, accessibility, security, bias, and human-review checks	rights impact, vulnerability, or accessibility issue has no owner
Version and rollback	model or prompt version, changelog, test fixture, and rollback path	change cannot be reproduced, compared, or reverted
Post-release monitoring	monitoring signal, incident threshold, refresh trigger, and owner	deployment or reuse occurs without logging and retest commitments

2.28 Risk exception and acceptance memo: residual risk, owner approval, and review clock

Field	Minimum content	Approval rule
Exception requested	what requirement cannot be met, why, affected groups, and duration	exception must be specific, time-bound, and tied to a compensating control
Risk basis	likelihood, impact, evidence, uncertainty, alternatives, and rejected options	unsupported confidence or missing alternatives returns the memo for revision
Compensating control	human review, monitoring, access limit, disclosure, remediation, and owner	control must reduce risk without creating an operational workaround
Expiry and retest	expiry date, retest condition, review cadence, and closure criteria	open-ended exceptions are rejected

2.29 Learner support and accommodation plan: support rows, access barriers, and escalation

Need	Support	Evidence
Access and modality	captions, alt text, keyboard path, plain-language summary, and structured tables	accessibility checklist, defect log, and retest result
Cognitive load	worked examples, staged release, glossary, checklist, and optional practice fixture	UDL design note and learner feedback record
Assessment fairness	allowed-tool statement, AI-use declaration, alternative submission mode, and transparent rubric	assessment-integrity note and accommodation record
Feedback and remediation	revision path, office-hour prompt, example correction, and due-date flexibility policy	feedback log and instructor disposition

2.30 Instructor question bank: prompts, evidence checks, and misconception probes

Question type	Prompt	Evidence
Source challenge	Which claim would fail if the strongest source were removed or downgraded?	claim ledger revision and source-lane note
Boundary challenge	Where could this exercise drift from analysis into action, and what safe substitute prevents it?	safe-substitution decision and excluded-action card
Rights challenge	Which affected group, accessibility need, privacy interest, or redress path is under-specified?	HRIA/DPIA update and accommodation note
Assurance challenge	What failure would the current evaluation miss, and what retest would reveal it?	adversarial assurance retest and remediation owner

2.31 Remediation backlog: issue owners, retest evidence, and closure boundaries

Backlog item	Trigger	Closure evidence
Unverified claim	claim lacks a guide citation or directly verified anchor	verified source, removed claim, or explicit source-guide context note
Unsafe phrasing	wording implies live targeting, external action, exploitation, manipulation, or unsafe control	safe substitute, blocked context, and reviewer sign-off
Accessibility defect	artifact cannot be inspected through an expected assistive or alternative workflow	defect fix, alternative means, and retest result
Assurance gap	evaluation, release, exception, incident, or vendor evidence is incomplete	owner, due date, retest, and accepted disposition

2.32 Scholarship and governance stance: source posture, claim limits, and public-readiness boundary

AGEINT treats agentic intelligence as a governed socio-technical practice, not as a bag of prompts or autonomous tricks. The curriculum therefore keeps AI agent evaluation, identity, authorization, secure tool use, structured analytic tradecraft, cognitive security, OSINT/GEOINT integrity, and ICS/OT safety in one source-backed frame. Each source anchor has a curriculum role, a domain, and a provenance type so readers can distinguish law, standards, official guidance, public-domain historical material, scholarly synthesis, and weaker practitioner or vendor context. Unless a section cites an empirical study or evaluation source for a narrower point, AGEINT language should be read as proposed design guidance and an assurance framework rather than measured performance evidence. Technical and theoretical analogies, including active-inference material, remain bounded by their direct domain sources and do not become deployment evidence without separate evaluation support.

The same stance now has a machine-checkable extension. Citation presence is necessary but not sufficient for AGEINT scholarship, so the generated manuscript is checked for source-family mix, uncited claim-bearing sections, thin claim-bearing support, and sections whose support comes from only one broad family. The audit distinguishes hard failures from review warnings: a claim-bearing overview, lesson, worked example, architecture source section, research-governance section, assessment review, or unit introduction with zero or one unique citation fails the current artifact evidence; a section with multiple citations from one source family is reported as a review target for future triangulation. The control surface is summarized in Figure 17, and the machine-readable companion report is written to `output/reports/scholarship_quality.json` during the current-evidence pass. This keeps source-guide inheritance visible while still preferring official, standards, law/policy, public-domain, and scholarly anchors whenever a section makes a stronger governance, technical, or empirical claim [Melissa L. Rethlefsen and the PRISMA-S Group, 2021]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d].

Claim calibration sits beside that scholarship audit. The source-strength layer classifies source-guide rows and curated anchors by whether they can carry a bounded claim directly or only provide context. Weak source-guide context, vendor/practitioner commentary, social/video rows, and mirror/copy rows cannot alone support empirical performance, statistical, governance-authority, safety, or formalism claims. The current report is written to `output/reports/claim_calibration.json` and `.md`, and the unified artifact evidence manifest exposes the result as `claim_calibration_ok`.

Analysis validation adds the reader-facing disposition layer, summarized as a claim-class-to-question matrix in Section 2.7 and Figure 20; that matrix is the boundary on what the manuscript can honestly say. This is why the artifact-evidence manifest records both positive counts and false-certification controls.

2.33 Verifier-first artifact evidence: build freshness, audits, and negative controls

AGEINT uses the RedTeam rule that a green validator is evidence only after the validator has been challenged. The artifact-evidence control loop in Figure 16 binds source-owned curriculum inputs, generated manuscript sections, citation inventories, figure metadata, PDF annotations, and current evidence reports into one falsifiable chain. This keeps scholarship, visual assets, and render validation in the same audit surface: a stale PDF, a local Markdown-file link, an uncovered source section, or a figure-registry mismatch must fail the evidence manifest before a maintainer can treat the render as ready. The same stance follows the evaluation and red-team assurance guidance already encoded in the bibliography atlas: adversarial testing is a scoped assurance method, not proof of universal safety or permission to run live operations [Cybersecurity and Agency, 2024a]; [of Standards and Technology, 2025a]; [of Standards and Technology, 2024e].

2.34 Orientation figures and course links: visual evidence, source flow, and navigation

The orientation uses Figure 5, Figure 6, Figure 7, Figure 8, Figure 9, Figure 10, Figure 11, Figure 12, Figure 13, Figure 14, Figure 15, Figure 16, Figure 17, Figure 18, Figure 19, Figure 20, Figure 21, Figure 22, Figure 23, Figure 24, Figure 25, Figure 26, Figure 27, Figure 28, and Figure 29 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.

Navigation links: Section 1, Section 3.

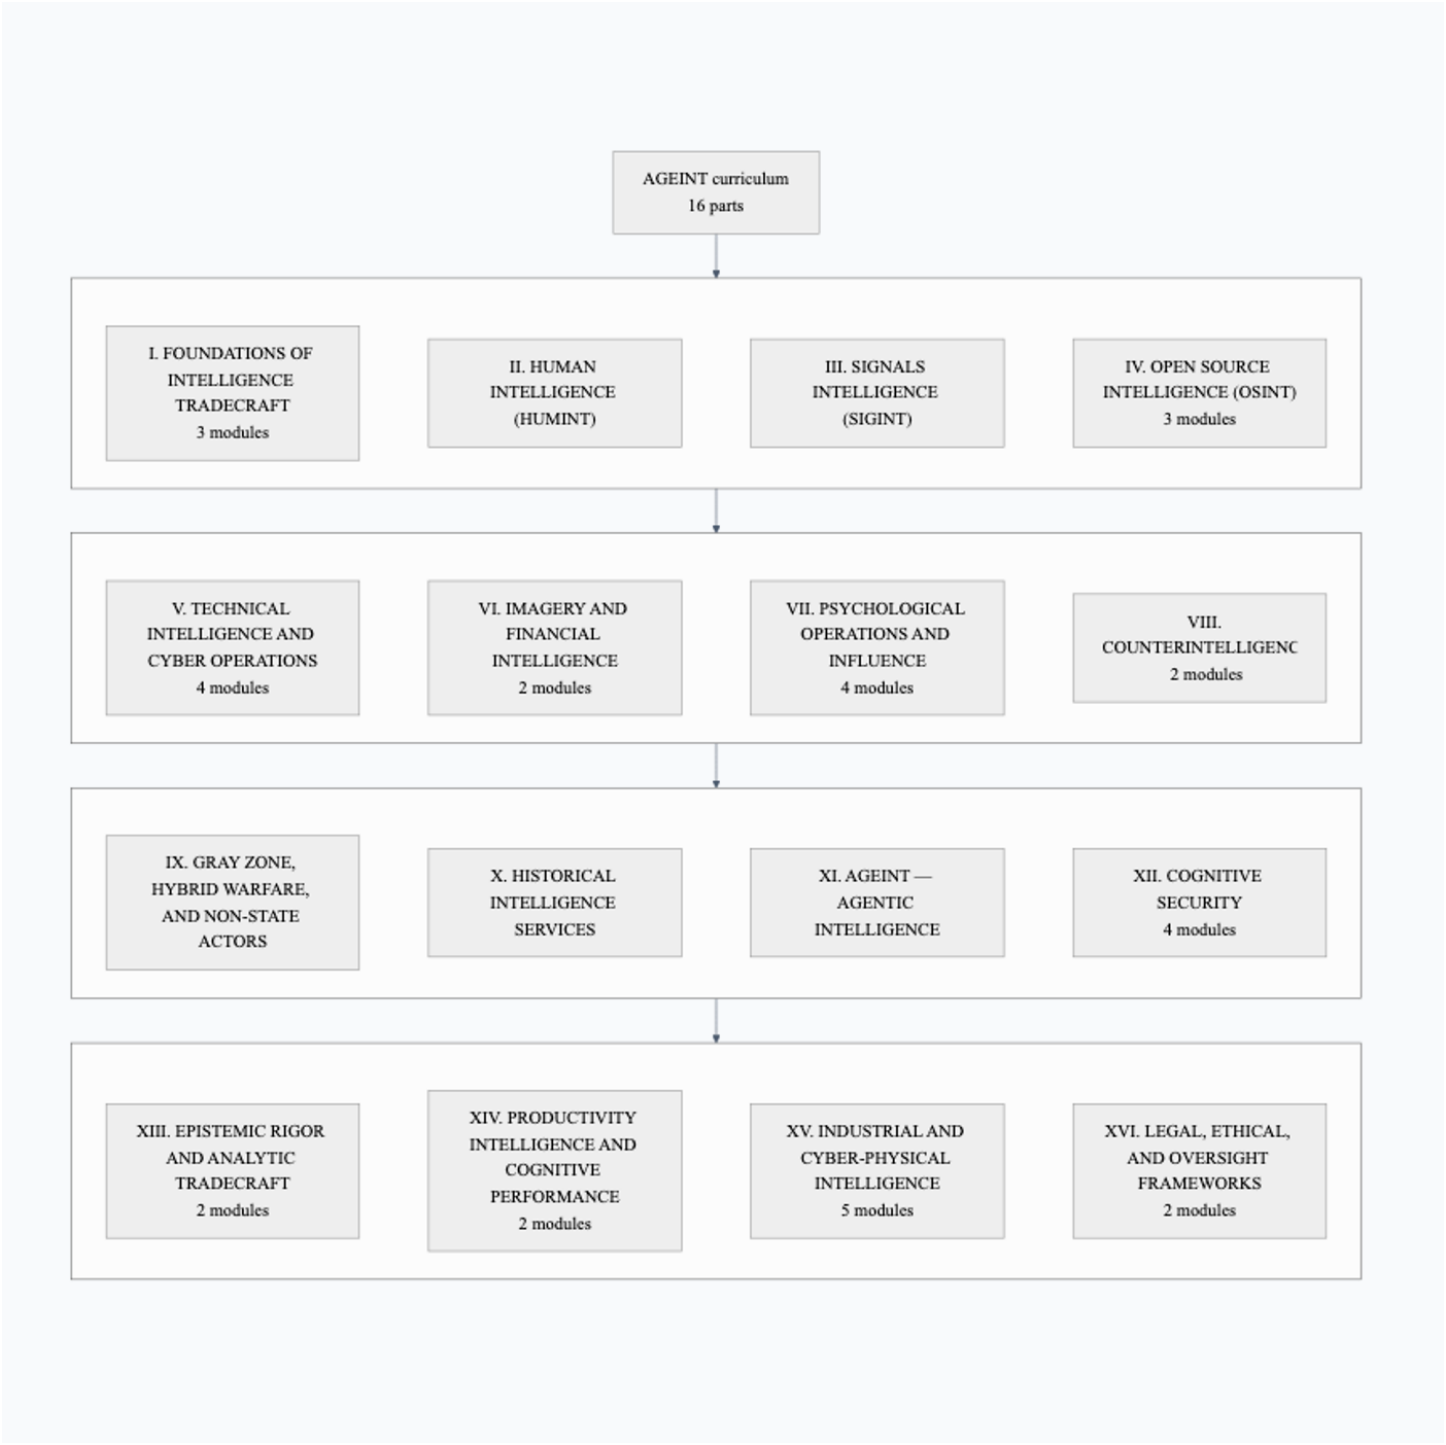

Figure 5: The curriculum map links AGEINT parts into a source-backed learning sequence. The captioned view belongs to the curriculum orientation and should be read as a map of 16 part nodes, source-backed module counts, and the reading path from tradecraft foundations through oversight frameworks, not as a capability score or live-task instruction.

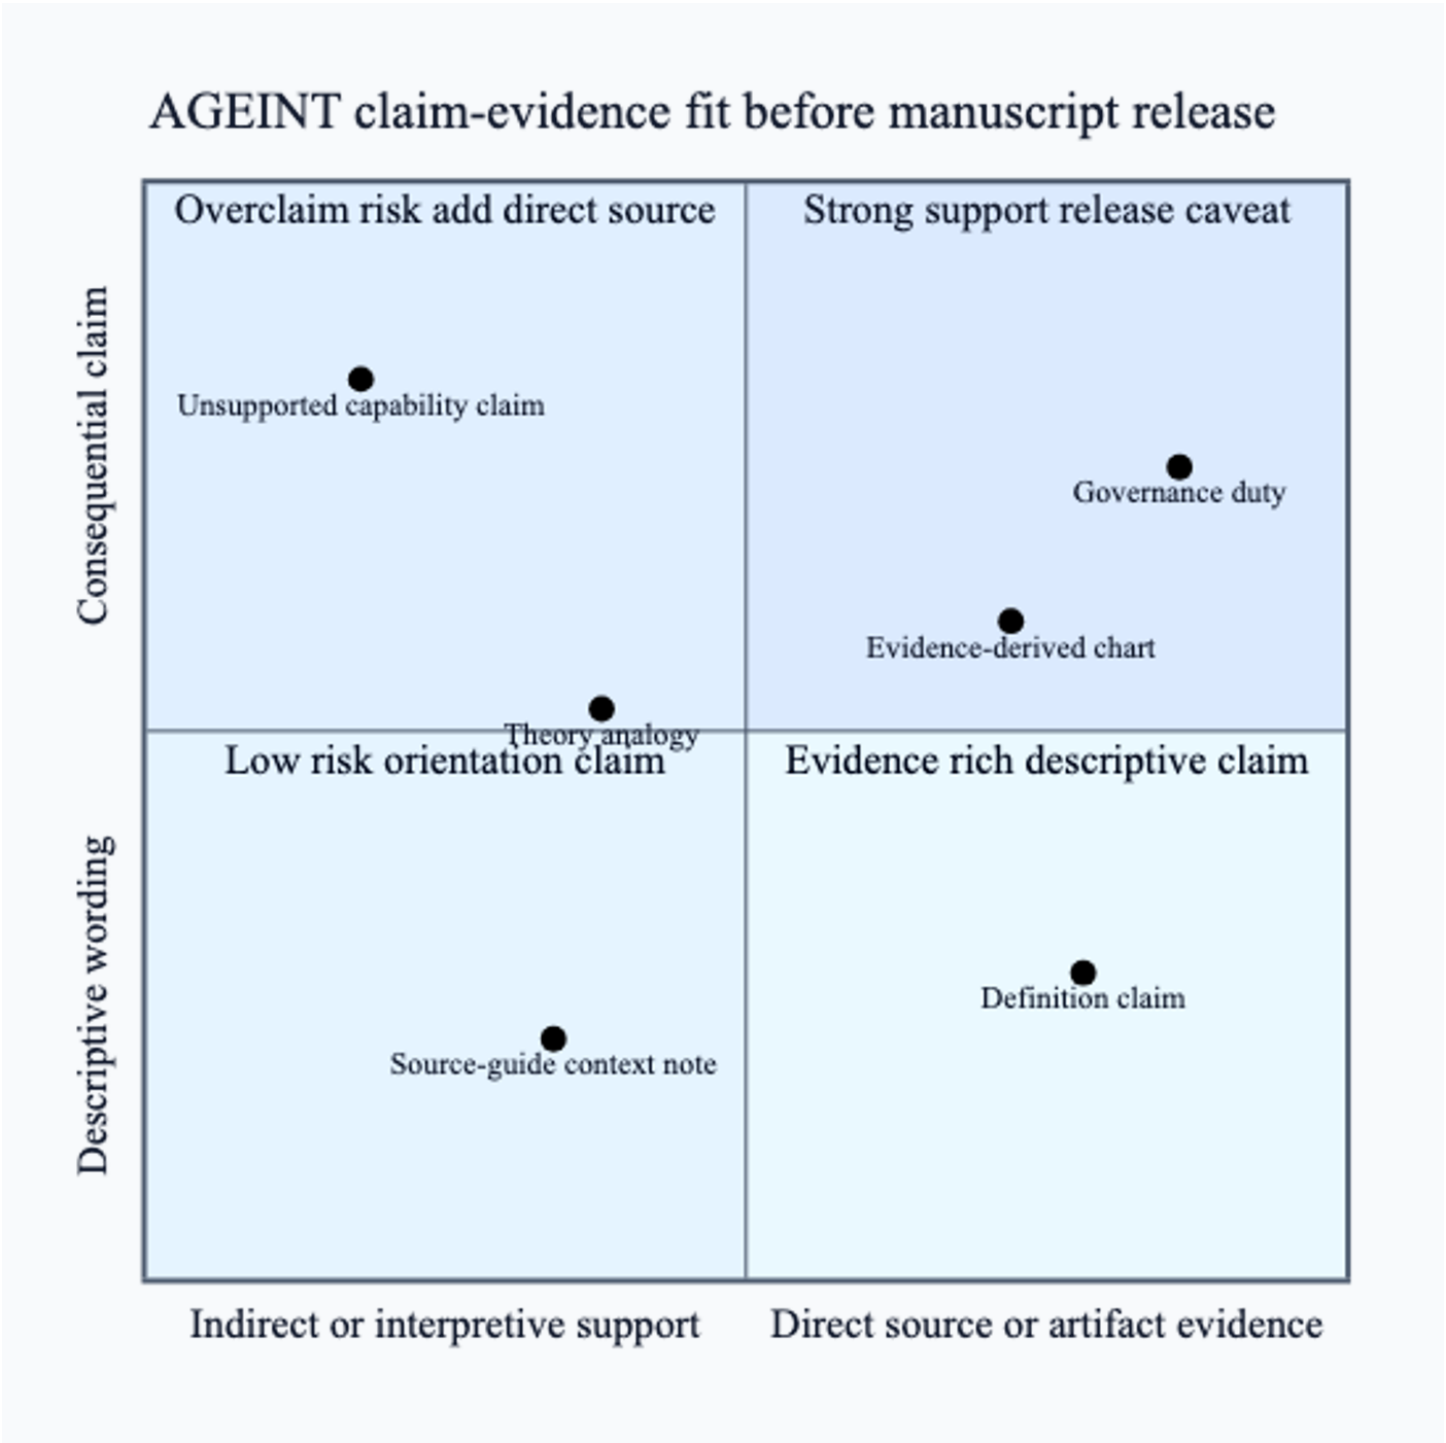

Figure 6: The claim-evidence quadrant helps reviewers distinguish low-risk definitional claims, governance duties, artifact-derived evidence, and high-caveat theory analogies before a manuscript sentence is treated as reviewable. Its reader value is to make x-axis evidence directness from indirect to direct, y-axis claim strength from descriptive to consequential, definition claims fit official or standard sources, and governance duties require policy or law text visible at a glance, with the curriculum orientation as the source section and defensive review as the boundary.

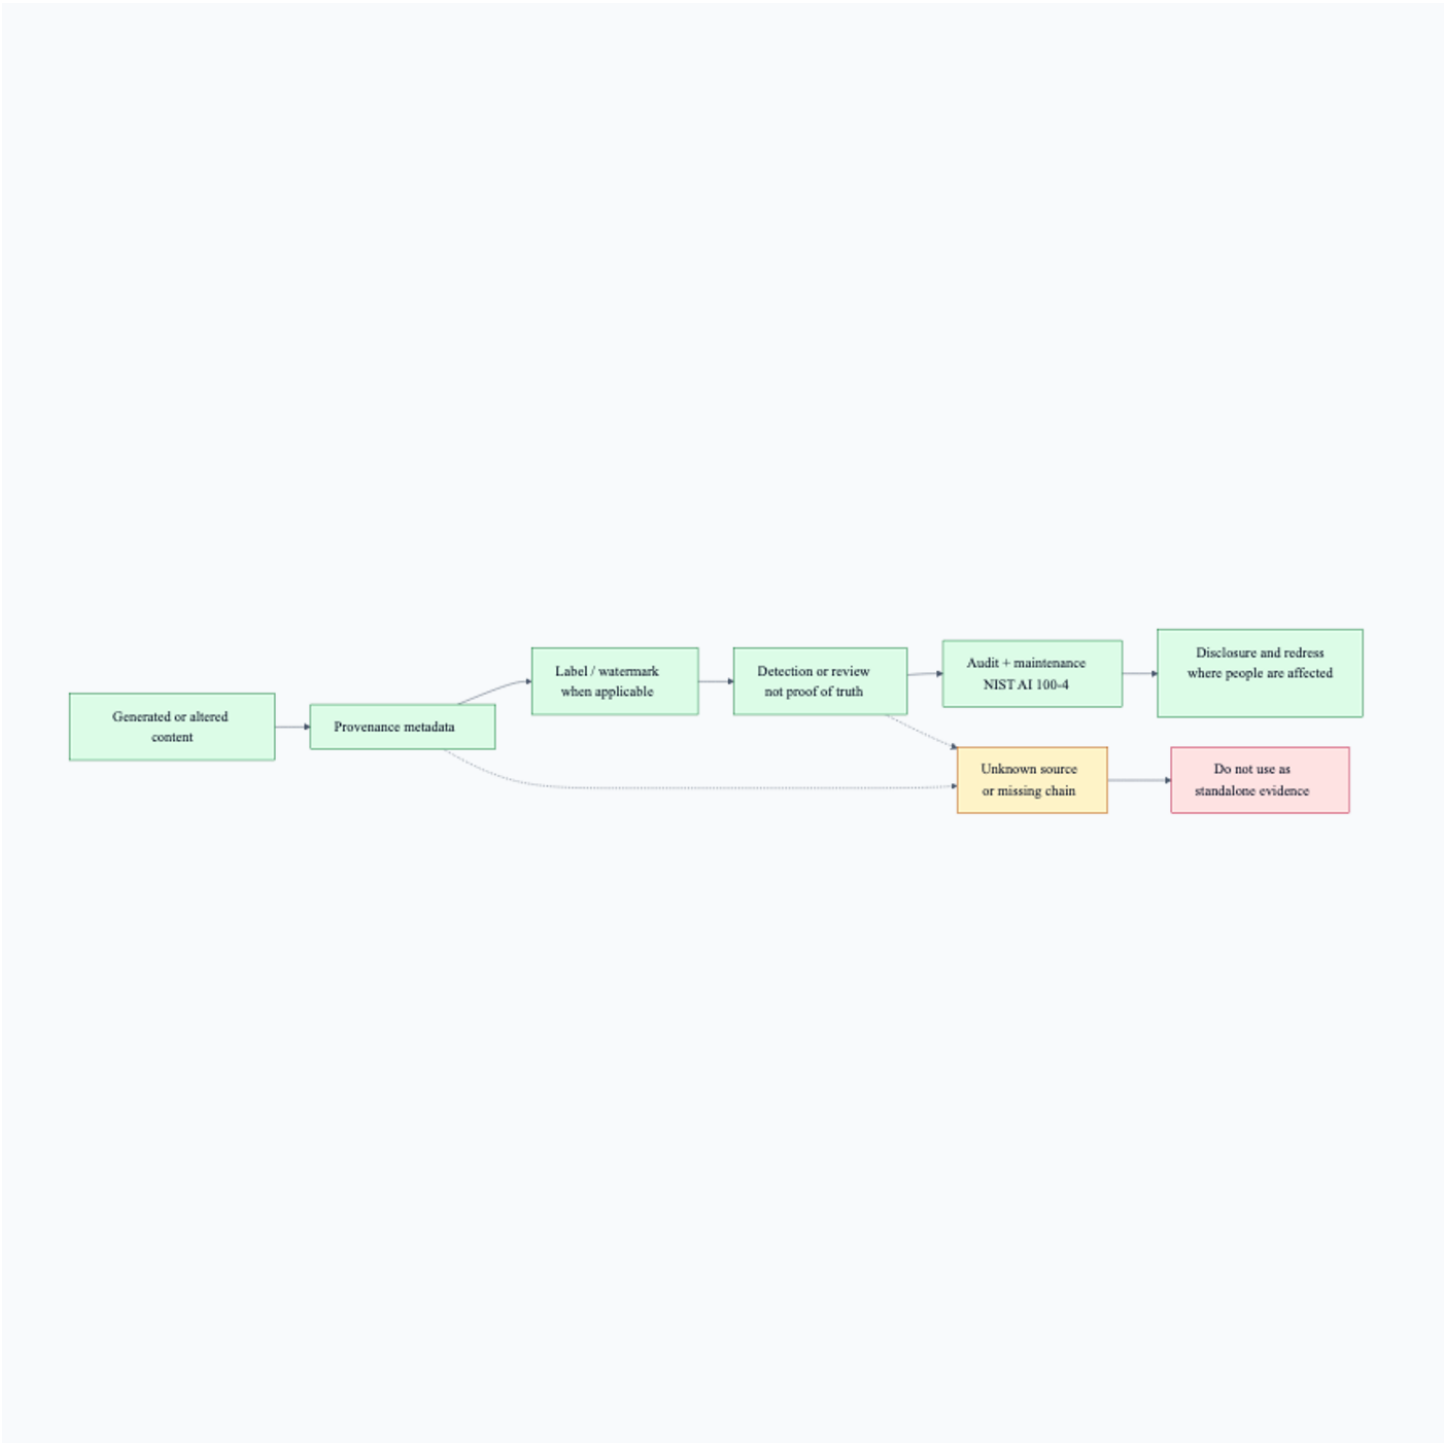

Figure 7: Source-backed conceptual schematic using NIST AI 100-4 to separate provenance, labeling, detection, testing, audit, and redress duties for generated visual and media claims. The captioned view belongs to the curriculum orientation and should be read as a map of Generated or altered content, Provenance metadata, Label / watermark when applicable, and Detection or review not proof of truth, not as a capability score or live-task instruction.

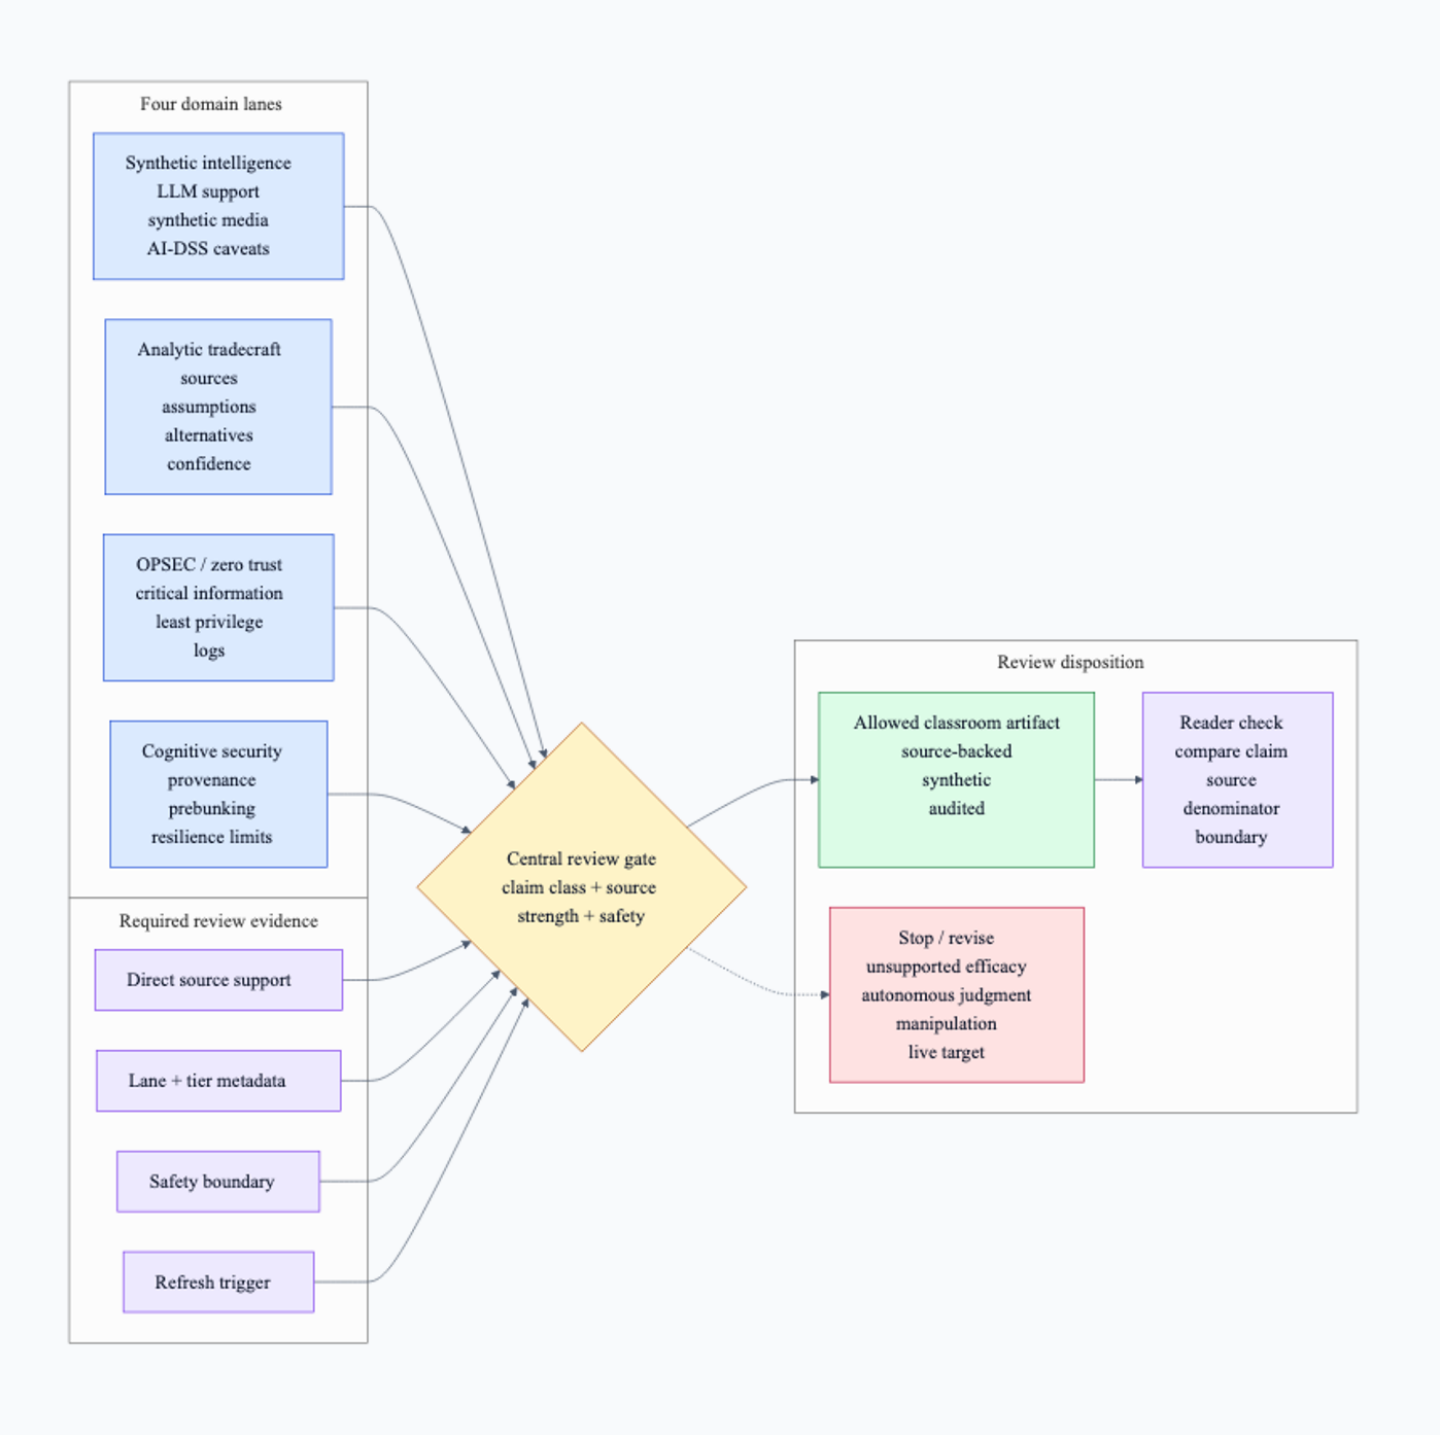

Figure 8: Source-backed architecture map showing four separate review lanes for synthetic intelligence, analytic tradecraft, OPSEC and zero-trust controls, and cognitive-security safeguards. The central gate requires direct source support, metadata, refresh evidence, and safety-boundary evidence before an allowed classroom artifact can be treated as source-backed; unsupported efficacy, autonomous judgment, manipulation, or live-target claims must stop or be revised.

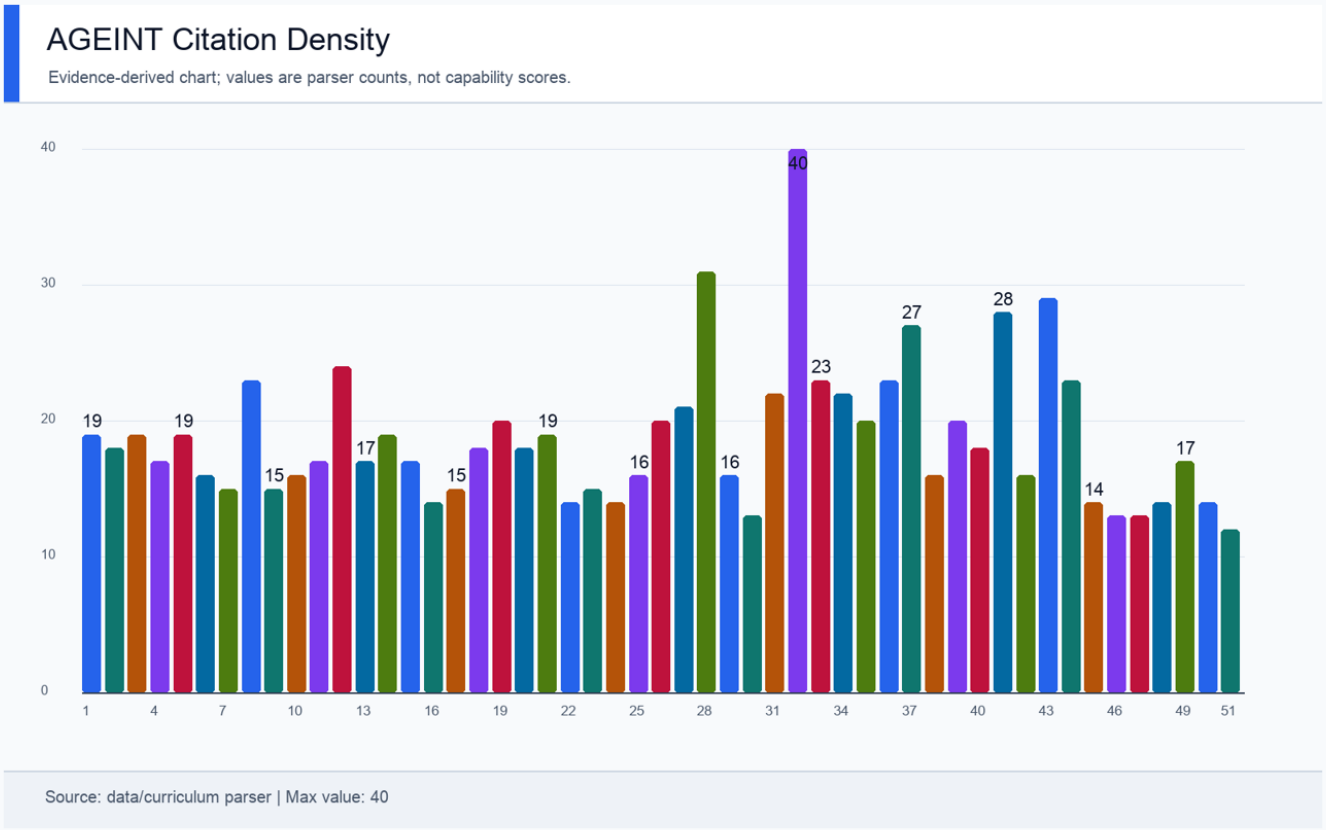

Figure 9: Method-backed audit chart reporting direct external citation counts per generated module; labels, denominators, and counting rule come from the curriculum parser. In the curriculum orientation, it lets readers compare citation density categories, denominators, evidence lanes, limitations, and reviewer-use cautions so the visual functions as a traceable course aid rather than an unscoped assertion.

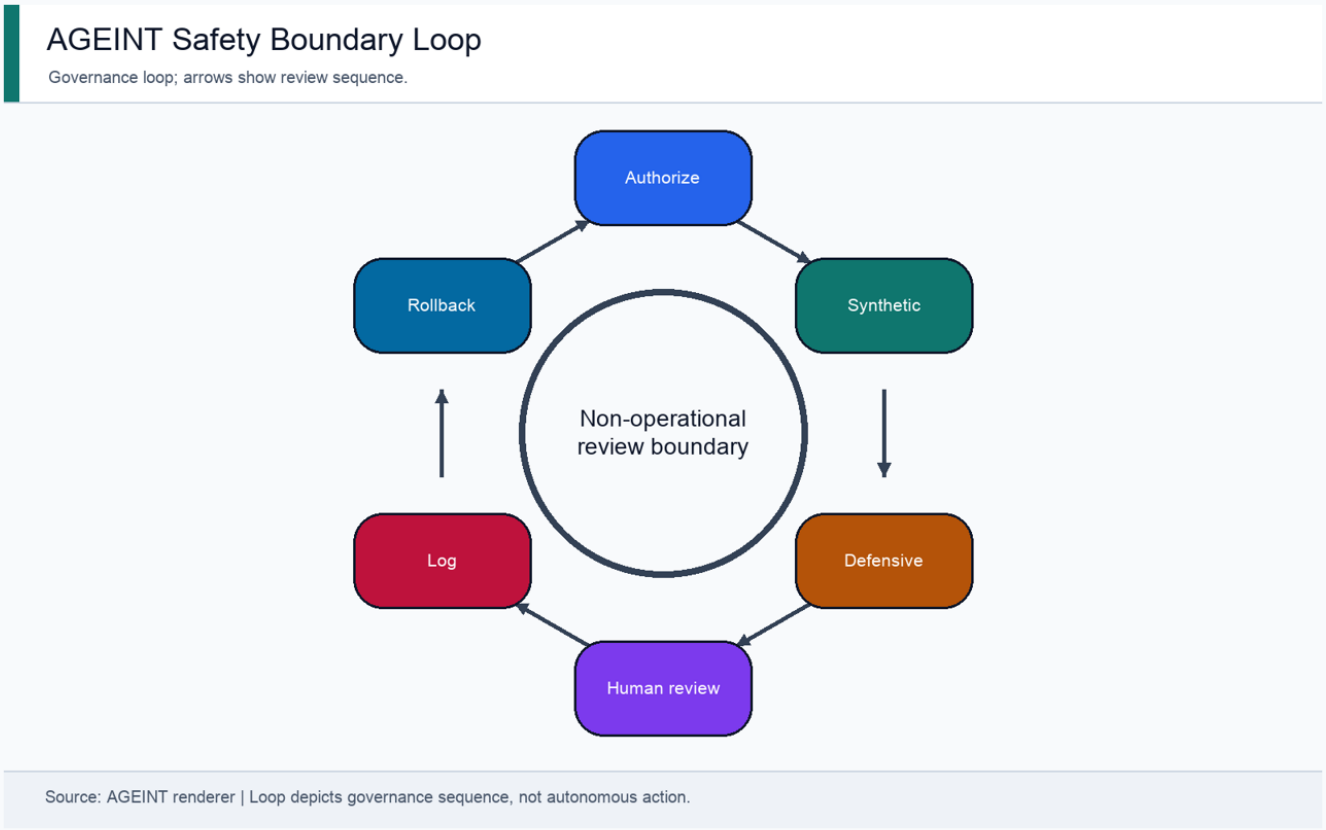

Figure 10: Conceptual governance schematic showing how accountable review, synthetic fixtures, human oversight, logging, and evidence-bounded practice stay connected. In the curriculum orientation, it lets readers compare safety boundary loop steps, decision gates, owner handoffs, refresh triggers, and closure evidence so the visual functions as a traceable course aid rather than an unscoped assertion.

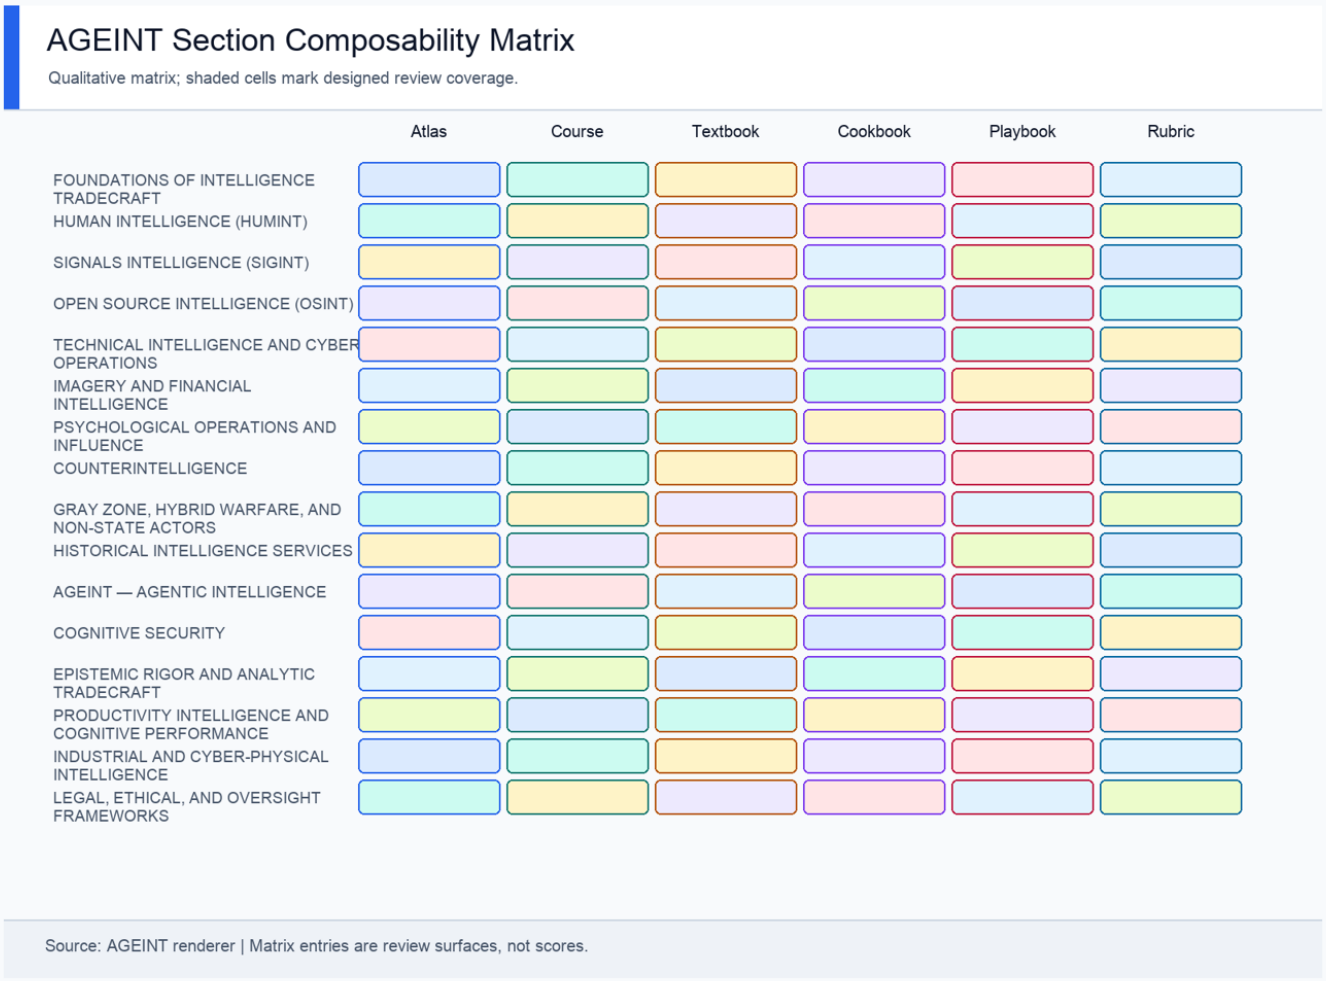

Figure 11: The section composability matrix shows which reusable curriculum artifacts support each part. It is anchored to the curriculum orientation; use it to inspect section composability matrix fields, row and column obligations, source records, reviewer decisions, and closure evidence while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

Figure 12: Conceptual compliance matrix with rows as governance lanes and columns as source, rights, assurance, artifact, and refresh obligations; color groups cells only. Its reader value is to make ai compliance map fields, row and column obligations, source records, reviewer decisions, and closure evidence visible at a glance, with the curriculum orientation as the source section and defensive review as the boundary.

Figure 13: The accessibility workflow joins WCAG, UDL, remediation, and refresh evidence. In the curriculum orientation, it lets readers compare accessibility workflow steps, decision gates, owner handoffs, refresh triggers, and closure evidence so the visual functions as a traceable course aid rather than an unscoped assertion.

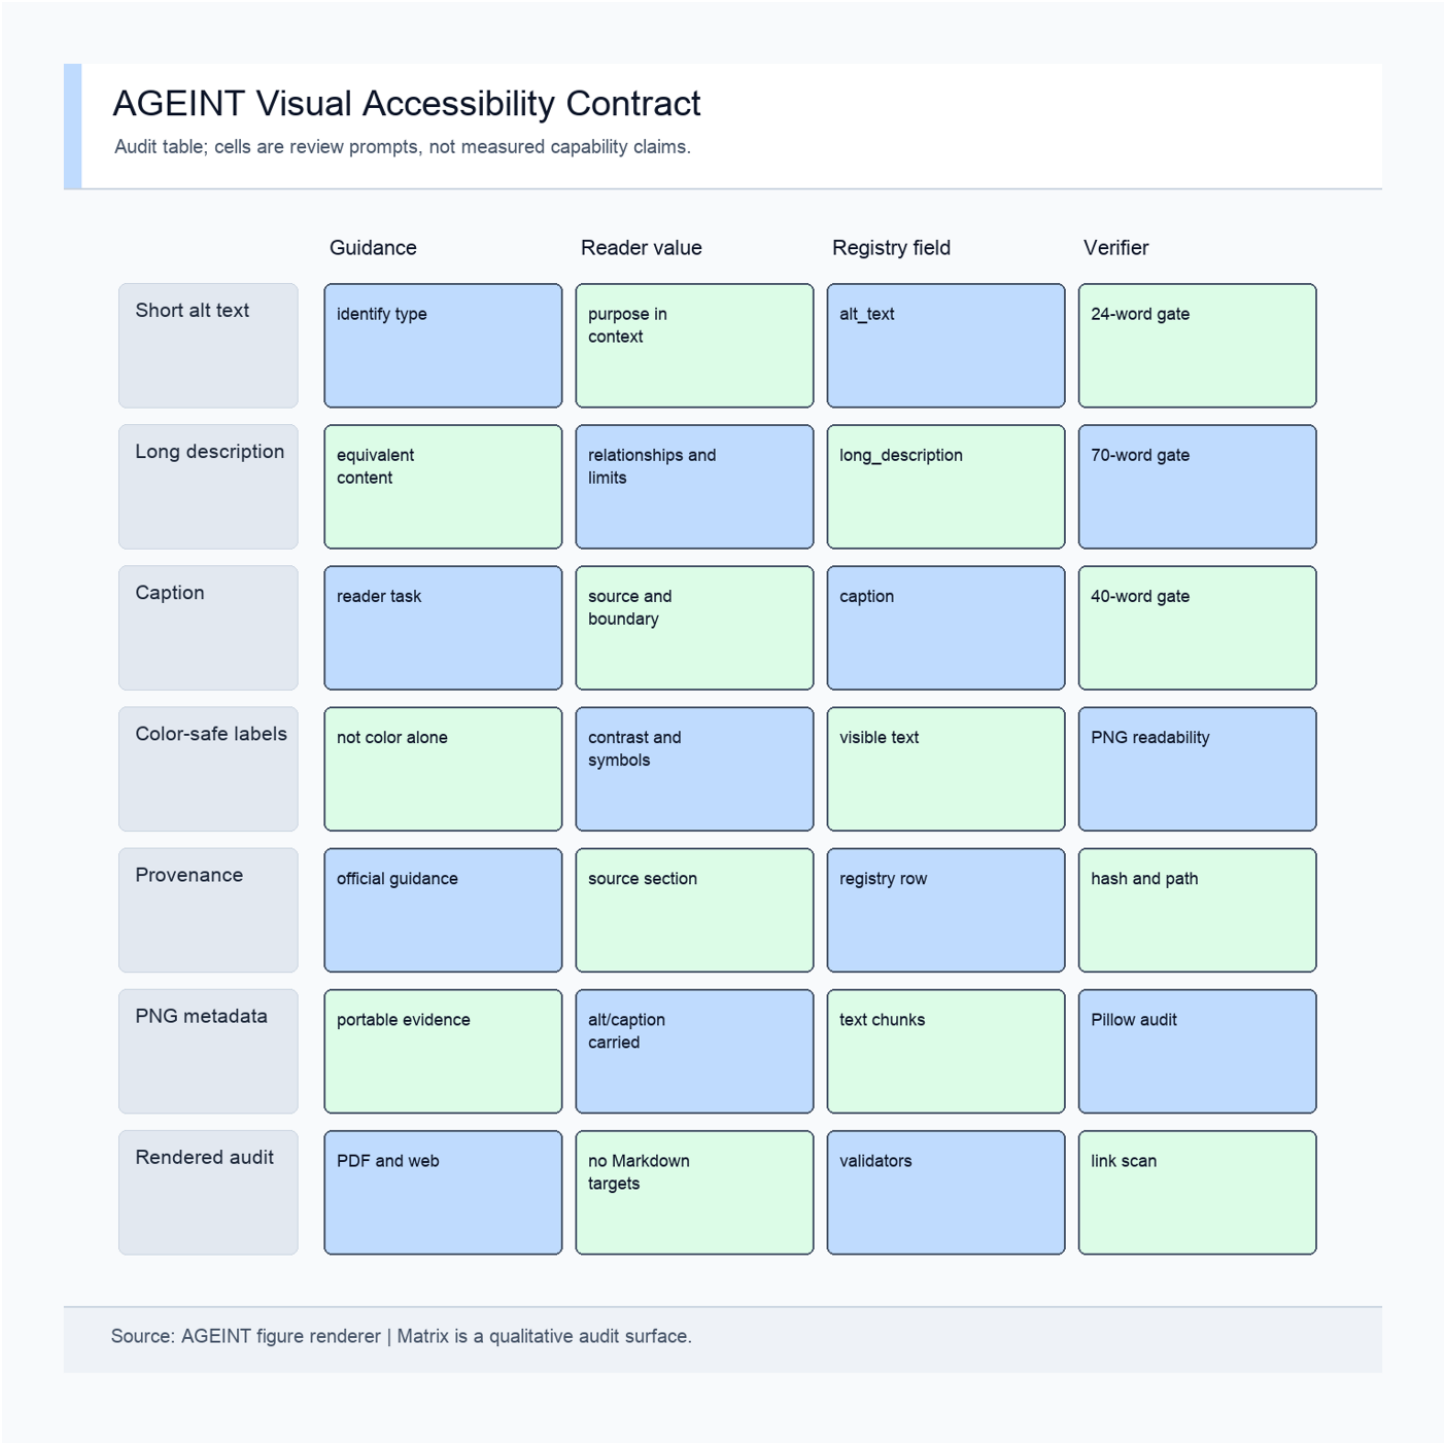

Figure 14: Source-backed accessibility contract mapping W3C WAI complex-image guidance, WCAG 2.2 non-text-content requirements, Section508 alternative-text and PDF checking guidance, and USWDS data-visualization guidance to AGEINT's generated figure registry. It shows how each figure carries a caption, short alt text, long description, source section, provenance, and rendered-artifact validation before PDF or web use.

Figure 15: Machine-checkable dashboard for the generated figure pipeline. It summarizes the quality gates that every AGEINT visual must pass: readable PNG assets, square-normalized layout, informative captions, short alt text, long descriptions, embedded PNG metadata, local provenance, and rendered-output link safety. The companion machine-readable artifact is `../figures/visual_quality_audit.json`.

Figure 16: Source-backed control-loop figure showing how AGEINT binds source-owned inputs, rebuilt manuscript files, citation inventory, figure registry metadata, PDF annotation audits, and current evidence reports so validators cannot certify a stale or partially copied artifact as complete. It is anchored to the curriculum orientation; use it to inspect artifact evidence control loop steps, decision gates, owner handoffs, refresh triggers, and closure evidence while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

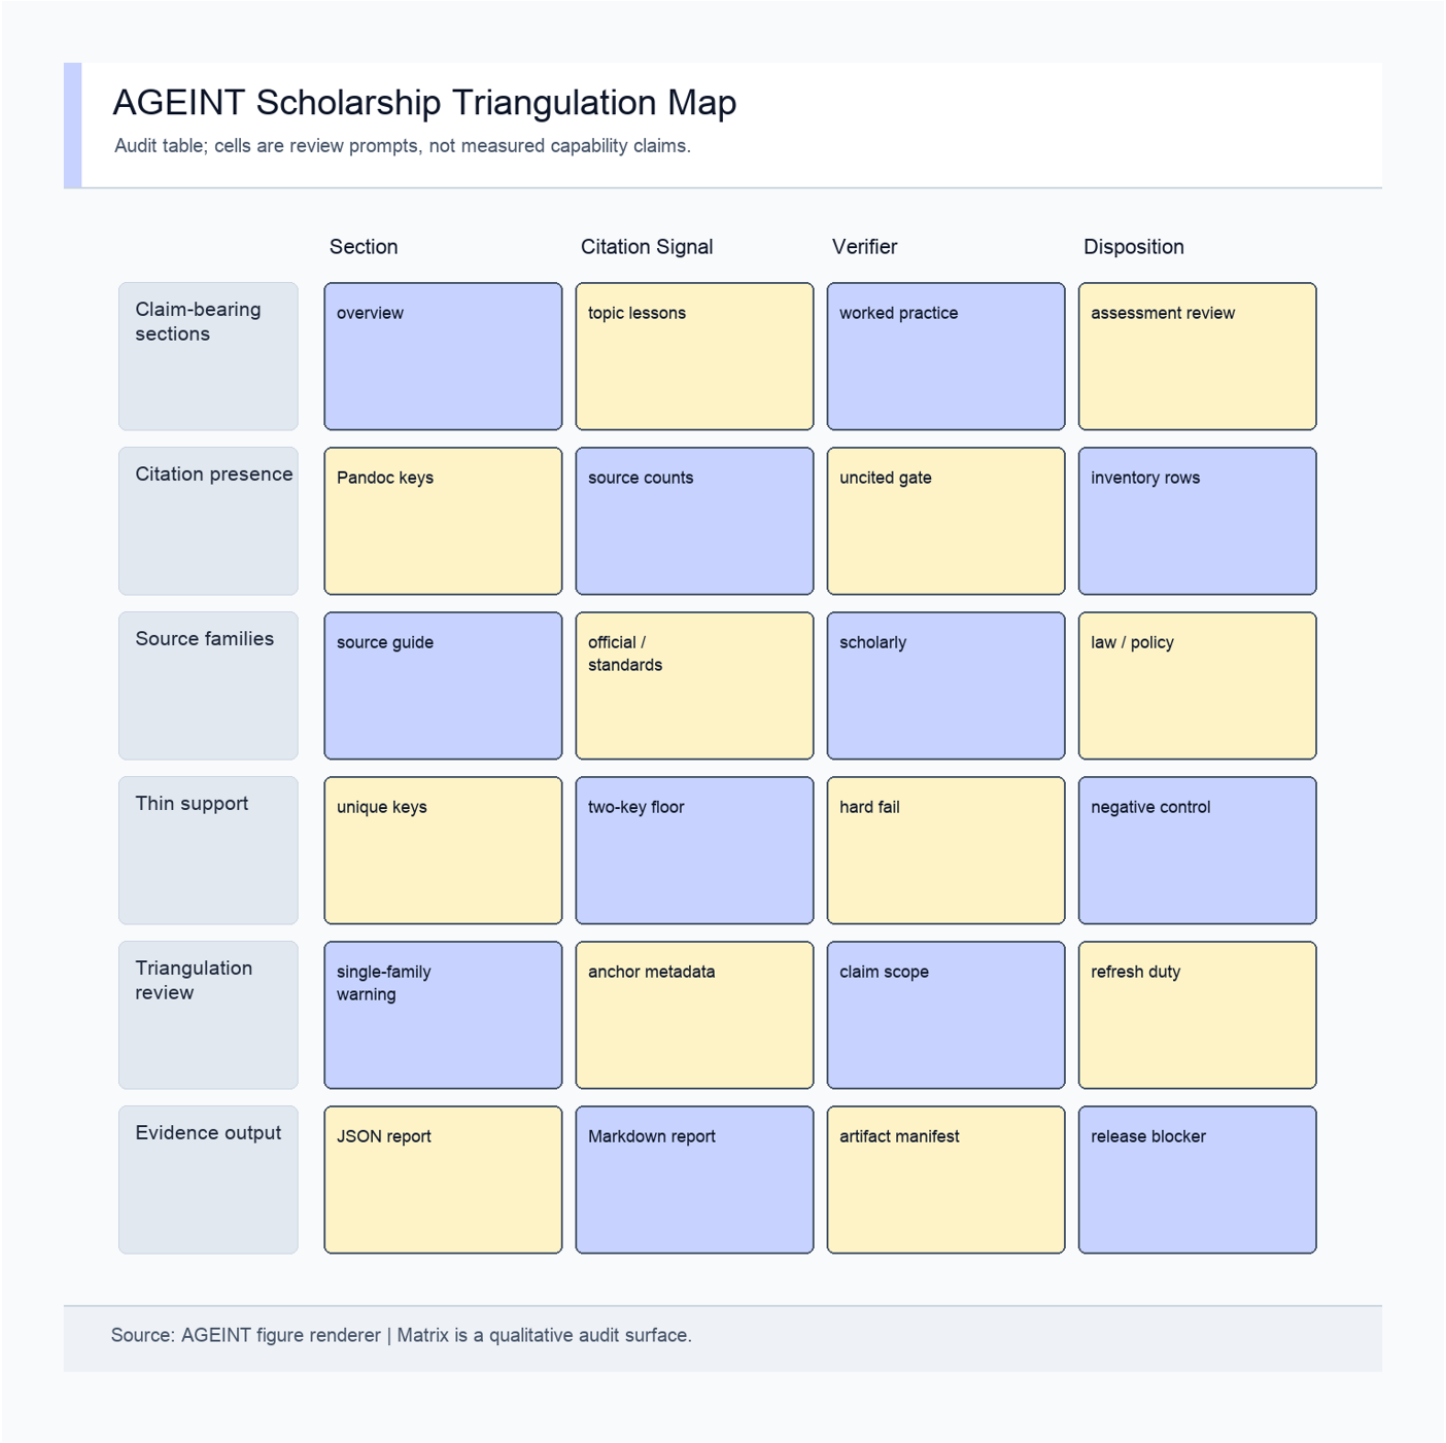

Figure 17: The scholarship triangulation map shows how generated AGEINT sections move from citation presence through source-family classification, thin-support gates, single-family review warnings, and current artifact-evidence reports. Its reader value is to make scholarship triangulation map fields, row and column obligations, source records, reviewer decisions, and closure evidence visible at a glance, with the curriculum orientation as the source section and defensive review as the boundary.

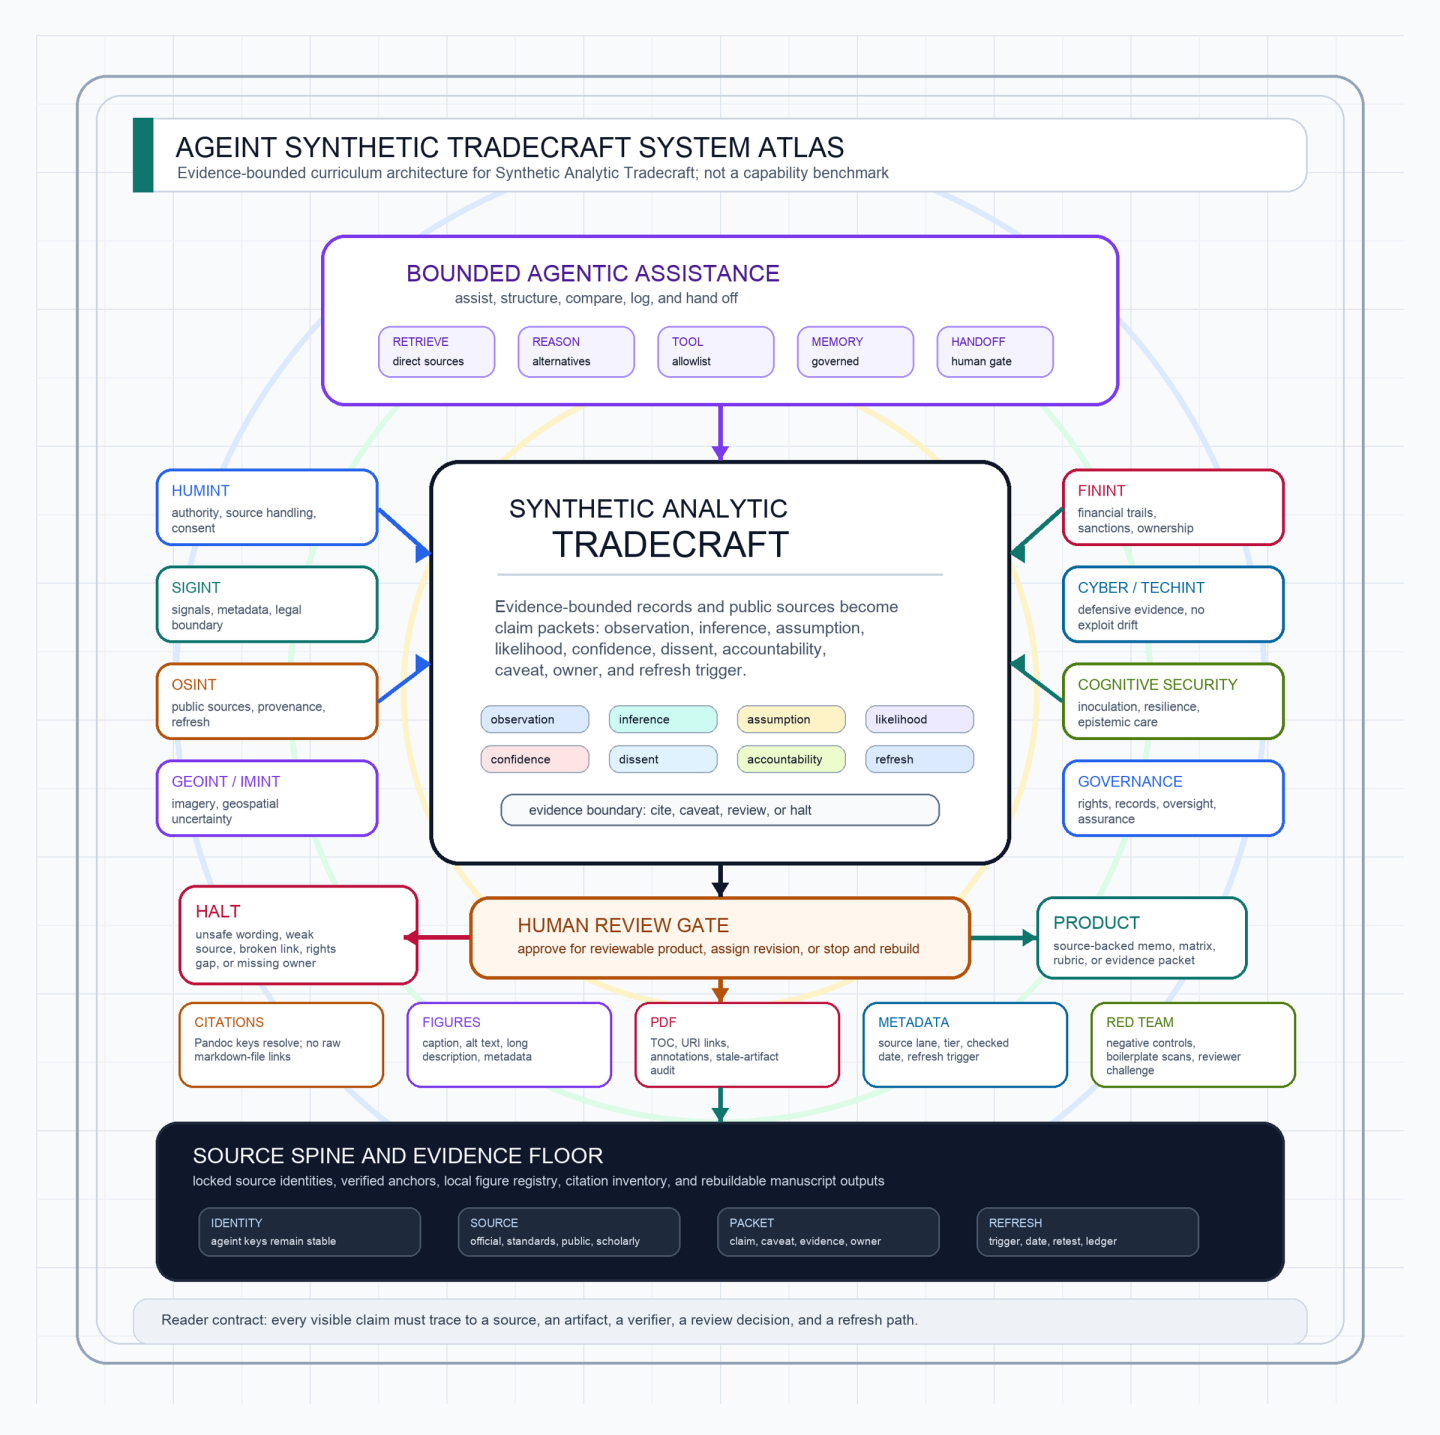

Figure 18: The Synthetic Tradecraft System Atlas replaces the former graphical abstract with a governed-system view of AGEINT. It shows the source spine as the evidence floor; intelligence disciplines as collection and context lanes; Synthetic Analytic Tradecraft as the central claim-making contract; bounded agentic assistance as a limited support layer; and verification, safety, and human-review gates as the outer assurance ring. The figure is a curriculum architecture map, not a claim that AGEINT has measured field capability or learning outcomes.

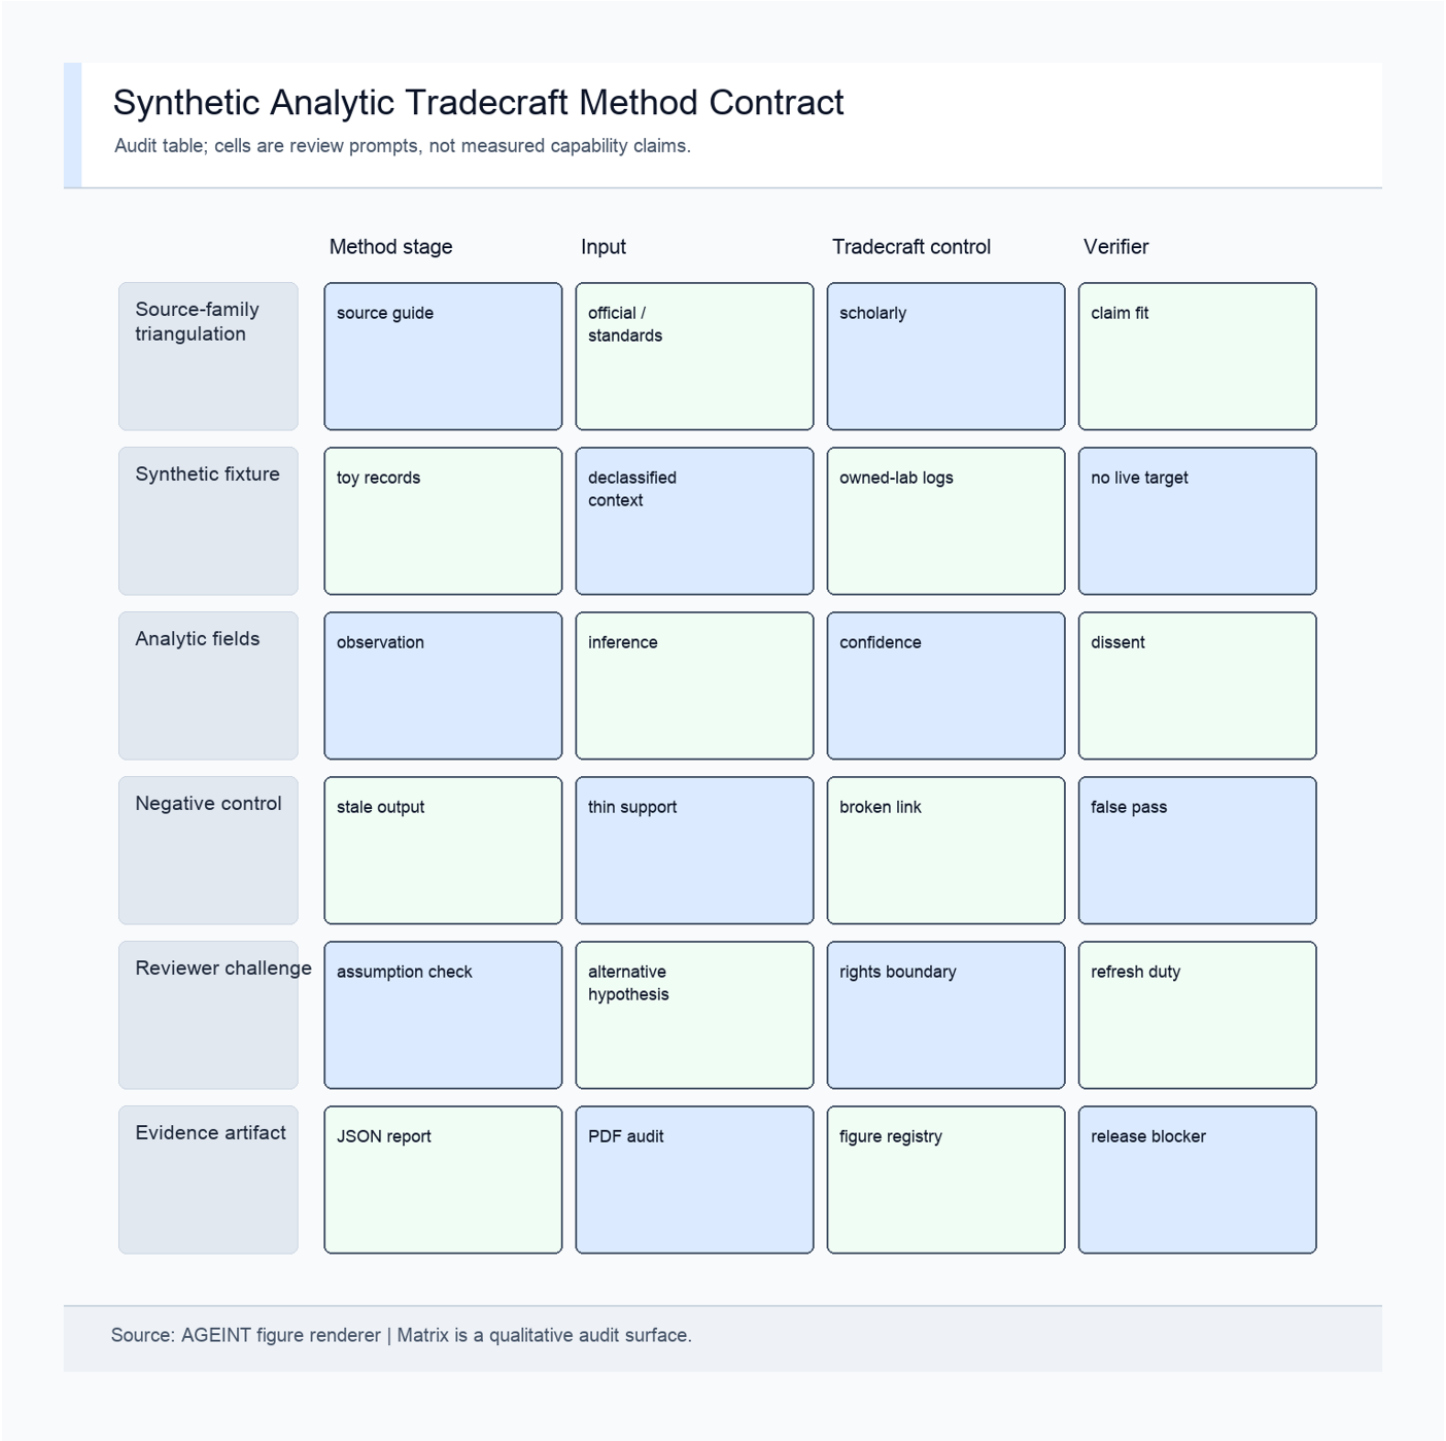

Figure 19: The method-contract figure makes AGEINT's Synthetic Analytic Tradecraft claim falsifiable. It links source-family triangulation, synthetic fixtures, analytic field separation, negative-control testing, reviewer challenge, and artifact-evidence reports so early manuscript claims remain method commitments rather than prestige language. Its reader value is to make synthetic tradecraft method contract labels, source records, review gates, refresh cues, and reader-use boundaries visible at a glance, with the curriculum orientation as the source section and defensive review as the boundary.

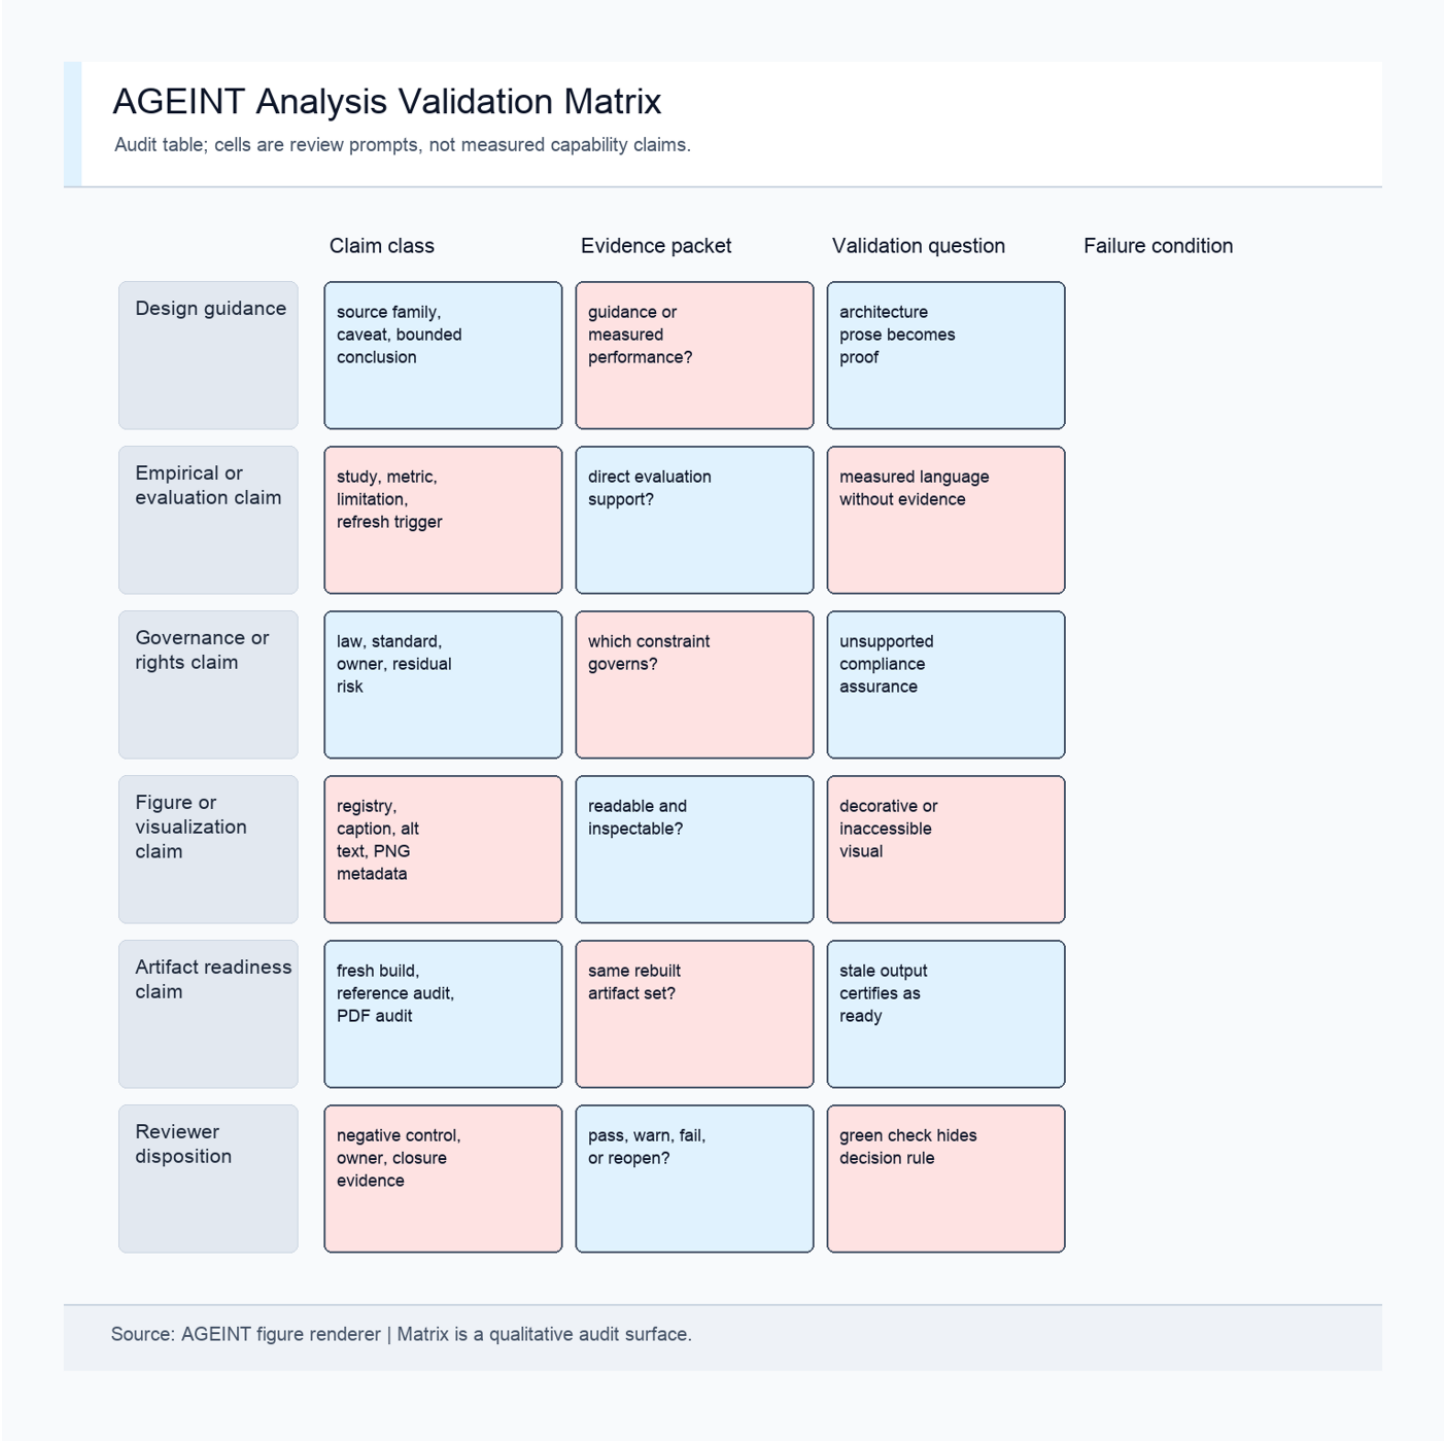

Figure 20: The analysis-validation matrix makes the manuscript's scholarship and assurance claims reviewable by class. It separates design guidance, empirical or evaluation claims, governance claims, figure/readability claims, rendered-artifact readiness claims, and reviewer disposition claims so each one has a required evidence packet, validation question, failure condition, and remediation path.

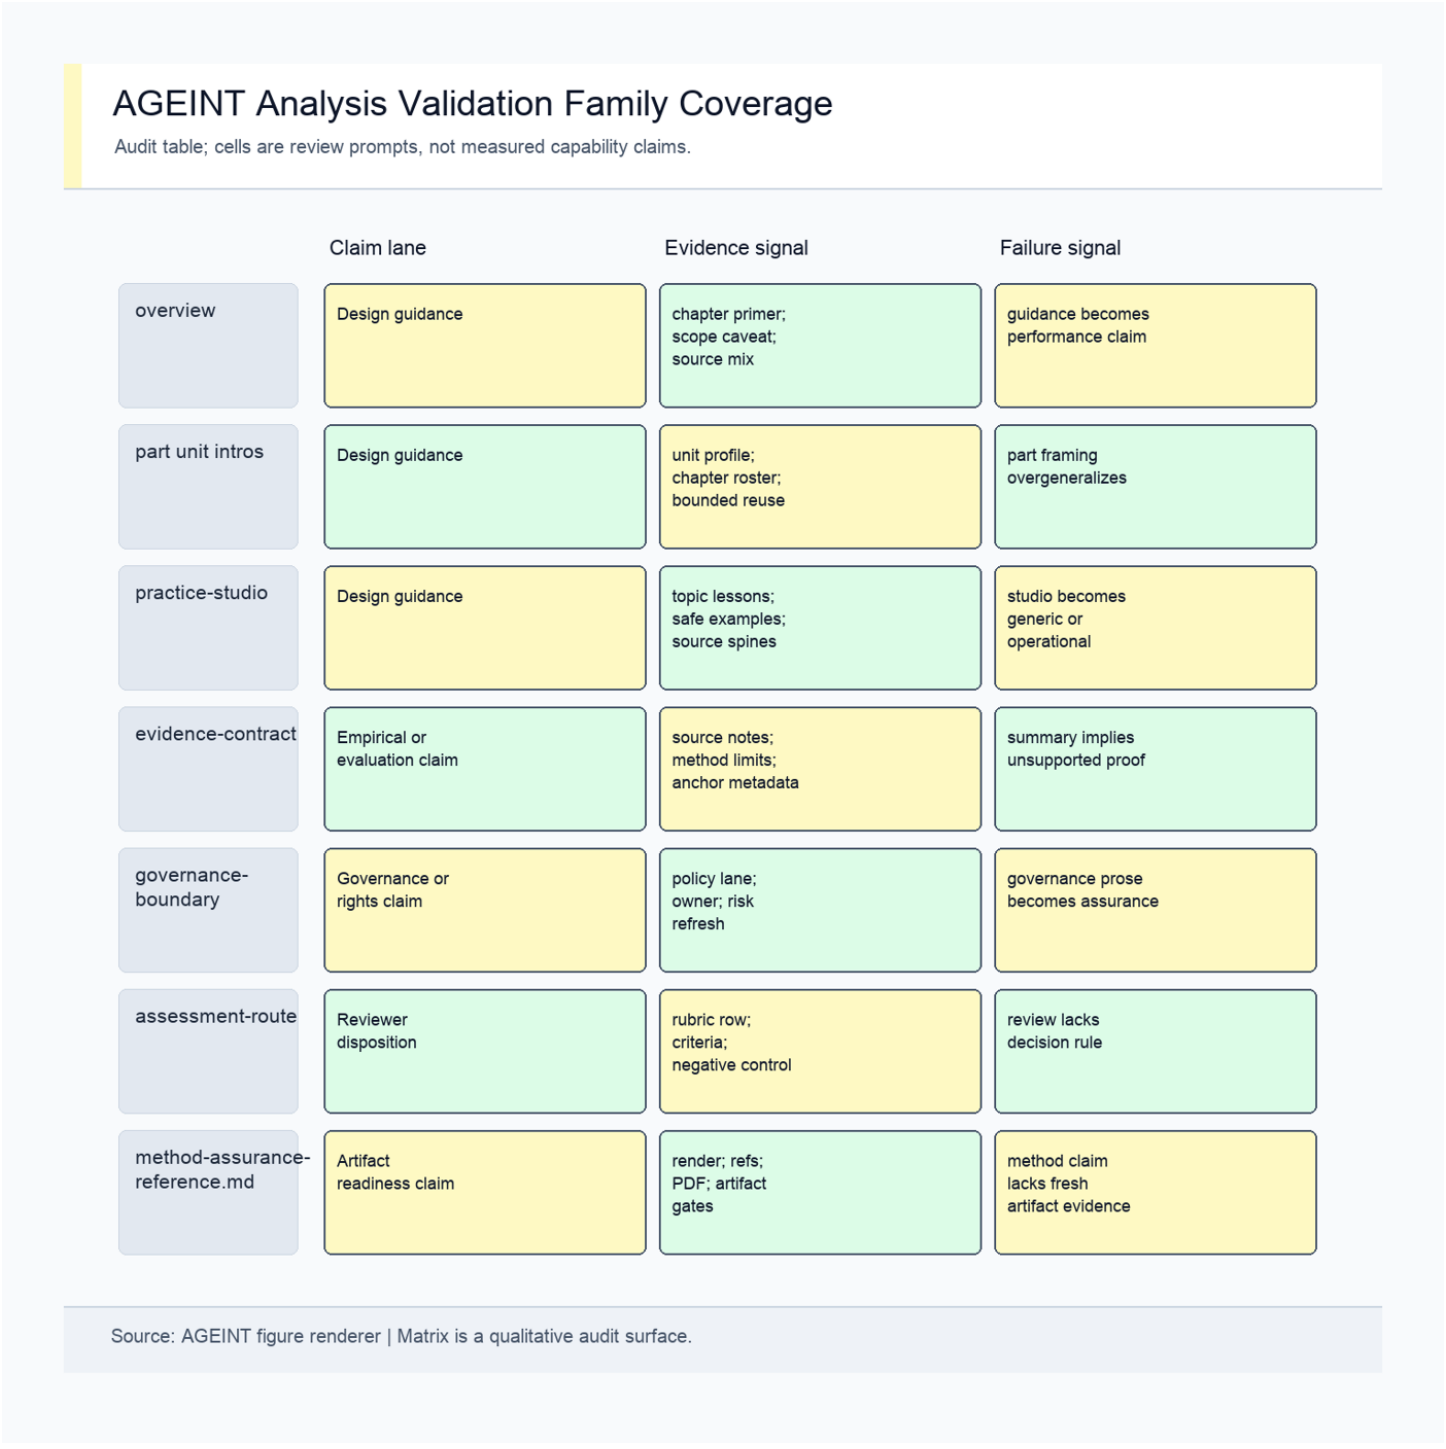

Figure 21: The analysis-validation family-coverage figure closes the gap between method prose and generated manuscript structure. It maps each claim-bearing manuscript family to a canonical analysis-validation lane, the evidence signal that should be present, and the failure signal that should block local readiness if a family becomes claim-bearing without a review class.

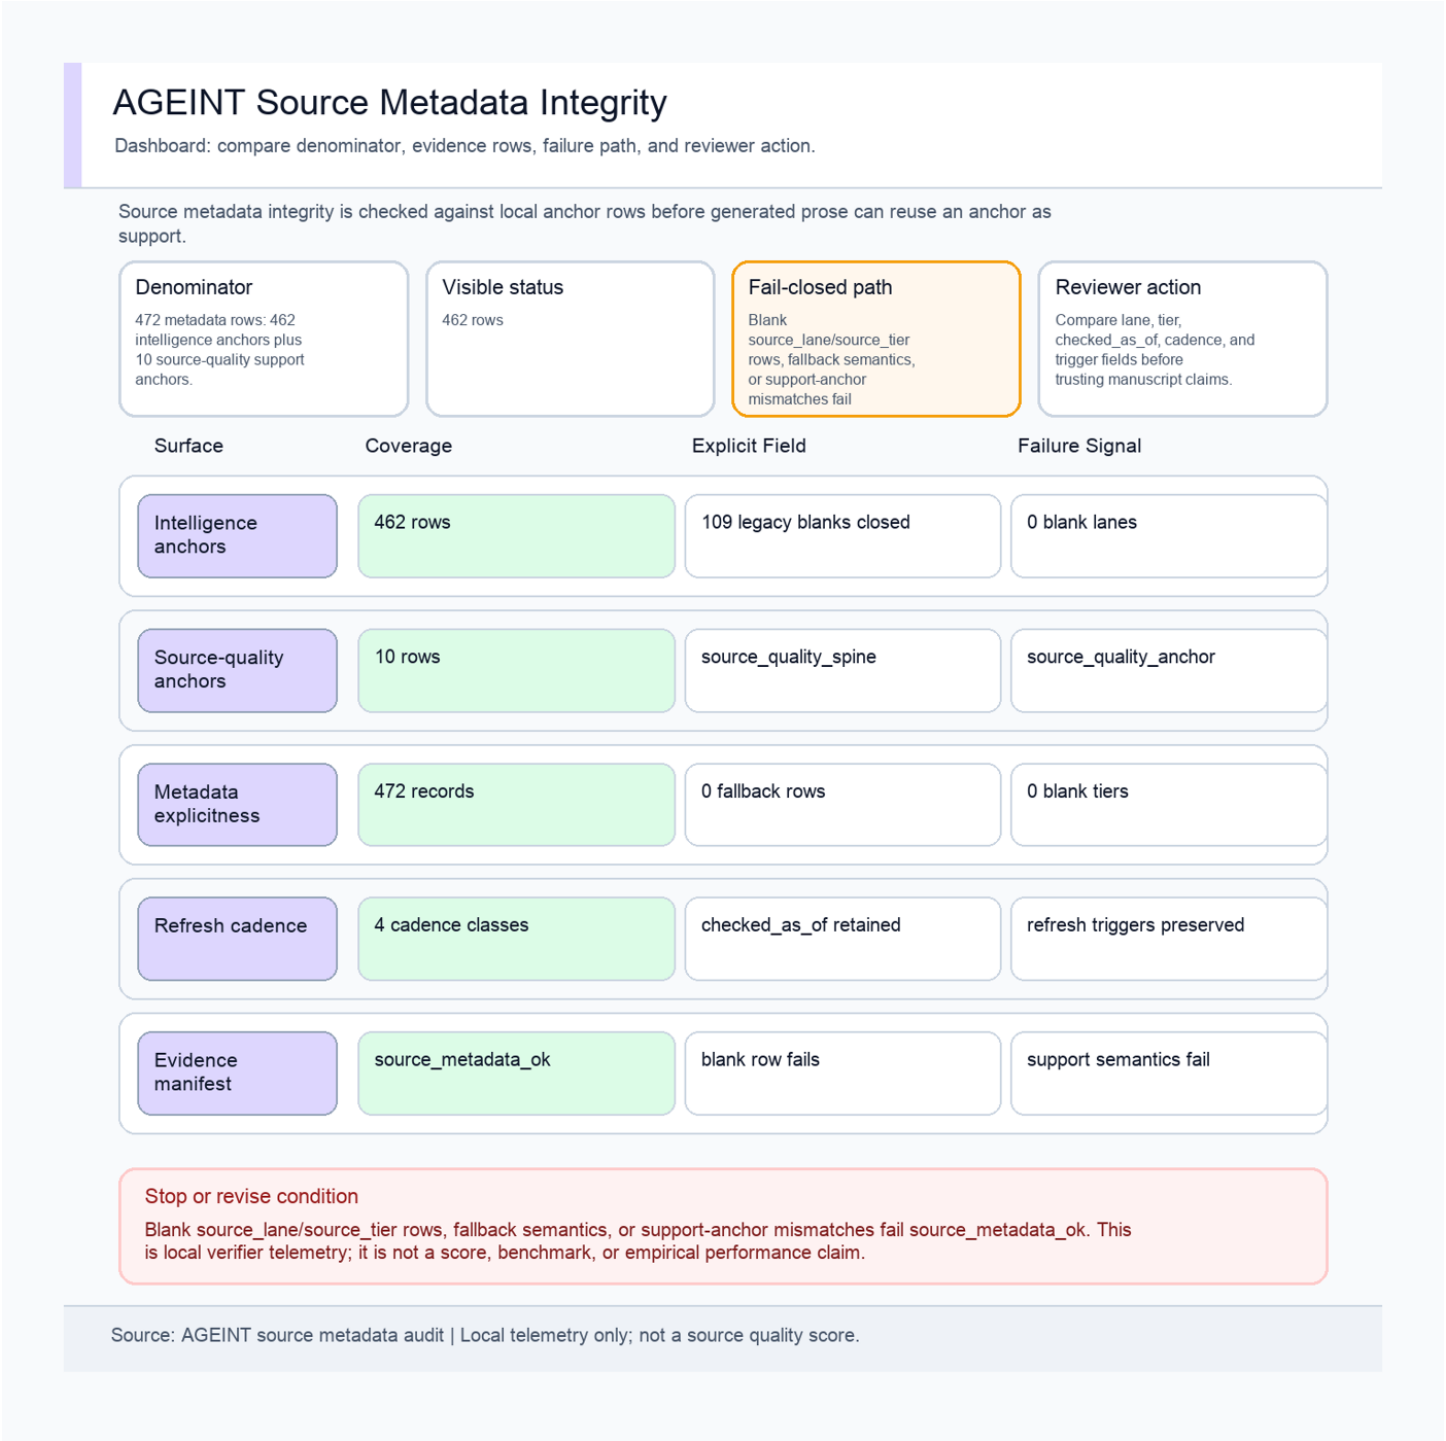

Figure 22: The source metadata integrity figure makes the anchor-lane hardening contract visible to reviewers. It separates curated intelligence anchors, source-quality support anchors, explicit lane and tier fields, refresh cadence evidence, denominator context, reviewer action, and the artifact-evidence manifest failure path so source rows cannot silently fall back to broad domain or source-type semantics while the rendered PDF still appears locally ready. Read it as local metadata telemetry, not a quality score for the cited sources.

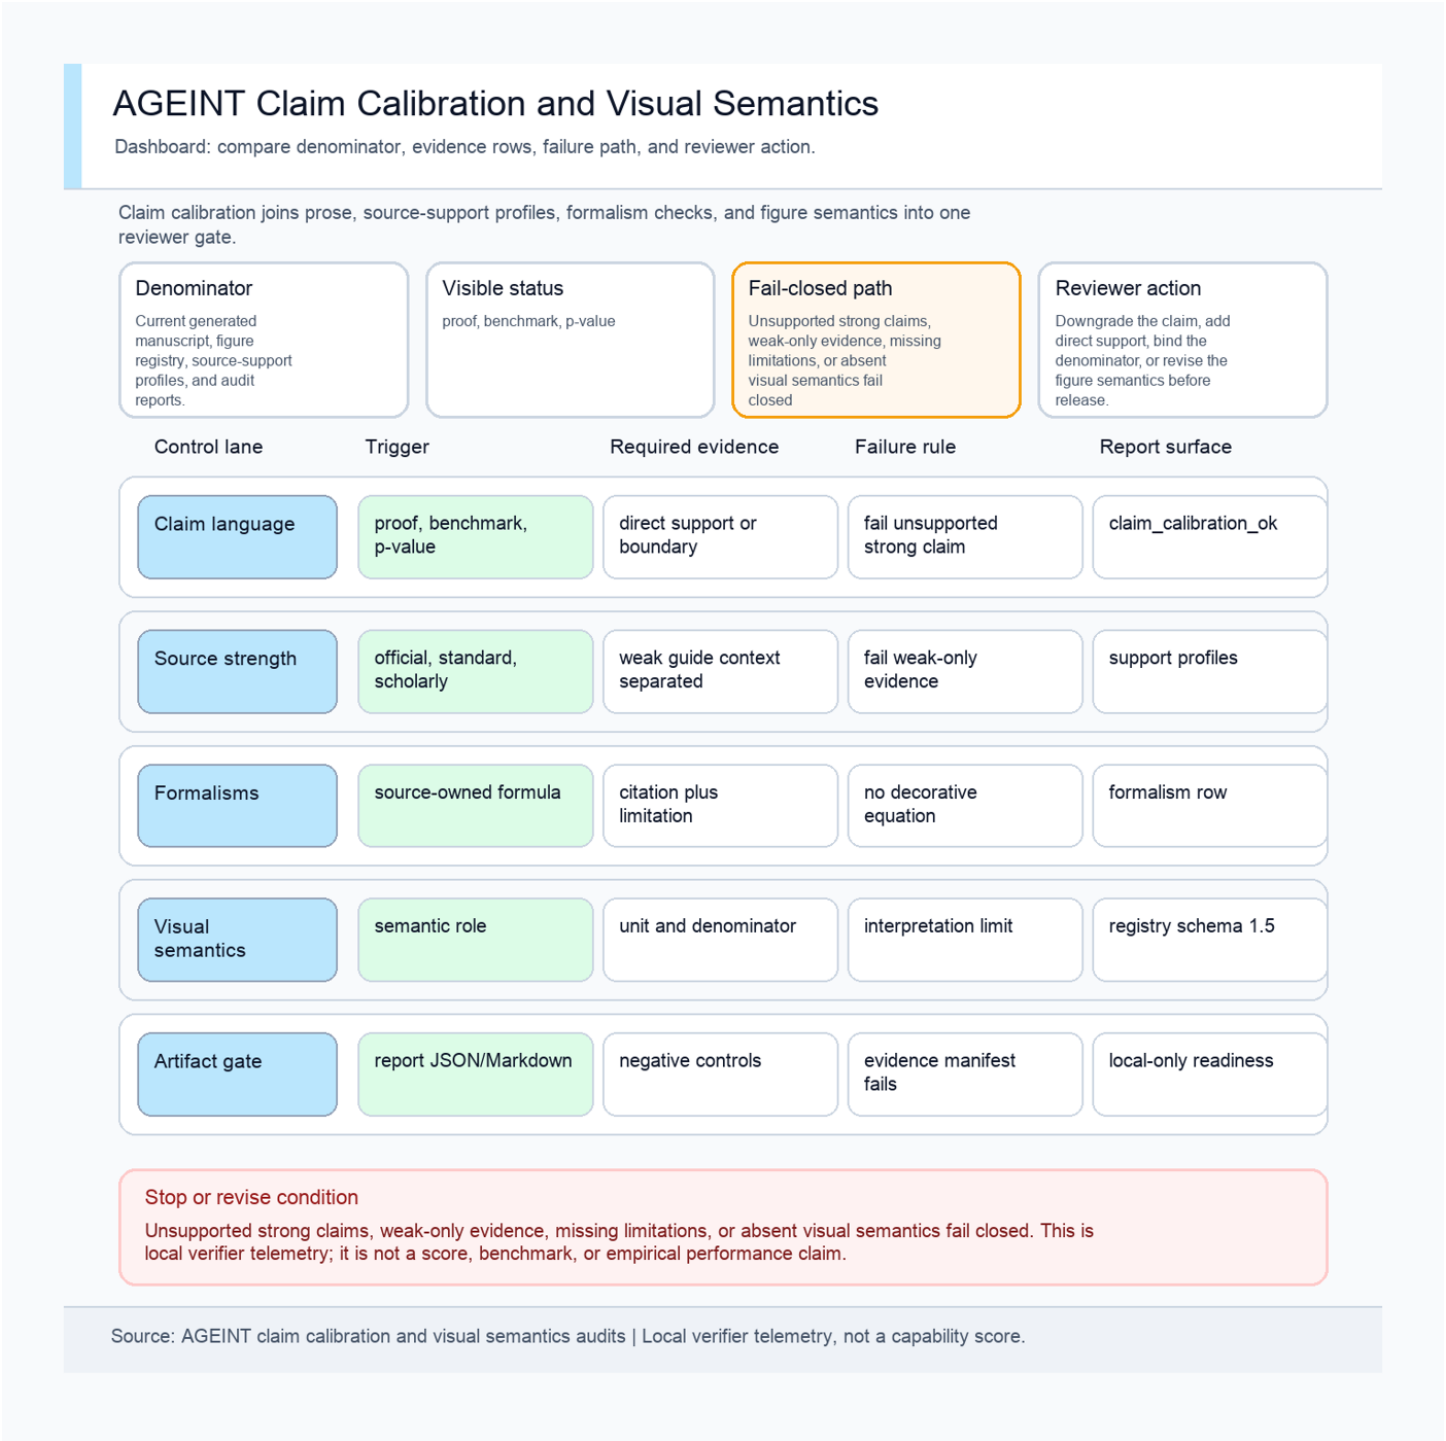

Figure 23: The claim-calibration verifier figure makes the final RedTeam/Science hardening layer visible: high-risk manuscript claims are separated into empirical, governance, visualization, artifact-readiness, safety, and formalism lanes; each lane must show direct support or explicit boundary language; weak source-guide context cannot carry measured-performance or statistical claims alone; and figure metadata must state semantic role, evidence role, quantitative status, denominator, counting rule, reviewer action, and interpretation limit before the artifact-evidence manifest can pass. Compare the local manuscript, registry, source-support, and report surfaces as reviewer inputs; do not read the visual as a score, benchmark, or empirical performance claim.

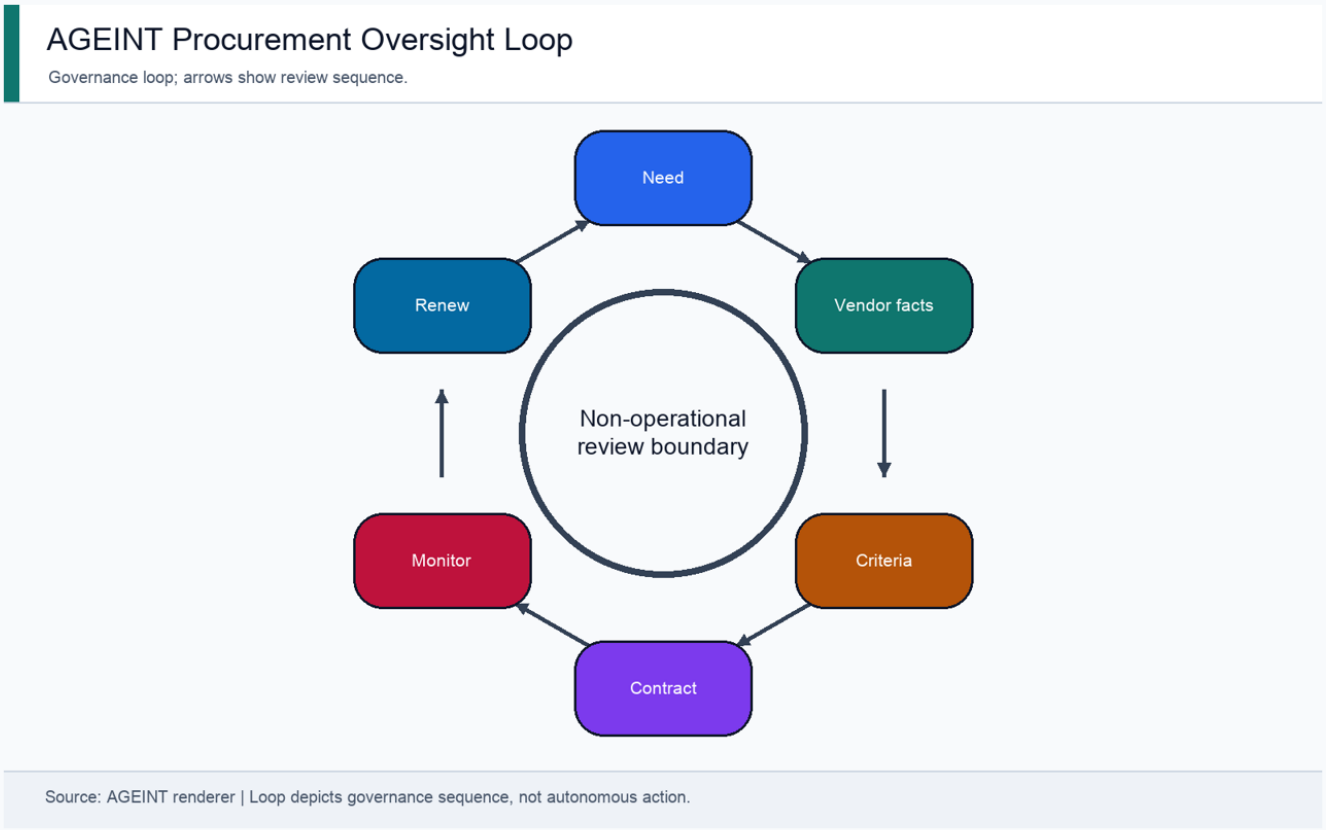

Figure 24: The procurement oversight loop connects need, transparency, criteria, contract controls, and lifecycle monitoring. It is anchored to the curriculum orientation; use it to inspect procurement oversight loop steps, decision gates, owner handoffs, refresh triggers, and closure evidence while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

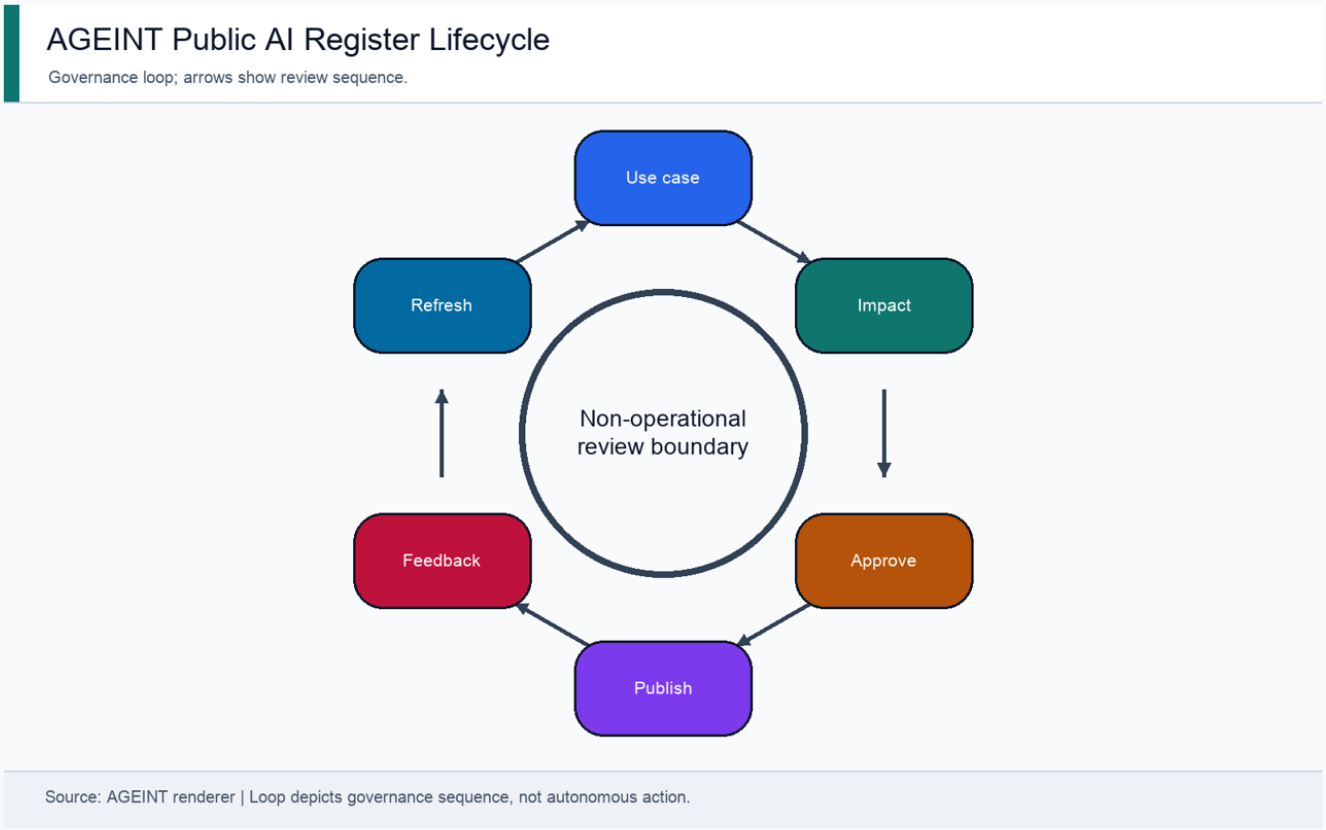

Figure 25: The public AI register lifecycle keeps use-case purpose, impact review, publication, feedback, and refresh visible. Its reader value is to make public ai register lifecycle steps, decision gates, owner handoffs, refresh triggers, and closure evidence visible at a glance, with the curriculum orientation as the source section and defensive review as the boundary.

Figure 26: The model and dataset card keeps purpose, provenance, collection process, evaluation caveats, lifecycle controls, and review ownership visible for model and dataset claims. It is anchored to the curriculum orientation; use it to inspect model dataset card fields, row and column obligations, source records, reviewer decisions, and closure evidence while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

Figure 27: The boundary-control matrix shows how purpose, tool permissions, data access, human review, logging, and rollback constrain agentic assistance before any external action can occur. In the curriculum orientation, it lets readers compare agentic intelligence boundary categories, denominators, evidence lanes, limitations, and reviewer-use cautions so the visual functions as a traceable course aid rather than an unscoped assertion.

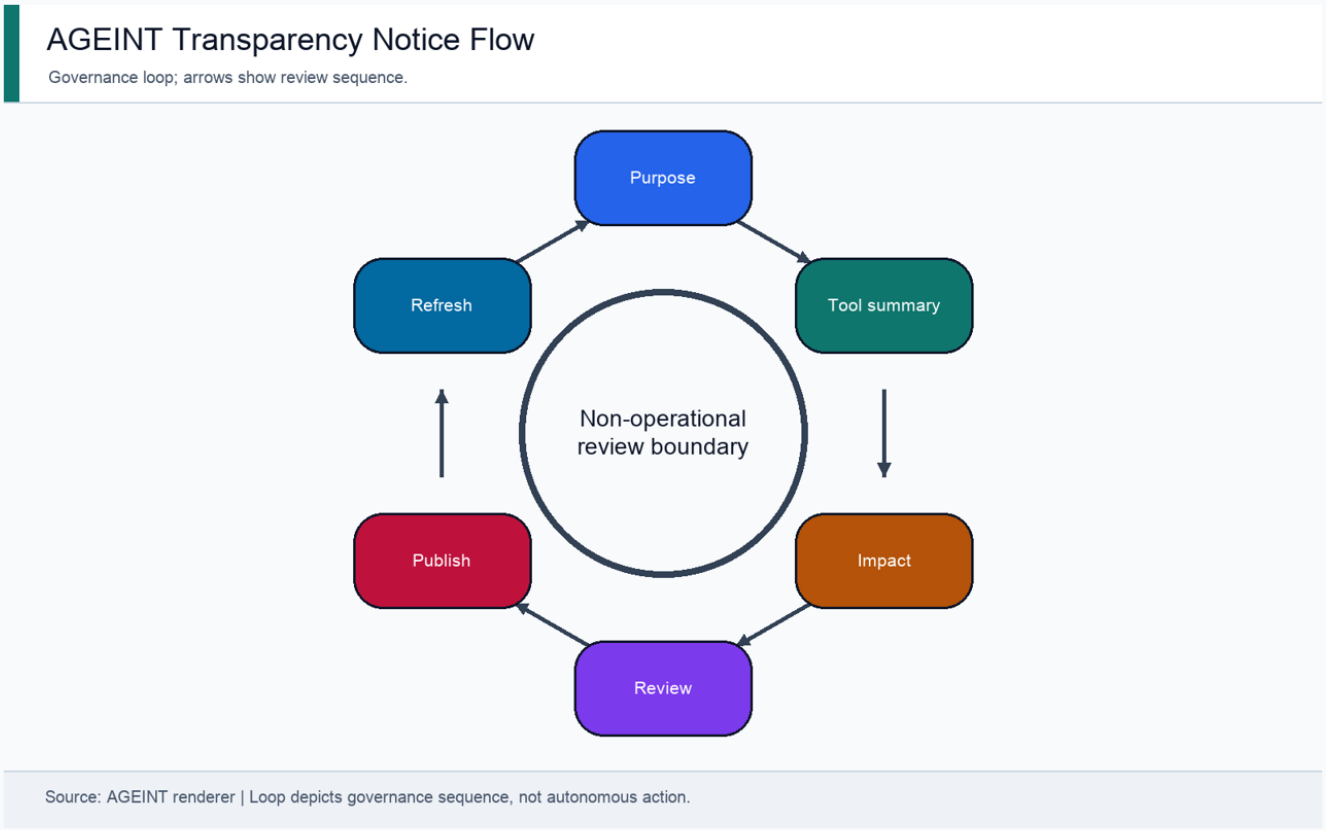

Figure 28: The transparency notice flow links public purpose, tool and data summary, impact review, and publication decisions. The captioned view belongs to the curriculum orientation and should be read as a map of transparency notice flow steps, decision gates, owner handoffs, refresh triggers, and closure evidence, not as a capability score or live-task instruction.

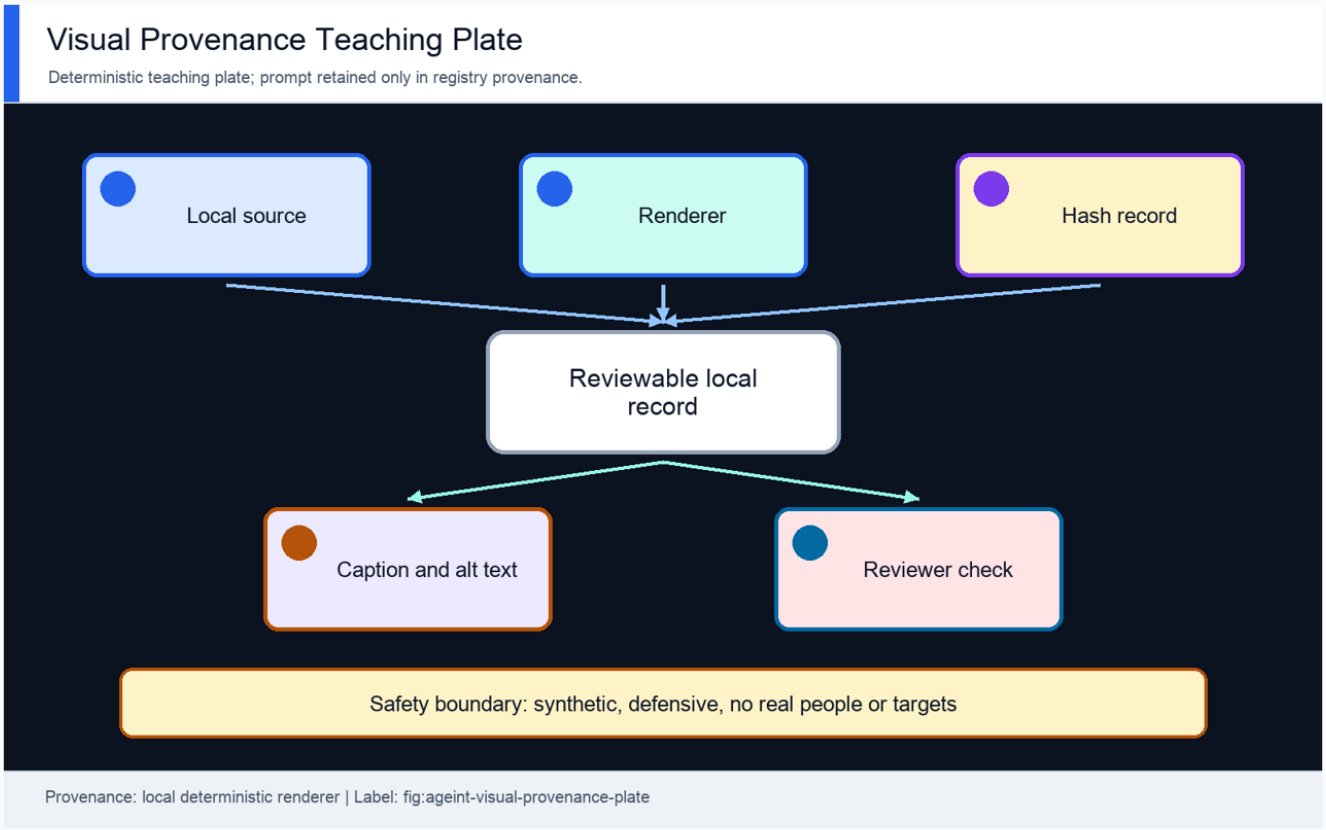

Figure 29: Deterministic teaching plate showing how AGEINT visual assets preserve local source, renderer, hash, caption, and review metadata before manuscript use. Its reader value is to make Local source, Renderer, Hash record, and Caption and alt text visible at a glance, with the curriculum orientation as the source section and defensive review as the boundary.

2.35 AGEINT pattern library: design-pattern rows, safe substitutions, and source identity

Source identity	Safe curriculum treatment	Methods	Defensive application	Safety boundary
Pattern 1: The Solo Reasoner (source identity only)	Focused Analytic Reasoner	bounded source reading, explicit assumptions, self-critique, and confidence notes	single public-source report critique with provenance and uncertainty fields	keeps reasoning reviewable without exposing hidden reasoning or delegating action
Pattern 2: The Reflection Agent (source identity only)	Reflection and Bias-Check Agent	rubric-based critique, source-quality scoring, and trajectory validation	analytic-bias review over a synthetic or public-source evidence packet	supports quality review and never replaces accountable human judgment
Pattern 3: The Tool-Forager (source identity only)	Tool-Allowlist Research Assistant	schema-bound tool calls, public-source retrieval, allowlisted connectors, and grounded summaries	accountable bibliography, source inventory, or standards-mapping exercise	excludes broad scraping, credentialed collection, and exposure-search tooling
Pattern 4: The Planner-Executor (source identity only)	Governed Planner-Executor	milestone decomposition, approval gates, dependency checks, and rollback notes	classroom project plan for evidence review, policy analysis, or tabletop preparation	plans curriculum artifacts only and does not create live operational tasking
Pattern 5: The Parallel Collector (source identity only)	Parallel Source-Corroboration Agent	bounded concurrent retrieval, deduplication, contradiction capture, and source descriptors	side-by-side comparison of public official, standards, and scholarly sources	uses public or provided materials and avoids intelligence collection expansion
Pattern 6: The Multi-Agent Crew (source identity only)	Role-Separated Review Crew	planner, retriever, validator, safety reviewer, and reporter roles	tabletop red-team critique of an analytic memo, not an operational exercise	keeps roles educational, logged, and constrained to benign artifacts
Pattern 7: The Debate Agent (source identity only)	Competing-Hypotheses Debate Agent	alternative generation, evidence challenge, dissent capture, and judge rubric	ACH-style review of a classroom claim with clearly separated evidence and judgment	does not generate adversarial persuasion or policy advocacy content
Pattern 8: The RAG-Operator (source identity only)	Provenance-Bound Retrieval Operator	curated corpus retrieval, hybrid ranking, source snippets, and citation audits	course-pack retrieval over provided readings, standards, and official guidance	does not connect to live sensitive stores or unapproved data collections
Pattern 9: The Memory-State Machine (source identity only)	Evidence-Memory State Machine	episodic note cards, retention limits, consolidation, and source change logs	longitudinal claim ledger for curriculum evidence and revision history	tracks claims and sources, not people, assets, or behavioral patterns
Pattern 10: The Control Plane Agent (source identity only)	Permissioned Control Plane Agent	single-interface routing, policy checks, budget limits, and audit logs	tool-governance demo that routes among benign summarization and validation utilities	keeps every tool revocable, observable, and constrained to evidence-bounded actions
Pattern 11: The Surveillance Agent (source identity only)	Monitoring-Governance Tabletop Agent	synthetic event polling, threshold rationale, alert review, and escalation logging	accountable monitoring governance exercise over toy asset-health records	prohibits tracking real people, real targets, private forums, or infrastructure
Pattern 12: The Red Team Agent (source identity only)	Control-Coverage Critique Agent	policy-safe scenario cards, control mapping, misuse-case review, and mitigation scoring	defensive tabletop review of controls against published high-level tactics	does not automate exploitation, weakness discovery, or attack-chain execution
Pattern 13: The Cover Story Generator (source identity only)	Identity-and-Provenance Fiction Audit	synthetic persona-risk critique, provenance labeling, and consistency-error detection	ethics exercise that detects fabricated identity artifacts in clearly synthetic materials	prohibits impersonation, false identity creation, and operational-security support
Pattern 14: The Deception Detector (source identity only)	Source-Reliability Verification Agent	corroboration, metadata review, provenance checks, and content-authenticity labels	public-source validation packet with uncertainty and review escalations	supports verification and does not accuse, deanonymize, or profile real people
Pattern 15: The Analyst in the Loop (source identity only)	Analyst-in-the-Loop Review Agent	interrupt gates, confidence thresholds, human approvals, and audit handoffs	supervised classroom analysis workflow for compliance-constrained exercises	requires accountable human review before any external communication or decision
Pattern 16: The Cyber Sentinel (source identity only)	SOC Tabletop Triage Agent	synthetic alert enrichment, ATT&CK mapping, severity rationale, and debrief notes	tier-1 incident tabletop over fabricated logs and published technique descriptions	does not run response actions, touch production systems, or publish indicators as fact
Pattern 17: The Supply Chain Inspector (source identity only)	Software Provenance Review Agent	SBOM reading, dependency graph review, advisory matching, and integrity questions	defensive package-governance exercise over sample manifests and public advisories	does not hunt real maintainers or produce exploitability claims without evidence
Pattern 18: The GEOINT Analyst (source identity only)	GEOINT Data-Quality Audit Agent	provided-image annotation, quality flags, geospatial metadata review, and caveat writing	synthetic imagery-change exercise focused on uncertainty and data quality	limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples
Pattern 19: The Cognitive Inoculant (source identity only)	Cognitive-Resilience Education Agent	manipulation-technique labeling, transparent prebunking, and audience-harm review	opt-in media-literacy micro-lesson for a sample classroom scenario	does not design persuasion campaigns, microtargeting, or covert influence content

Source identity	Safe curriculum treatment	Methods	Defensive application	Safety boundary
Pattern 20: The Hierarchical Command (source identity only)	Hierarchical Curriculum Orchestrator	role delegation, output aggregation, exception routing, and failure recovery drills	multi-domain capstone coordination across benign module artifacts	orchestrates learning artifacts only and preserves human authorization gates

2.36 Safety rail: accountable, synthetic, defensive, and evidence-bounded boundaries

All exercises remain educational, lawful, defensive, historical, synthetic, and evidence-bounded. Modules may discuss intelligence, cyber, influence, counterintelligence, and industrial systems as objects of study, but they do not provide instructions for unauthorized collection, evasion, exploitation, manipulation, covert targeting, or real-world harm.

3 Method & Assurance Reference: claim evidence, safety gates, and refresh duties

This reference holds the shared method, governance, and assurance tables that every module applies. Each module links here instead of restamping the same tables, so a reader maintains one canonical copy of the capstone thread, claim ledger, competency rubric, refresh triggers, safety boundary, and mastery evidence. Module sections name their local source spine and topic, then point to the canonical table in this section.

3.1 Source-construction and reporting protocol: discovery records and citation boundaries

AGEINT is a curriculum-and-assurance atlas, not a PRISMA systematic review. Where a module makes a source-construction or literature-search claim, however, the source record follows PRISMA-S as a reporting discipline: record the discovery surface, search string or prompt, retrieval date, inclusion and exclusion rule, deduplication decision, source tier, conflict-handling note, direct URL, and refresh trigger [Melissa L. Rethlefsen and the PRISMA-S Group, 2021]. Discovery systems and summaries may suggest candidate sources, but final manuscript citations must resolve to directly checked official, standards, public-domain, or scholarly records in the AGEINT source atlas.

The review gate separates claim types before citation assignment. Governance claims require official or standards anchors; technical and theoretical claims require direct domain sources; empirical capability claims require evaluation or study evidence with context and subgroup caveats. If a source only supports an analogy, lesson design, or governance rationale, the generated prose must not promote it into a benchmark, deployment claim, or proof of autonomous performance.

3.2 Claim calibration and statistical limits: artifact telemetry versus empirical evidence

AGEINT treats citation counts, generated file counts, figure counts, PDF page counts, URI-link counts, and validator outcomes as **artifact telemetry**. They show what the local build produced and what the verifier checked; they are not learning-effect estimates, operational-performance measures, safety guarantees, or statistical evidence that the curriculum improves real-world analytic decisions. Stronger empirical or evaluated-capability language requires a direct benchmark, study, field evaluation, incident dataset, or scholarly empirical source with the method, denominator, subgroup/context caveat, and refresh trigger visible.

The claim-calibration audit enforces that separation after manuscript generation. It scans high-risk empirical, statistical, governance, safety, visualization, artifact-readiness, and formalism language; records the citation keys and source-support strength visible in the same row; allows explicit boundary language such as "not a benchmark" or "correct the misconception"; and fails unsupported proof-language, p-values, measured-performance claims, or formalisms without citations and limitations. The companion visual Figure 23 makes the control surface readable, while `output/reports/claim_calibration.json` and `.md` make the same disposition auditable by script.

Protocol claims are version-sensitive. MCP references use the 2025-06-18 specification for interoperability language and the current MCP security best-practice page for confused-deputy, token-handling, consent, and least-privilege examples; those claims must refresh when the protocol version, authorization profile, transport guidance, or security model changes [Project, 2025c]; [Project, 2025b]. Memory-language claims follow the same separation rule: MCP and official agentic-AI guidance support external-memory governance, tool boundaries, logging, and retention, not cognitive-taxonomy claims about episodic, semantic, or procedural memory unless a domain source is cited for that narrower taxonomy.

3.3 Method figures and course links: assurance visuals and navigation

The orientation uses Figure 10 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.

Navigation links: Section 2, Section 4.

3.4 Capstone phase, artifact, and review-gate ladder: required handoff sequence

Evidence anchor. Section 3; [Melissa L. Rethlefsen and the PRISMA-S Group, 2021].

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

3.5 Claim and evidence ledger: claim classes, evidence floors, and review duties

Evidence anchor. Section 3; [Melissa L. Rethlefsen and the PRISMA-S Group, 2021].

Claim class	Evidence required	Review gate
Source-spine claim	Parsed module title, module section map, and curriculum citation spine	Confirm the generated text does not invent counts, paths, or labels.
Research-backed governance claim	Direct official, standards, public-domain, or scholarly anchor in `references-*.bib`	Confirm the anchor has verification metadata and a stable URL.
Agentic workflow claim	Tool boundary, authority contract, human review point, and rollback condition	Confirm the workflow remains educational, logged, reversible, and evidence-bounded.
Technical or theoretical claim	Direct domain source for the formal expression, protocol, architecture, or theory, with analogy limits spelled out	Confirm the prose does not cite governance guidance as proof of technical performance or autonomous agency.
Empirical or evaluated capability claim	Direct benchmark, field evaluation, user study, incident evidence, or scholarly empirical source with context and subgroup caveats	Confirm the claim is not merely inferred from the AGEINT curriculum architecture.
Source-construction claim	Search surface, query or prompt, retrieval date, inclusion and exclusion rule, deduplication note, source tier, and direct URL	Confirm discovery sources are not treated as final citations unless directly verified.

Claim class	Evidence required	Review gate
Safety claim	Explicit prohibition plus safe alternative	Confirm the module blocks live targeting, exploitation, covert collection, manipulation, and unsafe cyber-physical action.
Cross-module claim	Link to the current unit and adjacent curriculum modules	Confirm the handoff names inputs, outputs, uncertainty, and next-review owner.

3.6 Competency and mastery rubric: scoring dimensions and visible proof

Evidence anchor. Section 3; [Melissa L. Rethlefsen and the PRISMA-S Group, 2021].

Competency	Evidence of mastery
Conceptual command	Terms are defined precisely and linked to the source spine.
Analytic rigor	Assumptions, uncertainty, alternatives, and confidence are explicit.
Agentic design	Human oversight, tool boundaries, logging, and rollback are specified.
Governance and rights	Authority, procurement, privacy, accessibility, retention, and redress evidence are visible.
Safety posture	Exercises remain accountable, synthetic, defensive, lawful, and evidence-bounded.

3.7 Refresh triggers and required actions: source, safety, and tool-change duties

Evidence anchor. Section 3; [Melissa L. Rethlefsen and the PRISMA-S Group, 2021].

Trigger	Required action
Source guide reference changes	preserve existing `ageintNNN` identities and append new references only after the locked range
Official or standards source updates	update source-lane metadata, checked date, and bibliography note
AI law, public-sector policy, education guidance, or rights guidance changes	rerun the compliance and rights map
API, protocol, data-space, or provenance specification changes	rerun interface and data-provenance checks
Safety audit finds operational wording	replace the treatment with tabletop, audit, governance, or synthetic-data framing
Instructor debrief finds unreproducible evidence	rebuild the source canon and claim ledger before reuse

3.8 Safety boundary: accountable, synthetic, defensive, and evidence-bounded practice

Evidence anchor. Section 3; [Melissa L. Rethlefsen and the PRISMA-S Group, 2021].

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded. Do not convert any module into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action. Where a module inherits a risky source motif, treat it as a tabletop, audit, provenance, or governance exercise.

3.9 Mastery evidence standard: retained artifacts, reviewer challenge, and transfer

Evidence anchor. Section 3; [Melissa L. Rethlefsen and the PRISMA-S Group, 2021].

Level	Evidence in the answer
Strong	Uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary.
Adequate	Defines the concept and names a relevant artifact, but leaves one caveat or review owner vague.
Revise	Gives a memorized definition without source evidence, uncertainty, or a safe transfer task.

4 FOUNDATIONS OF INTELLIGENCE TRADECRAFT

4.1 FOUNDATIONS OF INTELLIGENCE TRADECRAFT learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 4; [238, 2026].

4.1.1 intelligence-cycle governance discipline spine: domain question and learning focus

Evidence anchor. Section 4; [238, 2026].
This unit teaches **intelligence-cycle governance**. Requirements, collection, processing, analysis, dissemination, feedback, records, and oversight remain distinct so learners can see when research becomes intelligence work.

4.1.2 intelligence-cycle governance source-use contract: citation roles and evidence limits

Evidence anchor. Section 4; [238, 2026].
Use source-guide citations for inherited curriculum topics and official/standards anchors for claims about authority, quality, records, and review.

4.1.3 intelligence-cycle governance practice artifact: recurring packet and retained evidence

Evidence anchor. Section 4; [238, 2026].
The recurring practice artifact is a **requirements-to-product traceability ledger** that draws on requirement card, source descriptor, confidence statement, and dissemination and records note. The unit keeps its learning spine explicit. Learners translate a decision need into an accountable question, identify evidence channels, write confidence language, and preserve audit context.

4.1.4 intelligence-cycle governance safety boundary: accountable, synthetic, and evidence-bounded limits

Activities stay inside public, synthetic, or instructor-provided materials and never become live collection or tasking.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [238, 2026]; [237, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [238, 2026]; [237, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [238, 2026]; [237, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [238, 2026]; [237, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Analytic Tradecraft and Source Integrity. Core anchors: [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]. Conceptual focus: turning uncertainty into reviewable judgment through sourcing, alternatives, separated likelihood and confidence language, warning indicators, and explicit analytic lineage. Composability contract: every agent output must preserve evidence, assumptions, judgments, likelihood, confidence, dissent, empirical limits, and change history as separable fields. **Practice lens:** Structured-Judgment Lens; Which assumptions, alternatives, confidence statements, and source limits must stay visible for review? [238, 2026]; [237, 2026].

4.1.5 FOUNDATIONS OF INTELLIGENCE TRADECRAFT visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 30, Figure 31, and Figure 32 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 3, Section 5.

4.1.6 FOUNDATIONS OF INTELLIGENCE TRADECRAFT module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
The Nature of Intelligence	Section 5	[238, 2026]; [237, 2026]; [270, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [001, 2026]; [002, 2026]; [003, 2026]; [004, 2026]; [005, 2026]; [297, 2026]; [298, 2026]; [309, 2026]; [310, 2026]; [300, 2026].

Module	Section reference	Source spine
Intelligence Community Architectures	Section 6	[234, 2026]; [247, 2026]; [249, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [006, 2026]; [007, 2026]; [008, 2026]; [009, 2026]; [010, 2026]; [011, 2026]; [012, 2026]; [297, 2026]; [298, 2026].
Tradecraft: Core Principles	Section 7	[237, 2026]; [266, 2026]; [269, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [013, 2026]; [014, 2026]; [015, 2026]; [016, 2026]; [017, 2026]; [018, 2026]; [005, 2026]; [019, 2026]; [297, 2026]; [298, 2026].

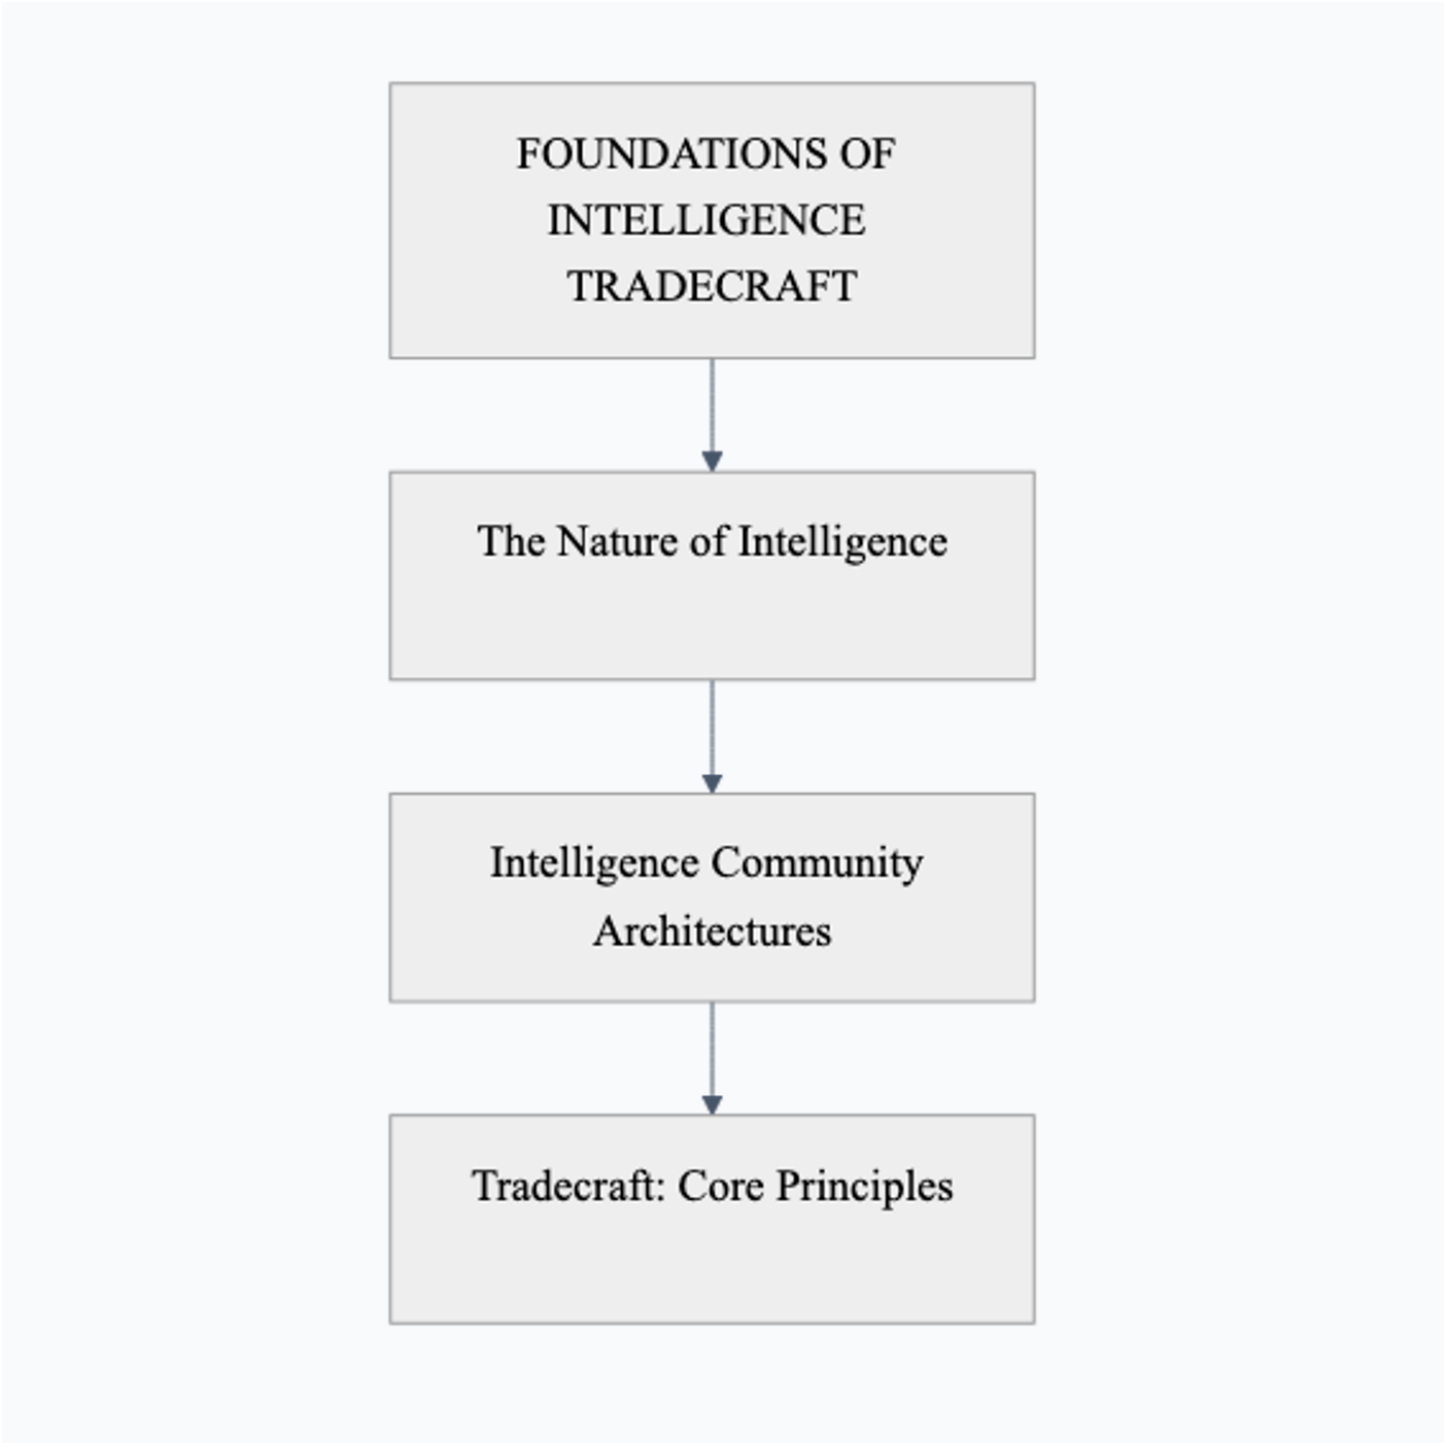

Figure 30: The unit module map traces the part's chapters as a linear reading sequence. The captioned view belongs to the foundations of intelligence tradecraft section and should be read as a map of 3 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last, not as a capability score or live-task instruction.

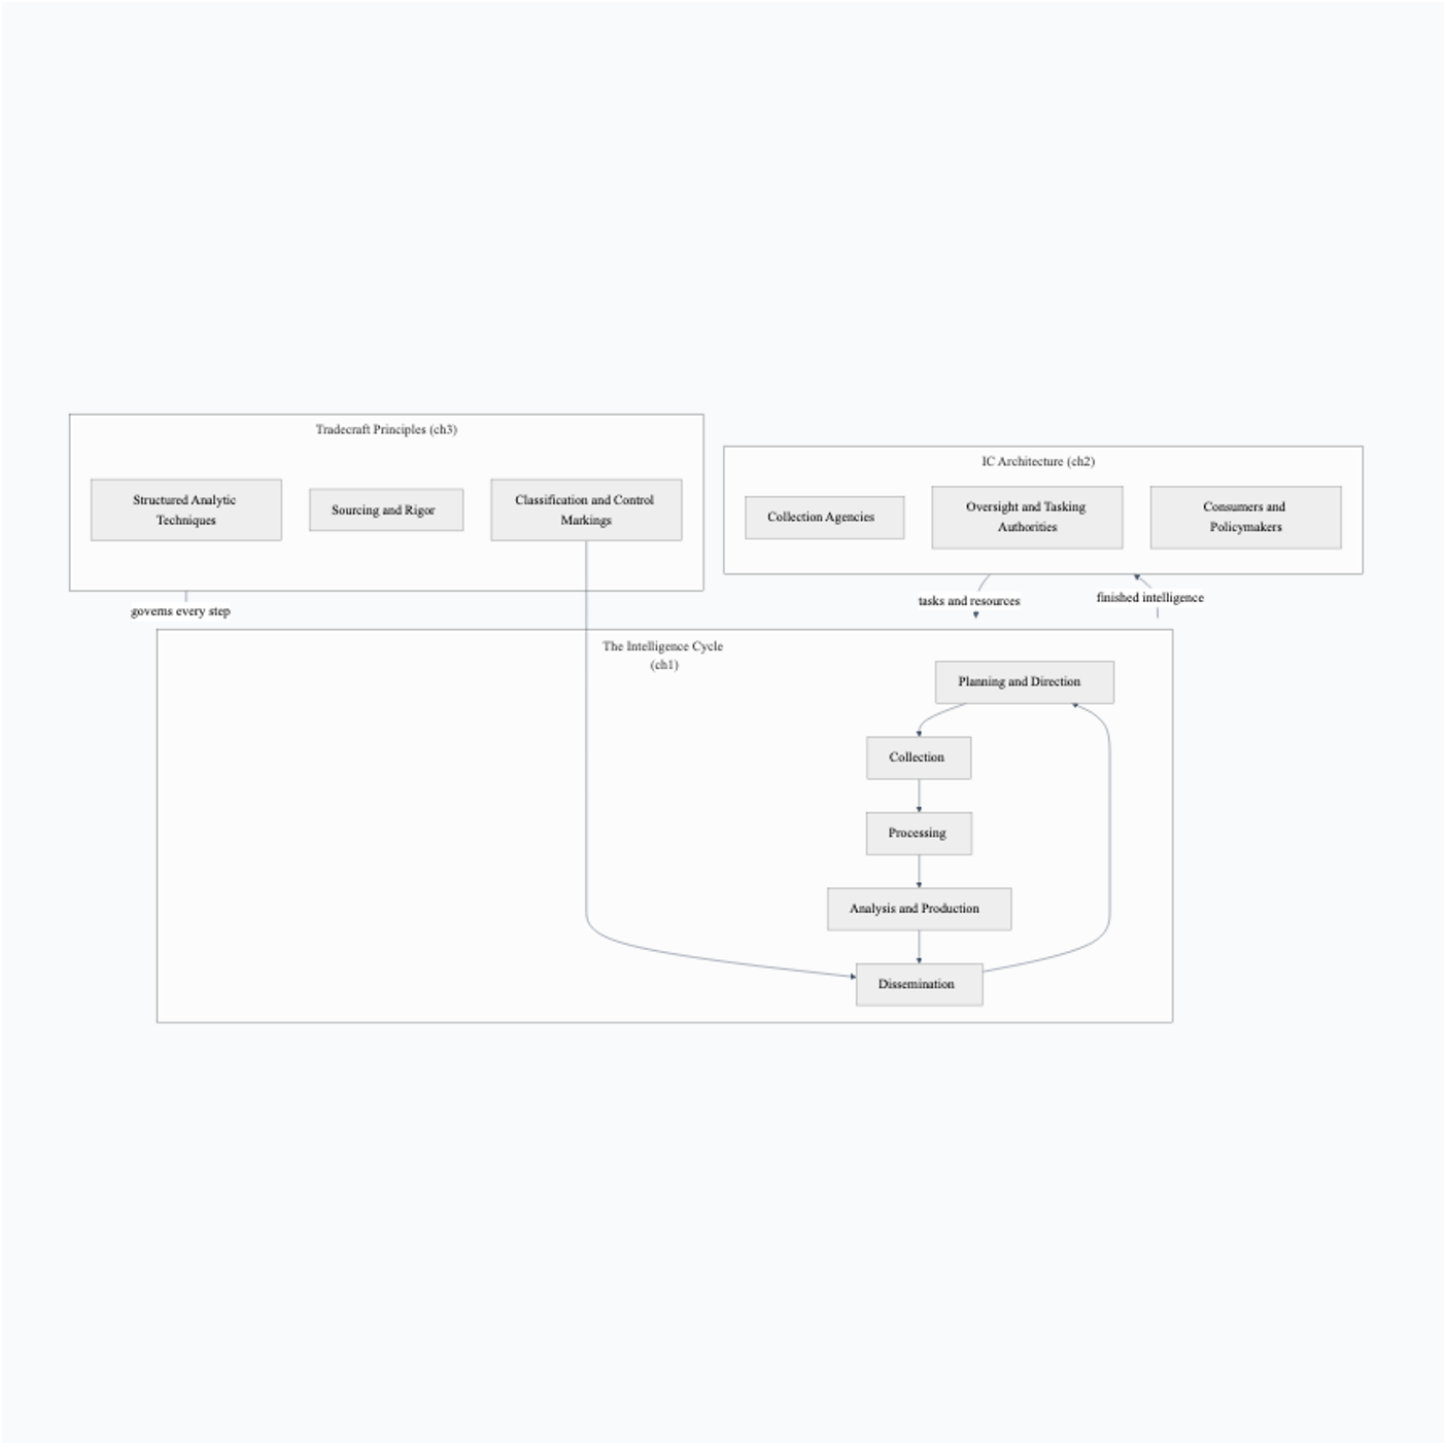

Figure 31: Part I frames intelligence as a cyclic process (ch1) driven by community architecture (ch2) and disciplined at every step by tradecraft principles and control markings (ch3). Its reader value is to make The Intelligence Cycle (ch1), Planning and Direction, Collection, and Processing visible at a glance, with the foundations of intelligence tradecraft section as the source section and defensive review as the boundary.

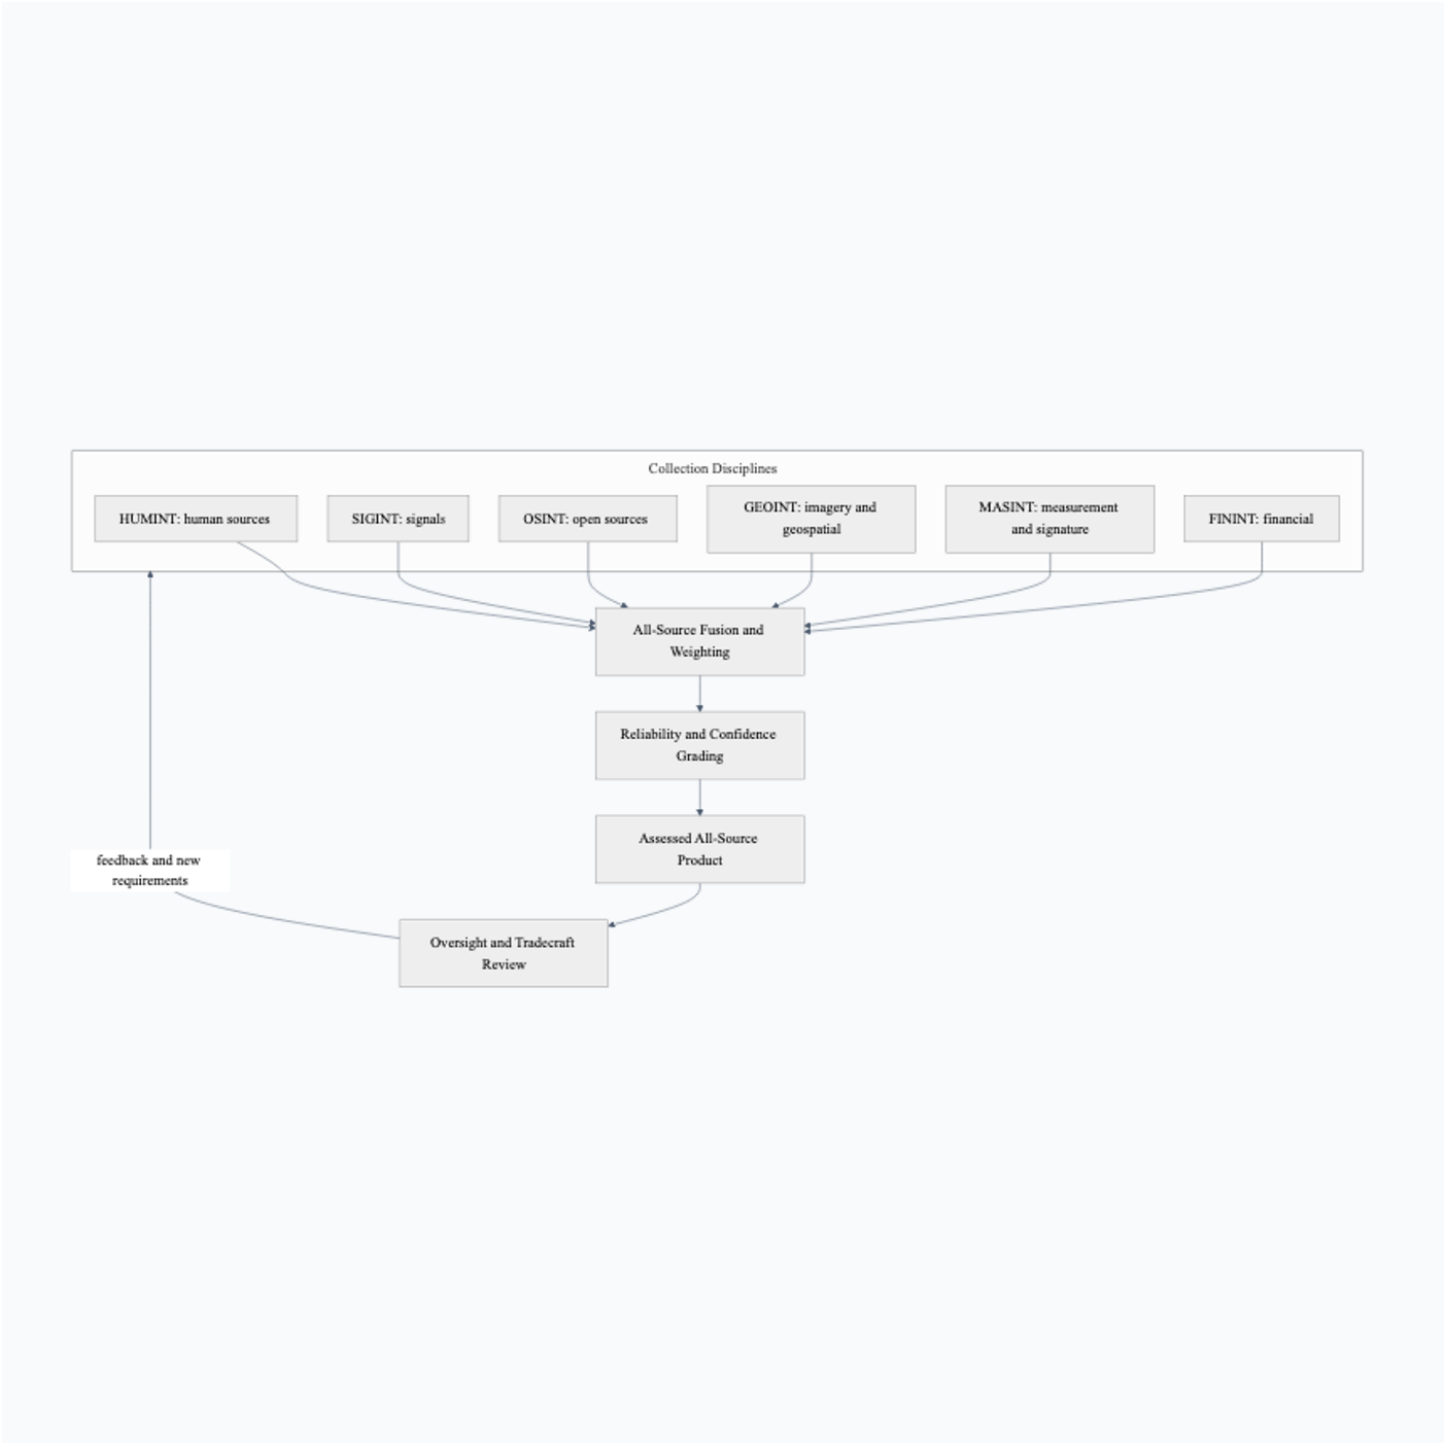

Figure 32: The intelligence disciplines each contribute distinct evidence that all-source analysis fuses, weights by reliability, and turns into an assessed product under oversight. In the foundations of intelligence tradecraft section, it lets readers compare Collection Disciplines, HUMINT: human sources, SIGINT: signals, and OSINT: open sources so the visual functions as a traceable course aid rather than an unscoped assertion.

5 The Nature of Intelligence

5.0.1 The Nature of Intelligence figures and course links: visual evidence, source flow, and navigation

The module uses Figure 33 and Figure 30 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 4, Section 6.
This module teaches the **Governed Intelligence Cycle and Dissemination Architecture** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [237, 2026].

5.1 Governed Intelligence Cycle and Dissemination Architecture frame for The Nature of Intelligence: source context, topic focus, and reader task

Evidence anchor. Section 5; [238, 2026].

5.1.1 The Nature of Intelligence orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 5; [238, 2026].

5.1.2 The Nature of Intelligence conceptual primer: source context, core model, and reader task

This chapter teaches intelligence as a governed information cycle: requirements become collection, collection becomes evaluated evidence, evidence becomes analytic judgment, and judgment becomes a disseminated product with markings, records, feedback, and oversight. The chapter uses **Dissemination-and-Marking Control Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.
The central distinction is to separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback. Core topics include **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle (Classic, Revised, and Critique); Types: Strategic, Operational, Tactical, Technical Intelligence**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [237, 2026].
Learners move from vocabulary and the **Dissemination-and-Marking Control Lens** distinction through topic lessons on **Defining Intelligence: Collection, Analysis, Production, Dissemination** with evidence and misconception checks, then assemble a **dissemination map with audience, caveat, marking, records, and feedback fields** with safety and rights gates.

5.1.3 The Nature of Intelligence learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 5; [238, 2026].

- Connect **Defining Intelligence: Collection, Analysis, Production, Dissemination and The Intelligence Cycle (Classic, Revised, and Critique)** to **Governed Intelligence Cycle and Dissemination Architecture** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **dissemination map with audience, caveat, marking, records, and feedback fields** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as cycle theater, undocumented dissemination, classification drift, unclear release authority, stale records assumptions, and feedback loops that hide bias, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: cycle and marking material remains public-source and educational; it never handles classified content, live release decisions, or source-method exposure.

5.1.4 The Nature of Intelligence core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 5; [238, 2026].

Term	Working definition
Requirement	the decision need or learning question that justifies evidence collection
Dissemination	the controlled movement of an intelligence product to an authorized audience
Marking	the vocabulary that communicates handling, caveat, and release limits
Feedback loop	the customer or reviewer signal that tests whether the product answered the need
Records duty	the retention, deletion, or refresh obligation attached to an artifact
Decision hygiene	habits that keep requirements, evidence, and reviewer judgment aligned under load
Information architecture	how sources, notes, and products are organized so uncertainty stays visible
Defining Intelligence: Collection, Analysis,...	Key terms: Defining, Collection, Analysis.
The Intelligence Cycle (Classic, Revised, and...	Key terms: Cycle, Classic, Revised.

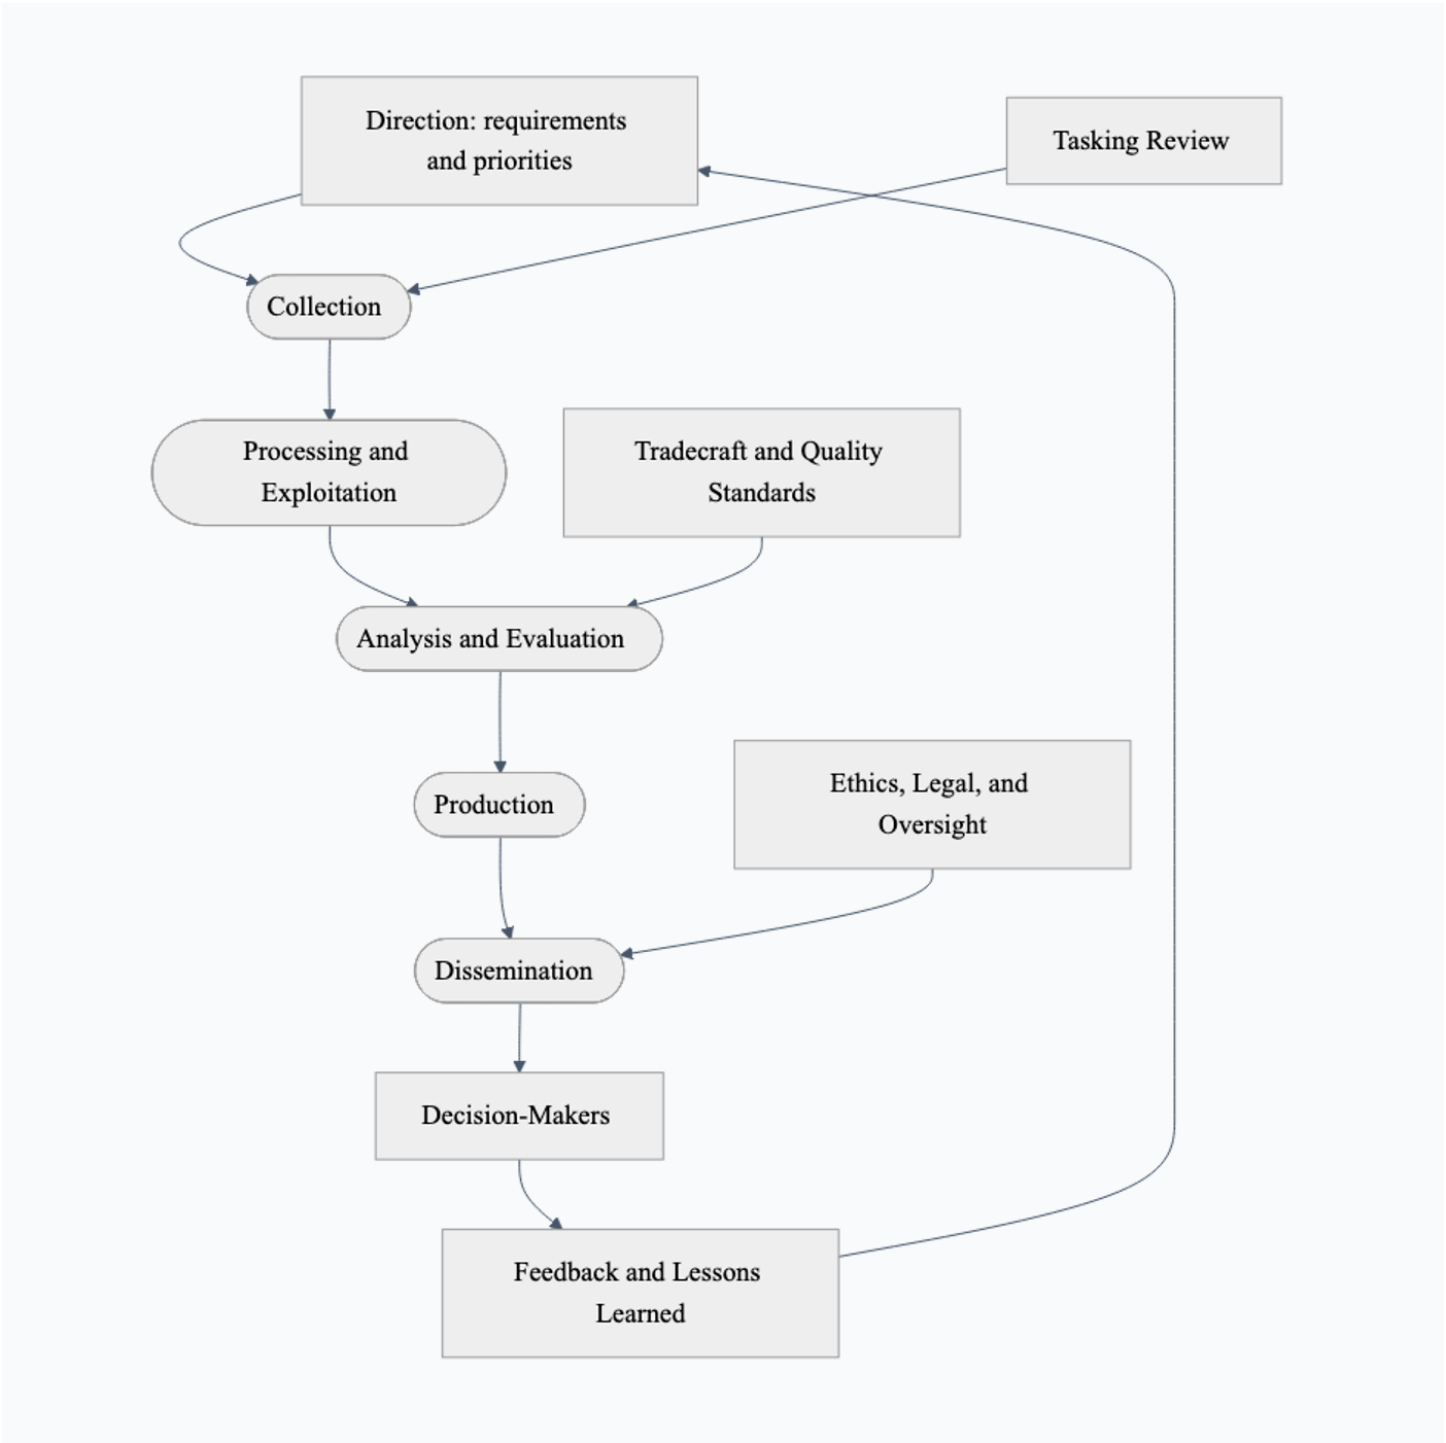

Figure 33: This diagram teaches the classic intelligence cycle as a governed, feedback-driven loop where each phase passes through review before products reach decision-makers. Its reader value is to make Direction: requirements and priorities, Decision-Makers, Feedback and Lessons Learned, and Tasking Review visible at a glance, with the foundations of intelligence tradecraft / the nature of intelligence section as the source section and defensive review as the boundary.

5.2 Dissemination-and-Marking Control Lens path for The Nature of Intelligence: lesson cluster, safe artifact, and review

Evidence anchor. Section 5; [238, 2026].

5.2.1 The Nature of Intelligence practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 5; [238, 2026].

5.2.2 The Nature of Intelligence topic lessons: source-backed concepts and transfer tasks

This module builds intelligence as a governed information cycle: requirements become collection, collection becomes evaluated evidence, evidence becomes analytic judgment, and judgment becomes a disseminated product with markings, records, feedback, and oversight. The sequence opens with **Defining Intelligence: Collection, Analysis, Production, Dissemination**, **The Intelligence Cycle (Classic, Revised, and Critique)**, **Types: Strategic, Operational, Tactical, Technical Intelligence** and applies the **Dissemination-and-Marking Control Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 30; module overview Section 5; curriculum atlas Section 2.

Triangulation anchors. In module 1's topic-lessons section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

5.2.2.1 Lesson 1: Defining Intelligence: Collection, Analysis, Production, Dissemination Concept. Defining Intelligence: Collection, Analysis, Production, Dissemination applies structured analytic methods with explicit alternatives, evidence tables, and calibrated confidence—not rhetorical certainty.

Why it matters. Analysts use **Defining Intelligence** to separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback. A defensible treatment names the judgment it enables for cycle mapping and audience-aware product design review, the proof limit that collapsing reporting, inference, and judgment into one line would otherwise hide, and the reviewer accountable for challenge.

Source support. Defining Intelligence: Collection, Analysis, Production, Dissemination rests on [309, 2026], [310, 2026], and [300, 2026]. The lead source's own note reads: The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. Use them for the working definition that **Defining Intelligence: Collection, Analysis, Production, Dissemination** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **Defining Intelligence**, work from the cited evidence behind this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Defining Intelligence**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this cycle mapping and audience-aware product design topic. The artifact must separate the source descriptor, the bounded judgment about **Defining Intelligence**, the analytic caveat, the confidence note, the excluded-inference boundary, and the reviewer who logs dissent. Shape **Defining Intelligence** work as a **requirements-to-product traceability ledger** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Defining Intelligence**: that a confident narrative is the same as a tested, source-backed judgment with its alternatives and confidence stated.

Transfer task. Reuse the **Defining Intelligence** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

5.2.2.2 Lesson 2: The Intelligence Cycle (Classic, Revised, and Critique) Concept. The Intelligence Cycle (Classic, Revised, and Critique) traces requirements through collection, processing, analysis, dissemination, and feedback while naming authority and audience at each transition.

Why it matters. Without explicit treatment of **The Intelligence Cycle (Classic, Revised, and Critique)**, collapsing reporting, inference, and judgment into one line undermines cycle mapping and audience-aware product design review; the lesson builds the habit to separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback.

Source support. The Intelligence Cycle (Classic, Revised, and Critique) rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the claim that **The Intelligence Cycle (Classic, Revised, and Critique)** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **The Intelligence Cycle (Classic, Revised, and Critique)**, reason from the sources cited in this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **The Intelligence Cycle (Classic, Revised, and Critique)**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this cycle mapping and audience-aware product design topic. The artifact must separate the source descriptor, the bounded judgment about **Intelligence Cycle**, the analytic caveat, the confidence note, the excluded-inference boundary, and the reviewer who logs dissent. Shape this subject work as a **requirements-to-product traceability ledger** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **The Intelligence Cycle (Classic, Revised, and Critique)**: that a confident narrative is the same as a tested, source-backed judgment with its alternatives and confidence stated.

Transfer task. Transfer **The Intelligence Cycle (Classic, Revised, and Critique)** from this module to a second motif by preserving cycle mapping and audience-aware product design, replacing action with audit, and naming the blocked use.

5.2.2.3 Lesson 3: Types: Strategic, Operational, Tactical, Technical Intelligence Concept. Types: Strategic, Operational, Tactical, Technical Intelligence applies structured analytic methods with explicit alternatives, evidence tables, and calibrated confidence—not rhetorical

certainty.

Why it matters. Analysts use **Types: Strategic, Operational, Tactical, Technical Intelligence** to separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback. A defensible treatment names the judgment it enables for cycle mapping and audience-aware product design review, the proof limit that collapsing reporting, inference, and judgment into one line would otherwise hide, and the reviewer accountable for challenge.

Source support. Types: Strategic, Operational, Tactical, Technical Intelligence rests on [309, 2026], [310, 2026], and [300, 2026]. The lead source's own note reads: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for the working definition that **Types: Strategic, Operational, Tactical, Technical Intelligence** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **Types: Strategic, Operational, Tactical, Technical Intelligence**, work from the cited evidence behind this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Types**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this cycle mapping and audience-aware product design topic. The artifact must separate the source descriptor, the bounded judgment about **Types**, the analytic caveat, the confidence note, the excluded-inference boundary, and the reviewer who logs dissent. Shape **Types: Strategic, Operational, Tactical, Technical Intelligence** work as a **requirements-to-product traceability ledger** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Types: Strategic, Operational, Tactical, Technical Intelligence**: that a confident narrative is the same as a tested, source-backed judgment with its alternatives and confidence stated.

Transfer task. Transfer **Types: Strategic, Operational, Tactical, Technical Intelligence** from this module to a second motif by preserving cycle mapping and audience-aware product design, replacing action with audit, and naming the blocked use.

5.2.2.4 Lesson 4: Intelligence as Social and Epistemological Practice

Concept. Intelligence as Social and Epistemological Practice applies structured analytic methods with explicit alternatives, evidence tables, and calibrated confidence—not rhetorical certainty.

Why it matters. Without explicit treatment of **Intelligence as Social and Epistemological Practice**, collapsing reporting, inference, and judgment into one line undermines cycle mapping and audience-aware product design review; the lesson builds the habit to separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback.

Source support. Intelligence as Social and Epistemological Practice uses curated analytic-tradecraft anchors [of the Director of National Intelligence, 2015]; [Agency, 2009]; [for the Study of Intelligence, 2002]; [Cooper, 2005]; [Johnston, 2005]; [on Terrorist Attacks Upon the United States, 2004]; [on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction, 2005]; [on Intelligence, 2004]; [Bruce, 2016]; [Coulthart, 2017]; [Tetlock, 2018]; [et al., 2019]; [Whitesmith, 2019]; [Mandel, 2020]; [Mandel, 2024]; [Barnes and Mandel, 2014]; [Tetlock, 2015b]; [Activity, 2010]; [Activity, 2023]; [McMahon, 2024]. The inherited guide citation(s) [001, 2026] remain context only; primary support must keep likelihood, confidence, assumptions, alternatives, dissent, source quality, ACH limits, and refresh duty separate. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **Intelligence as Social and Epistemological Practice**, use the curated analytic-tradecraft anchors [of the Director of National Intelligence, 2015]; [Agency, 2009]; [for the Study of Intelligence, 2002]; [Cooper, 2005]; [Johnston, 2005]; [on Terrorist Attacks Upon the United States, 2004]; [on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction, 2005]; [on Intelligence, 2004]; [Bruce, 2016]; [Coulthart, 2017]; [Tetlock, 2018]; [et al., 2019]; [Whitesmith, 2019]; [Mandel, 2020]; [Mandel, 2024]; [Barnes and Mandel, 2014]; [Tetlock, 2015b]; [Activity, 2010]; [Activity, 2023]; [McMahon, 2024]. Pull observation, inference, assumption, likelihood, confidence, dissent, decision-uptake boundary, postmortem learning, and the empirical limit that would force a weaker claim. Treat SATs as reviewable reasoning artifacts, not validated universal debiasing or autonomous judgment replacements.

Student artifact. For **Intelligence as Social and Epistemological Practice**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this cycle mapping and audience-aware product design topic. The artifact must separate the source descriptor, the bounded judgment about **Intelligence as Social and Epistemological**, the analytic caveat, the confidence note, the excluded-inference boundary, and the reviewer who logs dissent. Shape the same topic work as a **requirements-to-product traceability ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Intelligence as Social and Epistemological Practice**: that a confident narrative is the same as a tested, source-backed judgment with its alternatives and confidence stated.

Transfer task. Apply this module's safe boundary for **Intelligence as Social and Epistemological Practice** to another artifact while keeping cycle mapping and audience-aware product design and reviewer ownership explicit.

5.2.2.5 Lesson 5: National, Corporate, and Private Intelligence: Structural Differences

Concept. National, Corporate, and Private Intelligence: Structural Differences applies structured analytic methods with explicit alternatives, evidence tables, and calibrated confidence—not rhetorical certainty.

Why it matters. Analysts use **National, Corporate, and Private Intelligence** to separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback. A defensible treatment names the judgment it enables for cycle mapping and audience-aware product design review, the proof limit that collapsing reporting, inference, and judgment into one line would otherwise hide, and the reviewer accountable for challenge.

Source support. National, Corporate, and Private Intelligence: Structural Differences rests on [297, 2026] and [298, 2026]. The lead source's own note reads: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for fixing what **National, Corporate, and Private Intelligence: Structural Differences** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. Ground **National, Corporate, and Private Intelligence** in the evidence the row cites. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **National, Corporate, and Private Intelligence**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this cycle mapping and audience-aware product design topic. The artifact must separate the source descriptor, the bounded judgment about **National Corporate and Private Intelligence**, the analytic caveat, the confidence note, the excluded-inference boundary, and the reviewer who logs dissent. Shape **National, Corporate, and Private Intelligence** work as a **requirements-to-product traceability**

ledger that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **National, Corporate, and Private Intelligence**: that a confident narrative is the same as a tested, source-backed judgment with its alternatives and confidence stated.

Transfer task. Transfer **National, Corporate, and Private Intelligence** from this module to a second motif by preserving cycle mapping and audience-aware product design, replacing action with audit, and naming the blocked use.

5.2.2.6 Lesson 6: The Ethics of Intelligence: EO 12333, FISA, ICD 203, Allied Law

Concept. The Ethics of Intelligence: EO 12333, FISA, ICD 203, Allied Law — Calibrate confidence to evidence strength, source quality, and alternative explanations—not to rhetorical certainty.

Why it matters. Without explicit treatment of **The Ethics of Intelligence**, collapsing reporting, inference, and judgment into one line undermines cycle mapping and audience-aware product design review; the lesson builds the habit to separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback.

Source support. The Ethics of Intelligence: EO 12333, FISA, ICD 203, Allied Law rests on [002, 2026]. Its anchor reference records: ICD 203 directs the heads of IC elements to designate a similar individual or office to respond. Use it for the working definition that **The Ethics of Intelligence: EO 12333, FISA, ICD 203, Allied Law** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **The Ethics of Intelligence**, reason from the sources cited in this row. [002, 2026] ICD 203 directs the heads of IC elements to designate a similar individual or office to respond. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **The Ethics of Intelligence**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this cycle mapping and audience-aware product design topic. The artifact must separate the source descriptor, the bounded judgment about **Ethics of Intelligence**, the analytic caveat, the confidence note, the excluded-inference boundary, and the reviewer who logs dissent. Shape **The Ethics of Intelligence** work as a **requirements-to-product traceability ledger** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **The Ethics of Intelligence**: that a legal source grants authority without scope and oversight.

Transfer task. Transfer **The Ethics of Intelligence** from this module to a second motif by preserving cycle mapping and audience-aware product design, replacing action with audit, and naming the blocked use.

5.2.2.7 Lesson 7: Active Inference as a Unifying Cognitive Framework for Intelligence

Concept. Active Inference as a Unifying Cognitive Framework for Intelligence treats active inference as an agent-modeling vocabulary: beliefs, actions, expected observations, and policy selection are classroom concepts, not proof that an intelligence agent should act autonomously.

Why it matters. Active Inference connects classroom vocabulary to Governed Intelligence Cycle and Dissemination Architecture practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Active Inference as a Unifying Cognitive Framework for Intelligence rests on [003, 2026]. The lead source's own note reads: It maps concepts such as variational free energy, prediction error, generative models, and Markov blankets onto industrial engineering and quality management practices, treating organizational survival as the maintenance of process control limits. Use it for pinning down the scope of **Active Inference as a Unifying Cognitive Framework for Intelligence**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. Read **Active Inference** against the works cited for this row. [003, 2026] A 2021 peer-reviewed article by Stephen Fox in the journal Entropy that relates the active inference framework to social organization. It maps concepts such as variational free energy, prediction error, generative models, and Markov blankets onto industrial engineering and quality management practices, treating organizational survival as the maintenance of process control limits. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Active Inference**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this cycle mapping and audience-aware product design topic. The artifact must separate the source descriptor, the bounded judgment about **Active Inference as a Unifying**, the analytic caveat, the confidence note, the excluded-inference boundary, and the reviewer who logs dissent. Shape **Active Inference** work as a **requirements-to-product traceability ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Active Inference**: that a confident narrative is the same as a tested, source-backed judgment with its alternatives and confidence stated.

Transfer task. For **Active Inference**, transfer the idea to a non-AI chapter by naming the assumed model, the surprising observation, and the review point before any decision follows.

5.2.2.8 Lesson 8: The AI Inflection Point: How Artificial Intelligence Reshapes Every Phase of the Intelligence Cycle

Concept. The AI Inflection Point: How Artificial Intelligence Reshapes Every Phase of the Intelligence Cycle traces requirements through collection, processing, analysis, dissemination, and feedback while naming authority and audience at each transition.

Why it matters. Without explicit treatment of **The AI Inflection Point**, collapsing reporting, inference, and judgment into one line undermines cycle mapping and audience-aware product design review; the lesson builds the habit to separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback.

Source support. The AI Inflection Point: How Artificial Intelligence Reshapes Every Phase of the Intelligence Cycle rests on [004, 2026] and [005, 2026]. Its anchor reference records: 1, March 2026). Use them for fixing what **The AI Inflection Point: How Artificial Intelligence Reshapes Every Phase of the Intelligence Cycle** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **The AI Inflection Point**, reason from the sources cited in this row. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. [005, 2026] A blog post on SemperVerus summarizing a CIA Studies in Intelligence article, "Espionage in Our AI Future: Why Human Intelligence Still Matters" (Vol. 70, No. 1, March 2026). It argues that as AI makes technical intelligence cheaper and AI-driven fabrication more pervasive, human intelligence becomes relatively more valuable, since human specialists are needed to verify source reliability over time. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **The AI Inflection Point**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this cycle mapping and audience-aware product design topic. The artifact must separate the source descriptor, the bounded judgment about **AI Inflection Point**, the analytic caveat, the confidence note, the excluded-inference boundary, and the reviewer who logs dissent. Shape **The AI Inflection Point** work as a **requirements-to-product traceability ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **The AI Inflection Point**: that a confident narrative is the same as a tested, source-backed judgment with its alternatives and confidence stated.

Transfer task. Transfer **The AI Inflection Point** from this module to a second motif by preserving cycle mapping and audience-aware product design, replacing action with audit, and naming the blocked use.

5.2.3 The Nature of Intelligence worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic analyst team rebuilds a storm-impact brief after discovering a stale requirement and overloaded reading queue. [238, 2026]; [237, 2026].

Triangulation anchors. In module 1's worked-example section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **intelligence-cycle governance**. Learners use a **requirements-to-product traceability ledger** and keep this boundary visible: Activities stay inside public, synthetic, or instructor-provided materials and never become live collection or tasking.

Frame. The classroom question centers on **Defining Intelligence: Collection, Analysis, Production, Dissemination**. Excluded actions stay explicit, and the **Dissemination-and-Marking Control Lens** planning question is: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Inputs. For the **Defining Intelligence: Collection, Analysis, Production, Dissemination** scenario, use public weather bulletins, public infrastructure maps, historical outage summaries, and instructor-provided toy records. The Dissemination-and-Marking Control Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Defining Intelligence: Collection, Analysis, Production, Dissemination**, students map the requirement, tag each source, separate observation from judgment, assign caveats, and record the dissemination audience. Pause whenever an inference about Defining Intelligence: Collection, Analysis, Production, Dissemination appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Defining Intelligence: Collection, Analysis, Production, Dissemination** classroom scenario; unit artifact = requirements-to-product traceability ledger; evidence = allowed inputs; method = cycle mapping and audience-aware product design; output = a one-page release-neutral brief with source descriptors, confidence language, caveats, and a feedback owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Defining Intelligence: Collection, Analysis, Production, Dissemination** as "Dissemination-and-Marking Control Lens confirms it" is not enough. The revision ties the claim to cycle mapping and audience-aware product design, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Defining Intelligence: Collection, Analysis, Production, Dissemination** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

5.2.4 The Nature of Intelligence practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Dissemination-and-Marking Control Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

Triangulation anchors. In module 1's practice-sequence section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Defining Intelligence: Collection, Analysis, Production, Dissemination, The Intelligence Cycle, Types: Strategic, Operational, Tactical, Technical Intelligence; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Governed Intelligence Cycle and Dissemination Architecture** lane.
2. Frame	Answer the lens question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Defining Intelligence: Collection, Analysis, Production, Dissemination: dissemination map with audience, caveat, marking, records, and feedback fields.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the requirements-to-product traceability ledger fields for Defining Intelligence: Collection, Analysis, Production, Dissemination.	Unit profile note.	Evidence artifacts include requirement card, source descriptor.
4. Challenge	Test the misconception that a confident narrative is the same as a tested, source-backed judgment with its alternatives and confidence stated.	Failure-mode note.	The artifact applies the key distinction: separate intelligence work from ordinary research by naming authority, audience, caveats, and feedback.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

5.2.4.1 The Nature of Intelligence instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human

review point. Keep the focus on **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**. [238, 2026]; [237, 2026].

5.2.4.2 The Nature of Intelligence extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 5; [238, 2026].
Have learners swap artifacts and apply the **Dissemination-and-Marking Control Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

5.2.5 The Nature of Intelligence knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 5; [238, 2026].

1. Explain how **Defining Intelligence: Collection, Analysis, Production, Dissemination** is defined here; name the source descriptor that supports the definition.
2. Contrast **Defining Intelligence: Collection, Analysis, Production, Dissemination** with **The Intelligence Cycle** using the **Dissemination-and-Marking Control Lens** artifact fields.
3. Identify one failure mode from the **Governed Intelligence Cycle and Dissemination Architecture** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which requirement, source, or workflow step failed first when the team ran out of review time?
5. Correct this misconception: that a confident narrative is the same as a tested, source-backed judgment with its alternatives and confidence stated.

5.2.5.1 The Nature of Intelligence answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Defining Intelligence: Collection, Analysis, Production, Dissemination** without source evidence, uncertainty, or a safe transfer task.

5.3 The Nature of Intelligence assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 5; [238, 2026].

5.3.1 The Nature of Intelligence evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 5; [238, 2026].

5.3.2 The Nature of Intelligence transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 5; [238, 2026].

5.3.2.1 The Nature of Intelligence lineage and source tradition: profile, concepts, and first anchors This sits in the **Governed Intelligence Cycle and Dissemination Architecture** lineage: treating the intelligence cycle as a governed information system whose collection, processing, analysis, dissemination, evaluation, marking, and records obligations stay explicit. [238, 2026]; [237, 2026].

5.3.2.2 The Nature of Intelligence working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 5; [238, 2026].
The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**, with provenance and reviewability throughout.

5.3.2.3 The Nature of Intelligence knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** requirements, audience needs, public-source evidence, caveats, and feedback signals. [238, 2026]; [237, 2026].
- **Transforms:** requirement framing, collection scoping, source evaluation, analytic judgment, dissemination, and feedback review.
- **Outputs:** release-neutral brief, audience map, caveat register, and feedback note.
- **Failure modes:** unscoped audiences, missing caveats, weak records, and product reuse without feedback.

5.3.2.4 The Nature of Intelligence transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 5; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.
- **Evidence contract:** keep the **Governed Intelligence Cycle and Dissemination Architecture** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as release-neutral brief, audience map, caveat register, and feedback note that another reviewer can audit.

5.3.2.5 The Nature of Intelligence profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 5; [238, 2026].
The matched profile emphasizes treating the intelligence cycle as a governed information system whose collection, processing, analysis, dissemination, evaluation, marking, and records obligations stay explicit. The method stack is cycle mapping, priority-to-product traceability, data-lifecycle mapping, classification vocabulary review, dissemination-caveat audit, customer feedback, and oversight checkpointing; the local topic cluster is **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

5.3.3 The Nature of Intelligence evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 5; [238, 2026].
Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Governed Intelligence Cycle and Dissemination Architecture** profile tells reviewers what evidence is strong enough for the module artifact built around **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

5.3.3.1 The Nature of Intelligence guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [237, 2026]; [270, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [001, 2026]; [002, 2026]; [003, 2026]; [004, 2026]; [005, 2026]; [297, 2026]; [298, 2026]; [309, 2026]; [310, 2026]; [300, 2026].

5.3.3.2 The Nature of Intelligence verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [237, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [237, 2026]; [270, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [001, 2026]; [002, 2026]; [003, 2026]; [004, 2026]; [005, 2026]; [297, 2026]; [298, 2026]; [309, 2026]; [310, 2026]; [300, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 1's source-canon section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Maintenance rule: Perplexity may suggest candidates for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle** and [238, 2026]; [237, 2026], but only directly verified source URLs are encoded as citations.

5.3.3.3 The Nature of Intelligence intelligence practice lens: evidence artifact and safety check Practice lens: **Dissemination-and-Marking Control Lens** for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**. [238, 2026]; [237, 2026].

Planning question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Evidence artifact: dissemination map with audience, caveat, marking, records, and feedback fields.

Validation rule: verify source authority, public/classification status, CAPCO-safe vocabulary, audience need, and records disposition before reuse. Applied to **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

Handoff contract: deliver release-neutral summaries, source metadata, marking rationale, and review ownership as separate fields.

Safety check: exclude classified content, live release decisions, source-method exposure, and improvised control markings.

5.3.3.4 The Nature of Intelligence runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 5; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	1.99	1.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind The Nature of Intelligence to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	1.101	1.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for The Nature of Intelligence	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Model-card, recoverability, retention, and learner-support evidence package	1.102	1.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for The Nature of Intelligence	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Defining Intelligence: Collection, Analysis, Production, Dissemination	1.1	1.1 Defining Intelligence: Collection, Analysis, Production, Dissemination	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
The Intelligence Cycle (Classic, Revised, and Critique)	1.2	1.2 The Intelligence Cycle (Classic, Revised, and Critique)	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Types: Strategic, Operational, Tactical, Technical Intelligence	1.3	1.3 Types: Strategic, Operational, Tactical, Technical Intelligence	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Intelligence as Social and Epistemological Practice	1.4	1.4 Intelligence as Social and Epistemological Practice	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
National, Corporate, and Private Intelligence: Structural Differences	1.5	1.5 National, Corporate, and Private Intelligence: Structural Differences	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
The Ethics of Intelligence: EO 12333, FISA, ICD 203, Allied Law	1.6	1.6 The Ethics of Intelligence: EO 12333, FISA, ICD 203, Allied Law	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Active Inference as a Unifying Cognitive Framework for Intelligence	1.7	1.7 Active Inference as a Unifying Cognitive Framework for Intelligence	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
The AI Inflection Point: How Artificial Intelligence Reshapes Every Phase of the Intelligence Cycle	1.8	1.8 The AI Inflection Point: How Artificial Intelligence Reshapes Every Phase of the Intelligence Cycle	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

5.3.3.5 The Nature of Intelligence reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 5; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Defining Intelligence: Collection, Analysis, Production, Dissemination	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
The Intelligence Cycle (Classic, Revised, and Critique)	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Types: Strategic, Operational, Tactical, Technical Intelligence	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Intelligence as Social and Epistemological Practice	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
National, Corporate, and Private Intelligence: Structural Differences	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
The Ethics of Intelligence: EO 12333, FISA, ICD 203, Allied Law	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Active Inference as a Unifying Cognitive Framework for Intelligence	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
The AI Inflection Point: How Artificial Intelligence Reshapes Every Phase of the Intelligence Cycle	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

5.3.3.6 The Nature of Intelligence annotated source ledger: real titles and local contribution Each source cited by this **Governed Intelligence Cycle and Dissemination Architecture** module is paired below with its real title and a one-line note on what it contributes to **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide
[237, 2026]	Artificial Intelligence: An Accountability Framework for Federal Agencies and Other Entities	Official GAO AI accountability framework.	original source-guide
[270, 2026]	NIST Big Data Interoperability Framework	NIST Special Publication 1500-1 (revised edition by Chang and Grady) establishes foundational terminology and consensus definitions for Big Data through the NIST Big Data Public Working Group. The volume defines Big Data characteristics, taxonomy, and a reference architecture assigning roles to Application Providers, Data Consumers, Data Providers, and System Orchestrators.	verified source-guide
[273, 2026]	WCAG 2 Overview	The W3C Web Accessibility Initiative overview of the Web Content Accessibility Guidelines (WCAG), an international standard for making web content accessible to people with disabilities. It explains that WCAG is organized around four principles (perceivable, operable, understandable, robust) with testable success criteria at three conformance levels (A, AA, AAA), and covers versions 2.0, 2.1, and 2.2.	verified source-guide
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide
[275, 2026]	Fact Sheet: New Rule on the Accessibility of Web Content and Mobile Apps Provided by State and Local Governments	A US Department of Justice fact sheet explaining the 2024 ADA Title II rule requiring state and local governments to make their web content and mobile apps accessible. It establishes WCAG 2.1 Level AA as the technical standard, applies to entities such as schools, courts, libraries, and transit agencies, and sets compliance deadlines of April 2027 for larger jurisdictions and April 2028 for smaller ones.	verified source-guide

Source	Cited work	What it contributes	Status
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide
[001, 2026]	Epistemic Governance in the Context of Crisis	This article examines the concept of epistemic governance during crises.	original source-guide
[002, 2026]	Objectivity	ICD 203 directs the heads of IC elements to designate a similar individual or office to respond.	original source-guide
[003, 2026]	Active Inference: Applicability to Different Types of Social	A 2021 peer-reviewed article by Stephen Fox in the journal Entropy that relates the active inference framework to social organization. It maps concepts such as variational free energy, prediction error, generative models, and Markov blankets onto industrial engineering and quality management practices, treating organizational survival as the maintenance of process control limits.	verified source-guide
[004, 2026]	AI Won't Replace Spies—It Will Make Them More Powerful Than Ever	Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools.	verified source-guide

Source	Cited work	What it contributes	Status
[005, 2026]	CIA: Studies in AI and Human Intelligence - SemperVerus	A blog post on SemperVerus summarizing a CIA Studies in Intelligence article, "Espionage in Our AI Future: Why Human Intelligence Still Matters" (Vol. 70, No. 1, March 2026). It argues that as AI makes technical intelligence cheaper and AI-driven fabrication more pervasive, human intelligence becomes relatively more valuable, since human specialists are needed to verify source reliability over time.	verified source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide
[309, 2026]	STIX Version 2.1	An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection.	verified source-guide
[310, 2026]	TAXII Version 2.1	The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe).	verified source-guide
[300, 2026]	MITRE ATLAS	MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy.	original source-guide

Where this sits. This module's overview is Section 5; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

5.3.4 The Nature of Intelligence governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 5; [238, 2026].

5.3.5 The Nature of Intelligence analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 1's governance-boundary section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Governed Intelligence Cycle and Dissemination Architecture** for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle (Classic, Revised, and Critique)**. [238, 2026]; [237, 2026].

Curriculum topic spine: Defining Intelligence: Collection, Analysis, Production, Dissemination, **The Intelligence Cycle (Classic, Revised, and Critique)**, **Types: Strategic, Operational, Tactical, Technical Intelligence**. **Verified anchor cluster:** [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]; [of the Director of National Intelligence, 2026b]; [General Services Administration et al., 2026]; [Privacy and Board, 2026].

Conceptual depth: treating the intelligence cycle as a governed information system whose collection, processing, analysis, dissemination, evaluation, marking, and records obligations stay explicit.

Method stack: cycle mapping, priority-to-product traceability, data-lifecycle mapping, classification vocabulary review, dissemination-caveat audit, customer feedback, and oversight checkpointing.

Composability contract: requirements, data provenance, analytic judgments, markings, dissemination permissions, records obligations, and feedback remain separable artifacts.

Known failure modes: cycle theater, undocumented dissemination, classification drift, unclear release authority, stale records assumptions, and feedback loops that hide bias.

Defensive boundary: cycle and marking material remains public-source and educational; it never handles classified content, live release decisions, or source-method exposure. Applied to **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle (Classic, Revised, and Critique)**.

Anchor	Why it matters here
[Community, 2026]	Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.
[of the Director of National Intelligence, 2026c]	Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2025a]	Official IC data-management directive for data governance, data stewardship, CDO authority, interoperability, and data lifecycle management. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026b]	Official CAPCO register for classification and control-marking vocabulary, abbreviations, portion markings, and dissemination syntax. Checked as of 2026-05-21; role: curriculum_anchor.
[General Services Administration et al., 2026]	Official federal data-governance benchmark for data as a strategic asset, ethical governance, lifecycle practices, and learning culture. Checked as of 2026-05-21; role: curriculum_anchor.
[Privacy and Board, 2026]	Official oversight-report library for privacy, civil-liberties, surveillance, watchlisting, facial-recognition, and redress analysis. Checked as of 2026-05-21; role: curriculum_anchor.

5.3.5.1 The Nature of Intelligence evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Governed Intelligence Cycle and Dissemination Architecture** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [237, 2026].

5.3.6 The Nature of Intelligence agentic boundary: assist, approve, block, and record

Evidence anchor. Section 5; [238, 2026].

AGEINT translation is bounded by the **Governed Intelligence Cycle and Dissemination Architecture** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

5.3.6.1 The Nature of Intelligence permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 5; [238, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

5.3.6.2 The Nature of Intelligence excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [237, 2026] and **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

5.3.7 The Nature of Intelligence governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 5; [238, 2026].

Governance is practiced as a gate on the **Governed Intelligence Cycle and Dissemination Architecture** lane. Learners use the **Dissemination-and-Marking Control Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when

an agent-assisted artifact must stop for human review while using **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

5.3.7.1 The Nature of Intelligence governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [237, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Governed Intelligence Cycle and Dissemination Architecture** failure modes and the **Dissemination-and-Marking Control Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

5.3.7.2 The Nature of Intelligence evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 5; [238, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Dissemination-and-Marking Control Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

5.3.7.3 The Nature of Intelligence current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**. [238, 2026]; [237, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_intelligence_gov_how_ic_works` for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**?	How the IC Works; lane `governed_intelligence_cycle`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners.
What does the module inherit from `official_odni_icd_203` for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**?	Intelligence Community Directive 203: Analytic Standards; lane `source_quality_spine`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official ODNI analytic tradecraft standards directive.
What does the module inherit from `official_odni_icd_204` for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**?	Intelligence Community Directive 204: National Intelligence Priorities Framework; lane `collection_management`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation.
What does the module inherit from `official_odni_icd_504` for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**?	Intelligence Community Directive 504: Intelligence Community Data Management; lane `ai_ethics_data_governance`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official IC data-management directive for data governance, data stewardship, CDO authority, interoperability, and data lifecycle management.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 5; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

5.3.8 The Nature of Intelligence assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 5; [238, 2026].

5.3.9 The Nature of Intelligence assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 5; [238, 2026].

5.3.9.1 The Nature of Intelligence capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle** and [238, 2026]; [237, 2026].

5.3.9.2 The Nature of Intelligence instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle** and [238, 2026]; [237, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

5.3.9.3 The Nature of Intelligence assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Defining Intelligence: Collection, Analysis, Production, Dissemination	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
The Intelligence Cycle (Classic, Revised, and Critique)	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Types: Strategic, Operational, Tactical, Technical Intelligence	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

5.3.10 The Nature of Intelligence refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [237, 2026] and **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**.

5.3.10.1 The Nature of Intelligence refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**. The local signals begin with [238, 2026]; [237, 2026].

5.3.10.2 The Nature of Intelligence claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**, and the source spine for these checks begins with [238, 2026]; [237, 2026].

5.3.11 The Nature of Intelligence reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [237, 2026].

Triangulation anchors. In module 1's review-checklist section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle**. [238, 2026]; [237, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

5.3.12 The Nature of Intelligence learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **Defining Intelligence: Collection, Analysis, Production, Dissemination; The Intelligence Cycle** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [238, 2026]; [237, 2026].

Section 2, Section 4, Section 6

6 Intelligence Community Architectures

6.0.1 Intelligence Community Architectures figures and course links: visual evidence, source flow, and navigation

The module uses Figure 34 and Figure 30 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 4, Section 5, Section 7.
This module teaches the **Analytic Tradecraft and Source Integrity** lane through a bounded, source-backed coursebook chapter. [234, 2026]; [247, 2026].

6.1 Analytic Tradecraft and Source Integrity frame for Intelligence Community Architectures: source context, topic focus, and reader task

Evidence anchor. Section 6; [234, 2026].

6.1.1 Intelligence Community Architectures orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 6; [234, 2026].

6.1.2 Intelligence Community Architectures conceptual primer: source context, core model, and reader task

This chapter teaches analytic tradecraft as disciplined judgment under uncertainty: claims become useful only when evidence, assumptions, alternatives, confidence, and dissent remain visible. The chapter uses **Dissemination-and-Marking Control Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.
The central distinction is to separate reporting from inference, and inference from judgment. Core topics include **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study; British Architecture: Declassified source-protection and institutional-control case study**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [234, 2026]; [247, 2026].
Learners move from vocabulary and the **Dissemination-and-Marking Control Lens** distinction through topic lessons on **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships** with evidence and misconception checks, then assemble a **dissemination map with audience, caveat, marking, records, and feedback fields** with safety and rights gates.

6.1.3 Intelligence Community Architectures learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 6; [234, 2026].

- Connect **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships and Declassified source-protection and institutional-control case study** to **Analytic Tradecraft and Source Integrity** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **dissemination map with audience, caveat, marking, records, and feedback fields** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate reporting from inference, and inference from judgment; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as source laundering, automation bias, hidden assumptions, collapsed likelihood/confidence language, hindsight certainty, SAT-as-bias-cure overclaiming, and visually persuasive but weakly sourced claims, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: analysis remains educational and decision-supportive; it does not become tasking, targeting, covert collection, or policy advocacy.

6.1.4 Intelligence Community Architectures core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 6; [234, 2026].

Term	Working definition
Source descriptor	a compact statement of where evidence came from and what it can support
Assumption	a claim accepted for analysis that still needs challenge
Alternative hypothesis	a plausible explanation that competes with the favored account
Confidence	a calibrated expression of evidentiary strength and analytic uncertainty
Dissent	a documented disagreement that preserves minority reasoning for review
U.S. Intelligence Community: 18 Agencies,…	Key terms: Community, Agencies, Authorities.
Declassified source-protection and…	Key terms: Declassified, protection, institutional.

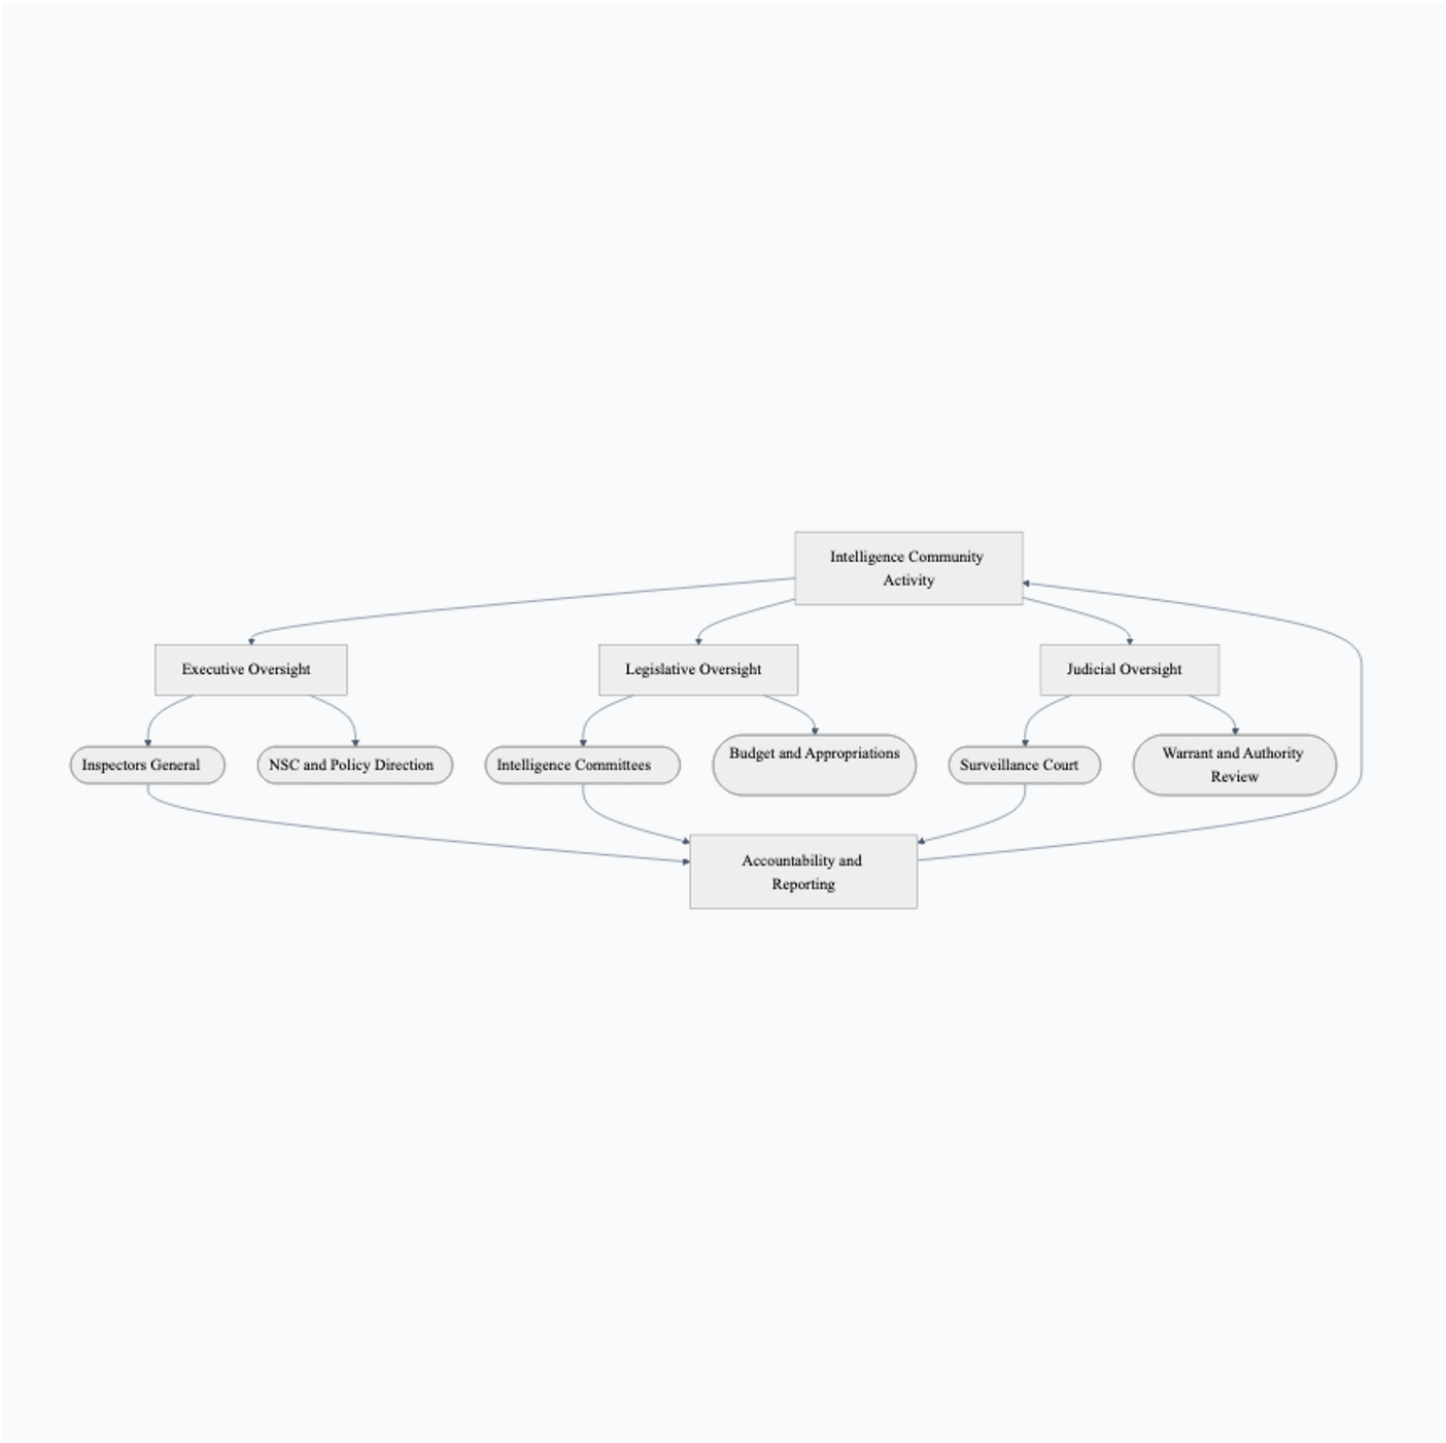

Figure 34: This diagram teaches how executive, legislative, and judicial oversight mechanisms jointly constrain and supervise intelligence community activity. It is anchored to the foundations of intelligence tradecraft / intelligence community architectures section; use it to inspect Intelligence Community Activity, Executive Oversight, Legislative Oversight, and Judicial Oversight while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

6.2 Dissemination-and-Marking Control Lens path for Intelligence Community Architectures: lesson cluster, safe artifact, and review

Evidence anchor. Section 6; [234, 2026].

6.2.1 Intelligence Community Architectures practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 6; [234, 2026].

6.2.2 Intelligence Community Architectures topic lessons: source-backed concepts and transfer tasks

This module builds analytic tradecraft as disciplined judgment under uncertainty: claims become useful only when evidence, assumptions, alternatives, confidence, and dissent remain visible. The sequence opens with **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships**, **Declassified source-protection and institutional-control case study**, **British Architecture: Declassified source-protection and institutional-control case study** and applies the **Dissemination-and-Marking Control Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 30; module overview Section 6; curriculum atlas Section 2.

Triangulation anchors. In module 2's topic-lessons section, directly verified anchors for the **Analytic Tradecraft and Source Integrity** lane include [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]; [Agency, 2009]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

6.2.2.1 Lesson 1: U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships

Concept. U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships maps the theory to institutions: priorities, feedback, incentives, review loops, and records shape what an intelligence community notices and ignores.

Why it matters. Without explicit treatment of **U.S. Intelligence Community**, source laundering undermines structured reasoning and source-integrity review; the lesson builds the habit to separate reporting from inference, and inference from judgment.

Source support. U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships rests on [006, 2026]. The lead source's own note reads: ICDs are the principal means by which the DNI provides policy, guidance, and direction to the U.S. Use it for pinning down the scope of **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d].

Evidence to inspect. For **U.S. Intelligence Community**, reason from the sources cited in this row. [006, 2026] A Federation of American Scientists repository cataloguing the Intelligence Community Directives (ICDs) issued by the Director of National Intelligence. ICDs are the principal means by which the DNI provides policy, guidance, and direction to the U.S. Intelligence Community. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **U.S. Intelligence Community**, build an institutional feedback-loop map with incentives, review points, and oversight hooks. Shape **U.S. Intelligence Community** work as a **requirements-to-product traceability ledger** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships replaces human review whenever evidence looks plausible.

Transfer task. Transfer **U.S. Intelligence Community** to a second module by preserving structured reasoning and source-integrity review, changing the source evidence, and naming a new reviewer.

6.2.2.2 Lesson 2: Declassified source-protection and institutional-control case study

Concept. Declassified source-protection and institutional-control case study uses attribution indicators cautiously by separating technical similarity, context, confidence, and geopolitical inference.

Why it matters. Without explicit treatment of **Declassified source-protection**, source laundering undermines structured reasoning and source-integrity review; the lesson builds the habit to separate reporting from inference, and inference from judgment.

Source support. Declassified source-protection and institutional-control case study rests on [297, 2026] and [298, 2026]. Its anchor reference records: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the working definition that **Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d].

Evidence to inspect. For **Declassified source-protection**, work from the cited evidence behind this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Declassified source-protection**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this structured reasoning and source-integrity review topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection and institutional-control case**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Declassified source-protection** work as a **requirements-to-product traceability ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Apply this module's safe boundary for **Declassified source-protection** to another artifact while keeping structured reasoning and source-integrity review and reviewer ownership explicit.

6.2.2.3 Lesson 3: British Architecture: Declassified source-protection and institutional-control case study

Concept. British Architecture: Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Without explicit treatment of **British Architecture**, source laundering undermines structured reasoning and source-integrity review; the lesson builds the habit to separate reporting from inference, and inference from judgment.

Source support. British Architecture: Declassified source-protection and institutional-control case study rests on [007, 2026]. The most specific cited work observes: It is SIS's task to pursue policy objectives by unorthodox means and to amass useful information. Use it for the working definition that **British Architecture: Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d].

Evidence to inspect. Read **British Architecture** against the works cited for this row. [007, 2026] It is SIS's task to pursue policy objectives by unorthodox means and to amass useful information. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **British Architecture**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this structured reasoning and source-integrity review topic. The artifact must cite the declassified source descriptor, the bounded lesson about **British Architecture**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **British Architecture** work as a **requirements-to-product traceability ledger** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **British Architecture** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

6.2.2.4 Lesson 4: Israeli Architecture: Declassified source-protection and institutional-control case study

Concept. Israeli Architecture: Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Israeli Architecture matters in the **Analytic Tradecraft and Source Integrity** lane because structured reasoning and source-integrity evidence must stay separate from judgment; source laundering is a common failure.

Source support. Israeli Architecture: Declassified source-protection and institutional-control case study rests on [008, 2026]. Its anchor reference records: An EBSCO Research Starter reference article on the Mossad, Israel's national intelligence agency established in 1949 and responsible for foreign intelligence collection and counterterrorism operations conducted outside Israel's borders. Use it for the working definition that **Israeli Architecture: Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d].

Evidence to inspect. Ground **Israeli Architecture** in the evidence the row cites. [008, 2026] An EBSCO Research Starter reference article on the Mossad, Israel's national intelligence agency established in 1949 and responsible for foreign intelligence collection and counterterrorism operations conducted outside Israel's borders. It describes the agency's departmental structure (collection, political action and liaison, research, technology) and reviews historically documented operations including the 1960 capture of Adolf Eichmann and the rescue of Ethiopian Jews. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Israeli Architecture**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this structured reasoning and source-integrity review topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Israeli Architecture**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Israeli Architecture** work as a **requirements-to-product traceability ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Israeli Architecture** from this module to a second motif by preserving structured reasoning and source-integrity review, replacing action with audit, and naming the blocked use.

6.2.2.5 Lesson 5: Chinese Architecture: MSS, PLA-SSF, United Front Work Department, APT Groups

Concept. Chinese Architecture: MSS, PLA-SSF, United Front Work Department, APT Groups studies APT reporting as attribution and confidence literacy: technical similarity, context, caveats, and geopolitical inference stay separate.

Why it matters. Without explicit treatment of **Chinese Architecture**, source laundering undermines structured reasoning and source-integrity review; the lesson builds the habit to separate reporting from inference, and inference from judgment.

Source support. Chinese Architecture: MSS, PLA-SSF, United Front Work Department, APT Groups rests on [009, 2026]. Its anchor reference records: A November 2023 report from MERICS (Mercator Institute for China Studies) analyzing Chinese state-affiliated cyber intrusions aimed at strategic goals. Use it for the claim that **Chinese Architecture: MSS, PLA-SSF, United Front Work Department, APT Groups** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d].

Evidence to inspect. For **Chinese Architecture**, work from the cited evidence behind this row. [009, 2026] A November 2023 report from MERICS (Mercator Institute for China Studies) analyzing Chinese state-affiliated cyber intrusions aimed at strategic goals. It argues that Chinese actors pursue long-term, persistent access to European technology firms and critical infrastructure for espionage rather than disruption, with targeting aligned to government priorities such as semiconductors, pharmaceuticals, and advanced manufacturing. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Chinese Architecture**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this structured reasoning and source-integrity review topic. The artifact must name the source descriptor, the bounded claim about **Chinese Architecture**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Chinese Architecture** work as a **requirements-to-product traceability ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Chinese Architecture: MSS, PLA-SSF, United Front Work Department, APT Groups replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Chinese Architecture** to a second module by preserving structured reasoning and source-integrity review, changing the source evidence, and naming a new reviewer.

6.2.2.6 Lesson 6: Five Eyes and Allied Intelligence Sharing: BRUSA to UKUSA

Concept. Five Eyes and Allied Intelligence Sharing: BRUSA to UKUSA uses the sharing arrangement to distinguish alliance governance, handling rules, legal authority, and source caveats.

Why it matters. Five Eyes and Allied Intelligence Sharing connects classroom vocabulary to Analytic Tradecraft and Source Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Five Eyes and Allied Intelligence Sharing: BRUSA to UKUSA rests on [010, 2026] and [011, 2026]. The lead source's own note reads: The collection traces the emergence and evolution of bilateral and multilateral agreements from the postwar era, including the BRUSA and UKUSA agreements, drawing on records from UK, US, and Australian agencies plus freedom-of-information releases. Use them for the claim that **Five Eyes and Allied Intelligence Sharing: BRUSA to UKUSA** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d].

Evidence to inspect. Read **Five Eyes and Allied Intelligence Sharing** against the works cited for this row. [010, 2026] An online archive maintained by Unredacted UK that compiles declassified government documents on intelligence sharing among the Five Eyes nations (United States, United Kingdom, Canada, Australia, and New Zealand). The collection traces the emergence and evolution of bilateral and multilateral agreements from the postwar era, including the BRUSA and UKUSA agreements, drawing on records from UK, US, and Australian agencies plus freedom-of-information releases. [011, 2026] A curated collection from Unredacted UK presenting documents declassified by the NSA and GCHQ in 2010 relating

to US-UK signals intelligence cooperation. It covers the 1946 British-US Communications Agreement (BRUSA), its wartime origins from 1940, and its evolution into the 1956 UKUSA Agreement and the broader Five Eyes alliance. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Five Eyes and Allied Intelligence Sharing**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this structured reasoning and source-integrity review topic. The artifact must name the source descriptor, the bounded claim about **Five Eyes and Allied Intelligence**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Five Eyes and Allied Intelligence Sharing** work as a **requirements-to-product traceability ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Five Eyes and Allied Intelligence Sharing: BRUSA to UKUSA can be used while ignoring the rule to separate reporting from inference, and inference from judgment.

Transfer task. Transfer **Five Eyes and Allied Intelligence Sharing** to a second module by preserving structured reasoning and source-integrity review, changing the source evidence, and naming a new reviewer.

6.2.2.7 Lesson 7: Non-State Intelligence Actors: Terrorist, Criminal, PMC

Concept. Non-State Intelligence Actors: Terrorist, Criminal, PMC studies non-state actors through organizational indicators, funding patterns, and open-source evidence with strict minimization.

Why it matters. Non-State Intelligence Actors matters in the **Analytic Tradecraft and Source Integrity** lane because structured reasoning and source-integrity evidence must stay separate from judgment; source laundering is a common failure.

Source support. Non-State Intelligence Actors: Terrorist, Criminal, PMC rests on [012, 2026]. The lead source's own note reads: A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. Use it for fixing what **Non-State Intelligence Actors: Terrorist, Criminal, PMC** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d].

Evidence to inspect. For **Non-State Intelligence Actors**, work from the cited evidence behind this row. [012, 2026] A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Non-State Intelligence Actors**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this structured reasoning and source-integrity review topic. The artifact must name the source descriptor, the bounded claim about **State Intelligence Actors**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Non-State Intelligence Actors** work as a **requirements-to-product traceability ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Non-State Intelligence Actors: Terrorist, Criminal, PMC is optional whenever separate reporting from inference, and inference from judgment feels inconvenient.

Transfer task. Transfer **Non-State Intelligence Actors** to a second module by preserving structured reasoning and source-integrity review, changing the source evidence, and naming a new reviewer.

6.2.2.8 Lesson 8: Fusion Centers, JITFs, and Inter-Agency Coordination

Concept. Fusion Centers, JITFs, and Inter-Agency Coordination applies Fusion, Centers, JITFs within Analytic Tradecraft and Source Integrity: learners use separate reporting from inference, and inference from judgment and structured reasoning and source-integrity review evidence before any judgment moves forward.

Why it matters. Analysts use **Fusion Centers, JITFs, and Inter-Agency Coordination** to separate reporting from inference, and inference from judgment. A defensible treatment names the judgment it enables for structured reasoning and source-integrity review, the proof limit that source laundering would otherwise hide, and the reviewer accountable for challenge.

Source support. Fusion Centers, JITFs, and Inter-Agency Coordination rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for fixing what **Fusion Centers, JITFs, and Inter-Agency Coordination** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d].

Evidence to inspect. For **Fusion Centers, JITFs, and Inter-Agency Coordination**, reason from the sources cited in this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Fusion Centers, JITFs, and Inter-Agency Coordination**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this structured reasoning and source-integrity review topic. The artifact must name the source descriptor, the bounded claim about **Fusion Centers JITFs and Inter-Agency**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **requirements-to-product traceability ledger** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Fusion Centers, JITFs, and Inter-Agency Coordination establishes intent without reviewing alternative explanations.

Transfer task. Transfer **Fusion Centers, JITFs, and Inter-Agency Coordination** to a second module by preserving structured reasoning and source-integrity review, changing the source evidence, and naming a new reviewer.

6.2.2.9 Lesson 9: Intelligence Oversight: Congressional, Judicial, Executive Mechanisms

Concept. Intelligence Oversight: Congressional, Judicial, Executive Mechanisms applies Oversight, Congressional, Judicial within Analytic Tradecraft and Source Integrity: learners use separate reporting from inference, and inference from judgment and structured reasoning and source-integrity review evidence before any judgment moves forward.

Why it matters. Intelligence Oversight matters in the **Analytic Tradecraft and Source Integrity** lane because structured reasoning and source-integrity evidence must stay separate from judgment; source laundering is a common failure.

Source support. Intelligence Oversight: Congressional, Judicial, Executive Mechanisms rests on [298, 2026] and [297, 2026]. Its anchor reference records: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for fixing what **Intelligence Oversight: Congressional, Judicial, Executive Mechanisms** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d].

Evidence to inspect. For **Intelligence Oversight**, work from the cited evidence behind this row. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Intelligence Oversight**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this structured reasoning and source-integrity review topic. The artifact must name the source descriptor, the bounded claim about **Intelligence Oversight**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Intelligence Oversight** work as a **requirements-to-product traceability ledger** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Intelligence Oversight: Congressional, Judicial, Executive Mechanisms replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Intelligence Oversight** to a second module by preserving structured reasoning and source-integrity review, changing the source evidence, and naming a new reviewer.

6.2.3 Intelligence Community Architectures worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic analyst cell evaluates whether a benign supplier delay signals normal friction or elevated risk. [234, 2026]; [247, 2026].

Triangulation anchors. In module 2's worked-example section, directly verified anchors for the **Analytic Tradecraft and Source Integrity** lane include [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]; [Agency, 2009]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **intelligence-cycle governance**. Learners use a **requirements-to-product traceability ledger** and keep this boundary visible: Activities stay inside public, synthetic, or instructor-provided materials and never become live collection or tasking.

Frame. The classroom question centers on **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships**. Excluded actions stay explicit, and the **Dissemination-and-Marking Control Lens** planning question is: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Inputs. For the **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships** scenario, use synthetic shipment notes, public policy excerpts, and a short instructor-provided event timeline. The Dissemination-and-Marking Control Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships**, students write hypotheses, list evidence for and against each, mark assumptions, and assign confidence only after alternatives are tested. Pause whenever an inference about U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships** classroom scenario; unit artifact = requirements-to-product traceability ledger; evidence = allowed inputs; method = structured reasoning and source-integrity review; output = an analytic note with a hypothesis table, confidence statement, dissent field, and collection gap list; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships** as "Dissemination-and-Marking Control Lens confirms it" is not enough. The revision ties the claim to structured reasoning and source-integrity review, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

6.2.4 Intelligence Community Architectures practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Dissemination-and-Marking Control Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

Triangulation anchors. In module 2's practice-sequence section, directly verified anchors for the **Analytic Tradecraft and Source Integrity** lane include [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]; [Agency, 2009]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships, Declassified source-protection and institutional-control case study, British Architecture: Declassified source-protection and institutional-control case study; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Analytic Tradecraft and Source Integrity** lane.
2. Frame	Answer the lens question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships: dissemination map with audience, caveat, marking, records, and feedback fields.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the requirements-to-product traceability ledger fields for U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships.	Unit profile note.	Evidence artifacts include requirement card, source descriptor.

Move	Learner action	Output	Check
4. Challenge	Test the misconception that U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships replaces human review whenever evidence looks plausible.	Failure-mode note.	The artifact applies the key distinction: separate reporting from inference, and inference from judgment.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

6.2.4.1 Intelligence Community Architectures instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**. [234, 2026]; [247, 2026].

6.2.4.2 Intelligence Community Architectures extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 6; [234, 2026].

Have learners swap artifacts and apply the **Dissemination-and-Marking Control Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

6.2.5 Intelligence Community Architectures knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 6; [234, 2026].

1. Explain how **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships** is defined here; name the source descriptor that supports the definition.
2. Contrast **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships** with **Declassified source-protection and institutional-control case study** using the **Dissemination-and-Marking Control Lens** artifact fields.
3. Identify one failure mode from the **Analytic Tradecraft and Source Integrity** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which assumption would change the judgment if it were false?
5. Correct this misconception: that U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships replaces human review whenever evidence looks plausible.

6.2.5.1 Intelligence Community Architectures answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships** without source evidence, uncertainty, or a safe transfer task.

6.3 Intelligence Community Architectures assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 6; [234, 2026].

6.3.1 Intelligence Community Architectures evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 6; [234, 2026].

6.3.2 Intelligence Community Architectures transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 6; [234, 2026].

6.3.2.1 Intelligence Community Architectures lineage and source tradition: profile, concepts, and first anchors This sits in the **Analytic Tradecraft and Source Integrity** lineage: turning uncertainty into reviewable judgment through sourcing, alternatives, separated likelihood and confidence language, warning indicators, and explicit analytic lineage. [234, 2026]; [247, 2026].

6.3.2.2 Intelligence Community Architectures working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 6; [234, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**, with provenance and reviewability throughout.

6.3.2.3 Intelligence Community Architectures knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** reporting, assumptions, alternatives, confidence language, dissent, and source descriptors. [234, 2026]; [247, 2026].
- **Transforms:** hypothesis generation, evidence sorting, assumption challenge, confidence calibration, and dissent capture.
- **Outputs:** analytic note, hypothesis table, assumption list, and confidence statement.
- **Failure modes:** single-hypothesis reasoning, source laundering, confidence inflation, and suppressed dissent.

6.3.2.4 Intelligence Community Architectures transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 6; [234, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.
- **Evidence contract:** keep the **Analytic Tradecraft and Source Integrity** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as analytic note, hypothesis table, assumption list, and confidence statement that another reviewer can audit.

6.3.2.5 Intelligence Community Architectures profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 6; [234, 2026].

The matched profile emphasizes turning uncertainty into reviewable judgment through sourcing, alternatives, separated likelihood and confidence language, warning indicators, and explicit analytic lineage. The method stack is key assumptions check, analysis of competing hypotheses, diagnosticity review, indicators and warnings, probability calibration, red-team review, collective tradecraft rating, and source descriptor audit; the local topic cluster is **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

6.3.3 Intelligence Community Architectures evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 6; [234, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Analytic Tradecraft and Source Integrity** profile tells reviewers what evidence is strong enough for the module artifact built around **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

6.3.3.1 Intelligence Community Architectures guide source spine: inherited keys and local citation roles Primary guide citations: [234, 2026]; [247, 2026]; [249, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [006, 2026]; [007, 2026]; [008, 2026]; [009, 2026]; [010, 2026]; [011, 2026]; [012, 2026]; [297, 2026]; [298, 2026].

6.3.3.2 Intelligence Community Architectures verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [234, 2026]; [247, 2026].

Tier	What counts	How it is used
Source guide	[234, 2026]; [247, 2026]; [249, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [006, 2026]; [007, 2026]; [008, 2026]; [009, 2026]; [010, 2026]; [011, 2026]; [012, 2026]; [297, 2026]; [298, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 2's source-canon section, directly verified anchors for the **Analytic Tradecraft and Source Integrity** lane include [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]; [Agency, 2009]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study** and [234, 2026]; [247, 2026], but only directly verified source URLs are encoded as citations.

6.3.3.3 Intelligence Community Architectures intelligence practice lens: evidence artifact and safety check Practice lens: **Dissemination-and-Marking Control Lens** for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**. [234, 2026]; [247, 2026].

Planning question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Evidence artifact: dissemination map with audience, caveat, marking, records, and feedback fields.

Validation rule: verify source authority, public/classification status, CAPCO-safe vocabulary, audience need, and records disposition before reuse. Applied to **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

Handoff contract: deliver release-neutral summaries, source metadata, marking rationale, and review ownership as separate fields.

Safety check: exclude classified content, live release decisions, source-method exposure, and improvised control markings.

6.3.3.4 Intelligence Community Architectures runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 6; [234, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	2.99	2.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Intelligence Community Architectures to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	2.101	2.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Intelligence Community Architectures	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Model-card, recoverability, retention, and learner-support evidence package	2.102	2.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Intelligence Community Architectures	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships	2.1	2.1 U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Declassified source-protection and institutional-control case study	2.2	2.2 source title transformed into safe curriculum treatment; original: Soviet/Russian Architecture: Cheka → GPU → NKVD → MGB → KGB → SVR/FSB/GRU	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Declassified source-protection and institutional-control case study	2.3	2.3 source title transformed into safe curriculum treatment; original: British Architecture: MI5, MI6/SIS, GCHQ, DI, JIC	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Declassified source-protection and institutional-control case study	2.4	2.4 source title transformed into safe curriculum treatment; original: Israeli Architecture: Mossad, Shin Bet, Unit 8200, LAKAM	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Chinese Architecture: MSS, PLA-SSF, United Front Work Department, APT Groups	2.5	2.5 Chinese Architecture: MSS, PLA-SSF, United Front Work Department, APT Groups	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Five Eyes and Allied Intelligence Sharing: BRUSA to UKUSA	2.6	2.6 Five Eyes and Allied Intelligence Sharing: BRUSA to UKUSA	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Non-State Intelligence Actors: Terrorist, Criminal, PMC	2.7	2.7 Non-State Intelligence Actors: Terrorist, Criminal, PMC	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Fusion Centers, JITFs, and Inter-Agency Coordination	2.8	2.8 Fusion Centers, JITFs, and Inter-Agency Coordination	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Intelligence Oversight: Congressional, Judicial, Executive Mechanisms	2.9	2.9 Intelligence Oversight: Congressional, Judicial, Executive Mechanisms	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

6.3.3.5 Intelligence Community Architectures reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 6; [234, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Declassified source-protection and institutional-control case study	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
British Architecture: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Israeli Architecture: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Chinese Architecture: MSS, PLA-SSF, United Front Work Department, APT Groups	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Five Eyes and Allied Intelligence Sharing: BRUSA to UKUSA	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Non-State Intelligence Actors: Terrorist, Criminal, PMC	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

Lesson topic	Practice lens	Evidence artifact	Safety check
Fusion Centers, JITFs, and Inter-Agency Coordination	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Intelligence Oversight: Congressional, Judicial, Executive Mechanisms	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

6.3.3.6 Intelligence Community Architectures annotated source ledger: real titles and local contribution Each source cited by this **Analytic Tradecraft and Source Integrity** module is paired below with its real title and a one-line note on what it contributes to **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

Source	Cited work	What it contributes	Status
[234, 2026]	AI Act	The European Commission's official page on the AI Act, described as the first comprehensive legal framework on artificial intelligence worldwide. It explains the regulation's risk-based approach, classifying AI systems into unacceptable, high, transparency, and minimal risk tiers, with prohibited practices and strict requirements for high-risk uses.	verified source-guide
[247, 2026]	AI in the Public Sector	Official OECD.AI public-sector AI theme page.	original source-guide
[249, 2026]	GovTech: Putting People First	The official page for the World Bank's Global Program on GovTech and Public Sector Innovation, which helps governments use technology and data to improve public services and governance. It describes support for digital transformation in public administration across areas such as tax administration, public financial management, human resource systems, and citizen engagement, with cross-cutting themes including responsible AI and green digital transformation.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[277, 2026]	Endorsed WP29 Guidelines	This is a European Data Protection Board webpage listing guidelines and documents originating from the Article 29 Working Party that the EDPB endorsed at its first plenary meeting. The catalogued materials relate to the GDPR and cover topics such as consent and transparency, data breach notification, automated decision-making and profiling, data protection impact assessments, data protection officers, and binding corporate rules.	verified source-guide

Source	Cited work	What it contributes	Status
[284, 2026]	Verifiable Credential Data Integrity 1.0	The W3C Recommendation for Verifiable Credential Data Integrity 1.0, published May 2025, defining mechanisms for ensuring the authenticity and integrity of verifiable credentials using cryptographic proofs. It specifies a process of data transformation, hashing, and proof generation, and a corresponding verification procedure, along with a proof data model containing properties such as type, verification method, purpose, and proof value.	verified source-guide
[288, 2026]	Algorithmic Transparency Recording Standard Hub	A GOV.UK collection page serving as the hub for the UK Algorithmic Transparency Recording Standard (ATRS), maintained by the Government Digital Service. It provides a standardized template for documenting public-sector use of algorithmic tools, completion guidance, policy on scope and compliance, and a searchable repository of published transparency records.	verified source-guide
[289, 2026]	Guidance for Organisations Using the Algorithmic Transparency Recording Standard	This is a GOV.UK guidance page published by the Government Digital Service that instructs public sector organizations on completing the Algorithmic Transparency Recording Standard (ATRS) template and publishing their records to the GOV.UK repository. It applies both to central government bodies required to publish under mandatory policy and to other public sector bodies doing so voluntarily.	verified source-guide
[293, 2026]	Inventory of NARA Artificial Intelligence (AI) Use Cases	The National Archives and Records Administration (NARA) official inventory of its artificial intelligence use cases, documenting 14 projects across deployed, pilot, and planned stages. Deployed efforts include workplace productivity tools, automated tagging for museum experiences, and historical record retrieval, while pilots cover PII detection and redaction, semantic search, and metadata generation, and planned work targets FOIA processing and public search.	verified source-guide
[006, 2026]	Director of National Intelligence - Intelligence Community Directives	A Federation of American Scientists repository cataloguing the Intelligence Community Directives (ICDs) issued by the Director of National Intelligence. ICDs are the principal means by which the DNI provides policy, guidance, and direction to the U.S. Intelligence Community.	verified source-guide
[007, 2026]	THE FRIENDS BRITAIN'S POST-WAR SECRET INTELLIGENCE	It is SIS's task to pursue policy objectives by unorthodox means and to amass useful information.	original source-guide

Source	Cited work	What it contributes	Status
[008, 2026]	Mossad / Military History and Science	An EBSCO Research Starter reference article on the Mossad, Israel's national intelligence agency established in 1949 and responsible for foreign intelligence collection and counterterrorism operations conducted outside Israel's borders. It describes the agency's departmental structure (collection, political action and liaison, research, technology) and reviews historically documented operations including the 1960 capture of Adolf Eichmann and the rescue of Ethiopian Jews.	verified source-guide
[009, 2026]	"Here to stay" – Chinese state-affiliated hacking for strategic goals	A November 2023 report from MERICS (Mercator Institute for China Studies) analyzing Chinese state-affiliated cyber intrusions aimed at strategic goals. It argues that Chinese actors pursue long-term, persistent access to European technology firms and critical infrastructure for espionage rather than disruption, with targeting aligned to government priorities such as semiconductors, pharmaceuticals, and advanced manufacturing.	verified source-guide
[010, 2026]	The Five Eyes Archive	An online archive maintained by Unredacted UK that compiles declassified government documents on intelligence sharing among the Five Eyes nations (United States, United Kingdom, Canada, Australia, and New Zealand). The collection traces the emergence and evolution of bilateral and multilateral agreements from the postwar era, including the BRUSA and UKUSA agreements, drawing on records from UK, US, and Australian agencies plus freedom-of-information releases.	verified source-guide
[011, 2026]	BRUSA and UKUSA Agreements: GCHQ and NSA	A curated collection from Unredacted UK presenting documents declassified by the NSA and GCHQ in 2010 relating to US-UK signals intelligence cooperation. It covers the 1946 British-US Communications Agreement (BRUSA), its wartime origins from 1940, and its evolution into the 1956 UKUSA Agreement and the broader Five Eyes alliance.	verified source-guide
[012, 2026]	Counterintelligence Activities of Non-State Actors - Grey Dynamics	A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion.	verified source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide

Where this sits. This module's overview is Section 6; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

6.3.4 Intelligence Community Architectures governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 6; [234, 2026].

6.3.5 Intelligence Community Architectures analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 2's governance-boundary section, directly verified anchors for the **Analytic Tradecraft and Source Integrity** lane include [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]; [Agency, 2009]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Analytic Tradecraft and Source Integrity** for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**. [234, 2026]; [247, 2026].

Curriculum topic spine: U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships, **Declassified source-protection and institutional-control case study**, **British Architecture: Declassified source-protection and institutional-control case study**. **Verified anchor cluster:** [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]; [Agency, 2009]; [for the Study of Intelligence, 2002]; [for the Study of Intelligence, 1994]; [Agency, 2016].

Conceptual depth: turning uncertainty into reviewable judgment through sourcing, alternatives, separated likelihood and confidence language, warning indicators, and explicit analytic lineage.

Method stack: key assumptions check, analysis of competing hypotheses, diagnosticity review, indicators and warnings, probability calibration, red-team review, collective tradecraft rating, and source descriptor audit.

Composability contract: every agent output must preserve evidence, assumptions, judgments, likelihood, confidence, dissent, empirical limits, and change history as separable fields.

Known failure modes: source laundering, automation bias, hidden assumptions, collapsed likelihood/confidence language, hindsight certainty, SAT-as-bias-cure overclaiming, and visually persuasive but weakly sourced claims.

Defensive boundary: analysis remains educational and decision-supportive; it does not become tasking, targeting, covert collection, or policy advocacy. Applied to **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

Anchor	Why it matters here
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026e]	Official ODNI explanation of analytic objectivity, ombuds, and tradecraft standards. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.
[for the Study of Intelligence, 2002]	Official CIA Center for the Study of Intelligence essay on Kent's professionalization of intelligence analysis and analytic standards. Checked as of 2026-06-11; role: curriculum_anchor.
[for the Study of Intelligence, 1994]	Official CIA CSI republication of Kent's final essay on analyst-policy relations, warning, intention, and communication boundaries. Checked as of 2026-06-11; role: curriculum_anchor.
[Agency, 2016]	Defense intelligence structured-analysis primer for classroom analytic exercises. Checked as of 2026-05-21; role: curriculum_anchor.

6.3.5.1 Intelligence Community Architectures evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Analytic Tradecraft and Source Integrity** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [234, 2026]; [247, 2026].

6.3.6 Intelligence Community Architectures agentic boundary: assist, approve, block, and record

Evidence anchor. Section 6; [234, 2026].

AGEINT translation is bounded by the **Analytic Tradecraft and Source Integrity** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

6.3.6.1 Intelligence Community Architectures permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 6; [234, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

6.3.6.2 Intelligence Community Architectures excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [234, 2026]; [247, 2026] and **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

6.3.7 Intelligence Community Architectures governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 6; [234, 2026].

Governance is practiced as a gate on the **Analytic Tradecraft and Source Integrity** lane. Learners use the **Dissemination-and-Marking Control Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

6.3.7.1 Intelligence Community Architectures governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [234, 2026]; [247, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Analytic Tradecraft and Source Integrity** failure modes and the **Dissemination-and-Marking Control Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

6.3.7.2 Intelligence Community Architectures evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 6; [234, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Dissemination-and-Marking Control Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

6.3.7.3 Intelligence Community Architectures current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**. [234, 2026]; [247, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_odni_icd_203` for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**?	Intelligence Community Directive 203: Analytic Standards; lane `source_quality_spine`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official ODNI analytic tradecraft standards directive.
What does the module inherit from `official_odni_icd_206` for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**?	Intelligence Community Directive 206: Sourcing Requirements for Disseminated Analytic Products; lane `analytic_tradecraft`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official sourcing directive for traceability, citations, source descriptors, and source summaries.
What does the module inherit from `official_odni_objectivity` for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**?	Objectivity and IC Analytic Standards; lane `analytic_tradecraft`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official ODNI explanation of analytic objectivity, ombuds, and tradecraft standards.
What does the module inherit from `official_cia_tradecraft_primer` for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**?	A Tradecraft Primer: Structured Analytic Techniques for Improving Intelligence Analysis; lane `analytic_tradecraft`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official structured analytic techniques primer for bias checks, alternatives, and warning analysis.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 6; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

6.3.8 Intelligence Community Architectures assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 6; [234, 2026].

6.3.9 Intelligence Community Architectures assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 6; [234, 2026].

6.3.9.1 Intelligence Community Architectures capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study** and [234, 2026]; [247, 2026].

6.3.9.2 Intelligence Community Architectures instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study** and [234, 2026]; [247, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

6.3.9.3 Intelligence Community Architectures assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Declassified source-protection and institutional-control case study	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
British Architecture: Declassified source-protection and institutional-control case study	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

6.3.10 Intelligence Community Architectures refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [234, 2026]; [247, 2026] and **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**.

6.3.10.1 Intelligence Community Architectures refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**. The local signals begin with [234, 2026]; [247, 2026].

6.3.10.2 Intelligence Community Architectures claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**, and the source spine for these checks begins with [234, 2026]; [247, 2026].

6.3.11 Intelligence Community Architectures reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [234, 2026]; [247, 2026].

Triangulation anchors. In module 2's review-checklist section, directly verified anchors for the **Analytic Tradecraft and Source Integrity** lane include [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]; [Agency, 2009]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study**. [234, 2026]; [247, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

6.3.12 Intelligence Community Architectures learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **U.S. Intelligence Community: 18 Agencies, Authorities, and Relationships; Declassified source-protection and institutional-control case study** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [234, 2026]; [247, 2026].

Section 2, Section 4, Section 5, Section 7

7 Tradecraft: Core Principles

7.0.1 Tradecraft: Core Principles figures and course links: visual evidence, source flow, and navigation

The module uses Figure 35 and Figure 30 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 4, Section 6, Section 8.
This module teaches the **Governed Intelligence Cycle and Dissemination Architecture** lane through a bounded, source-backed coursebook chapter. [237, 2026]; [266, 2026].

7.1 Governed Intelligence Cycle and Dissemination Architecture frame for Tradecraft: Core Principles: source context, topic focus, and reader task

Evidence anchor. Section 7; [237, 2026].

7.1.1 Tradecraft: Core Principles orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 7; [237, 2026].

7.1.2 Tradecraft: Core Principles conceptual primer: source context, core model, and reader task

This chapter teaches analytic tradecraft as disciplined judgment under uncertainty: claims become useful only when evidence, assumptions, alternatives, confidence, and dissent remain visible. The chapter uses **Structured-Judgment Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.
The central distinction is to separate reporting from inference, and inference from judgment. Core topics include **What Is Tradecraft? Historical Definitions and Evolution; Operations security (OPSEC) governance; Compartmentation and need-to-know governance**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [237, 2026]; [266, 2026].
Learners move from vocabulary and the **Structured-Judgment Lens** distinction through topic lessons on **What Is Tradecraft? Historical Definitions and Evolution** with evidence and misconception checks, then assemble an **analytic note with hypotheses, evidence table, confidence, and dissent fields** with safety and rights gates.

7.1.3 Tradecraft: Core Principles learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 7; [237, 2026].

- Connect **What Is Tradecraft? Historical Definitions and Evolution and Operations security (OPSEC) governance** to **Governed Intelligence Cycle and Dissemination Architecture** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build an **analytic note with hypotheses, evidence table, confidence, and dissent fields** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate reporting from inference, and inference from judgment; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as cycle theater, undocumented dissemination, classification drift, unclear release authority, stale records assumptions, and feedback loops that hide bias, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: cycle and marking material remains public-source and educational; it never handles classified content, live release decisions, or source-method exposure.

7.1.4 Tradecraft: Core Principles core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 7; [237, 2026].

Term	Working definition
Source descriptor	a compact statement of where evidence came from and what it can support
Assumption	a claim accepted for analysis that still needs challenge
Alternative hypothesis	a plausible explanation that competes with the favored account
Confidence	a calibrated expression of evidentiary strength and analytic uncertainty
Dissent	a documented disagreement that preserves minority reasoning for review
What Is Tradecraft? Historical Definitions and…	Key terms: What, Is, Tradecraft.
Operations security (OPSEC) governance	Key terms: Operations, security, OPSEC.

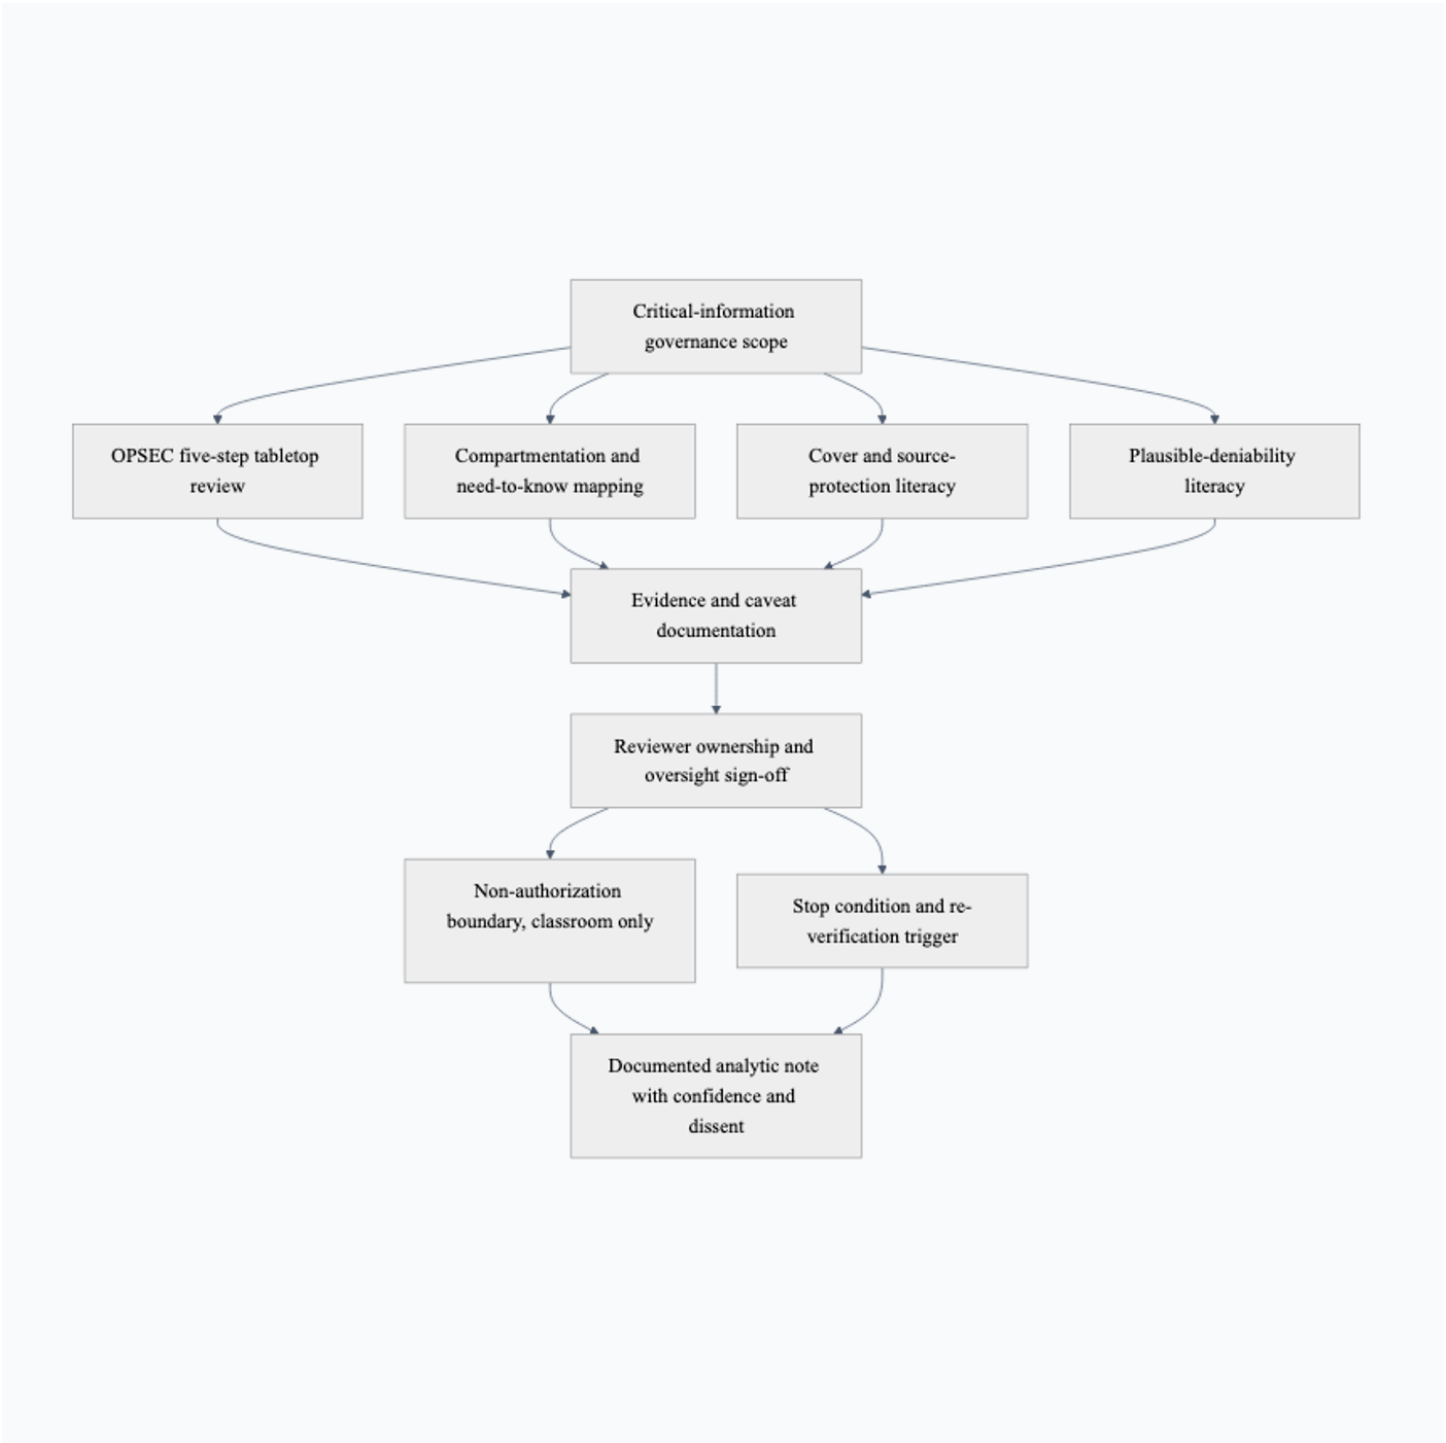

Figure 35: How core tradecraft concepts are taught as documented governance controls feeding analytic oversight, not as operational activity. It is anchored to the foundations of intelligence tradecraft / tradecraft core principles section; use it to inspect Critical-information governance scope, OPSEC five-step tabletop review, Compartmentation and need-to-know mapping, and Cover and source-protection literacy while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

7.2 Structured-Judgment Lens path for Tradecraft: Core Principles: lesson cluster, safe artifact, and review

Evidence anchor. Section 7; [237, 2026].

7.2.1 Tradecraft: Core Principles practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 7; [237, 2026].

7.2.2 Tradecraft: Core Principles topic lessons: source-backed concepts and transfer tasks

This module builds analytic tradecraft as disciplined judgment under uncertainty: claims become useful only when evidence, assumptions, alternatives, confidence, and dissent remain visible. The sequence opens with **What Is Tradecraft? Historical Definitions and Evolution**, **Operations security (OPSEC) governance**, **Compartmentation and need-to-know governance** and applies the **Structured-Judgment Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 30; module overview Section 7; curriculum atlas Section 2.

Triangulation anchors. In module 3's topic-lessons section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

7.2.2.1 Lesson 1: What Is Tradecraft? Historical Definitions and Evolution

Concept. What Is Tradecraft? Historical Definitions and Evolution treats operational tradecraft as governance: OPSEC, compartmentation, cover discipline, and oversight—not contact or evasion activity.

Why it matters. Analysts use **What Is Tradecraft? Historical Definitions** to separate reporting from inference, and inference from judgment. A defensible treatment names the judgment it enables for structured reasoning and source-integrity review, the proof limit that confusing governance vocabulary with operational authorization would otherwise hide, and the reviewer accountable for challenge.

Source support. What Is Tradecraft? Historical Definitions and Evolution rests on [013, 2026] and [014, 2026]. The closest source to this row notes: It surveys core disciplines such as surveillance and counter-surveillance, cover and disguise, technical and human intelligence work, and the field's evolution toward digital and cyber methods. Use them for fixing what **What Is Tradecraft? Historical Definitions and Evolution** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **What Is Tradecraft? Historical Definitions**, work from the cited evidence behind this row. [013, 2026] This is an instructional training document hosted on Scribd that introduces the fundamentals of intelligence tradecraft, defined as the methods and skills used in intelligence operations. It covers core concepts and types of tradecraft, cover and operational security, casing and surveillance, clandestine communication, and information gathering. [014, 2026] An educational article from TRDCRFT defining tradecraft as the techniques, strategies, and tools used by intelligence operatives to pursue objectives while maintaining secrecy and operational security. It surveys core disciplines such as surveillance and counter-surveillance, cover and disguise, technical and human intelligence work, and the field's evolution toward digital and cyber methods. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **What Is Tradecraft? Historical Definitions**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this structured reasoning and source-integrity review topic. The artifact must name the governance descriptor, the bounded claim about **What Is Tradecraft Historical Definitions**, the compartmentation caveat, the uncertainty note, the non-authorization boundary, and the reviewer who signs oversight. Shape **What Is Tradecraft? Historical Definitions** work as a **requirements-to-product traceability ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **What Is Tradecraft? Historical Definitions**: that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.

Transfer task. Reuse the **What Is Tradecraft? Historical Definitions** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

7.2.2.2 Lesson 2: Operations security (OPSEC) governance

Concept. Operations security (OPSEC) governance applies the five-step OPSEC process—identify critical information, analyze threats, analyze vulnerabilities, assess risk, apply countermeasures—in tabletop governance review only.

Why it matters. Analysts use **Operations security (OPSEC) governance** to separate reporting from inference, and inference from judgment. A defensible treatment names the judgment it enables for structured reasoning and source-integrity review, the proof limit that confusing governance vocabulary with operational authorization would otherwise hide, and the reviewer accountable for challenge.

Source support. Operations security (OPSEC) governance rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for pinning down the scope of **Operations security (OPSEC) governance**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. Read **Operations security (OPSEC) governance** against the works cited for this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Operations security (OPSEC) governance**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this structured reasoning and source-integrity review topic. The artifact must name the governance descriptor, the bounded claim about **Operations security governance**, the compartmentation caveat, the uncertainty note, the non-authorization boundary, and the reviewer who signs oversight. Shape this subject work as a **requirements-to-product traceability ledger** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Operations security (OPSEC) governance**: that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.

Transfer task. Reuse the **Operations security (OPSEC) governance** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

7.2.2.3 Lesson 3: Compartmentation and need-to-know governance

Concept. Compartmentation and need-to-know governance maps compartment boundaries, access lists, and need-to-know fields before any information moves across teams.

Why it matters. Compartmentation and need-to-know governance connects classroom vocabulary to Governed Intelligence Cycle and Dissemination Architecture practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Compartmentation and need-to-know governance rests on [297, 2026] and [298, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the claim that **Compartmentation and need-to-know governance** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **Compartmentation and need-to-know governance**, reason from the sources cited in this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this structured reasoning and source-integrity review topic. The artifact must name the governance descriptor, the bounded claim about **Compartmentation and need-to-know governance**, the compartmentation caveat, the uncertainty note, the non-authorization boundary, and the reviewer who signs oversight. Shape this subject work as a **requirements-to-product traceability ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Compartmentation and need-to-know governance**: that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.

Transfer task. Reuse the **Compartmentation and need-to-know governance** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

7.2.2.4 Lesson 4: Cover and legend governance literacy

Concept. Cover and legend governance literacy — Review cover-and-legend governance as oversight, documentation, and source-protection literacy—not identity fabrication.

Why it matters. Cover and legend governance literacy matters in the **Governed Intelligence Cycle and Dissemination Architecture** lane because structured reasoning and source-integrity evidence must stay separate from judgment; confusing governance vocabulary with operational authorization is a common failure.

Source support. Cover and legend governance literacy rests on [015, 2026]. The closest source to this row notes: It distinguishes official cover (diplomatic channels, immunity) from non-official cover (no government acknowledgment, less protection). Use it for the claim that **Cover and legend governance literacy** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **Cover and legend governance literacy**, reason from the sources cited in this row. [015, 2026] A Wikipedia article explaining the concept of cover in human intelligence and counterintelligence work, defined as the ostensible identity assumed by a covert agent. It distinguishes official cover (diplomatic channels, immunity) from non-official cover (no government acknowledgment, less protection). The article surveys historical examples of front organizations and assumed identities. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this structured reasoning and source-integrity review topic. The artifact must name the governance descriptor, the bounded claim about **Cover and legend governance literacy**, the compartmentation caveat, the uncertainty note, the non-authorization boundary, and the reviewer who signs oversight. Shape this subject work as a **requirements-to-product traceability ledger** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Cover and legend governance literacy**: that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.

Transfer task. Apply this module's safe boundary for **Cover and legend governance literacy** to another artifact while keeping structured reasoning and source-integrity review and reviewer ownership explicit.

7.2.2.5 Lesson 5: The Principle of Plausible Deniability

Concept. The Principle of Plausible Deniability treats operational tradecraft as governance: OPSEC, compartmentation, cover discipline, and oversight—not contact or evasion activity.

Why it matters. Analysts use **The Principle of Plausible Deniability** to separate reporting from inference, and inference from judgment. A defensible treatment names the judgment it enables for structured reasoning and source-integrity review, the proof limit that confusing governance vocabulary with operational authorization would otherwise hide, and the reviewer accountable for challenge.

Source support. The Principle of Plausible Deniability rests on [297, 2026] and [298, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the claim that **The Principle of Plausible Deniability** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **The Principle of Plausible Deniability**, work from the cited evidence behind this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **The Principle**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this structured reasoning and source-integrity review topic. The artifact must name the governance descriptor, the bounded claim about **Principle of Plausible Deniability**, the compartmentation caveat, the uncertainty note, the non-authorization boundary, and the reviewer who signs oversight. Shape **The Principle of Plausible Deniability** work as a **requirements-to-product traceability ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **The Principle of Plausible Deniability**: that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.

Transfer task. Apply this module's safe boundary for **The Principle of Plausible Deniability** to another artifact while keeping structured reasoning and source-integrity review and reviewer ownership explicit.

7.2.2.6 Lesson 6: Claim-ledger memory exercise that tracks evidence changes rather than people

Concept. Claim-ledger memory exercise that tracks evidence changes rather than people connects cognitive science claims to analytic bias literacy: what the brain prioritizes, what it misses, and how review compensates.

Why it matters. Claim-ledger memory exercise that tracks evidence changes rather than people connects classroom vocabulary to Governed Intelligence Cycle and Dissemination Architecture practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Claim-ledger memory exercise that tracks evidence changes rather than people rests on [016, 2026]. Its anchor reference records: Place where victim can be controlled with limited avenues of escape. Use it for fixing what **Claim-ledger memory exercise that tracks evidence changes rather than people** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. Ground **Claim-ledger memory exercise that tracks evidence changes rather than people** in the evidence the row cites. [016, 2026] Place where victim can be controlled with limited avenues of escape. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Claim-ledger memory exercise that tracks evidence changes rather than people**, build a claim-ledger memory card with source descriptor, source-change event, retention rule, contamination check, and reviewer disposition; it must not track real people, assets, or behavioral patterns. Shape this subject work as a **requirements-to-product traceability ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a current record reflects the original, when undocumented changes to evidence over time can silently rewrite what is remembered.

Transfer task. Transfer **Claim-ledger memory exercise that tracks evidence changes rather than people** from this module to a second motif by preserving structured reasoning and source-integrity review, replacing action with audit, and naming the blocked use.

7.2.2.7 Lesson 7: Situational Awareness: Urban and Rural Tradecraft

Concept. Situational Awareness: Urban and Rural Tradecraft treats operational tradecraft as governance: OPSEC, compartmentation, cover discipline, and oversight—not contact or evasion activity.

Why it matters. Situational Awareness connects classroom vocabulary to Governed Intelligence Cycle and Dissemination Architecture practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Situational Awareness: Urban and Rural Tradecraft rests on [014, 2026]. The most specific cited work observes: An educational article from TRDCRFT defining tradecraft as the techniques, strategies, and tools used by intelligence operatives to pursue objectives while maintaining secrecy and operational security. Use it for pinning down the scope of **Situational Awareness: Urban and Rural Tradecraft**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **Situational Awareness**, work from the cited evidence behind this row. [014, 2026] An educational article from TRDCRFT defining tradecraft as the techniques, strategies, and tools used by intelligence operatives to pursue objectives while maintaining secrecy and operational security. It surveys core disciplines such as surveillance and counter-surveillance, cover and disguise, technical and human intelligence work, and the field's evolution toward digital and cyber methods. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Situational Awareness**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this structured reasoning and source-integrity review topic. The artifact must name the governance descriptor, the bounded claim about **Situational Awareness**, the compartmentation caveat, the uncertainty note, the non-authorization boundary, and the reviewer who signs oversight. Shape **Situational Awareness** work as a **requirements-to-product traceability ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Situational Awareness**: that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.

Transfer task. Reuse the **Situational Awareness** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

7.2.2.8 Lesson 8: Code Words, Glossaries, and the Language of Espionage

Concept. Code Words, Glossaries, and the Language of Espionage treats operational tradecraft as governance: OPSEC, compartmentation, cover discipline, and oversight—not contact or evasion activity.

Why it matters. Code Words, Glossaries, and the Language of Espionage matters in the **Governed Intelligence Cycle and Dissemination Architecture** lane because structured reasoning and source-integrity evidence must stay separate from judgment; confusing governance vocabulary with operational authorization is a common failure.

Source support. Code Words, Glossaries, and the Language of Espionage rests on [017, 2026]. The lead source's own note reads: An educational glossary from the International Spy Museum, a nonprofit institution in Washington, DC, presenting an alphabetized dictionary of espionage terminology. Use it for the claim that **Code Words, Glossaries, and the Language of Espionage** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. Ground **Code Words, Glossaries, and the Language of Espionage** in the evidence the row cites. [017, 2026] An educational glossary from the International Spy Museum, a nonprofit institution in Washington, DC, presenting an alphabetized dictionary of espionage terminology. It defines operational roles (agent, handler, case officer), intelligence disciplines such as HUMINT, SIGINT, and IMINT, major organizations (CIA, FBI, KGB, MI5, MI6, NSA), and historical equipment like the Enigma machine and U-2 aircraft. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Code Words, Glossaries, and the Language of Espionage**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this structured reasoning and source-integrity review topic. The artifact must name the governance descriptor, the bounded claim about **Code Words Glossaries and the**, the compartmentation caveat, the uncertainty note, the non-authorization boundary, and the reviewer who signs oversight. Shape this subject work as a **requirements-to-product traceability ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Code Words, Glossaries, and the Language of Espionage**: that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.

Transfer task. Apply this module's safe boundary for **Code Words, Glossaries, and the Language of Espionage** to another artifact while keeping structured reasoning and source-integrity review and reviewer ownership explicit.

7.2.2.9 Lesson 9: Historical clandestine-communications ethics

Concept. Historical clandestine-communications ethics uses the historical motif to discuss source-protection ethics, documentation, and oversight without recreating handling procedures.

Why it matters. Analysts use **Historical clandestine-communications ethics** to separate reporting from inference, and inference from judgment. A defensible treatment names the judgment it enables for structured reasoning and source-integrity review, the proof limit that cycle theater would otherwise hide, and the reviewer accountable for challenge.

Source support. Historical clandestine-communications ethics rests on [018, 2026], [005, 2026], and [019, 2026]. The closest source to this row notes: 1, March 2026). Use them for fixing what **Historical clandestine-communications ethics** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2015].

Evidence to inspect. For **Historical clandestine-communications ethics**, work from the cited evidence behind this row. [018, 2026] A Nextgov article reporting on an essay in the CIA's Studies in Intelligence journal by RAND researcher Thomas Mulligan. It argues that as AI makes deepfakes and synthetic communications easier, trust in digital channels erodes, paradoxically increasing the value of traditional human intelligence methods. [005, 2026] A blog post on SemperVerus summarizing a CIA Studies in Intelligence article, "Espionage in Our AI Future: Why Human Intelligence Still Matters" (Vol. 70, No. 1, March 2026). It argues that as AI makes technical intelligence cheaper and AI-driven fabrication more pervasive, human intelligence becomes relatively more valuable, since human specialists are needed to verify source reliability over time. [019, 2026] By Thomas Mulligan, a researcher at the RAND Corporation who served in CIA during 2008–14. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this structured reasoning and source-integrity review topic. The artifact must cite the historical descriptor, the bounded lesson about **Historical clandestine-communications**

ethics, the handling caveat, the uncertainty note, the protected-tradecraft boundary, and the reviewer who clears the account. Shape this subject work as a **requirements-to-product traceability ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Historical clandestine-communications ethics**: that a documented handling precedent licenses repeating the approach, rather than a case-bound record whose risks must be re-assessed each time.

Transfer task. Apply this module's safe boundary for **Historical clandestine-communications ethics** to another artifact while keeping structured reasoning and source-integrity review and reviewer ownership explicit.

7.2.3 Tradecraft: Core Principles worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic analyst cell evaluates whether a benign supplier delay signals normal friction or elevated risk. [237, 2026]; [266, 2026].

Triangulation anchors. In module 3's worked-example section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **intelligence-cycle governance**. Learners use a **requirements-to-product traceability ledger** and keep this boundary visible: Activities stay inside public, synthetic, or instructor-provided materials and never become live collection or tasking.

Frame. The classroom question centers on **What Is Tradecraft? Historical Definitions and Evolution**. Excluded actions stay explicit, and the **Structured-Judgment Lens** planning question is: Which assumptions, alternatives, confidence statements, and source limits must stay visible for review?

Inputs. For the **What Is Tradecraft? Historical Definitions and Evolution** scenario, use synthetic shipment notes, public policy excerpts, and a short instructor-provided event timeline. The Structured-Judgment Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **What Is Tradecraft? Historical Definitions and Evolution**, students write hypotheses, list evidence for and against each, mark assumptions, and assign confidence only after alternatives are tested. Pause whenever an inference about What Is Tradecraft? Historical Definitions and Evolution appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **What Is Tradecraft? Historical Definitions and Evolution** classroom scenario; unit artifact = requirements-to-product traceability ledger; evidence = allowed inputs; method = structured reasoning and source-integrity review; output = an analytic note with a hypothesis table, confidence statement, dissent field, and collection gap list; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **What Is Tradecraft? Historical Definitions and Evolution** as "Structured-Judgment Lens confirms it" is not enough. The revision ties the claim to structured reasoning and source-integrity review, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **What Is Tradecraft? Historical Definitions and Evolution** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

7.2.4 Tradecraft: Core Principles practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Structured-Judgment Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

Triangulation anchors. In module 3's practice-sequence section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare What Is Tradecraft? Historical Definitions and Evolution, Operations security governance, Compartmentation and need-to-know governance; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Governed Intelligence Cycle and Dissemination Architecture** lane.
2. Frame	Answer the lens question: Which assumptions, alternatives, confidence statements, and source limits must stay visible for review?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for What Is Tradecraft? Historical Definitions and Evolution: analytic note with hypotheses, evidence table, confidence, and dissent fields.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the requirements-to-product traceability ledger fields for What Is Tradecraft? Historical Definitions and Evolution.	Unit profile note.	Evidence artifacts include requirement card, source descriptor.
4. Challenge	Test the misconception that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.	Failure-mode note.	The artifact applies the key distinction: separate reporting from inference, and inference from judgment.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

7.2.4.1 Tradecraft: Core Principles instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**. [237, 2026]; [266, 2026].

7.2.4.2 Tradecraft: Core Principles extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 7; [237, 2026].

Have learners swap artifacts and apply the **Structured-Judgment Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

7.2.5 Tradecraft: Core Principles knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 7; [237, 2026].

1. Explain how **What Is Tradecraft? Historical Definitions and Evolution** is defined here; name the source descriptor that supports the definition.
2. Contrast **What Is Tradecraft? Historical Definitions and Evolution** with **Operations security governance** using the **Structured-Judgment Lens** artifact fields.
3. Identify one failure mode from the **Governed Intelligence Cycle and Dissemination Architecture** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which assumption would change the judgment if it were false?
5. Correct this misconception: that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.

7.2.5.1 Tradecraft: Core Principles answer quality rubric: source evidence, uncertainty, and safe transfer

Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **What Is Tradecraft? Historical Definitions and Evolution** without source evidence, uncertainty, or a safe transfer task.

7.3 Tradecraft: Core Principles assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 7; [237, 2026].

7.3.1 Tradecraft: Core Principles evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 7; [237, 2026].

7.3.2 Tradecraft: Core Principles transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 7; [237, 2026].

7.3.2.1 Tradecraft: Core Principles lineage and source tradition: profile, concepts, and first anchors This sits in the **Governed Intelligence Cycle and Dissemination Architecture** lineage: treating the intelligence cycle as a governed information system whose collection, processing, analysis, dissemination, evaluation, marking, and records obligations stay explicit. [237, 2026]; [266, 2026].

7.3.2.2 Tradecraft: Core Principles working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 7; [237, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**, with provenance and reviewability throughout.

7.3.2.3 Tradecraft: Core Principles knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** requirements, audience needs, public-source evidence, caveats, and feedback signals. [237, 2026]; [266, 2026].
- **Transforms:** requirement framing, collection scoping, source evaluation, analytic judgment, dissemination, and feedback review.
- **Outputs:** release-neutral brief, audience map, caveat register, and feedback note.
- **Failure modes:** unscoped audiences, missing caveats, weak records, and product reuse without feedback.

7.3.2.4 Tradecraft: Core Principles transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 7; [237, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.
- **Evidence contract:** keep the **Governed Intelligence Cycle and Dissemination Architecture** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as release-neutral brief, audience map, caveat register, and feedback note that another reviewer can audit.

7.3.2.5 Tradecraft: Core Principles profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 7; [237, 2026].

The matched profile emphasizes treating the intelligence cycle as a governed information system whose collection, processing, analysis, dissemination, evaluation, marking, and records obligations stay explicit. The method stack is cycle mapping, priority-to-product traceability, data-lifecycle mapping, classification vocabulary review, dissemination-caveat audit, customer feedback, and oversight checkpointing; the local topic cluster is **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

7.3.3 Tradecraft: Core Principles evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 7; [237, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Governed Intelligence Cycle and Dissemination Architecture** profile tells reviewers what evidence is strong enough for the module artifact built around **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

7.3.3.1 Tradecraft: Core Principles guide source spine: inherited keys and local citation roles Primary guide citations: [237, 2026]; [266, 2026]; [269, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [013, 2026]; [014, 2026]; [015, 2026]; [016, 2026]; [017, 2026]; [018, 2026]; [005, 2026]; [019, 2026]; [297, 2026]; [298, 2026].

7.3.3.2 Tradecraft: Core Principles verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [237, 2026]; [266, 2026].

Tier	What counts	How it is used
Source guide	[237, 2026]; [266, 2026]; [269, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [013, 2026]; [014, 2026]; [015, 2026]; [016, 2026]; [017, 2026]; [018, 2026]; [005, 2026]; [019, 2026]; [297, 2026]; [298, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 3's source-canon section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance** and [237, 2026]; [266, 2026], but only directly verified source URLs are encoded as citations.

7.3.3.3 Tradecraft: Core Principles intelligence practice lens: evidence artifact and safety check Practice lens: **Structured-Judgment Lens** for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**. [237, 2026]; [266, 2026].

Planning question: Which assumptions, alternatives, confidence statements, and source limits must stay visible for review?

Evidence artifact: analytic note with hypotheses, evidence table, confidence, and dissent fields.

Validation rule: separate raw reporting, inference, judgment, and recommendation before synthesis. Applied to **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

Handoff contract: handoff preserves alternatives, uncertainty, caveats, and revision history for downstream modules.

Safety check: avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence.

7.3.3.4 Tradecraft: Core Principles runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 7; [237, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	3.99	3.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Tradecraft: Core Principles to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	3.101	3.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Tradecraft: Core Principles	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Model-card, recoverability, retention, and learner-support evidence package	3.102	3.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Tradecraft: Core Principles	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
What Is Tradecraft? Historical Definitions and Evolution	3.1	3.1 What Is Tradecraft? Historical Definitions and Evolution	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Operations security (OPSEC) governance	3.2	3.2 source title transformed into safe curriculum treatment; original: Operational Security (OPSEC): Process and the Five-Step Method	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Compartmentation and need-to-know governance	3.3	3.3 source title transformed into safe curriculum treatment; original: Compartmentation: Need-to-Know vs. Need-to-Share	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Cover and legend governance literacy	3.4	3.4 source title transformed into safe curriculum treatment; original: Cover: Official, Non-Official Cover (NOC), Deep Cover, Legends	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
The Principle of Plausible Deniability	3.5	3.5 The Principle of Plausible Deniability	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Claim-ledger memory exercise that tracks evidence changes rather than people	3.6	3.6 source title transformed into safe curriculum treatment; original: Pattern-of-Life Analysis and How to Disrupt It	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Situational Awareness: Urban and Rural Tradecraft	3.7	3.7 Situational Awareness: Urban and Rural Tradecraft	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Code Words, Glossaries, and the Language of Espionage	3.8	3.8 Code Words, Glossaries, and the Language of Espionage	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Historical clandestine-communications ethics	3.9	3.9 source title transformed into safe curriculum treatment; original: Return of Classical Tradecraft in the AI Era: Dead Drops, Brush Passes, In-Person Exchanges	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

7.3.3.5 Tradecraft: Core Principles reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 7; [237, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
What Is Tradecraft? Historical Definitions and Evolution	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Operations security (OPSEC) governance	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Compartmentation and need-to-know governance	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Cover and legend governance literacy	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
The Principle of Plausible Deniability	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

Lesson topic	Practice lens	Evidence artifact	Safety check
Claim-ledger memory exercise that tracks evidence changes rather than people	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Situational Awareness: Urban and Rural Tradecraft	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Code Words, Glossaries, and the Language of Espionage	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Historical clandestine-communications ethics	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

7.3.3.6 Tradecraft: Core Principles annotated source ledger: real titles and local contribution Each source cited by this **Governed Intelligence Cycle and Dissemination Architecture** module is paired below with its real title and a one-line note on what it contributes to **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

Source	Cited work	What it contributes	Status
[237, 2026]	Artificial Intelligence: An Accountability Framework for Federal Agencies and Other Entities	Official GAO AI accountability framework.	original source-guide
[266, 2026]	PROV Overview	A W3C Working Group Note from 2013 that provides an overview and roadmap for the PROV family of specifications for representing and exchanging provenance information on the web. It defines provenance as information about the entities, activities, and people involved in producing data, used to assess quality, reliability, and trustworthiness.	verified source-guide
[269, 2026]	Data on the Web Best Practices	A W3C Recommendation, "Data on the Web Best Practices," published January 31, 2017 by the Data on the Web Best Practices Working Group. It offers 35 best practices for publishing and consuming data on the Web, covering metadata, licensing and provenance, data quality, dataset versioning, persistent URIs, machine-readable formats, vocabulary reuse, access methods, preservation, and feedback.	verified source-guide
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide
[279, 2026]	Open Contracting Data Standard	The documentation homepage for the Open Contracting Data Standard, version 1.1.5, maintained by the Open Contracting Partnership to support disclosure of government contracting data across the procurement lifecycle. It provides a common data model spanning planning, tender, award, contract, and implementation stages, along with a primer, implementation guidance, technical schemas, and validation tooling.	verified source-guide

Source	Cited work	What it contributes	Status
[283, 2026]	Recommendation of the Council on Open Government	An OECD legal instrument document reproducing the Recommendation of the Council on Open Government (OECD/LEGAL/0438), adopted on 14 December 2017. It defines open government as a culture of governance promoting transparency, integrity, accountability, and stakeholder participation in support of democracy and inclusive growth.	verified source-guide
[290, 2026]	NIST SP 800-218A: Secure Software Development Practices for Generative AI and Dual-Use Foundation Models	NIST Special Publication 800-218A (July 2024), which augments the Secure Software Development Framework with practices specific to AI model development across the software lifecycle. Produced in response to Executive Order 14110, it addresses AI model producers, developers building on those models, and acquirers of AI systems, and is designed to be used alongside NIST SP 800-218.	verified source-guide
[291, 2026]	Revised 508 Standards and 255 Guidelines	Official documentation from the U.S. Access Board on the Revised 508 Standards and 255 Guidelines for information and communication technology accessibility. It establishes mandatory accessibility requirements for federal agencies and voluntary guidelines for telecommunications manufacturers, covering hardware, software, websites, electronic documents, and support services.	verified source-guide
[294, 2026]	M-25-21: Accelerating Federal Use of AI through Innovation, Governance, and Public Trust	An April 2025 Office of Management and Budget memorandum (M-25-21) directing executive branch agencies on federal use of artificial intelligence. Issued under Executive Order 14179, it instructs agencies to accelerate adoption of AI to improve public services and government efficiency while maintaining safeguards for civil rights, civil liberties, and privacy.	verified source-guide
[013, 2026]	Intelligence Tradecraft Overview / PDF / Surveillance	This is an instructional training document hosted on Scribd that introduces the fundamentals of intelligence tradecraft, defined as the methods and skills used in intelligence operations. It covers core concepts and types of tradecraft, cover and operational security, casing and surveillance, clandestine communication, and information gathering.	verified source-guide context; do not use as primary analytic support
[014, 2026]	Tradecraft: Covert Operative Tactics and Techniques	An educational article from TRDCRFT defining tradecraft as the techniques, strategies, and tools used by intelligence operatives to pursue objectives while maintaining secrecy and operational security. It surveys core disciplines such as surveillance and counter-surveillance, cover and disguise, technical and human intelligence work, and the field's evolution toward digital and cyber methods.	verified source-guide

Source	Cited work	What it contributes	Status
[015, 2026]	Cover (intelligence gathering)	A Wikipedia article explaining the concept of cover in human intelligence and counterintelligence work, defined as the ostensible identity assumed by a covert agent. It distinguishes official cover (diplomatic channels, immunity) from non-official cover (no government acknowledgment, less protection). The article surveys historical examples of front organizations and assumed identities.	verified source-guide context; do not use as primary analytic support
[016, 2026]	Surveillance Detection - State.gov	Place where victim can be controlled with limited avenues of escape.	original source-guide
[017, 2026]	Language of Espionage / International Spy Museum	An educational glossary from the International Spy Museum, a nonprofit institution in Washington, DC, presenting an alphabetized dictionary of espionage terminology. It defines operational roles (agent, handler, case officer), intelligence disciplines such as HUMINT, SIGINT, and IMINT, major organizations (CIA, FBI, KGB, MI5, MI6, NSA), and historical equipment like the Enigma machine and U-2 aircraft.	verified source-guide
[018, 2026]	Old-school spycraft could make a comeback as AI undermines trust	A Nextgov article reporting on an essay in the CIA's Studies in Intelligence journal by RAND researcher Thomas Mulligan. It argues that as AI makes deepfakes and synthetic communications easier, trust in digital channels erodes, paradoxically increasing the value of traditional human intelligence methods.	verified source-guide
[005, 2026]	CIA: Studies in AI and Human Intelligence - SemperVerus	A blog post on SemperVerus summarizing a CIA Studies in Intelligence article, "Espionage in Our AI Future: Why Human Intelligence Still Matters" (Vol. 70, No. 1, March 2026). It argues that as AI makes technical intelligence cheaper and AI-driven fabrication more pervasive, human intelligence becomes relatively more valuable, since human specialists are needed to verify source reliability over time.	verified source-guide
[019, 2026]	Espionage in Our AI Future: Why Human Intelligence Still Matters - CSI	By Thomas Mulligan, a researcher at the RAND Corporation who served in CIA during 2008–14.	original source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide

Where this sits. This module's overview is Section 7; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

7.3.4 Tradecraft: Core Principles governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 7; [237, 2026].

7.3.5 Tradecraft: Core Principles analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 3's governance-boundary section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Analytic Tradecraft and Source Integrity** for **What Is Tradecraft? Historical Definitions and Evolution; Operations security (OPSEC) governance**. [237, 2026]; [266, 2026].

Curriculum topic spine: What Is Tradecraft? Historical Definitions and Evolution, **Operations security (OPSEC) governance**, **Compartmentation and need-to-know governance**. **Verified anchor cluster:** [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2026e]; [Agency, 2009]; [for the Study of Intelligence, 2002]; [for the Study of Intelligence, 1994]; [Agency, 2016].

Conceptual depth: turning uncertainty into reviewable judgment through sourcing, alternatives, separated likelihood and confidence language, warning indicators, and explicit analytic lineage.

Method stack: key assumptions check, analysis of competing hypotheses, diagnosticity review, indicators and warnings, probability calibration, red-team review, collective tradecraft rating, and source descriptor audit.

Composability contract: every agent output must preserve evidence, assumptions, judgments, likelihood, confidence, dissent, empirical limits, and change history as separable fields.

Known failure modes: source laundering, automation bias, hidden assumptions, collapsed likelihood/confidence language, hindsight certainty, SAT-as-bias-cure overclaiming, and visually persuasive but weakly sourced claims.

Defensive boundary: analysis remains educational and decision-supportive; it does not become tasking, targeting, covert collection, or policy advocacy. Applied to **What Is Tradecraft? Historical Definitions and Evolution; Operations security (OPSEC) governance**.

Anchor	Why it matters here
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026e]	Official ODNI explanation of analytic objectivity, ombuds, and tradecraft standards. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.
[for the Study of Intelligence, 2002]	Official CIA Center for the Study of Intelligence essay on Kent's professionalization of intelligence analysis and analytic standards. Checked as of 2026-06-11; role: curriculum_anchor.
[for the Study of Intelligence, 1994]	Official CIA CSI republication of Kent's final essay on analyst-policy relations, warning, intention, and communication boundaries. Checked as of 2026-06-11; role: curriculum_anchor.
[Agency, 2016]	Defense intelligence structured-analysis primer for classroom analytic exercises. Checked as of 2026-05-21; role: curriculum_anchor.

7.3.5.1 Tradecraft: Core Principles evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Governed Intelligence Cycle and Dissemination Architecture** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [237, 2026]; [266, 2026].

7.3.6 Tradecraft: Core Principles agentic boundary: assist, approve, block, and record

Evidence anchor. Section 7; [237, 2026].

AGEINT translation is bounded by the **Governed Intelligence Cycle and Dissemination Architecture** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

7.3.6.1 Tradecraft: Core Principles permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 7; [237, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

7.3.6.2 Tradecraft: Core Principles excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [237, 2026]; [266, 2026] and **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

7.3.7 Tradecraft: Core Principles governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 7; [237, 2026].

Governance is practiced as a gate on the **Governed Intelligence Cycle and Dissemination Architecture** lane. Learners use the **Structured-Judgment Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

7.3.7.1 Tradecraft: Core Principles governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [237, 2026]; [266, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Governed Intelligence Cycle and Dissemination Architecture** failure modes and the **Structured-Judgment Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

7.3.7.2 Tradecraft: Core Principles evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 7; [237, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Structured-Judgment Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

7.3.7.3 Tradecraft: Core Principles current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**. [237, 2026]; [266, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_intelligence_gov_how_ic_works` for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**?	How the IC Works; lane `governed_intelligence_cycle`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners.
What does the module inherit from `official_odni_icd_203` for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**?	Intelligence Community Directive 203: Analytic Standards; lane `source_quality_spine`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official ODNI analytic tradecraft standards directive.
What does the module inherit from `official_odni_icd_204` for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**?	Intelligence Community Directive 204: National Intelligence Priorities Framework; lane `collection_management`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation.
What does the module inherit from `official_odni_icd_504` for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**?	Intelligence Community Directive 504: Intelligence Community Data Management; lane `ai_ethics_data_governance`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official IC data-management directive for data governance, data stewardship, CDO authority, interoperability, and data lifecycle management.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 7; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

7.3.8 Tradecraft: Core Principles assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 7; [237, 2026].

7.3.9 Tradecraft: Core Principles assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 7; [237, 2026].

7.3.9.1 Tradecraft: Core Principles capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**. Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance** and [237, 2026]; [266, 2026].

7.3.9.2 Tradecraft: Core Principles instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance** and [237, 2026]; [266, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

7.3.9.3 Tradecraft: Core Principles assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
What Is Tradecraft? Historical Definitions and Evolution	Completed **analytic note with hypotheses, evidence table, confidence, and dissent fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Operations security (OPSEC) governance	Completed **analytic note with hypotheses, evidence table, confidence, and dissent fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Compartmentation and need-to-know governance	Completed **analytic note with hypotheses, evidence table, confidence, and dissent fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

7.3.10 Tradecraft: Core Principles refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [237, 2026]; [266, 2026] and **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**.

7.3.10.1 Tradecraft: Core Principles refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**. The local signals begin with [237, 2026]; [266, 2026].

7.3.10.2 Tradecraft: Core Principles claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**, and the source spine for these checks begins with [237, 2026]; [266, 2026].

7.3.11 Tradecraft: Core Principles reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [237, 2026]; [266, 2026].
Triangulation anchors. In module 3's review-checklist section, directly verified anchors for the **Governed Intelligence Cycle and Dissemination Architecture** lane include [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]; [of the Director of National Intelligence, 2025a]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance**. [237, 2026]; [266, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

7.3.12 Tradecraft: Core Principles learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **What Is Tradecraft? Historical Definitions and Evolution; Operations security governance** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [237, 2026]; [266, 2026].
Section 2, Section 4, Section 6, Section 8

8 HUMAN INTELLIGENCE (HUMINT)

8.1 HUMAN INTELLIGENCE (HUMINT) learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 8; [238, 2026].

8.1.1 human-source literacy and source protection discipline spine: domain question and learning focus

Evidence anchor. Section 8; [238, 2026].
This unit teaches **human-source literacy and source protection**. HUMINT lessons focus on motivation literacy, validation, consent, source risk, debrief hygiene, and oversight without teaching contact handling.

8.1.2 human-source literacy and source protection source-use contract: citation roles and evidence limits

Evidence anchor. Section 8; [238, 2026].
Use guide citations for HUMINT vocabulary and official oversight anchors for source-risk, minimization, and governance claims.

8.1.3 human-source literacy and source protection practice artifact: recurring packet and retained evidence

Evidence anchor. Section 8; [238, 2026].
The recurring practice artifact is a **source-risk and validation ethics worksheet** that draws on validation note, pressure-risk checklist, source-protection boundary, and oversight escalation memo. The unit keeps its learning spine explicit. Learners distinguish motivation frameworks from authorization, identify validation limits, and route sensitive concerns to oversight.

8.1.4 human-source literacy and source protection safety boundary: accountable, synthetic, and evidence-bounded limits

No elicitation, impersonation, covert contact, or operational source-management procedures; all cases use classroom fixtures.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [238, 2026]; [239, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [238, 2026]; [239, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [238, 2026]; [239, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [238, 2026]; [239, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Collection Management and Multi-INT Requirements Discipline. Core anchors: [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]. Conceptual focus: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. Composability contract: requirements, authorities, source disciplines, collection notes, retention limits, caveats, and evaluation metrics remain separable. **Practice lens:** Requirements-to-Evidence Lens; What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit? [238, 2026]; [239, 2026].

8.1.5 HUMAN INTELLIGENCE (HUMINT) visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 36 and Figure 37 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 7, Section 9.

8.1.6 HUMAN INTELLIGENCE (HUMINT) module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
Agent Recruitment	Section 9	[238, 2026]; [239, 2026]; [240, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [020, 2026]; [021, 2026]; [298, 2026]; [297, 2026]; [022, 2026]; [023, 2026]; [024, 2026]; [004, 2026].
Agent Handling and Management	Section 10	[239, 2026]; [240, 2026]; [241, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [025, 2026]; [029, 2026]; [004, 2026]; [026, 2026]; [016, 2026]; [027, 2026]; [028, 2026]; [030, 2026]; [031, 2026]; [032, 2026].

Module	Section reference	Source spine
Source Protection and CI Integration	Section 11	[238, 2026]; [241, 2026]; [266, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [307, 2026]; [305, 2026]; [304, 2026]; [029, 2026]; [033, 2026]; [019, 2026]; [034, 2026].

Figure 36: The unit module map traces the part's chapters as a linear reading sequence. In the human intelligence humint section, it lets readers compare 3 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last so the visual functions as a traceable course aid rather than an unscoped assertion.

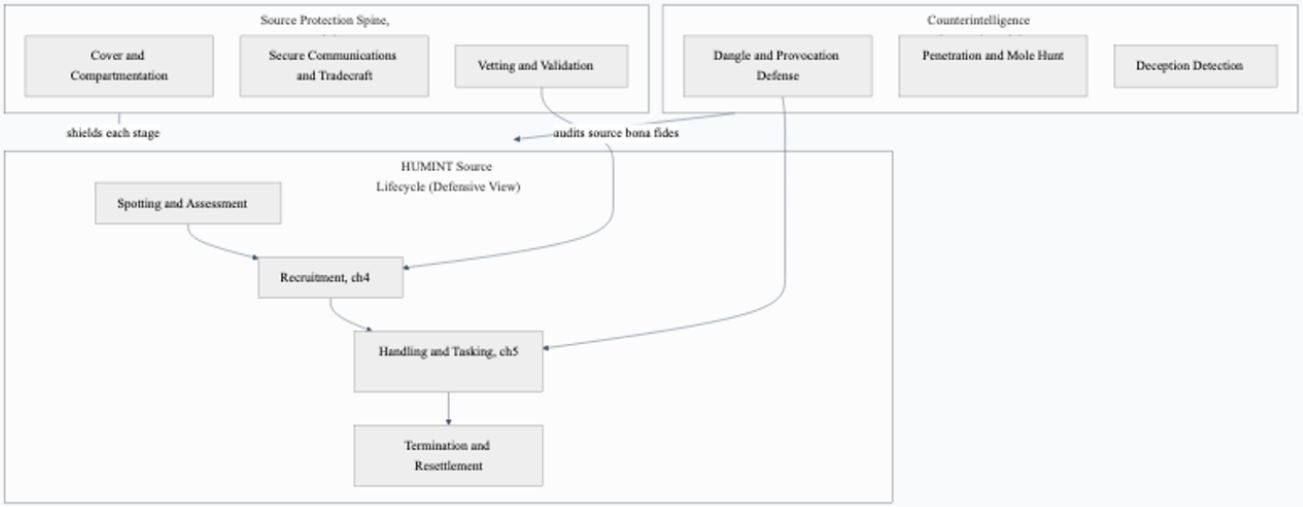

Figure 37: Part II presents HUMINT defensively as a managed source lifecycle (recruitment ch4, handling ch5) wrapped by a source-protection spine and continuous counterintelligence validation (ch6). It is anchored to the human intelligence humint section; use it to inspect HUMINT Source Lifecycle (Defensive View), Spotting and Assessment, Recruitment, ch4, and Handling and Tasking, ch5 while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

9 Agent Recruitment

9.0.1 Agent Recruitment figures and course links: visual evidence, source flow, and navigation

The module uses Figure 38 and Figure 36 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 8, Section 10.
This module teaches the **Collection Management and Multi-INT Requirements Discipline** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [239, 2026].

9.1 Collection Management and Multi-INT Requirements Discipline frame for Agent Recruitment: source context, topic focus, and reader task

Evidence anchor. Section 9; [238, 2026].

9.1.1 Agent Recruitment orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 9; [238, 2026].

9.1.2 Agent Recruitment conceptual primer: source context, core model, and reader task

This chapter teaches collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The chapter uses **Requirements-to-Evidence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.
The central distinction is to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. Core topics include **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy; Spotting indicators literacy for recruitment-risk**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [239, 2026].
Learners move from vocabulary and the **Requirements-to-Evidence Lens** distinction through topic lessons on **MICE Framework for recruitment-risk literacy** with evidence and misconception checks, then assemble a **requirements matrix with source descriptors, caveats, and collection limits** with safety and rights gates.

9.1.3 Agent Recruitment learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 9; [238, 2026].

- Connect **MICE Framework for recruitment-risk literacy and MICE Expanded: MICE Framework for recruitment-risk literacy** to **Collection Management and Multi-INT Requirements Discipline** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **requirements matrix with source descriptors, caveats, and collection limits** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures.

9.1.4 Agent Recruitment core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 9; [238, 2026].

Term	Working definition
Priority	the relative importance of an intelligence question
Source discipline	a broad evidence channel such as HUMINT, SIGINT, GEOINT, OSINT, or FININT
Minimization	the rule that limits acquisition, retention, or use of unnecessary information
Source protection	the duty to reduce risk to people, methods, and sensitive relationships
Evaluation	the feedback step that tests whether the evidence satisfied the requirement
Gray-zone indicator	an observable signal of ambiguous coercion below armed conflict thresholds
Proxy pattern	a relationship suggesting indirect sponsorship without confirmed operational control
MICE Framework for recruitment-risk literacy	Key terms: MICE, Framework, recruitment.
MICE Expanded: MICE Framework for…	Key terms: MICE, Expanded, MICE.

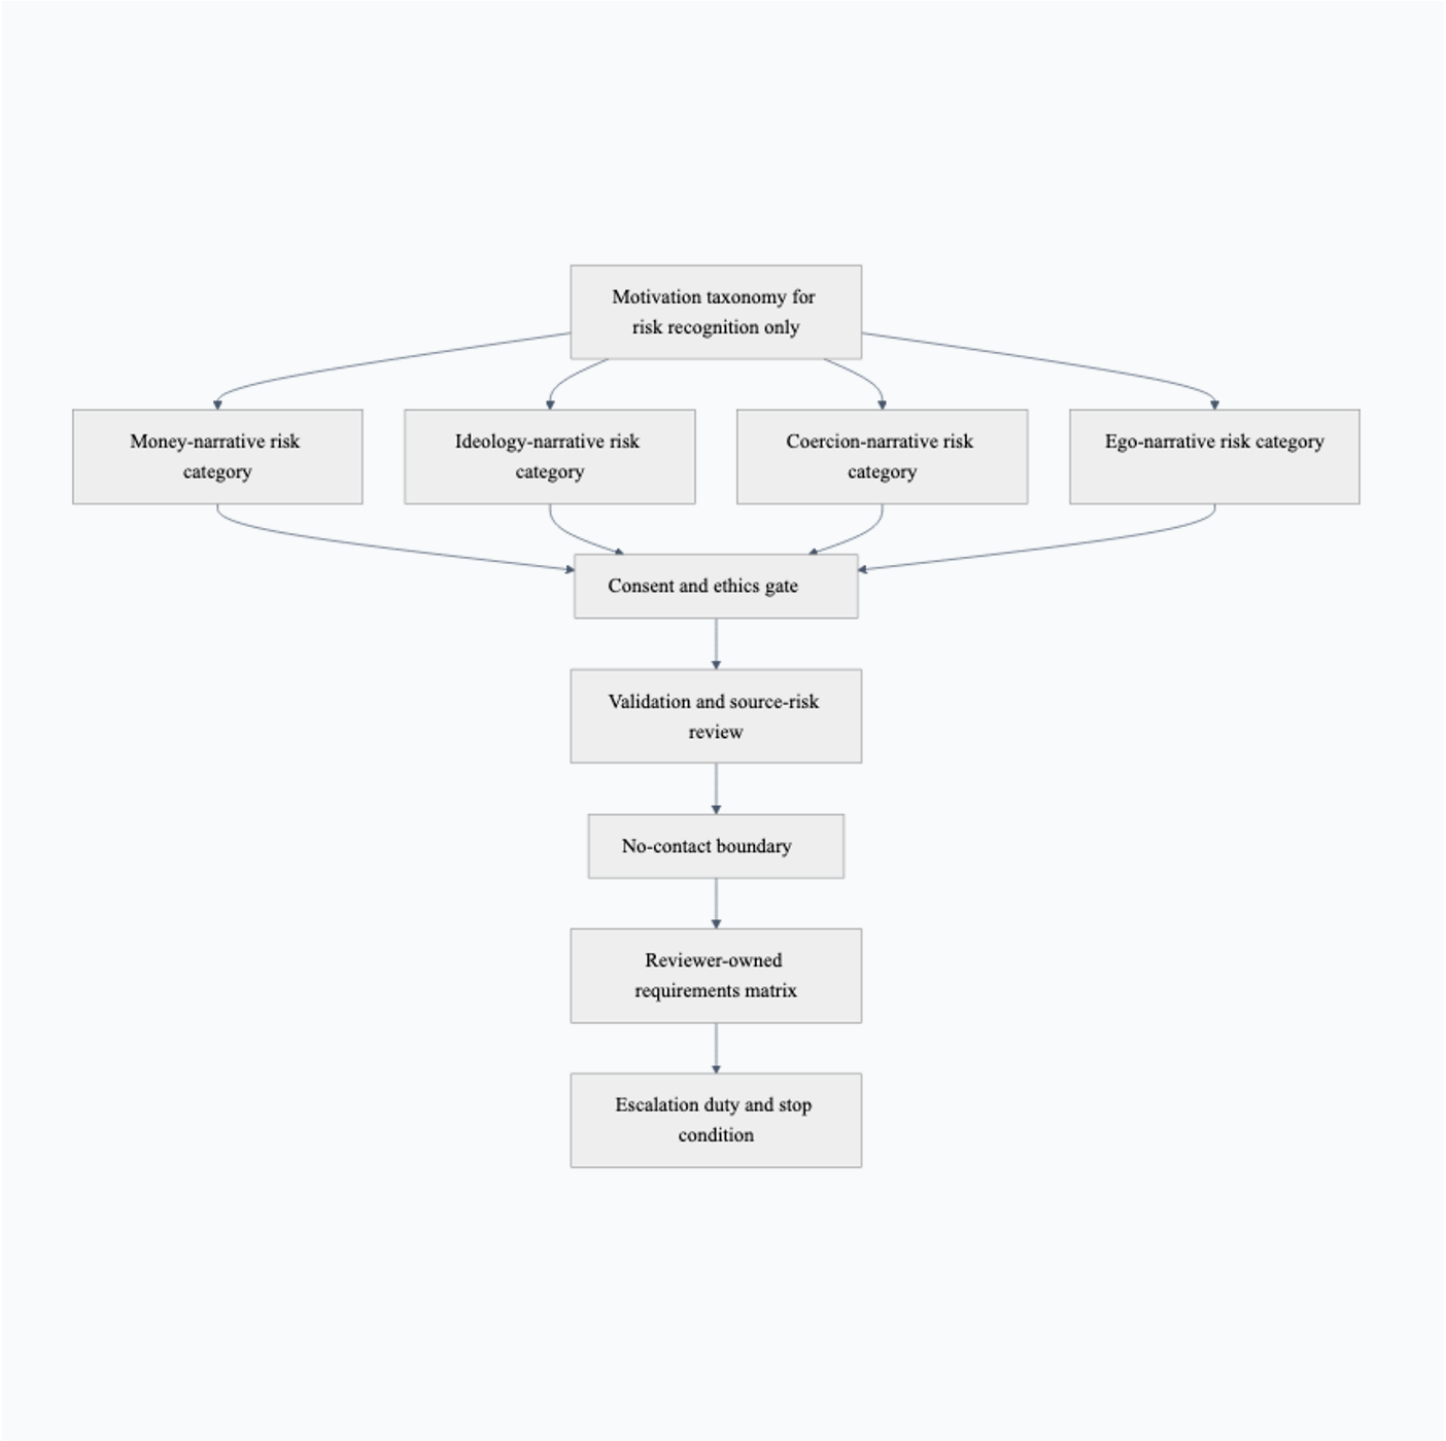

Figure 38: A study taxonomy for reading recruitment-risk literature as ethics, consent, and validation governance rather than as persuasion design. The captioned view belongs to the human intelligence humint / agent recruitment section and should be read as a map of Motivation taxonomy for risk recognition only, Money-narrative risk category, Ideology-narrative risk category, and Coercion-narrative risk category, not as a capability score or live-task instruction.

9.2 Requirements-to-Evidence Lens path for Agent Recruitment: lesson cluster, safe artifact, and review

Evidence anchor. Section 9; [238, 2026].

9.2.1 Agent Recruitment practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 9; [238, 2026].

9.2.2 Agent Recruitment topic lessons: source-backed concepts and transfer tasks

This module builds collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The sequence opens with **MICE Framework for recruitment-risk literacy**, **MICE Expanded: MICE Framework for recruitment-risk literacy**, **Spotting indicators literacy for recruitment-risk** and applies the **Requirements-to-Evidence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 36; module overview Section 9; curriculum atlas Section 2.

Triangulation anchors. In module 4's topic-lessons section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

9.2.2.1 Lesson 1: MICE Framework for recruitment-risk literacy

Concept. MICE Framework for recruitment-risk literacy uses the motivation taxonomy to recognize recruitment-risk narratives and ethics constraints, not to design persuasion.

Why it matters. MICE Framework connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. MICE Framework for recruitment-risk literacy rests on [020, 2026] and [021, 2026]. The most specific cited work observes: The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Use them for fixing what **MICE Framework for recruitment-risk literacy** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **MICE Framework** against the works cited for this row. [020, 2026] A publisher and training-organization page from HSM Training and Consultancy (London) promoting the book The Human Source Management System, a guide of over 500 pages that applies social psychology to the management of confidential informants. The site states the book draws on research and practitioner interviews and is used by law enforcement and intelligence bodies across more than 40 countries. [021, 2026] A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **MICE Framework**, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape this subject work as a **source-risk and validation ethics worksheet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **MICE Framework**: that a motivation taxonomy is a recruitment checklist.

Transfer task. Transfer **MICE Framework** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

9.2.2.2 Lesson 2: MICE Expanded: MICE Framework for recruitment-risk literacy

Concept. MICE Expanded: MICE Framework for recruitment-risk literacy uses the motivation taxonomy to recognize recruitment-risk narratives and ethics constraints, not to design persuasion.

Why it matters. MICE Expanded connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. MICE Expanded: MICE Framework for recruitment-risk literacy rests on [298, 2026] and [297, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the working definition that **MICE Expanded: MICE Framework for recruitment-risk literacy** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **MICE Expanded** against the works cited for this row. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **MICE Expanded**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **MICE Expanded**, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape **MICE Expanded** work as a **source-risk and validation ethics worksheet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **MICE Expanded**: that a motivation taxonomy is a recruitment checklist.

Transfer task. Apply this module's safe boundary for **MICE Expanded** to another artifact while keeping requirements decomposition and source-discipline fit and reviewer ownership explicit.

9.2.2.3 Lesson 3: Spotting indicators literacy for recruitment-risk

Concept. Spotting indicators literacy for recruitment-risk reads recruitment doctrine as risk literacy: pressure, consent, validation, and the line that blocks operational contact.

Why it matters. Without explicit treatment of **Spotting indicators literacy**, confusing motivation literacy with contact authorization undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Spotting indicators literacy for recruitment-risk rests on [020, 2026] and [021, 2026]. The lead source's own note reads: A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. Use them for the claim that **Spotting indicators literacy for recruitment-risk** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Spotting indicators literacy**, reason from the sources cited in this row. [020, 2026] A publisher and training-organization page from HSM Training and Consultancy (London) promoting the book The Human Source Management System, a guide of over 500 pages that applies social psychology to the management of confidential informants. The site states the book draws on research and practitioner interviews and is used by law enforcement and intelligence bodies across more than 40 countries. [021, 2026] A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **Spotting indicators literacy**, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape this subject work as a **source-risk and validation ethics worksheet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Spotting indicators literacy**: that motivation literacy is contact authorization.

Transfer task. Transfer **Spotting indicators literacy** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

9.2.2.4 Lesson 4: Assessment-and-development ethics literacy

Concept. Assessment-and-development ethics literacy reads recruitment doctrine as risk literacy: pressure, consent, validation, and the line that blocks operational contact.

Why it matters. Without explicit treatment of **Assessment-and-development ethics literacy**, confusing motivation literacy with contact authorization undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Assessment-and-development ethics literacy rests on [020, 2026] and [021, 2026]. Its anchor reference records: The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Use them for pinning down the scope of **Assessment-and-development ethics literacy**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Assessment-and-development ethics literacy**, work from the cited evidence behind this row. [020, 2026] A publisher and training-organization page from HSM Training and Consultancy (London) promoting the book The Human Source Management System, a guide of over 500 pages that applies social psychology to the management of confidential informants. The site states the book draws on research and practitioner interviews and is used by law enforcement and intelligence bodies across more than 40 countries. [021, 2026] A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **Assessment-and-development ethics literacy**, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape this subject work as a **source-risk and validation ethics worksheet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Assessment-and-development ethics literacy**: that motivation literacy is contact authorization.

Transfer task. Transfer **Assessment-and-development ethics literacy** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

9.2.2.5 Lesson 5: Recruitment-doctrine ethics and source-protection literacy

Concept. Recruitment-doctrine ethics and source-protection literacy reads recruitment doctrine as risk literacy: pressure, consent, validation, and the line that blocks operational contact.

Why it matters. Recruitment-doctrine ethics connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Recruitment-doctrine ethics and source-protection literacy rests on [020, 2026]. The most specific cited work observes: A publisher and training-organization page from HSM Training and Consultancy (London) promoting the book The Human Source Management System, a guide of over 500 pages that applies social psychology to the management of confidential informants. Use it for the working definition that **Recruitment-doctrine ethics and source-protection literacy** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **Recruitment-doctrine ethics** in the evidence the row cites. [020, 2026] A publisher and training-organization page from HSM Training and Consultancy (London) promoting the book The Human Source Management System, a guide of over 500 pages that applies social psychology to the management of confidential informants. The site states the book draws on research and practitioner interviews and is used by law enforcement and intelligence bodies across more than 40 countries. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **Recruitment-doctrine ethics**, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape this subject work as a **source-risk and validation ethics worksheet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Recruitment-doctrine ethics**: that motivation literacy is contact authorization.

Transfer task. Reuse the **Recruitment-doctrine ethics** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

9.2.2.6 Lesson 6: Declassified psychological-pressure ethics

Concept. Declassified psychological-pressure ethics reads recruitment doctrine as risk literacy: pressure, consent, validation, and the line that blocks operational contact.

Why it matters. Analysts use **Declassified psychological-pressure ethics** to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. A defensible treatment names the judgment it enables for requirements decomposition and source-discipline fit review, the proof limit that opportunistic collection would otherwise hide, and the reviewer accountable for challenge.

Source support. Declassified psychological-pressure ethics rests on [021, 2026] and [022, 2026]. The closest source to this row notes: It summarizes a set of newly obtained manuals spanning several decades and describes the topics they cover, including operational terminology, agent classification, information-gathering methods, recruitment and vetting procedures, and counterintelligence concerns. Use them for the claim that **Declassified psychological-pressure ethics** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Declassified psychological-pressure ethics**, work from the cited evidence behind this row. [021, 2026] A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. The article describes how the manuals cover intelligence methods such as agent recruitment, psychological

manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. [022, 2026] An article from The Interpreter, a publication focused on Russian affairs and disinformation, announcing a project to translate, analyze, and publish previously unpublished Soviet KGB training documents. It summarizes a set of newly obtained manuals spanning several decades and describes the topics they cover, including operational terminology, agent classification, information-gathering methods, recruitment and vetting procedures, and counterintelligence concerns. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified psychological-pressure ethics**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as a **source-risk and validation ethics worksheet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Declassified psychological-pressure ethics**: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Apply this module's safe boundary for **Declassified psychological-pressure ethics** to another artifact while keeping requirements decomposition and source-discipline fit and reviewer ownership explicit.

9.2.2.7 Lesson 7: Digital-age recruitment-risk and consent-boundary Concept. Digital-age recruitment-risk and consent-boundary

Digital-age recruitment-risk and consent-boundary reads recruitment doctrine as risk literacy: pressure, consent, validation, and the line that blocks operational contact.

Why it matters. Analysts use **Digital-age recruitment-risk** to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. A defensible treatment names the judgment it enables for requirements decomposition and source-discipline fit review, the proof limit that confusing motivation literacy with contact authorization would otherwise hide, and the reviewer accountable for challenge.

Source support. Digital-age recruitment-risk and consent-boundary rests on [023, 2026]. The lead source's own note reads: A 2024 International Master in Security, Intelligence and Strategic Studies thesis (Glasgow, Trento, Charles University) titled 'Human Intelligence in the Modern Era: The Impact of Digital Technology on Clandestine the module.' It uses a literature-based analysis plus three case studies to compare traditional human-source practices with technology-enabled approaches. Use it for pinning down the scope of **Digital-age recruitment-risk and consent-boundary**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **Digital-age recruitment-risk** against the works cited for this row. [023, 2026] A 2024 International Master in Security, Intelligence and Strategic Studies thesis (Glasgow, Trento, Charles University) titled 'Human Intelligence in the Modern Era: The Impact of Digital Technology on Clandestine the module.' It uses a literature-based analysis plus three case studies to compare traditional human-source practices with technology-enabled approaches. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **Digital-age recruitment-risk**, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape this subject work as a **source-risk and validation ethics worksheet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Digital-age recruitment-risk**: that motivation literacy is contact authorization.

Transfer task. Transfer **Digital-age recruitment-risk** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

9.2.2.8 Lesson 8: Shared Experience as a Recruitment Tool: Experimental Research Concept. Shared Experience as a Recruitment Tool: Experimental Research

Shared Experience as a Recruitment Tool: Experimental Research reads recruitment doctrine as risk literacy: pressure, consent, validation, and the line that blocks operational contact.

Why it matters. Shared Experience as a Recruitment Tool connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Shared Experience as a Recruitment Tool: Experimental Research rests on [024, 2026]. Use it for pinning down the scope of **Shared Experience as a Recruitment Tool: Experimental Research**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Shared Experience as a Recruitment Tool**, reason from the sources cited in this row. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Shared Experience as a Recruitment Tool**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **Shared Experience as a Recruitment**, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape **Shared Experience as a Recruitment Tool** work as a **source-risk and validation ethics worksheet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Shared Experience as a Recruitment Tool**: that motivation literacy is contact authorization.

Transfer task. Transfer **Shared Experience as a Recruitment Tool** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

9.2.2.9 Lesson 9: How AI Lowers the Cost of Recruitment and Social Engineering Concept. How AI Lowers the Cost of Recruitment and Social Engineering

How AI Lowers the Cost of Recruitment and Social Engineering reads recruitment doctrine as risk literacy: pressure, consent, validation, and the line that blocks operational contact.

Why it matters. How AI Lowers the Cost matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; confusing motivation literacy with contact authorization is a common failure.

Source support. How AI Lowers the Cost of Recruitment and Social Engineering rests on [004, 2026]. The most specific cited work observes: He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. Use it for the claim that **How AI Lowers the Cost of Recruitment and Social Engineering** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **How AI Lowers the Cost**, reason from the sources cited in this row. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **How AI Lowers the Cost**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **How AI**

Lowers the Cost, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape **How AI Lowers the Cost** work as a **source-risk and validation ethics worksheet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **How AI Lowers the Cost**: that motivation literacy is contact authorization.

Transfer task. Transfer **How AI Lowers the Cost** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

9.2.2.10 Lesson 10: Recruitment Ethics and Legal Constraints **Concept. Recruitment Ethics and Legal Constraints** reads recruitment doctrine as risk literacy: pressure, consent, validation, and the line that blocks operational contact.

Why it matters. Recruitment Ethics matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; confusing motivation literacy with contact authorization is a common failure.

Source support. Recruitment Ethics and Legal Constraints rests on [298, 2026] and [297, 2026]. Its anchor reference records: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for pinning down the scope of **Recruitment Ethics and Legal Constraints**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Recruitment Ethics**, work from the cited evidence behind this row. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **Recruitment Ethics**, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape this subject work as a **source-risk and validation ethics worksheet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Recruitment Ethics**: that motivation literacy is contact authorization.

Transfer task. Reuse the **Recruitment Ethics** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

9.2.3 Agent Recruitment worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic policy cell compares public indicators of hybrid pressure against an approved collection plan for a benign border-disruption exercise. [238, 2026]; [239, 2026].

Triangulation anchors. In module 4's worked-example section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **human-source literacy and source protection**. Learners use a **source-risk and validation ethics worksheet** and keep this boundary visible: No elicitation, impersonation, covert contact, or operational source-management procedures; all cases use classroom fixtures.

Frame. The classroom question centers on **MICE Framework for recruitment-risk literacy**. Excluded actions stay explicit, and the **Requirements-to-Evidence Lens** planning question is: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Inputs. For the **MICE Framework for recruitment-risk literacy** scenario, use public notices, synthetic interview summaries, public logistics records, and an instructor scope card. The Requirements-to-Evidence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **MICE Framework for recruitment-risk literacy**, students rank requirements, choose the least intrusive source discipline, list excluded actions, and evaluate evidence quality. Pause whenever an inference about MICE Framework for recruitment-risk literacy appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **MICE Framework for recruitment-risk literacy** classroom scenario; unit artifact = source-risk and validation ethics worksheet; evidence = allowed inputs; method = requirements decomposition and source-discipline fit; output = a requirements-to-evidence matrix with discipline fit, source caveats, minimization notes, and gaps; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **MICE Framework for recruitment-risk literacy** as "Requirements-to-Evidence Lens confirms it" is not enough. The revision ties the claim to requirements decomposition and source-discipline fit, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **MICE Framework for recruitment-risk literacy** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

9.2.4 Agent Recruitment practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Requirements-to-Evidence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

Triangulation anchors. In module 4's practice-sequence section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare MICE Framework for recruitment-risk literacy, MICE Expanded: MICE Framework for recruitment-risk literacy, Spotting indicators literacy for recruitment-risk; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Collection Management and Multi-INT Requirements Discipline** lane.

Move	Learner action	Output	Check
2. Frame	Answer the lens question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for MICE Framework for recruitment-risk literacy: requirements matrix with source descriptors, caveats, and collection limits.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the source-risk and validation ethics worksheet fields for MICE Framework for recruitment-risk literacy.	Unit profile note.	Evidence artifacts include validation note, pressure-risk checklist.
4. Challenge	Test the misconception that a motivation taxonomy is a recruitment checklist.	Failure-mode note.	The artifact applies the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

9.2.4.1 Agent Recruitment instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**. [238, 2026]; [239, 2026].

9.2.4.2 Agent Recruitment extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 9; [238, 2026]. Have learners swap artifacts and apply the **Requirements-to-Evidence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

9.2.5 Agent Recruitment knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 9; [238, 2026].

1. Explain how **MICE Framework for recruitment-risk literacy** is defined here; name the source descriptor that supports the definition.
2. Contrast **MICE Framework for recruitment-risk literacy** with **MICE Expanded: MICE Framework for recruitment-risk literacy** using the **Requirements-to-Evidence Lens** artifact fields.
3. Identify one failure mode from the **Collection Management and Multi-INT Requirements Discipline** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which gray-zone indicator changes the least-intrusive source choice without crossing into operational tasking?
5. Correct this misconception: that a motivation taxonomy is a recruitment checklist.

9.2.5.1 Agent Recruitment answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **MICE Framework for recruitment-risk literacy** without source evidence, uncertainty, or a safe transfer task.

9.3 Agent Recruitment assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 9; [238, 2026].

9.3.1 Agent Recruitment evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 9; [238, 2026].

9.3.2 Agent Recruitment transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 9; [238, 2026].

9.3.2.1 Agent Recruitment lineage and source tradition: profile, concepts, and first anchors This sits in the **Collection Management and Multi-INT Requirements Discipline** lineage: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. [238, 2026]; [239, 2026].

9.3.2.2 Agent Recruitment working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 9; [238, 2026].
The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**, with provenance and reviewability throughout.

9.3.2.3 Agent Recruitment knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** accountable requirements, source-discipline choices, minimization rules, source-risk notes, and evaluation criteria. [238, 2026]; [239, 2026].
- **Transforms:** priority mapping, source-discipline fit, least-intrusive evidence selection, and feedback review.
- **Outputs:** requirements matrix, collection-limit note, source-quality card, and gap list.
- **Failure modes:** recruitment or interception drift, over-collection, weak minimization, and source exposure.

9.3.2.4 Agent Recruitment transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 9; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.
- **Evidence contract:** keep the **Collection Management and Multi-INT Requirements Discipline** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as requirements matrix, collection-limit note, source-quality card, and gap list that another reviewer can audit.

9.3.2.5 Agent Recruitment profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 9; [238, 2026].
The matched profile emphasizes requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. The method stack is priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop; the local topic cluster is **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

9.3.3 Agent Recruitment evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 9; [238, 2026].
Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Collection Management and Multi-INT Requirements Discipline** profile tells reviewers what evidence is strong enough for the module artifact built around **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

9.3.3.1 Agent Recruitment guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [239, 2026]; [240, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [020, 2026]; [021, 2026]; [298, 2026]; [297, 2026]; [022, 2026]; [023, 2026]; [024, 2026]; [004, 2026].

9.3.3.2 Agent Recruitment verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [239, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [239, 2026]; [240, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [020, 2026]; [021, 2026]; [298, 2026]; [297, 2026]; [022, 2026]; [023, 2026]; [024, 2026]; [004, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 4's source-canon section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Maintenance rule: Perplexity may suggest candidates for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy** and [238, 2026]; [239, 2026], but only directly verified source URLs are encoded as citations.

9.3.3.3 Agent Recruitment intelligence practice lens: evidence artifact and safety check Practice lens: **Requirements-to-Evidence Lens** for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**. [238, 2026]; [239, 2026].

Planning question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Evidence artifact: requirements matrix with source descriptors, caveats, and collection limits.

Validation rule: show priority, authority, minimization, corroboration, and source quality before any claim is reused. Applied to **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

Handoff contract: deliver metadata-rich evidence packets, not unscoped data piles or implicit targeting requests.

Safety check: exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure.

9.3.3.4 Agent Recruitment runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 9; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	4.99	4.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Agent Recruitment to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	4.101	4.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Agent Recruitment	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	4.102	4.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Agent Recruitment	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
MICE Framework for recruitment-risk literacy	4.1	4.1 source title transformed into safe curriculum treatment; original: The MICE Framework: Money, Ideology, Coercion/Compromise, Ego	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
MICE Framework for recruitment-risk literacy	4.2	4.2 source title transformed into safe curriculum treatment; original: MICE Expanded: RASCLS — Reciprocity, Authority, Scarcity, Commitment, Liking, Social Proof	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Spotting indicators literacy for recruitment-risk	4.3	4.3 source title transformed into safe curriculum treatment; original: Targeting, Spotting, and Initial Assessment	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Assessment-and-development ethics literacy	4.4	4.4 source title transformed into safe curriculum treatment; original: Assessment and Development Operations	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Recruitment-doctrine ethics and source-protection literacy	4.5	4.5 source title transformed into safe curriculum treatment; original: The Recruitment Pitch: Methods and Psychology	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Declassified psychological-pressure ethics	4.6	4.6 source title transformed into safe curriculum treatment; original: KGB Recruitment Doctrine: Psychological Methods and Manipulation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Digital-age recruitment-risk and consent-boundary	4.7	4.7 source title transformed into safe curriculum treatment; original: Digital-Age Recruitment: LinkedIn, Telegram, Cryptocurrencies, Dark Web	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Shared Experience as a Recruitment Tool: Experimental Research	4.8	4.8 Shared Experience as a Recruitment Tool: Experimental Research	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
How AI Lowers the Cost of Recruitment and Social Engineering	4.9	4.9 How AI Lowers the Cost of Recruitment and Social Engineering	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Recruitment Ethics and Legal Constraints	4.10	4.10 Recruitment Ethics and Legal Constraints	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

9.3.3.5 Agent Recruitment reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 9; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
MICE Framework for recruitment-risk literacy	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
MICE Expanded: MICE Framework for recruitment-risk literacy	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Spotting indicators literacy for recruitment-risk	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Lesson topic	Practice lens	Evidence artifact	Safety check
Assessment-and-development ethics literacy	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Recruitment-doctrine ethics and source-protection literacy	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Declassified psychological-pressure ethics	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Digital-age recruitment-risk and consent-boundary	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Shared Experience as a Recruitment Tool: Experimental Research	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
How AI Lowers the Cost of Recruitment and Social Engineering	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Recruitment Ethics and Legal Constraints	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

9.3.3.6 Agent Recruitment annotated source ledger: real titles and local contribution Each source cited by this **Collection Management and Multi-INT Requirements Discipline** module is paired below with its real title and a one-line note on what it contributes to **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide
[239, 2026]	Digital Space and Human Rights	Official OHCHR digital rights portal.	original source-guide
[240, 2026]	The Right to Privacy in the Digital Age	The Office of the High Commissioner for Human Rights (OHCHR) hub page on the right to privacy in the digital age. It addresses how data-intensive technologies, particularly artificial intelligence, create risks for privacy, autonomy, and human dignity, and curates international standards, reports, and expert consultations.	verified source-guide
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide

Source	Cited work	What it contributes	Status
[281, 2026]	Artificial Intelligence Cybersecurity Challenges	An ENISA (European Union Agency for Cybersecurity) report published December 15, 2020 mapping the cybersecurity challenges of artificial intelligence. It defines AI scope through a lifecycle approach, identifies the assets requiring protection within AI ecosystems, and develops a threat taxonomy classified across lifecycle stages and asset categories.	verified source-guide
[282, 2026]	AI Research: Security and Resilience	A NIST page on AI research focused on security and resilience, framing these as core characteristics of trustworthy AI under the NIST AI Risk Management Framework.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[296, 2026]	Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile	NIST AI 600-1, the Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile, a cross-sectoral companion resource to the NIST AI RMF 1.0 issued pursuant to Executive Order 14110. It identifies risks that are unique to or amplified by generative AI and organizes suggested actions for managing those risks, mapped to the AI RMF functions.	verified source-guide
[020, 2026]	The Human Source Management System (Confidential Informant	A publisher and training-organization page from HSM Training and Consultancy (London) promoting the book The Human Source Management System, a guide of over 500 pages that applies social psychology to the management of confidential informants. The site states the book draws on research and practitioner interviews and is used by law enforcement and intelligence bodies across more than 40 countries.	verified source-guide

Source	Cited work	What it contributes	Status
[021, 2026]	Learn how to be a spy from previously unpublished KGB training	A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services.	verified source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[022, 2026]	Summaries of Newly Obtained KGB Training Manuals - The Interpreter	An article from The Interpreter, a publication focused on Russian affairs and disinformation, announcing a project to translate, analyze, and publish previously unpublished Soviet KGB training documents. It summarizes a set of newly obtained manuals spanning several decades and describes the topics they cover, including operational terminology, agent classification, information-gathering methods, recruitment and vetting procedures, and counterintelligence concerns.	verified source-guide
[023, 2026]	The Impact of Digital Technology on Clandestine Agent Recruitment	A 2024 International Master in Security, Intelligence and Strategic Studies thesis (Glasgow, Trento, Charles University) titled 'Human Intelligence in the Modern Era: The Impact of Digital Technology on Clandestine Agent Recruitment.' It uses a literature-based analysis plus three case studies to compare traditional human-source practices with technology-enabled approaches.	verified source-guide
[024, 2026]	Using shared experiences to recruit committed human intelligence	See bibliography for scope.	original source-guide
[004, 2026]	AI Won't Replace Spies—It Will Make Them More Powerful Than Ever	Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools.	verified source-guide

Where this sits. This module's overview is Section 9; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

9.3.4 Agent Recruitment governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 9; [238, 2026].

9.3.5 Agent Recruitment analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 4's governance-boundary section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Collection Management and Multi-INT Requirements Discipline** for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**. [238, 2026]; [239, 2026].

Curriculum topic spine: MICE Framework for recruitment-risk literacy, **MICE Expanded: MICE Framework for recruitment-risk literacy**, **Spotting indicators literacy for recruitment-risk**. **Verified anchor cluster:** [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]; [Archives and Administration, 1981]; [Agency, 2026g]; [of the Director of National Intelligence, 2026d].

Conceptual depth: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit.

Method stack: priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop.

Composability contract: requirements, authorities, source disciplines, collection notes, retention limits, caveats, and evaluation metrics remain separable.

Known failure modes: opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority.

Defensive boundary: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures. Applied to **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

Anchor	Why it matters here
[Community, 2026]	Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026c]	Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation. Checked as of 2026-05-21; role: curriculum_anchor.
[of Staff, 2026]	Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026g]	Official NSA public explanation of FISA oversight for signals intelligence collection governed by statutory and court-authorized controls. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.

9.3.5.1 Agent Recruitment evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Collection Management and Multi-INT Requirements Discipline** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [239, 2026].

9.3.6 Agent Recruitment agentic boundary: assist, approve, block, and record

Evidence anchor. Section 9; [238, 2026].

AGEINT translation is bounded by the **Collection Management and Multi-INT Requirements Discipline** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

9.3.6.1 Agent Recruitment permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 9; [238, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

9.3.6.2 Agent Recruitment excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [239, 2026] and **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

9.3.7 Agent Recruitment governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 9; [238, 2026].

Governance is practiced as a gate on the **Collection Management and Multi-INT Requirements Discipline** lane. Learners use the **Requirements-to-Evidence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues

remain, and when an agent-assisted artifact must stop for human review while using **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

9.3.7.1 Agent Recruitment governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [239, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Collection Management and Multi-INT Requirements Discipline** failure modes and the **Requirements-to-Evidence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

9.3.7.2 Agent Recruitment evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 9; [238, 2026]. Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Requirements-to-Evidence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

9.3.7.3 Agent Recruitment current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**. [238, 2026]; [239, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_intelligence_gov_how_ic_works` for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**?	How the IC Works; lane `governed_intelligence_cycle`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners.
What does the module inherit from `official_odni_icd_204` for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**?	Intelligence Community Directive 204: National Intelligence Priorities Framework; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation.
What does the module inherit from `official_joint_pub_2_0` for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**?	JP 2-0: Joint Intelligence; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments.
What does the module inherit from `official_ic_osint_strategy` for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 9; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

9.3.8 Agent Recruitment assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 9; [238, 2026].

9.3.9 Agent Recruitment assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 9; [238, 2026].

9.3.9.1 Agent Recruitment capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy** and [238, 2026]; [239, 2026].

9.3.9.2 Agent Recruitment instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy** and [238, 2026]; [239, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

9.3.9.3 Agent Recruitment assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
MICE Framework for recruitment-risk literacy	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
MICE Expanded: MICE Framework for recruitment-risk literacy	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Spotting indicators literacy for recruitment-risk	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

9.3.10 Agent Recruitment refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [239, 2026] and **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**.

9.3.10.1 Agent Recruitment refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**. The local signals begin with [238, 2026]; [239, 2026].

9.3.10.2 Agent Recruitment claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**, and the source spine for these checks begins with [238, 2026]; [239, 2026].

9.3.11 Agent Recruitment reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [239, 2026].

Triangulation anchors. In module 4's review-checklist section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy**. [238, 2026]; [239, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

9.3.12 Agent Recruitment learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **MICE Framework for recruitment-risk literacy; MICE Expanded: MICE Framework for recruitment-risk literacy** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [238, 2026]; [239, 2026].

Section 2, Section 8, Section 10

10 Agent Handling and Management

10.0.1 Agent Handling and Management figures and course links: visual evidence, source flow, and navigation

The module uses Figure 39 and Figure 36 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 8, Section 9, Section 11.
This module teaches the **Collection Management and Multi-INT Requirements Discipline** lane through a bounded, source-backed coursebook chapter. [239, 2026]; [240, 2026].

10.1 Collection Management and Multi-INT Requirements Discipline frame for Agent Handling and Management: source context, topic focus, and reader task

Evidence anchor. Section 10; [239, 2026].

10.1.1 Agent Handling and Management orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 10; [239, 2026].

10.1.2 Agent Handling and Management conceptual primer: source context, core model, and reader task

This chapter teaches collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The chapter uses **Requirements-to-Evidence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.
The central distinction is to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. Core topics include **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics; Historical surveillance-risk and source-protection**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [239, 2026]; [240, 2026].
Learners move from vocabulary and the **Requirements-to-Evidence Lens** distinction through topic lessons on **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust** with evidence and misconception checks, then assemble a **requirements matrix with source descriptors, caveats, and collection limits** with safety and rights gates.

10.1.3 Agent Handling and Management learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 10; [239, 2026].

- Connect **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust and Historical meeting-structure ethics** to **Collection Management and Multi-INT Requirements Discipline** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **requirements matrix with source descriptors, caveats, and collection limits** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures.

10.1.4 Agent Handling and Management core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 10; [239, 2026].

Term	Working definition
Priority	the relative importance of an intelligence question
Source discipline	a broad evidence channel such as HUMINT, SIGINT, GEOINT, OSINT, or FININT
Minimization	the rule that limits acquisition, retention, or use of unnecessary information
Source protection	the duty to reduce risk to people, methods, and sensitive relationships
Evaluation	the feedback step that tests whether the evidence satisfied the requirement
Gray-zone indicator	an observable signal of ambiguous coercion below armed conflict thresholds
Proxy pattern	a relationship suggesting indirect sponsorship without confirmed operational control
The Case Officer–Agent Relationship: Building,...	Key terms: Case, Officer, Agent.
Historical meeting-structure ethics	Key terms: Historical, meeting, structure.

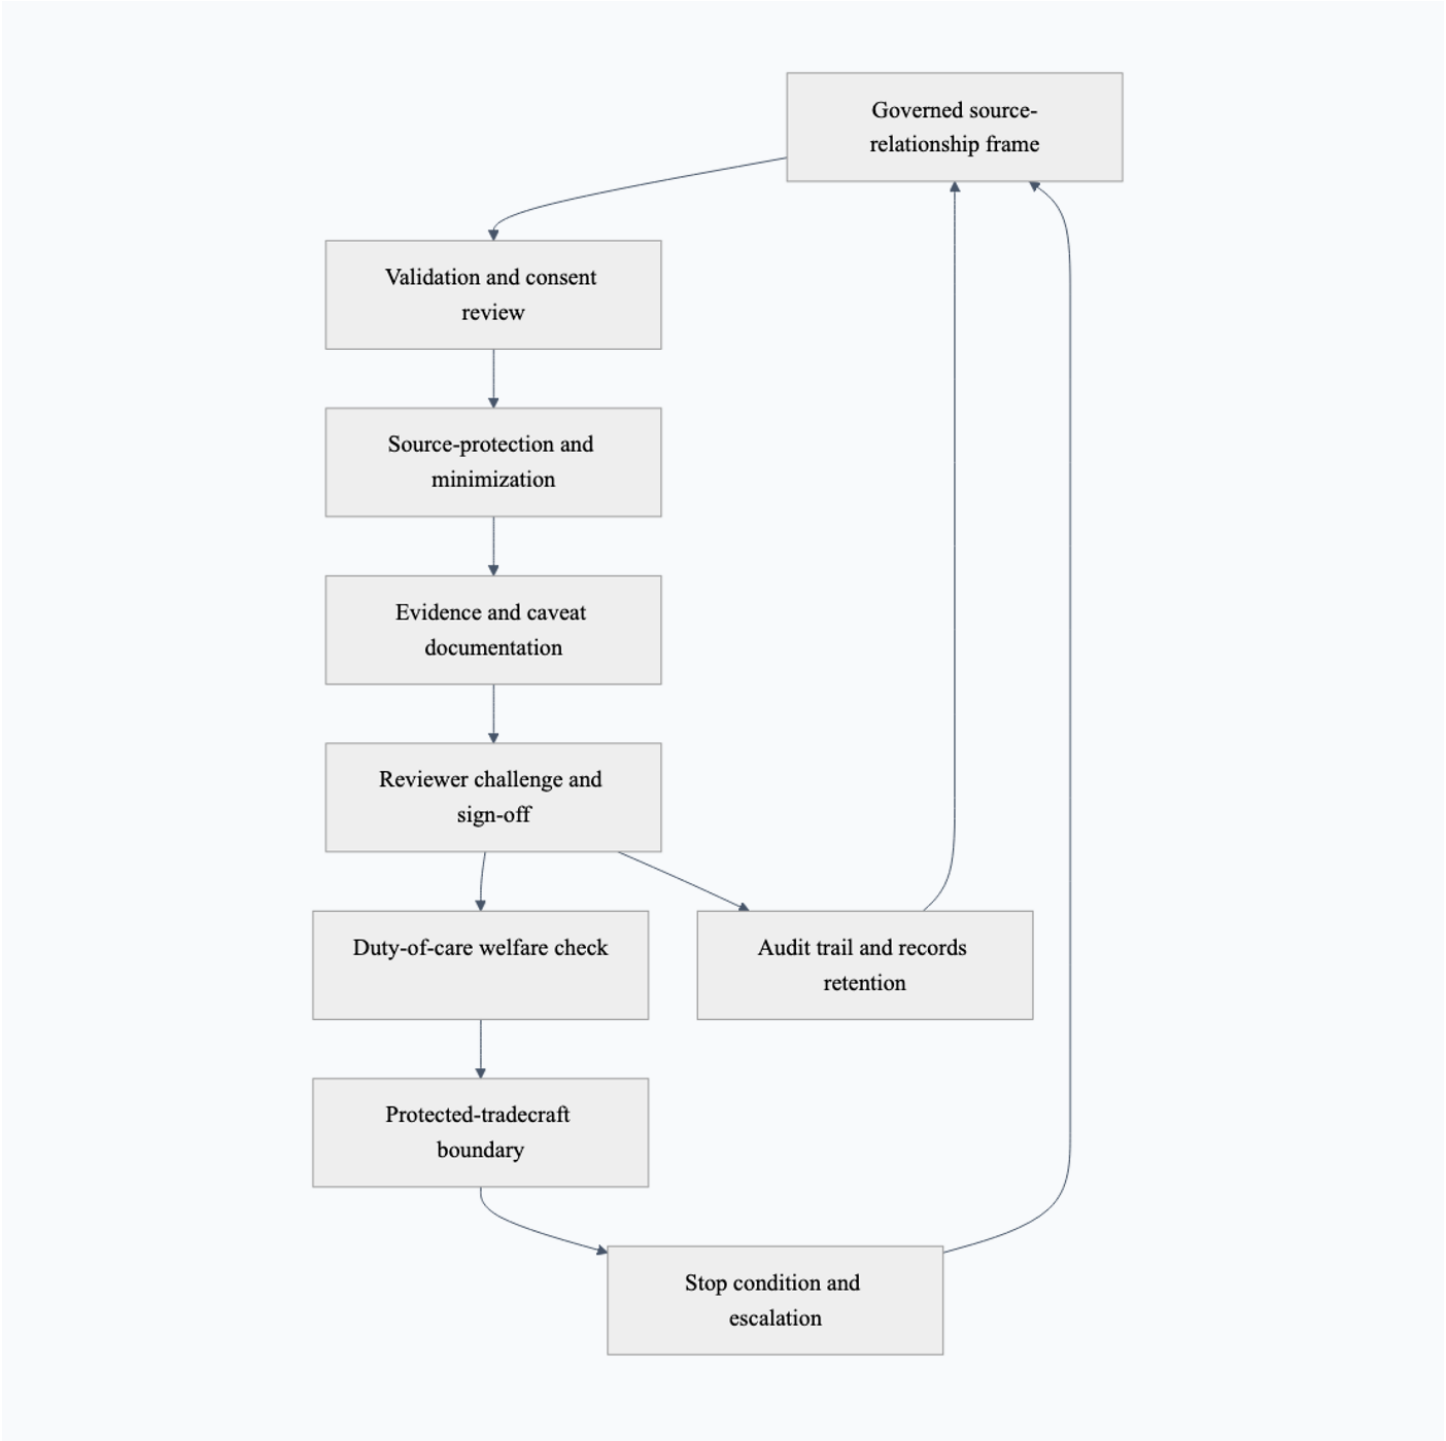

Figure 39: The governed review cycle for documenting source relationships, protection, and reviewer accountability without recreating handling procedures. In the human intelligence humint / agent handling and management section, it lets readers compare Governed source-relationship frame, Validation and consent review, Source-protection and minimization, and Evidence and caveat documentation so the visual functions as a traceable course aid rather than an unscoped assertion.

10.2 Requirements-to-Evidence Lens path for Agent Handling and Management: lesson cluster, safe artifact, and review

Evidence anchor. Section 10; [239, 2026].

10.2.1 Agent Handling and Management practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 10; [239, 2026].

10.2.2 Agent Handling and Management topic lessons: source-backed concepts and transfer tasks

This module builds collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The sequence opens with **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust**, **Historical meeting-structure ethics**, **Historical surveillance-risk and source-protection** and applies the **Requirements-to-Evidence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 36; module overview Section 10; curriculum atlas Section 2.

Triangulation anchors. In module 5's topic-lessons section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

10.2.2.1 Lesson 1: The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust **Concept. The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust** treats human-source work as a governed relationship: validation, consent, reporting, source protection, and oversight—not contact activity.

Why it matters. Without explicit treatment of **The Case Officer–Agent Relationship**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust rests on [025, 2026]. The closest source to this row notes: It also addresses how operatives are selected, the isolation of covert work, and its psychological effects on personal relationships. Use it for pinning down the scope of **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **The Case Officer–Agent Relationship** in the evidence the row cites. [025, 2026] This is an episode of The Unmistakable Creative Podcast featuring former CIA field operative Andrew Bustamante discussing intelligence work. The conversation covers his background at the Air Force Academy and CIA training, and frames espionage as resting on reading people, trust, influence, and empathy rather than glamour or action. It also addresses how operatives are selected, the isolation of covert work, and its psychological effects on personal relationships. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **The Case Officer–Agent Relationship**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the source descriptor, the bounded claim about **Case Officer Agent Relationship**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **The Case Officer–Agent Relationship** work as a **source-risk and validation ethics worksheet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust is optional whenever separate collection discipline concepts from operational recruitment, interception, or tasking procedures feels inconvenient.

Transfer task. Transfer **The Case Officer–Agent Relationship** to a second module by preserving requirements decomposition and source-discipline fit, changing the source evidence, and naming a new reviewer.

10.2.2.2 Lesson 2: Historical meeting-structure ethics **Concept. Historical meeting-structure ethics** uses the historical motif to discuss source-protection ethics, documentation, and oversight without recreating handling procedures.

Why it matters. Historical meeting-structure ethics matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; opportunistic collection is a common failure.

Source support. Historical meeting-structure ethics rests on [029, 2026] and [004, 2026]. The closest source to this row notes: It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. Use them for fixing what **Historical meeting-structure ethics** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **Historical meeting-structure ethics** in the evidence the row cites. [029, 2026] A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the historical descriptor, the bounded lesson about **Historical meeting-structure ethics**, the handling caveat, the uncertainty note, the protected-tradecraft boundary, and the reviewer who clears the account. Shape this subject work as a **source-risk and validation ethics worksheet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Historical meeting-structure ethics**: that a documented handling precedent licenses repeating the approach, rather than a case-bound record whose risks must be re-assessed each time.

Transfer task. Reuse the **Historical meeting-structure ethics** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

10.2.2.3 Lesson 3: Historical surveillance-risk and source-protection **Concept. Historical surveillance-risk and source-protection** uses the historical motif to discuss source-protection ethics, documentation, and oversight without recreating handling procedures.

Why it matters. Historical surveillance-risk matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; opportunistic collection is a common failure.

Source support. Historical surveillance-risk and source-protection rests on [026, 2026] and [016, 2026]. The most specific cited work observes: It conveys the difficulty and stress of clandestine field meetings as recounted from personal experience. Use them for fixing what **Historical surveillance-risk and source-protection** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **Historical surveillance-risk** in the evidence the row cites. [026, 2026] A YouTube video titled "Inside the CIA: The tension and drama behind surveillance detection operations," released May 3, 2024, featuring a former CIA officer. The speaker describes the operational complexity and interpersonal tension involved in moving safely from a starting point to a meeting while accounting for the presence of hostile observation. It conveys the difficulty and stress of clandestine field meetings as recounted from personal experience. [016, 2026] Place where victim can be controlled with limited avenues of escape. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the historical descriptor, the bounded lesson about **Historical surveillance-risk**, the handling caveat, the uncertainty note, the protected-tradecraft boundary, and the reviewer who clears the account. Shape this subject work as a **source-risk and validation ethics worksheet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Historical surveillance-risk**: that a documented handling precedent licenses repeating the approach, rather than a case-bound record whose risks must be re-assessed each time.

Transfer task. Transfer **Historical surveillance-risk** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

10.2.2.4 Lesson 4: Historical clandestine-communications ethics

Concept. Historical clandestine-communications ethics uses the historical motif to discuss source-protection ethics, documentation, and oversight without recreating handling procedures.

Why it matters. Without explicit treatment of **Historical clandestine-communications ethics**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Historical clandestine-communications ethics rests on [027, 2026] and [028, 2026]. The most specific cited work observes: Learn a technique for communicating with your family in an emergency using a method used by spies. Use them for the claim that **Historical clandestine-communications ethics** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Historical clandestine-communications ethics**, reason from the sources cited in this row. [027, 2026] Learn a technique for communicating with your family in an emergency using a method used by spies. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the historical descriptor, the bounded lesson about **Historical clandestine-communications ethics**, the handling caveat, the uncertainty note, the protected-tradecraft boundary, and the reviewer who clears the account. Shape this subject work as a **source-risk and validation ethics worksheet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Historical clandestine-communications ethics**: that a documented handling precedent licenses repeating the approach, rather than a case-bound record whose risks must be re-assessed each time.

Transfer task. Apply this module's safe boundary for **Historical clandestine-communications ethics** to another artifact while keeping requirements decomposition and source-discipline fit and reviewer ownership explicit.

10.2.2.5 Lesson 5: Historical cutout-and-intermediary provenance

Concept. Historical cutout-and-intermediary provenance uses the historical motif to discuss source-protection ethics, documentation, and oversight without recreating handling procedures.

Why it matters. Analysts use **Historical cutout-and-intermediary provenance** to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. A defensible treatment names the judgment it enables for requirements decomposition and source-discipline fit review, the proof limit that opportunistic collection would otherwise hide, and the reviewer accountable for challenge.

Source support. Historical cutout-and-intermediary provenance rests on [029, 2026]. The most specific cited work observes: It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. Use it for the claim that **Historical cutout-and-intermediary provenance** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **Historical cutout-and-intermediary provenance** in the evidence the row cites. [029, 2026] A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the historical descriptor, the bounded lesson about **Historical cutout-and-intermediary provenance**, the handling caveat, the uncertainty note, the protected-tradecraft boundary, and the reviewer who clears the account. Shape this subject work as a **source-risk and validation ethics worksheet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Historical cutout-and-intermediary provenance**: that a documented handling precedent licenses repeating the approach, rather than a case-bound record whose risks must be re-assessed each time.

Transfer task. Transfer **Historical cutout-and-intermediary provenance** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

10.2.2.6 Lesson 6: Historical front-entity provenance

Concept. Historical front-entity provenance treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Without explicit treatment of **Historical front-entity provenance**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Historical front-entity provenance rests on [029, 2026]. The closest source to this row notes: A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. Use it for pinning down the scope of **Historical front-entity provenance**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **Historical front-entity provenance** against the works cited for this row. [029, 2026] A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting

sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the historical descriptor, the bounded lesson about **Historical front-entity provenance**, the handling caveat, the uncertainty note, the protected-tradecraft boundary, and the reviewer who clears the account. Shape this subject work as a **source-risk and validation ethics worksheet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Historical front-entity provenance**: that a documented handling precedent licenses repeating the approach, rather than a case-bound record whose risks must be re-assessed each time.

Transfer task. Apply this module's safe boundary for **Historical front-entity provenance** to another artifact while keeping requirements decomposition and source-discipline fit and reviewer ownership explicit.

10.2.2.7 Lesson 7: Counter-Surveillance and Detecting Hostile Surveillance: Historical surveillance-risk and source-protection

Concept. Counter-Surveillance and Detecting Hostile Surveillance: Historical surveillance-risk and source-protection uses the historical motif to discuss source-protection ethics, documentation, and oversight without recreating handling procedures.

Why it matters. Without explicit treatment of **Counter-Surveillance and Detecting Hostile Surveillance**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Counter-Surveillance and Detecting Hostile Surveillance: Historical surveillance-risk and source-protection rests on [030, 2026] and [031, 2026]. The closest source to this row notes: There are cameras everywhere! Use them for the working definition that **Counter-Surveillance and Detecting Hostile Surveillance: Historical surveillance-risk and source-protection** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Counter-Surveillance and Detecting Hostile Surveillance**, reason from the sources cited in this row. [031, 2026] There are cameras everywhere! Everything is trackable! Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Counter-Surveillance and Detecting Hostile Surveillance**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the historical descriptor, the bounded lesson about **Counter-Surveillance and Detecting Hostile Surveillance**, the handling caveat, the uncertainty note, the protected-tradecraft boundary, and the reviewer who clears the account. Shape **Counter-Surveillance and Detecting Hostile Surveillance** work as a **source-risk and validation ethics worksheet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Counter-Surveillance and Detecting Hostile Surveillance**: that a documented handling precedent licenses repeating the approach, rather than a case-bound record whose risks must be re-assessed each time.

Transfer task. Reuse the **Counter-Surveillance and Detecting Hostile Surveillance** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

10.2.2.8 Lesson 8: Historical agent-tasking oversight

Concept. Historical agent-tasking oversight treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Historical agent-tasking oversight connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Historical agent-tasking oversight rests on [029, 2026] and [004, 2026]. Its anchor reference records: A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. Use them for the claim that **Historical agent-tasking oversight** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Historical agent-tasking oversight**, work from the cited evidence behind this row. [029, 2026] A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the historical descriptor, the bounded lesson about **Historical agent-tasking oversight**, the handling caveat, the uncertainty note, the protected-tradecraft boundary, and the reviewer who clears the account. Shape this subject work as a **source-risk and validation ethics worksheet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Historical agent-tasking oversight**: that a documented handling precedent licenses repeating the approach, rather than a case-bound record whose risks must be re-assessed each time.

Transfer task. Transfer **Historical agent-tasking oversight** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

10.2.2.9 Lesson 9: Historical extraction-and-termination ethics

Concept. Historical extraction-and-termination ethics uses the historical motif to discuss source-protection ethics, documentation, and oversight without recreating handling procedures.

Why it matters. Without explicit treatment of **Historical extraction-and-termination ethics**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Historical extraction-and-termination ethics rests on [029, 2026] and [004, 2026]. The most specific cited work observes: It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. Use them for the claim that **Historical extraction-and-termination ethics** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Historical extraction-and-termination ethics**, work from the cited evidence behind this row. [029, 2026] A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the historical descriptor, the bounded lesson about **Historical extraction-and-termination ethics**, the handling caveat, the uncertainty note, the protected-tradecraft boundary, and the reviewer who clears the account. Shape this subject work as a **source-risk and validation ethics worksheet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Historical extraction-and-termination ethics**: that a documented handling precedent licenses repeating the approach, rather than a case-bound record whose risks must be re-assessed each time.

Transfer task. Apply this module's safe boundary for **Historical extraction-and-termination ethics** to another artifact while keeping requirements decomposition and source-discipline fit and reviewer ownership explicit.

10.2.2.10 Lesson 10: Declassified source-protection and agent-handling ethics

Concept. Declassified source-protection and agent-handling ethics studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Declassified source-protection connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Declassified source-protection and agent-handling ethics rests on [032, 2026]. The most specific cited work observes: The 144-page volume is presented as a historical document on Soviet human-intelligence doctrine and counterintelligence practice. Use it for fixing what **Declassified source-protection and agent-handling ethics** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **Declassified source-protection** against the works cited for this row. [032, 2026] A Google Books catalog entry for a 2025 English-translation edition of a Cold War-era Soviet intelligence training manual, published by Century Print Media Group with a translator's note by a retired NATO intelligence officer. The 144-page volume is presented as a historical document on Soviet human-intelligence doctrine and counterintelligence practice. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as a **source-risk and validation ethics worksheet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Declassified source-protection**: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **Declassified source-protection** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

10.2.2.11 Lesson 11: AI-Enhanced Micro-Expression Analysis for Source Validation

Concept. AI-Enhanced Micro-Expression Analysis for Source Validation connects source-protection duties to reporting quality, compartmentation, and counterintelligence review without recreating handling tradecraft.

Why it matters. AI-Enhanced Micro-Expression Analysis connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. AI-Enhanced Micro-Expression Analysis for Source Validation rests on [004, 2026]. Its anchor reference records: Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. Use it for fixing what **AI-Enhanced Micro-Expression Analysis for Source Validation** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **AI-Enhanced Micro-Expression Analysis** against the works cited for this row. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **AI-Enhanced Micro-Expression Analysis**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the source descriptor, the bounded claim about **AI-Enhanced Micro-Expression Analysis for Source**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **AI-Enhanced Micro-Expression Analysis** work as a **source-risk and validation ethics worksheet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that AI-Enhanced Micro-Expression Analysis for Source Validation replaces human review whenever evidence looks plausible.

Transfer task. Transfer **AI-Enhanced Micro-Expression Analysis** to a second module by preserving requirements decomposition and source-discipline fit, changing the source evidence, and naming a new reviewer.

10.2.2.12 Lesson 12: Digital-age recruitment-risk and consent-boundary

Concept. Digital-age recruitment-risk and consent-boundary reads recruitment doctrine as risk literacy: pressure, consent, validation, and the line that blocks operational contact.

Why it matters. Without explicit treatment of **Digital-age recruitment-risk**, confusing motivation literacy with contact authorization undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Digital-age recruitment-risk and consent-boundary rests on [004, 2026]. The lead source's own note reads: He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. Use it for pinning down the scope of **Digital-age recruitment-risk and consent-boundary**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **Digital-age recruitment-risk** against the works cited for this row. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must note the motivation descriptor, the bounded claim about **Digital-age recruitment-risk**, the consent caveat, the uncertainty note, the no-contact boundary, and the reviewer who owns escalation duties. Shape this subject work as a **source-risk and validation ethics worksheet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Digital-age recruitment-risk**: that motivation literacy is contact authorization.

Transfer task. Transfer **Digital-age recruitment-risk** from this module to a second motif by preserving requirements decomposition and source-

discipline fit, replacing action with audit, and naming the blocked use.

10.2.3 Agent Handling and Management worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic policy cell compares public indicators of hybrid pressure against an approved collection plan for a benign border-disruption exercise. [239, 2026]; [240, 2026].

Triangulation anchors. In module 5's worked-example section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **human-source literacy and source protection**. Learners use a **source-risk and validation ethics worksheet** and keep this boundary visible: No elicitation, impersonation, covert contact, or operational source-management procedures; all cases use classroom fixtures.

Frame. The classroom question centers on **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust**. Excluded actions stay explicit, and the **Requirements-to-Evidence Lens** planning question is: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Inputs. For the **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust** scenario, use public notices, synthetic interview summaries, public logistics records, and an instructor scope card. The Requirements-to-Evidence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust**, students rank requirements, choose the least intrusive source discipline, list excluded actions, and evaluate evidence quality. Pause whenever an inference about The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust** classroom scenario; unit artifact = source-risk and validation ethics worksheet; evidence = allowed inputs; method = requirements decomposition and source-discipline fit; output = a requirements-to-evidence matrix with discipline fit, source caveats, minimization notes, and gaps; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust** as "Requirements-to-Evidence Lens confirms it" is not enough. The revision ties the claim to requirements decomposition and source-discipline fit, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

10.2.4 Agent Handling and Management practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Requirements-to-Evidence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

Triangulation anchors. In module 5's practice-sequence section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust, Historical meeting-structure ethics, Historical surveillance-risk and source-protection; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Collection Management and Multi-INT Requirements Discipline** lane.
2. Frame	Answer the lens question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust: requirements matrix with source descriptors, caveats, and collection limits.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the source-risk and validation ethics worksheet fields for The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust.	Unit profile note.	Evidence artifacts include validation note, pressure-risk checklist.
4. Challenge	Test the misconception that The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust is optional whenever separate collection discipline concepts from operational recruitment, interception, or tasking procedures feels inconvenient.	Failure-mode note.	The artifact applies the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

10.2.4.1 Agent Handling and Management instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor

or a human review point. Keep the focus on **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**. [239, 2026]; [240, 2026].

10.2.4.2 Agent Handling and Management extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 10; [239, 2026].
Have learners swap artifacts and apply the **Requirements-to-Evidence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

10.2.5 Agent Handling and Management knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 10; [239, 2026].

1. Explain how **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust** is defined here; name the source descriptor that supports the definition.
2. Contrast **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust** with **Historical meeting-structure ethics** using the **Requirements-to-Evidence Lens** artifact fields.
3. Identify one failure mode from the **Collection Management and Multi-INT Requirements Discipline** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which gray-zone indicator changes the least-intrusive source choice without crossing into operational tasking?
5. Correct this misconception: that The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust is optional whenever separate collection discipline concepts from operational recruitment, interception, or tasking procedures feels inconvenient.

10.2.5.1 Agent Handling and Management answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust** without source evidence, uncertainty, or a safe transfer task.

10.3 Agent Handling and Management assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 10; [239, 2026].

10.3.1 Agent Handling and Management evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 10; [239, 2026].

10.3.2 Agent Handling and Management transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 10; [239, 2026].

10.3.2.1 Agent Handling and Management lineage and source tradition: profile, concepts, and first anchors This sits in the **Collection Management and Multi-INT Requirements Discipline** lineage: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. [239, 2026]; [240, 2026].

10.3.2.2 Agent Handling and Management working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 10; [239, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**, with provenance and reviewability throughout.

10.3.2.3 Agent Handling and Management knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** accountable requirements, source-discipline choices, minimization rules, source-risk notes, and evaluation criteria. [239, 2026]; [240, 2026].
- **Transforms:** priority mapping, source-discipline fit, least-intrusive evidence selection, and feedback review.
- **Outputs:** requirements matrix, collection-limit note, source-quality card, and gap list.
- **Failure modes:** recruitment or interception drift, over-collection, weak minimization, and source exposure.

10.3.2.4 Agent Handling and Management transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 10; [239, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.
- **Evidence contract:** keep the **Collection Management and Multi-INT Requirements Discipline** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as requirements matrix, collection-limit note, source-quality card, and gap list that another reviewer can audit.

10.3.2.5 Agent Handling and Management profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 10; [239, 2026].

The matched profile emphasizes requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. The method stack is priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop; the local topic cluster is **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

10.3.3 Agent Handling and Management evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 10; [239, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Collection Management and Multi-INT Requirements Discipline** profile tells reviewers what evidence is strong enough for the module artifact built around **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

10.3.3.1 Agent Handling and Management guide source spine: inherited keys and local citation roles Primary guide citations: [239, 2026]; [240, 2026]; [241, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [025, 2026]; [029, 2026]; [004, 2026]; [026, 2026]; [016, 2026]; [027, 2026]; [028, 2026]; [030, 2026]; [031, 2026]; [032, 2026].

10.3.3.2 Agent Handling and Management verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [239, 2026]; [240, 2026].

Tier	What counts	How it is used
Source guide	[239, 2026]; [240, 2026]; [241, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [025, 2026]; [029, 2026]; [004, 2026]; [026, 2026]; [016, 2026]; [027, 2026]; [028, 2026]; [030, 2026]; [031, 2026]; [032, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 5's source-canon section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics** and [239, 2026]; [240, 2026], but only directly verified source URLs are encoded as citations.

10.3.3.3 Agent Handling and Management intelligence practice lens: evidence artifact and safety check Practice lens: **Requirements-to-Evidence Lens** for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**. [239, 2026]; [240, 2026].

Planning question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Evidence artifact: requirements matrix with source descriptors, caveats, and collection limits.

Validation rule: show priority, authority, minimization, corroboration, and source quality before any claim is reused. Applied to **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

Handoff contract: deliver metadata-rich evidence packets, not unscoped data piles or implicit targeting requests.

Safety check: exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure.

10.3.3.4 Agent Handling and Management runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 10; [239, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	5.99	5.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Agent Handling and Management to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	5.101	5.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Agent Handling and Management	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	5.102	5.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Agent Handling and Management	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust	5.1	5.1 The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Historical meeting-structure ethics	5.2	5.2 source title transformed into safe curriculum treatment; original: Meeting Structures: Overt, Covert, and Clandestine	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical surveillance-risk and source-protection	5.3	5.3 source title transformed into safe curriculum treatment; original: The Surveillance Detection Route (SDR)	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical clandestine-communications ethics	5.4	5.4 source title transformed into safe curriculum treatment; original: Dead Drops: Physical and Digital Methods	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical cutout-and-intermediary provenance	5.5	5.5 source title transformed into safe curriculum treatment; original: Cutouts, Intermediaries, and Deniability Chains	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical front-entity provenance	5.6	5.6 source title transformed into safe curriculum treatment; original: Fronts and Shell Entities as Agent Infrastructure	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical surveillance-risk and source-protection	5.7	5.7 source title transformed into safe curriculum treatment; original: Counter-Surveillance and Detecting Hostile Surveillance	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical agent-tasking oversight	5.8	5.8 source title transformed into safe curriculum treatment; original: Running Agents-in-Place: Frequency, Tasking, Validation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical extraction-and-termination ethics	5.9	5.9 source title transformed into safe curriculum treatment; original: Burning, Exfiltrating, and Terminating Agents	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Declassified source-protection and agent-handling ethics	5.10	5.10 source title transformed into safe curriculum treatment; original: KGB Working-with-Agents Doctrine (Declassified Manuals)	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
AI-Enhanced Micro-Expression Analysis for Source Validation	5.11	5.11 AI-Enhanced Micro-Expression Analysis for Source Validation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Digital-age recruitment-risk and consent-boundary	5.12	5.12 source title transformed into safe curriculum treatment; original: AI-Personalized Communication: Tailoring Persuasion to Source Personality	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

10.3.3.5 Agent Handling and Management reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 10; [239, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical meeting-structure ethics	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical surveillance-risk and source-protection	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical clandestine-communications ethics	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical cutout-and-intermediary provenance	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical front-entity provenance	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Counter-Surveillance and Detecting Hostile Surveillance: Historical surveillance-risk and source-protection	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical agent-tasking oversight	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Historical extraction-and-termination ethics	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Declassified source-protection and agent-handling ethics	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
AI-Enhanced Micro-Expression Analysis for Source Validation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Digital-age recruitment-risk and consent-boundary	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

10.3.3.6 Agent Handling and Management annotated source ledger: real titles and local contribution Each source cited by this **Collection Management and Multi-INT Requirements Discipline** module is paired below with its real title and a one-line note on what it contributes to **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

Source	Cited work	What it contributes	Status
[239, 2026]	Digital Space and Human Rights	Official OHCHR digital rights portal.	original source-guide
[240, 2026]	The Right to Privacy in the Digital Age	The Office of the High Commissioner for Human Rights (OHCHR) hub page on the right to privacy in the digital age. It addresses how data-intensive technologies, particularly artificial intelligence, create risks for privacy, autonomy, and human dignity, and curates international standards, reports, and expert consultations.	verified source-guide
[241, 2026]	Modernised Convention 108	Official Council of Europe Convention 108+ source.	original source-guide

Source	Cited work	What it contributes	Status
[273, 2026]	WCAG 2 Overview	The W3C Web Accessibility Initiative overview of the Web Content Accessibility Guidelines (WCAG), an international standard for making web content accessible to people with disabilities. It explains that WCAG is organized around four principles (perceivable, operable, understandable, robust) with testable success criteria at three conformance levels (A, AA, AAA), and covers versions 2.0, 2.1, and 2.2.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[285, 2026]	NIST AI Resource Center	The NIST AI Resource Center (AIRC), a government platform supporting implementation of the NIST AI Risk Management Framework, a voluntary framework for managing AI risk. It provides the core framework along with a playbook of practical actions, profiles tailored to specific sectors and technologies, use cases, and crosswalks linking the framework to other governance structures.	verified source-guide
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide
[290, 2026]	NIST SP 800-218A: Secure Software Development Practices for Generative AI and Dual-Use Foundation Models	NIST Special Publication 800-218A (July 2024), which augments the Secure Software Development Framework with practices specific to AI model development across the software lifecycle. Produced in response to Executive Order 14110, it addresses AI model producers, developers building on those models, and acquirers of AI systems, and is designed to be used alongside NIST SP 800-218.	verified source-guide
[294, 2026]	M-25-21: Accelerating Federal Use of AI through Innovation, Governance, and Public Trust	An April 2025 Office of Management and Budget memorandum (M-25-21) directing executive branch agencies on federal use of artificial intelligence. Issued under Executive Order 14179, it instructs agencies to accelerate adoption of AI to improve public services and government efficiency while maintaining safeguards for civil rights, civil liberties, and privacy.	verified source-guide

Source	Cited work	What it contributes	Status
[025, 2026]	Andrew Bustamante: Inside the Mind of a Spy — Tradecraft, Trust	This is an episode of The Unmistakable Creative Podcast featuring former CIA field operative Andrew Bustamante discussing intelligence work. The conversation covers his background at the Air Force Academy and CIA training, and frames espionage as resting on reading people, trust, influence, and empathy rather than glamour or action. It also addresses how operatives are selected, the isolation of covert work, and its psychological effects on personal relationships.	verified source-guide
[029, 2026]	Agent Handling in Counterintelligence / PDF	A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches.	verified source-guide context; do not use as primary analytic support
[004, 2026]	AI Won't Replace Spies—It Will Make Them More Powerful Than Ever	Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools.	verified source-guide
[026, 2026]	The tension and drama behind surveillance detection operations	A YouTube video titled "Inside the CIA: The tension and drama behind surveillance detection operations," released May 3, 2024, featuring a former CIA officer. The speaker describes the operational complexity and interpersonal tension involved in moving safely from a starting point to a meeting while accounting for the presence of hostile observation. It conveys the difficulty and stress of clandestine field meetings as recounted from personal experience.	verified source-guide
[016, 2026]	Surveillance Detection - State.gov	Place where victim can be controlled with limited avenues of escape.	original source-guide
[027, 2026]	The Dead Drop: Design a Communications Method Like a Spy	Learn a technique for communicating with your family in an emergency using a method used by spies.	original source-guide
[028, 2026]	Cited source (see bibliography)	See bibliography for scope.	original source-guide
[030, 2026]	The Secrets of Countersurveillance	See bibliography for scope.	original source-guide
[031, 2026]	KGB counter surveillance: How to know if you're being followed	There are cameras everywhere! Everything is trackable!	original source-guide
[032, 2026]	Cited source (see bibliography)	A Google Books catalog entry for a 2025 English-translation edition of a Cold War-era Soviet intelligence training manual, published by Century Print Media Group with a translator's note by a retired NATO intelligence officer. The 144-page volume is presented as a historical document on Soviet human-intelligence doctrine and counterintelligence practice.	verified source-guide

Where this sits. This module's overview is Section 10; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates

that govern this module.

10.3.4 Agent Handling and Management governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 10; [239, 2026].

10.3.5 Agent Handling and Management analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 5's governance-boundary section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Collection Management and Multi-INT Requirements Discipline** for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**. [239, 2026]; [240, 2026].

Curriculum topic spine: The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust, **Historical meeting-structure ethics**, **Historical surveillance-risk and source-protection**. **Verified anchor cluster:** [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]; [Archives and Administration, 1981]; [Agency, 2026g]; [of the Director of National Intelligence, 2026d].

Conceptual depth: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit.

Method stack: priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop.

Composability contract: requirements, authorities, source disciplines, collection notes, retention limits, caveats, and evaluation metrics remain separable.

Known failure modes: opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority.

Defensive boundary: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures. Applied to **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

Anchor	Why it matters here
[Community, 2026]	Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026c]	Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation. Checked as of 2026-05-21; role: curriculum_anchor.
[of Staff, 2026]	Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026g]	Official NSA public explanation of FISA oversight for signals intelligence collection governed by statutory and court-authorized controls. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.

10.3.5.1 Agent Handling and Management evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Collection Management and Multi-INT Requirements Discipline** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [239, 2026]; [240, 2026].

10.3.6 Agent Handling and Management agentic boundary: assist, approve, block, and record

Evidence anchor. Section 10; [239, 2026].

AGEINT translation is bounded by the **Collection Management and Multi-INT Requirements Discipline** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

10.3.6.1 Agent Handling and Management permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 10; [239, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

10.3.6.2 Agent Handling and Management excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [239, 2026]; [240, 2026] and **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

10.3.7 Agent Handling and Management governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 10; [239, 2026].

Governance is practiced as a gate on the **Collection Management and Multi-INT Requirements Discipline** lane. Learners use the **Requirements-to-Evidence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

10.3.7.1 Agent Handling and Management governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [239, 2026]; [240, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Collection Management and Multi-INT Requirements Discipline** failure modes and the **Requirements-to-Evidence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

10.3.7.2 Agent Handling and Management evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 10; [239, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Requirements-to-Evidence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

10.3.7.3 Agent Handling and Management current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**. [239, 2026]; [240, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_intelligence_gov_how_ic_works` for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**?	How the IC Works; lane `governed_intelligence_cycle`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners.
What does the module inherit from `official_odni_icd_204` for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**?	Intelligence Community Directive 204: National Intelligence Priorities Framework; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation.
What does the module inherit from `official_joint_pub_2_0` for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**?	JP 2-0: Joint Intelligence; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments.
What does the module inherit from `official_ic_osint_strategy` for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 10; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

10.3.8 Agent Handling and Management assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 10; [239, 2026].

10.3.9 Agent Handling and Management assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 10; [239, 2026].

10.3.9.1 Agent Handling and Management capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics** and [239, 2026]; [240, 2026].

10.3.9.2 Agent Handling and Management instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics** and [239, 2026]; [240, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

10.3.9.3 Agent Handling and Management assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Historical meeting-structure ethics	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Historical surveillance-risk and source-protection	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

10.3.10 Agent Handling and Management refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [239, 2026]; [240, 2026] and **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**.

10.3.10.1 Agent Handling and Management refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**. The local signals begin with [239, 2026]; [240, 2026].

10.3.10.2 Agent Handling and Management claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**, and the source spine for these checks begins with [239, 2026]; [240, 2026].

10.3.11 Agent Handling and Management reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [239, 2026]; [240, 2026].

Triangulation anchors. In module 5's review-checklist section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics**. [239, 2026]; [240, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

10.3.12 Agent Handling and Management learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **The Case Officer–Agent Relationship: Building, Maintaining, Testing Trust; Historical meeting-structure ethics** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [239, 2026]; [240, 2026].

Section 2, Section 8, Section 9, Section 11

11 Source Protection and CI Integration

11.0.1 Source Protection and CI Integration figures and course links: visual evidence, source flow, and navigation

The module uses Figure 40 and Figure 36 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 8, Section 10, Section 12.
This module teaches the **Collection Management and Multi-INT Requirements Discipline** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [241, 2026].

11.1 Collection Management and Multi-INT Requirements Discipline frame for Source Protection and CI Integration: source context, topic focus, and reader task

Evidence anchor. Section 11; [238, 2026].

11.1.1 Source Protection and CI Integration orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 11; [238, 2026].

11.1.2 Source Protection and CI Integration conceptual primer: source context, core model, and reader task

This chapter teaches collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The chapter uses **Requirements-to-Evidence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.
The central distinction is to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. Core topics include **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance; Lie Detection, Vetting, Polygraph, and Its Alternatives**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [241, 2026].
Learners move from vocabulary and the **Requirements-to-Evidence Lens** distinction through topic lessons on **Identifying Penetration: Signs of Compromise** with evidence and misconception checks, then assemble a **requirements matrix with source descriptors, caveats, and collection limits** with safety and rights gates.

11.1.3 Source Protection and CI Integration learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 11; [238, 2026].

- Connect **Identifying Penetration: Signs of Compromise and Compartmentation and need-to-know governance** to **Collection Management and Multi-INT Requirements Discipline** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **requirements matrix with source descriptors, caveats, and collection limits** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures.

11.1.4 Source Protection and CI Integration core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 11; [238, 2026].

Term	Working definition
Priority	the relative importance of an intelligence question
Source discipline	a broad evidence channel such as HUMINT, SIGINT, GEOINT, OSINT, or FININT
Minimization	the rule that limits acquisition, retention, or use of unnecessary information
Source protection	the duty to reduce risk to people, methods, and sensitive relationships
Evaluation	the feedback step that tests whether the evidence satisfied the requirement
Gray-zone indicator	an observable signal of ambiguous coercion below armed conflict thresholds
Proxy pattern	a relationship suggesting indirect sponsorship without confirmed operational control
Identifying Penetration: Signs of Compromise	Key terms: Identifying, Penetration, Signs.
Compartmentation and need-to-know governance	Key terms: Compartmentation, need, know.

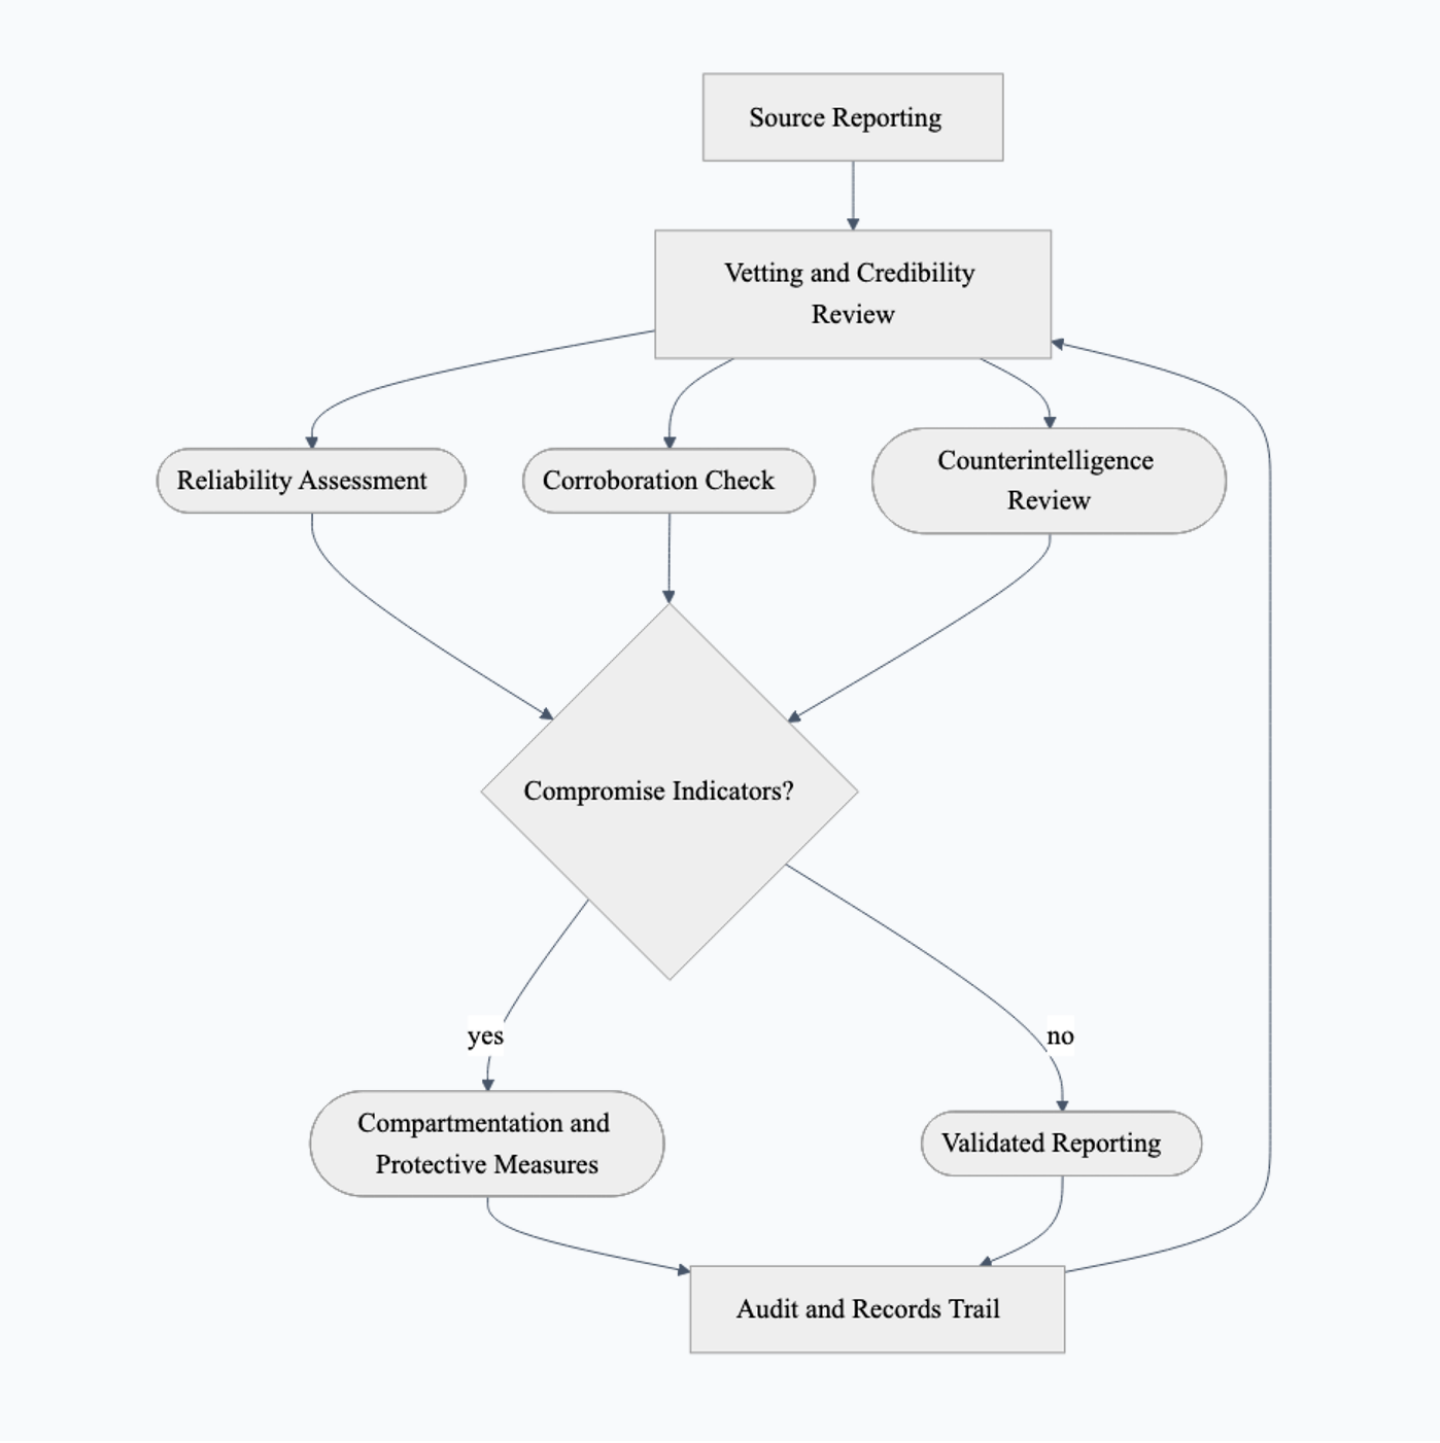

Figure 40: This diagram teaches the defensive governance flow that evaluates source reliability and protects sources through compartmentation and counterintelligence review. Its reader value is to make Source Reporting, Vetting and Credibility Review, and Audit and Records Trail visible at a glance, with the human intelligence humint / source protection and ci integration section as the source section and defensive review as the boundary.

11.2 Requirements-to-Evidence Lens path for Source Protection and CI Integration: lesson cluster, safe artifact, and review

Evidence anchor. Section 11; [238, 2026].

11.2.1 Source Protection and CI Integration practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 11; [238, 2026].

11.2.2 Source Protection and CI Integration topic lessons: source-backed concepts and transfer tasks

This module builds collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The sequence opens with **Identifying Penetration: Signs of Compromise**, **Compartmentation and need-to-know governance**, **Lie Detection, Vetting, Polygraph, and Its Alternatives** and applies the **Requirements-to-Evidence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 36; module overview Section 11; curriculum atlas Section 2.

Triangulation anchors. In module 6's topic-lessons section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

11.2.2.1 Lesson 1: Identifying Penetration: Signs of Compromise

Concept. Identifying Penetration: Signs of Compromise applies Identifying, Penetration, Signs within Collection Management and Multi-INT Requirements Discipline: learners use separate collection discipline concepts from operational recruitment, interception, or tasking procedures and requirements decomposition and source-discipline fit evidence before any judgment moves forward.

Why it matters. Identifying Penetration connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Identifying Penetration: Signs of Compromise rests on [307, 2026], [305, 2026], and [304, 2026]. Its anchor reference records: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for fixing what **Identifying Penetration: Signs of Compromise** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **Identifying Penetration** against the works cited for this row. [307, 2026] Official CISA Industrial Control Systems recommended practices page for defensive ICS/OT safety, resilience, and incident-preparation guidance. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Identifying Penetration**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the source descriptor, the bounded claim about **Identifying Penetration**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Identifying Penetration** work as a **source-risk and validation ethics worksheet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Identifying Penetration: Signs of Compromise can be used while ignoring the rule to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Transfer task. Transfer **Identifying Penetration** to a second module by preserving requirements decomposition and source-discipline fit, changing the source evidence, and naming a new reviewer.

11.2.2.2 Lesson 2: Compartmentation and need-to-know governance

Concept. Compartmentation and need-to-know governance treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Compartmentation and need-to-know governance connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Compartmentation and need-to-know governance rests on [029, 2026]. The closest source to this row notes: It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. Use it for pinning down the scope of **Compartmentation and need-to-know governance**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **Compartmentation and need-to-know governance** in the evidence the row cites. [029, 2026] A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the governance descriptor, the bounded claim about **Compartmentation and need-to-know governance**, the compartmentation caveat, the uncertainty note, the non-authorization boundary, and the reviewer who signs oversight. Shape this subject work as a **source-risk and validation ethics worksheet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Compartmentation and need-to-know governance**: that governance vocabulary about tradecraft confers operational authorization rather than the constraints under which any action must be approved.

Transfer task. Reuse the **Compartmentation and need-to-know governance** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

11.2.2.3 Lesson 3: Lie Detection, Vetting, Polygraph, and Its Alternatives

Concept. Lie Detection, Vetting, Polygraph, and Its Alternatives connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. Lie Detection, Vetting, Polygraph, and Its Alternatives connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Lie Detection, Vetting, Polygraph, and Its Alternatives rests on [307, 2026], [305, 2026], and [304, 2026]. The closest source to this row notes: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set

of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for pinning down the scope of **Lie Detection, Vetting, Polygraph, and Its Alternatives**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Lie Detection, Vetting, Polygraph, and Its Alternatives**, work from the cited evidence behind this row. [307, 2026] Official CISA Industrial Control Systems recommended practices page for defensive ICS/OT safety, resilience, and incident-preparation guidance. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Lie Detection, Vetting, Polygraph, and Its Alternatives**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the source descriptor, the bounded claim about **Lie Detection Vetting Polygraph and**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **source-risk and validation ethics worksheet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Lie Detection, Vetting, Polygraph, and Its Alternatives establishes intent without reviewing alternative explanations.

Transfer task. Transfer **Lie Detection, Vetting, Polygraph, and Its Alternatives** to a second module by preserving requirements decomposition and source-discipline fit, changing the source evidence, and naming a new reviewer.

11.2.2.4 Lesson 4: The Double-Agent Operation

Concept. The Double-Agent Operation treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Without explicit treatment of **The Double-Agent Operation**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. The Double-Agent Operation rests on [029, 2026]. The most specific cited work observes: A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. Use it for the working definition that **The Double-Agent Operation** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **The Double-Agent Operation** against the works cited for this row. [029, 2026] A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **The Double-Agent Operation**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the source descriptor, the bounded claim about **Double-Agent Operation**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **source-risk and validation ethics worksheet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that The Double-Agent Operation replaces human review whenever evidence looks plausible.

Transfer task. Transfer **The Double-Agent Operation** to a second module by preserving requirements decomposition and source-discipline fit, changing the source evidence, and naming a new reviewer.

11.2.2.5 Lesson 5: Non-state actor indicator review with attribution caution and governance boundaries

Concept. Non-state actor indicator review with attribution caution and governance boundaries uses attribution indicators cautiously by separating technical similarity, context, confidence, and geopolitical inference.

Why it matters. Without explicit treatment of **Non-state actor indicator review**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Non-state actor indicator review with attribution caution and governance boundaries rests on [033, 2026]. The lead source's own note reads: How seriously is the U.S. Use it for the claim that **Non-state actor indicator review with attribution caution and governance boundaries** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Non-state actor indicator review**, work from the cited evidence behind this row. [033, 2026] How seriously is the U.S. Intelligence Community (IC) considering this challenge to U.S. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Non-state actor indicator review**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the actor descriptor, the bounded claim about **state actor indicator review with**, the attribution caveat, the uncertainty note, the non-targeting boundary, and the reviewer who approves the assessment. Shape **Non-state actor indicator review** work as a **source-risk and validation ethics worksheet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that lacking a state sponsor places an actor outside the reach of governance, accountability, and applicable rules.

Transfer task. Reuse the **Non-state actor indicator review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

11.2.2.6 Lesson 6: Espionage in the AI Era: Why HUMINT Will Grow in Importance

Concept. Espionage in the AI Era: Why HUMINT Will Grow in Importance treats human-source work as a governed relationship: validation, consent, reporting, source protection, and oversight—not contact activity.

Why it matters. Without explicit treatment of **Espionage in the AI Era: Why HUMINT Will Grow in Importance**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Espionage in the AI Era: Why HUMINT Will Grow in Importance rests on [019, 2026] and [034, 2026]. The closest source to this row notes: By Thomas Mulligan, a researcher at the RAND Corporation who served in CIA during 2008–14. Use them for pinning down the scope of **Espionage in the AI Era: Why HUMINT Will Grow in Importance**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **Espionage in the AI Era: Why HUMINT Will Grow in Importance** in the evidence the row cites. [019, 2026] By Thomas Mulligan, a researcher at the RAND Corporation who served in CIA during 2008–14. [034, 2026] Thomas Mulligan is a researcher at the RAND Corporation and former CIA officer. Ana P. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Espionage in the AI Era**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the source descriptor, the bounded claim about **Espionage in the AI Era**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Espionage in the AI Era: Why HUMINT Will Grow in Importance** work as a **source-risk and validation ethics worksheet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Espionage in the AI Era: Why HUMINT Will Grow in Importance is optional whenever separate collection discipline concepts from operational recruitment, interception, or tasking procedures feels inconvenient.

Transfer task. Transfer **Espionage in the AI Era: Why HUMINT Will Grow in Importance** to a second module by preserving requirements decomposition and source-discipline fit, changing the source evidence, and naming a new reviewer.

11.2.3 Source Protection and CI Integration worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic policy cell compares public indicators of hybrid pressure against an approved collection plan for a benign border-disruption exercise. [238, 2026]; [241, 2026].

Triangulation anchors. In module 6's worked-example section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **human-source literacy and source protection**. Learners use a **source-risk and validation ethics worksheet** and keep this boundary visible: No elicitation, impersonation, covert contact, or operational source-management procedures; all cases use classroom fixtures.

Frame. The classroom question centers on **Identifying Penetration: Signs of Compromise**. Excluded actions stay explicit, and the **Requirements-to-Evidence Lens** planning question is: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Inputs. For the **Identifying Penetration: Signs of Compromise** scenario, use public notices, synthetic interview summaries, public logistics records, and an instructor scope card. The Requirements-to-Evidence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Identifying Penetration: Signs of Compromise**, students rank requirements, choose the least intrusive source discipline, list excluded actions, and evaluate evidence quality. Pause whenever an inference about Identifying Penetration: Signs of Compromise appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Identifying Penetration: Signs of Compromise** classroom scenario; unit artifact = source-risk and validation ethics worksheet; evidence = allowed inputs; method = requirements decomposition and source-discipline fit; output = a requirements-to-evidence matrix with discipline fit, source caveats, minimization notes, and gaps; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Identifying Penetration: Signs of Compromise** as "Requirements-to-Evidence Lens confirms it" is not enough. The revision ties the claim to requirements decomposition and source-discipline fit, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Identifying Penetration: Signs of Compromise** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

11.2.4 Source Protection and CI Integration practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Requirements-to-Evidence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

Triangulation anchors. In module 6's practice-sequence section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Identifying Penetration: Signs of Compromise, Compartmentation and need-to-know governance, Lie Detection, Vetting, Polygraph, and Its Alternatives; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Collection Management and Multi-INT Requirements Discipline** lane.
2. Frame	Answer the lens question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Identifying Penetration: Signs of Compromise: requirements matrix with source descriptors, caveats, and collection limits.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the source-risk and validation ethics worksheet fields for Identifying Penetration: Signs of Compromise.	Unit profile note.	Evidence artifacts include validation note, pressure-risk checklist.

Move	Learner action	Output	Check
4. Challenge	Test the misconception that Identifying Penetration: Signs of Compromise can be used while ignoring the rule to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.	Failure-mode note.	The artifact applies the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

11.2.4.1 Source Protection and CI Integration instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**. [238, 2026]; [241, 2026].

11.2.4.2 Source Protection and CI Integration extension exercise: peer validation and refresh trigger review Evidence anchor. Section 11; [238, 2026].

Have learners swap artifacts and apply the **Requirements-to-Evidence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

11.2.5 Source Protection and CI Integration knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 11; [238, 2026].

1. Explain how **Identifying Penetration: Signs of Compromise** is defined here; name the source descriptor that supports the definition.
2. Contrast **Identifying Penetration: Signs of Compromise** with **Compartmentation and need-to-know governance** using the **Requirements-to-Evidence Lens** artifact fields.
3. Identify one failure mode from the **Collection Management and Multi-INT Requirements Discipline** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which gray-zone indicator changes the least-intrusive source choice without crossing into operational tasking?
5. Correct this misconception: that Identifying Penetration: Signs of Compromise can be used while ignoring the rule to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

11.2.5.1 Source Protection and CI Integration answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Identifying Penetration: Signs of Compromise** without source evidence, uncertainty, or a safe transfer task.

11.3 Source Protection and CI Integration assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 11; [238, 2026].

11.3.1 Source Protection and CI Integration evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 11; [238, 2026].

11.3.2 Source Protection and CI Integration transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 11; [238, 2026].

11.3.2.1 Source Protection and CI Integration lineage and source tradition: profile, concepts, and first anchors This sits in the **Collection Management and Multi-INT Requirements Discipline** lineage: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. [238, 2026]; [241, 2026].

11.3.2.2 Source Protection and CI Integration working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 11; [238, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**, with provenance and reviewability throughout.

11.3.2.3 Source Protection and CI Integration knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** accountable requirements, source-discipline choices, minimization rules, source-risk notes, and evaluation criteria. [238, 2026]; [241, 2026].
- **Transforms:** priority mapping, source-discipline fit, least-intrusive evidence selection, and feedback review.
- **Outputs:** requirements matrix, collection-limit note, source-quality card, and gap list.
- **Failure modes:** recruitment or interception drift, over-collection, weak minimization, and source exposure.

11.3.2.4 Source Protection and CI Integration transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 11; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.
- **Evidence contract:** keep the **Collection Management and Multi-INT Requirements Discipline** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as requirements matrix, collection-limit note, source-quality card, and gap list that another reviewer can audit.

11.3.2.5 Source Protection and CI Integration profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 11; [238, 2026].

The matched profile emphasizes requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. The method stack is priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop; the local topic cluster is **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

11.3.3 Source Protection and CI Integration evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 11; [238, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Collection Management and Multi-INT Requirements Discipline** profile tells reviewers what evidence is strong enough for the module artifact built around **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

11.3.3.1 Source Protection and CI Integration guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [241, 2026]; [266, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [307, 2026]; [305, 2026]; [304, 2026]; [029, 2026]; [033, 2026]; [019, 2026]; [034, 2026].

11.3.3.2 Source Protection and CI Integration verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [241, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [241, 2026]; [266, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [307, 2026]; [305, 2026]; [304, 2026]; [029, 2026]; [033, 2026]; [019, 2026]; [034, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 6's source-canon section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance** and [238, 2026]; [241, 2026], but only directly verified source URLs are encoded as citations.

11.3.3.3 Source Protection and CI Integration intelligence practice lens: evidence artifact and safety check Practice lens: **Requirements-to-Evidence Lens** for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**. [238, 2026]; [241, 2026].

Planning question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Evidence artifact: requirements matrix with source descriptors, caveats, and collection limits.

Validation rule: show priority, authority, minimization, corroboration, and source quality before any claim is reused. Applied to **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

Handoff contract: deliver metadata-rich evidence packets, not unscoped data piles or implicit targeting requests.

Safety check: exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure.

11.3.3.4 Source Protection and CI Integration runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 11; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	6.99	6.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Source Protection and CI Integration to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	6.101	6.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Source Protection and CI Integration	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	6.102	6.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Source Protection and CI Integration	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Identifying Penetration: Signs of Compromise	6.1	6.1 Identifying Penetration: Signs of Compromise	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Compartmentation and need-to-know governance	6.2	6.2 source title transformed into safe curriculum treatment; original: Compartmentation in Agent Networks	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Lie Detection, Vetting, Polygraph, and Its Alternatives	6.3	6.3 Lie Detection, Vetting, Polygraph, and Its Alternatives	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Non-state actor indicator review with attribution caution and governance boundaries	6.5	6.5 source title transformed into safe curriculum treatment; original: Hostile Intelligence from Non-State Actors	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Espionage in the AI Era: Why HUMINT Will Grow in Importance	6.6	6.6 Espionage in the AI Era: Why HUMINT Will Grow in Importance	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

11.3.3.5 Source Protection and CI Integration reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 11; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Identifying Penetration: Signs of Compromise	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Compartmentation and need-to-know governance	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Lie Detection, Vetting, Polygraph, and Its Alternatives	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
The Double-Agent Operation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Non-state actor indicator review with attribution caution and governance boundaries	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Espionage in the AI Era: Why HUMINT Will Grow in Importance	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

11.3.3.6 Source Protection and CI Integration annotated source ledger: real titles and local contribution Each source cited by this **Collection Management and Multi-INT Requirements Discipline** module is paired below with its real title and a one-line note on what it contributes to **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide
[241, 2026]	Modernised Convention 108	Official Council of Europe Convention 108+ source.	original source-guide

Source	Cited work	What it contributes	Status
[266, 2026]	PROV Overview	A W3C Working Group Note from 2013 that provides an overview and roadmap for the PROV family of specifications for representing and exchanging provenance information on the web. It defines provenance as information about the entities, activities, and people involved in producing data, used to assess quality, reliability, and trustworthiness.	verified source-guide
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide
[288, 2026]	Algorithmic Transparency Recording Standard Hub	A GOV.UK collection page serving as the hub for the UK Algorithmic Transparency Recording Standard (ATRS), maintained by the Government Digital Service. It provides a standardized template for documenting public-sector use of algorithmic tools, completion guidance, policy on scope and compliance, and a searchable repository of published transparency records.	verified source-guide

Source	Cited work	What it contributes	Status
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[307, 2026]	ICS Recommended Practices	Official CISA Industrial Control Systems recommended practices page for defensive ICS/OT safety, resilience, and incident-preparation guidance.	original source-guide
[305, 2026]	DevSecOps	Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support.	original source-guide
[304, 2026]	Secure Software Development Framework (SSDF) Version 1.1: Recommendations for Mitigating the Risk of Software Vulnerabilities	NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences.	verified source-guide
[029, 2026]	Agent Handling in Counterintelligence / PDF	A roughly 28-page Scribd document titled “Agent Handling in Counterintelligence” providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches.	verified source-guide context; do not use as primary analytic support
[033, 2026]	The Counterintelligence Threat from Non-State Actors	How seriously is the U.S. Intelligence Community (IC) considering this challenge to U.S.	original source-guide context; do not use as primary analytic support
[019, 2026]	Espionage in Our AI Future: Why Human Intelligence Still Matters - CSI	By Thomas Mulligan, a researcher at the RAND Corporation who served in CIA during 2008–14.	original source-guide
[034, 2026]	Studies in Intelligence Vol. 70, No. 1 (Extracts, March 2026) - CSI	Thomas Mulligan is a researcher at the RAND Corporation and former CIA officer. Ana P.	original source-guide

Where this sits. This module's overview is Section 11; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

11.3.4 Source Protection and CI Integration governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 11; [238, 2026].

11.3.5 Source Protection and CI Integration analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 6's governance-boundary section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Collection Management and Multi-INT Requirements Discipline** for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**. [238, 2026]; [241, 2026].

Curriculum topic spine: Identifying Penetration: Signs of Compromise, **Compartmentation and need-to-know governance**, **Lie Detection, Vetting, Polygraph, and Its Alternatives**. **Verified anchor cluster:** [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]; [Archives and Administration, 1981]; [Agency, 2026g]; [of the Director of National Intelligence, 2026d].

Conceptual depth: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit.

Method stack: priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop.

Composability contract: requirements, authorities, source disciplines, collection notes, retention limits, caveats, and evaluation metrics remain separable.

Known failure modes: opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority.

Defensive boundary: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures. Applied to **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

Anchor	Why it matters here
[Community, 2026]	Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026c]	Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation. Checked as of 2026-05-21; role: curriculum_anchor.
[of Staff, 2026]	Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026g]	Official NSA public explanation of FISA oversight for signals intelligence collection governed by statutory and court-authorized controls. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.

11.3.5.1 Source Protection and CI Integration evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Collection Management and Multi-INT Requirements Discipline** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [241, 2026].

11.3.6 Source Protection and CI Integration agentic boundary: assist, approve, block, and record

Evidence anchor. Section 11; [238, 2026].

AGEINT translation is bounded by the **Collection Management and Multi-INT Requirements Discipline** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

11.3.6.1 Source Protection and CI Integration permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 11; [238, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

11.3.6.2 Source Protection and CI Integration excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [241, 2026] and **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

11.3.7 Source Protection and CI Integration governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 11; [238, 2026].

Governance is practiced as a gate on the **Collection Management and Multi-INT Requirements Discipline** lane. Learners use the **Requirements-to-Evidence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues

remain, and when an agent-assisted artifact must stop for human review while using **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

11.3.7.1 Source Protection and CI Integration governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [241, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Collection Management and Multi-INT Requirements Discipline** failure modes and the **Requirements-to-Evidence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

11.3.7.2 Source Protection and CI Integration evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 11; [238, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Requirements-to-Evidence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

11.3.7.3 Source Protection and CI Integration current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**. [238, 2026]; [241, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_intelligence_gov_how_ic_works` for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**?	How the IC Works; lane `governed_intelligence_cycle`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners.
What does the module inherit from `official_odni_icd_204` for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**?	Intelligence Community Directive 204: National Intelligence Priorities Framework; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation.
What does the module inherit from `official_joint_pub_2_0` for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**?	JP 2-0: Joint Intelligence; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments.
What does the module inherit from `official_ic_osint_strategy` for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 11; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

11.3.8 Source Protection and CI Integration assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 11; [238, 2026].

11.3.9 Source Protection and CI Integration assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 11; [238, 2026].

11.3.9.1 Source Protection and CI Integration capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance** and [238, 2026]; [241, 2026].

11.3.9.2 Source Protection and CI Integration instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance** and [238, 2026]; [241, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

11.3.9.3 Source Protection and CI Integration assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Identifying Penetration: Signs of Compromise	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Compartmentation and need-to-know governance	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Lie Detection, Vetting, Polygraph, and Its Alternatives	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

11.3.10 Source Protection and CI Integration refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [241, 2026] and **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**.

11.3.10.1 Source Protection and CI Integration refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**. The local signals begin with [238, 2026]; [241, 2026].

11.3.10.2 Source Protection and CI Integration claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**, and the source spine for these checks begins with [238, 2026]; [241, 2026].

11.3.11 Source Protection and CI Integration reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [241, 2026].

Triangulation anchors. In module 6's review-checklist section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance**. [238, 2026]; [241, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

11.3.12 Source Protection and CI Integration learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **Identifying Penetration: Signs of Compromise; Compartmentation and need-to-know governance** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [238, 2026]; [241, 2026].

Section 2, Section 8, Section 10, Section 12

12 SIGNALS INTELLIGENCE (SIGINT)

12.1 SIGNALS INTELLIGENCE (SIGINT) learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 12; [255, 2026].

12.1.1 signals-intelligence governance discipline spine: domain question and learning focus

Evidence anchor. Section 12; [255, 2026].
This unit teaches **signals-intelligence governance**. SIGINT is taught as legal, technical, and minimization-aware interpretation of signal-derived evidence, not interception procedure.

12.1.2 signals-intelligence governance source-use contract: citation roles and evidence limits

Evidence anchor. Section 12; [255, 2026].
Use source-guide citations for discipline concepts and directive/legal anchors for authority, minimization, retention, and dissemination claims.

12.1.3 signals-intelligence governance practice artifact: recurring packet and retained evidence

Evidence anchor. Section 12; [255, 2026].
The recurring practice artifact is a **signal-evidence minimization card** that draws on authority boundary note, minimization field, signal-quality caveat, and dissemination restriction. The unit keeps its learning spine explicit. Learners separate signal availability, collection authority, analytic inference, and dissemination controls.

12.1.4 signals-intelligence governance safety boundary: accountable, synthetic, and evidence-bounded limits

No interception, decryption, surveillance target selection, or collection-expansion guidance.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [255, 2026]; [258, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [255, 2026]; [258, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [255, 2026]; [258, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [255, 2026]; [258, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Collection Management and Multi-INT Requirements Discipline. Core anchors: [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]. Conceptual focus: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. Composability contract: requirements, authorities, source disciplines, collection notes, retention limits, caveats, and evaluation metrics remain separable. **Practice lens:** Requirements-to-Evidence Lens; What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit? [255, 2026]; [258, 2026].

12.1.5 SIGNALS INTELLIGENCE (SIGINT) visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 41 and Figure 42 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 11, Section 13.

12.1.6 SIGNALS INTELLIGENCE (SIGINT) module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
SIGINT Fundamentals	Section 13	[255, 2026]; [258, 2026]; [261, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [035, 2026]; [036, 2026]; [037, 2026]; [038, 2026]; [039, 2026]; [040, 2026].
Modern SIGINT and Cryptography	Section 14	[258, 2026]; [260, 2026]; [261, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [041, 2026]; [042, 2026]; [027, 2026]; [028, 2026]; [043, 2026]; [044, 2026]; [045, 2026]; [046, 2026]; [018, 2026]; [298, 2026]; [297, 2026]; [309, 2026]; [310, 2026]; [300, 2026].

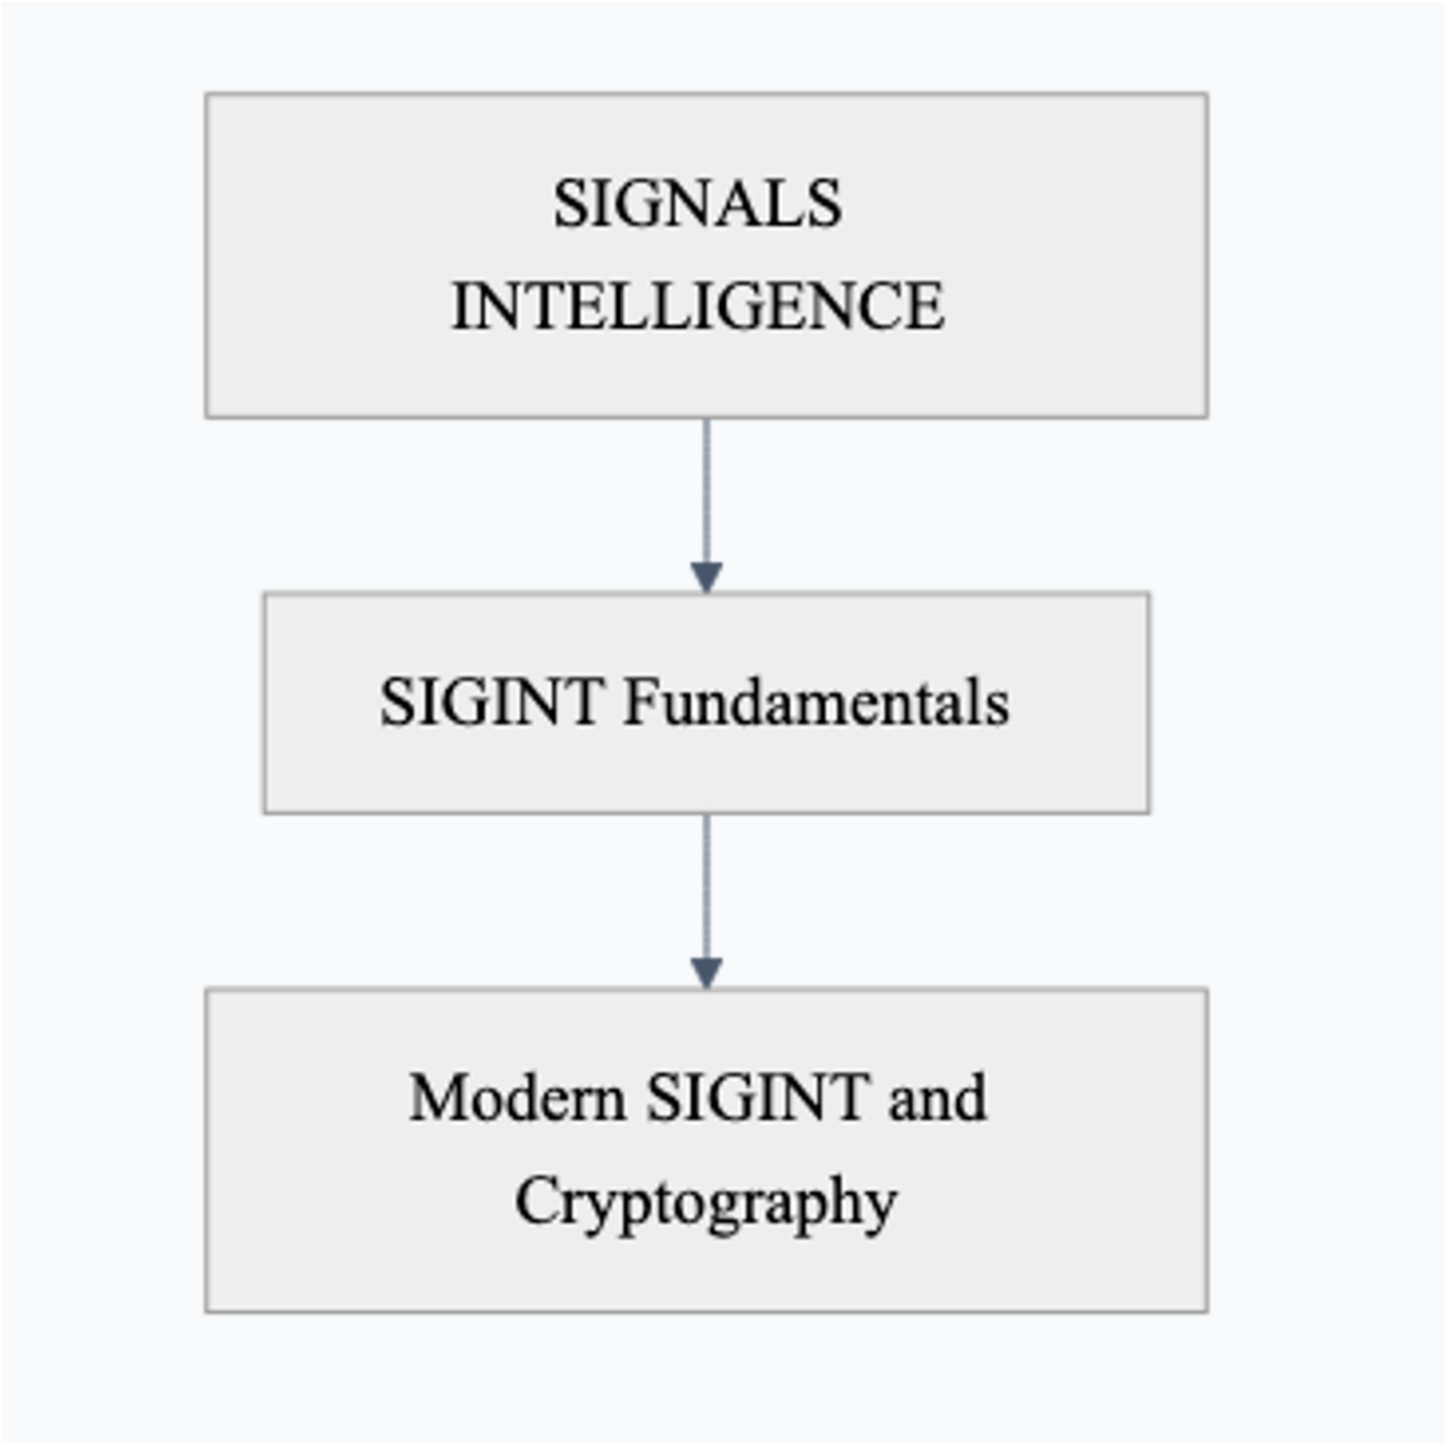

Figure 41: The unit module map traces the part's chapters as a linear reading sequence. Its reader value is to make 2 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last visible at a glance, with the signals intelligence sigint section as the source section and defensive review as the boundary.

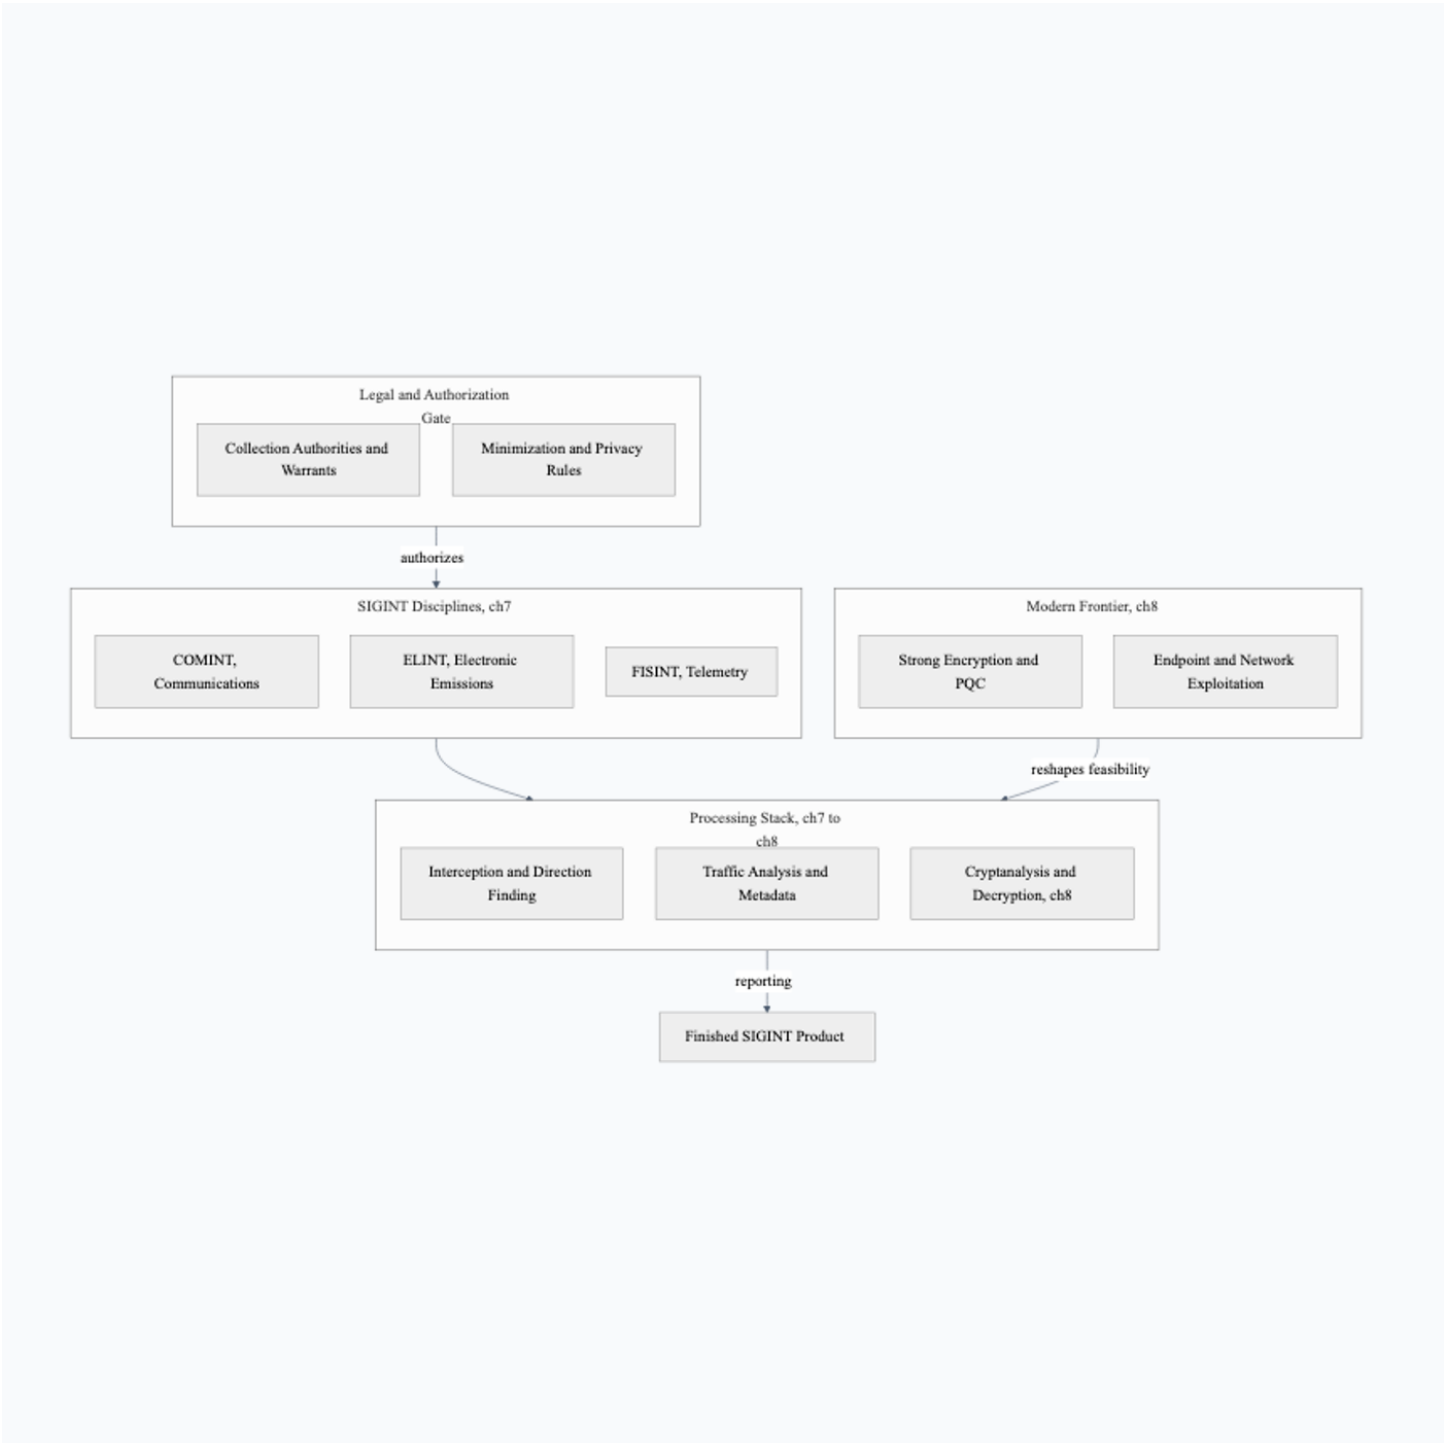

Figure 42: Part III shows SIGINT as a legally gated, layered pipeline where authorities and minimization rules govern collection disciplines (ch7), feed a processing stack into cryptanalysis (ch8), with the modern crypto frontier reshaping what is feasible. In the signals intelligence sigint section, it lets readers compare Legal and Authorization Gate, Collection Authorities and Warrants, Minimization and Privacy Rules, and SIGINT Disciplines, ch7 so the visual functions as a traceable course aid rather than an unscoped assertion.

13 SIGINT Fundamentals

13.0.1 SIGINT Fundamentals figures and course links: visual evidence, source flow, and navigation

The module uses Figure 43 and Figure 41 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 12, Section 14.
This module teaches the **Collection Management and Multi-INT Requirements Discipline** lane through a bounded, source-backed coursebook chapter. [255, 2026]; [258, 2026].

13.1 Collection Management and Multi-INT Requirements Discipline frame for SIGINT Fundamentals: source context, topic focus, and reader task

Evidence anchor. Section 13; [255, 2026].

13.1.1 SIGINT Fundamentals orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 13; [255, 2026].

13.1.2 SIGINT Fundamentals conceptual primer: source context, core model, and reader task

This chapter teaches collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The chapter uses **Requirements-to-Evidence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.
The central distinction is to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. Core topics include **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise; Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [255, 2026]; [258, 2026].
Learners move from vocabulary and the **Requirements-to-Evidence Lens** distinction through topic lessons on **SIGINT legal-authority and communications-security governance exercise** with evidence and misconception checks, then assemble a **requirements matrix with source descriptors, caveats, and collection limits** with safety and rights gates.

13.1.3 SIGINT Fundamentals learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 13; [255, 2026].

- Connect **SIGINT legal-authority and communications-security governance exercise and WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise** to **Collection Management and Multi-INT Requirements Discipline** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **requirements matrix with source descriptors, caveats, and collection limits** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures.

13.1.4 SIGINT Fundamentals core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 13; [255, 2026].

Term	Working definition
Priority	the relative importance of an intelligence question
Source discipline	a broad evidence channel such as HUMINT, SIGINT, GEOINT, OSINT, or FININT
Minimization	the rule that limits acquisition, retention, or use of unnecessary information
Source protection	the duty to reduce risk to people, methods, and sensitive relationships
Evaluation	the feedback step that tests whether the evidence satisfied the requirement
Gray-zone indicator	an observable signal of ambiguous coercion below armed conflict thresholds
Proxy pattern	a relationship suggesting indirect sponsorship without confirmed operational control
SIGINT legal-authority and…	Key terms: SIGINT, legal, authority.
WWII Axis SIGINT: SIGINT legal-authority and…	Key terms: WWII, Axis, SIGINT.

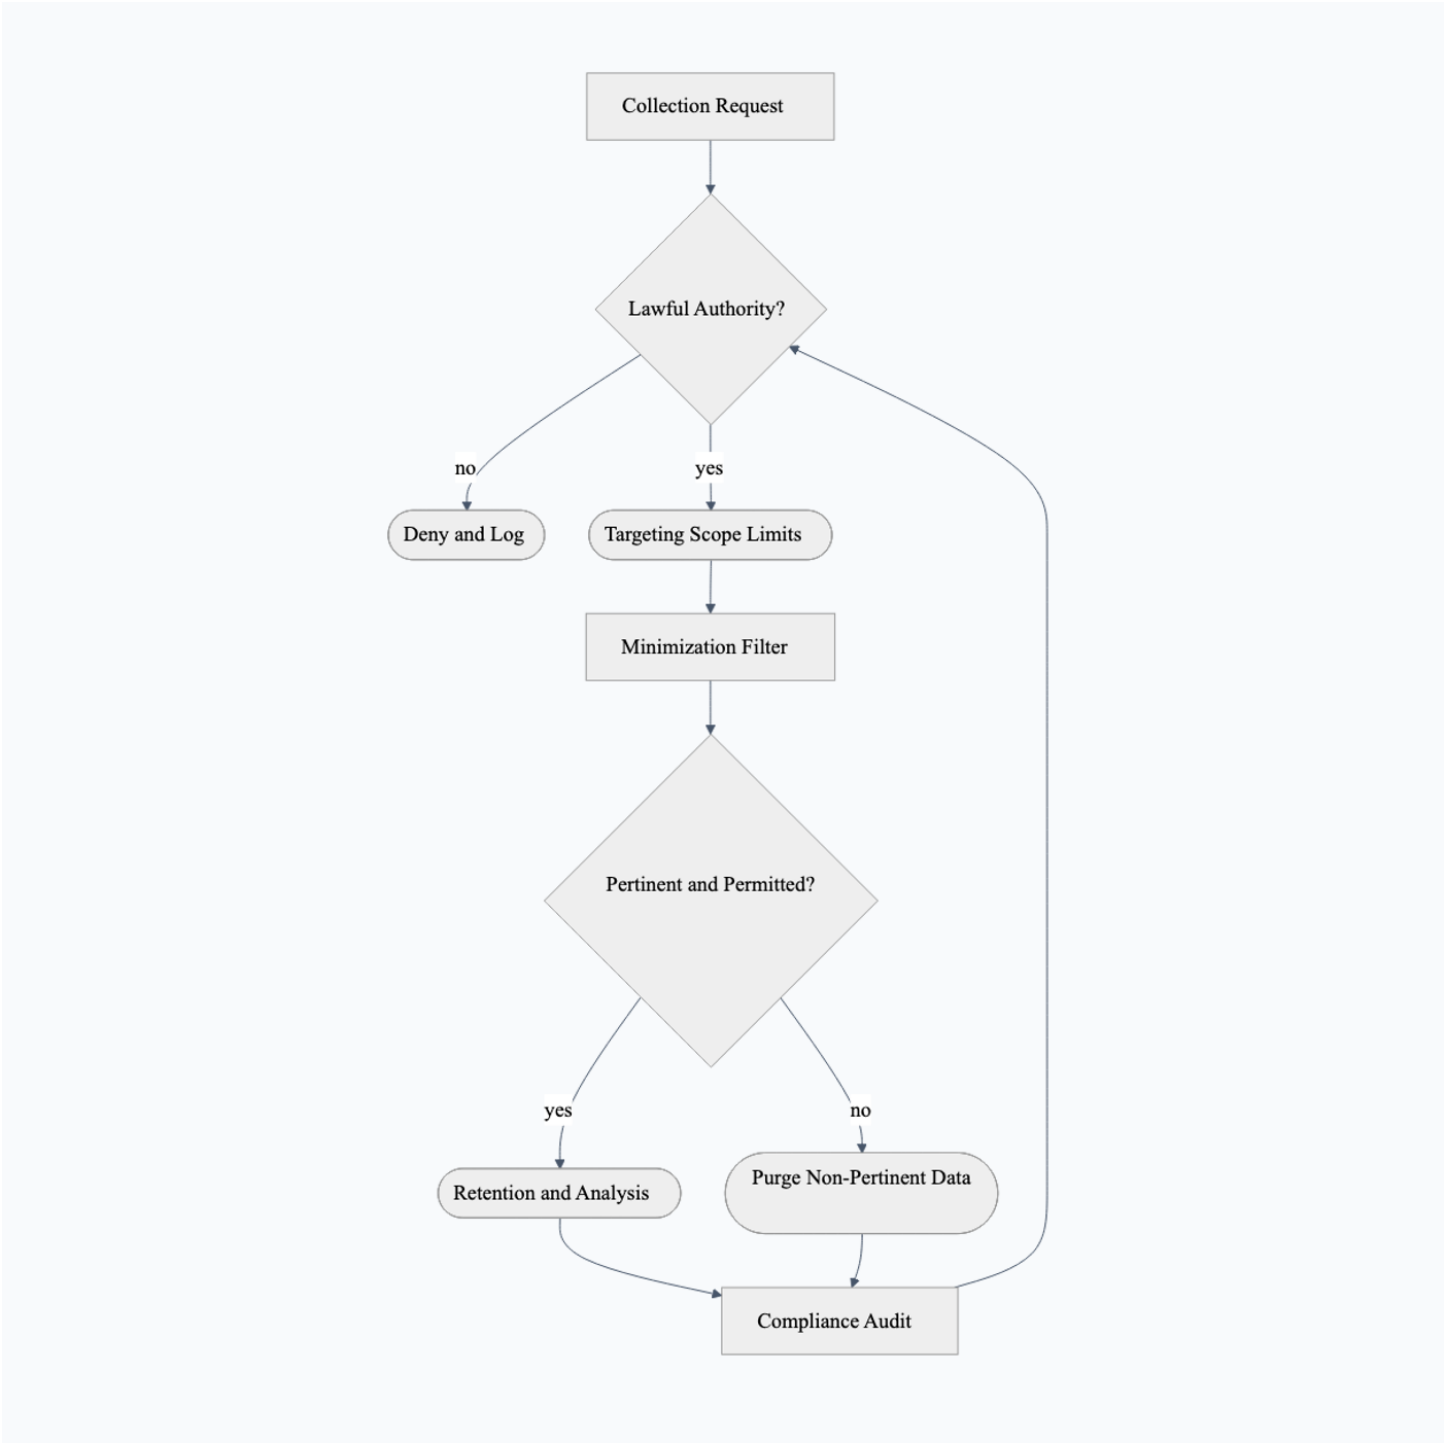

Figure 43: This diagram teaches how a lawful-authority check and minimization rules gate signals collection so that non-pertinent and protected data are filtered before retention. It is anchored to the signals intelligence sigint / sigint fundamentals section; use it to inspect Collection Request, Minimization Filter, and Compliance Audit while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

13.2 Requirements-to-Evidence Lens path for SIGINT Fundamentals: lesson cluster, safe artifact, and review

Evidence anchor. Section 13; [255, 2026].

13.2.1 SIGINT Fundamentals practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 13; [255, 2026].

13.2.2 SIGINT Fundamentals topic lessons: source-backed concepts and transfer tasks

This module builds collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The sequence opens with **SIGINT legal-authority and communications-security governance exercise**, **WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**, **Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise** and applies the **Requirements-to-Evidence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 41; module overview Section 13; curriculum atlas Section 2.

Triangulation anchors. In module 7's topic-lessons section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

13.2.2.1 Lesson 1: SIGINT legal-authority and communications-security governance exercise

Concept. SIGINT legal-authority and communications-security governance exercise distinguishes communications content from electronic signatures by evidence type, authority, minimization, and uncertainty.

Why it matters. Without explicit treatment of **SIGINT legal-authority**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. SIGINT legal-authority and communications-security governance exercise rests on [035, 2026]. The closest source to this row notes: SIGINT is intelligence derived from electronic signals and systems used by foreign targets. Use it for pinning down the scope of **SIGINT legal-authority and communications-security governance exercise**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **SIGINT legal-authority** against the works cited for this row. [035, 2026] SIGINT is intelligence derived from electronic signals and systems used by foreign targets. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **SIGINT legal-authority**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **SIGINT legal-authority and communications-security governance**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **SIGINT legal-authority** work as a **signal-evidence minimization card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **SIGINT legal-authority**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Reuse the **SIGINT legal-authority** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

13.2.2.2 Lesson 2: WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise

Concept. WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. Analysts use **WWII Axis SIGINT** to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. A defensible treatment names the judgment it enables for requirements decomposition and source-discipline fit review, the proof limit that opportunistic collection would otherwise hide, and the reviewer accountable for challenge.

Source support. WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise rests on [036, 2026]. The closest source to this row notes: Volumes 1 - 9 of the European Axis Signal Intelligence in WWII documentation. Use it for pinning down the scope of **WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **WWII Axis SIGINT** in the evidence the row cites. [036, 2026] Volumes 1 - 9 of the European Axis Signal Intelligence in WWII documentation. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **WWII Axis SIGINT**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **WWII Axis SIGINT**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **WWII Axis SIGINT** work as a **signal-evidence minimization card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **WWII Axis SIGINT**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Apply this module's safe boundary for **WWII Axis SIGINT** to another artifact while keeping requirements decomposition and source-discipline fit and reviewer ownership explicit.

13.2.2.3 Lesson 3: Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise

Concept. Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. Without explicit treatment of **Spartans in Darkness**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise rests on [037, 2026]. The lead source's own note reads: This Federation of American Scientists article reports on the NSA's declassification of a roughly 500-page historical study titled "Spartans in Darkness," which examines American signals intelligence during the Vietnam War from 1945 to 1975. Use it for the working definition that **Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Spartans in Darkness**, work from the cited evidence behind this row. [037, 2026] This Federation of American Scientists article reports on the NSA's declassification of a roughly 500-page historical study titled "Spartans in Darkness," which examines American signals intelligence during the Vietnam War from 1945 to 1975. Author Robert J. Hanyok documents that no second attack occurred during the 1964 Gulf of Tonkin Incident, contradicting prior official testimony, and also covers episodes such as the Tet Offensive and the Son Tay prison rescue. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Spartans in Darkness**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **Spartans in Darkness**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **Spartans in Darkness** work as a **signal-evidence minimization card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Spartans in Darkness**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Transfer **Spartans in Darkness** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

13.2.2.4 Lesson 4: CIA NSA SIGINT Relationship: SIGINT legal-authority and communications-security governance exercise

Concept. CIA NSA SIGINT Relationship: SIGINT legal-authority and communications-security governance exercise frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. CIA NSA SIGINT Relationship matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; opportunistic collection is a common failure.

Source support. CIA NSA SIGINT Relationship: SIGINT legal-authority and communications-security governance exercise rests on [038, 2026] and [039, 2026]. The closest source to this row notes: Richelson, presenting declassified documents on the CIA's signals intelligence activities from roughly 1947 to 1970. Use them for fixing what **CIA NSA SIGINT Relationship: SIGINT legal-authority and communications-security governance exercise** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **CIA NSA SIGINT Relationship**, reason from the sources cited in this row. [038, 2026] A January 2018 blog post on Open INT recounting the CIA's role in signals intelligence from roughly 1947 to 1970, noting that SIGINT is often associated with the NSA but the CIA also participated. It distinguishes communications intelligence from electronic intelligence and references declassified Cold War operations including U-2 collection and a Berlin communications-tapping effort. [039, 2026] A 2015 briefing book from the National Security Archive, compiled by Jeffrey T. Richelson, presenting declassified documents on the CIA's signals intelligence activities from roughly 1947 to 1970. It documents the CIA's parallel SIGINT operations alongside the NSA during the Cold War, covering programs and collection efforts as well as recurring friction between the two agencies over mission overlap, budgets, and access to intelligence. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **CIA NSA SIGINT Relationship**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **CIA NSA SIGINT Relationship**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **CIA NSA SIGINT Relationship** work as a **signal-evidence minimization card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **CIA NSA SIGINT Relationship**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Reuse the **CIA NSA SIGINT Relationship** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

13.2.2.5 Lesson 5: NSA Basic Cryptography: SIGINT legal-authority and communications-security governance exercise

Concept. NSA Basic Cryptography: SIGINT legal-authority and communications-security governance exercise frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. NSA Basic Cryptography matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; opportunistic collection is a common failure.

Source support. NSA Basic Cryptography: SIGINT legal-authority and communications-security governance exercise rests on [040, 2026]. The most specific cited work observes: Codes will first be considered, but as they do not fulfill the conditions required of a means. Use it for fixing what **NSA Basic Cryptography: SIGINT legal-authority and communications-security governance exercise** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **NSA Basic Cryptography** against the works cited for this row. [040, 2026] Codes will first be considered, but as they do not fulfill the conditions required of a means. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **NSA Basic Cryptography**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **NSA Basic Cryptography**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **NSA Basic Cryptography** work as a **signal-evidence minimization card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **NSA Basic Cryptography**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Apply this module's safe boundary for **NSA Basic Cryptography** to another artifact while keeping requirements decomposition and source-discipline fit and reviewer ownership explicit.

13.2.3 SIGINT Fundamentals worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic policy cell compares public indicators of hybrid pressure against an approved collection plan for a benign border-disruption exercise. [255, 2026]; [258, 2026].

Triangulation anchors. In module 7's worked-example section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **signals-intelligence governance**. Learners use a **signal-evidence minimization card** and keep this boundary visible: No interception, decryption, surveillance target selection, or collection-expansion guidance.

Frame. The classroom question centers on **SIGINT legal-authority and communications-security governance exercise**. Excluded actions

stay explicit, and the **Requirements-to-Evidence Lens** planning question is: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Inputs. For the **SIGINT legal-authority and communications-security governance exercise** scenario, use public notices, synthetic interview summaries, public logistics records, and an instructor scope card. The Requirements-to-Evidence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **SIGINT legal-authority and communications-security governance exercise**, students rank requirements, choose the least intrusive source discipline, list excluded actions, and evaluate evidence quality. Pause whenever an inference about SIGINT legal-authority and communications-security governance exercise appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **SIGINT legal-authority and communications-security governance exercise** classroom scenario; unit artifact = signal-evidence minimization card; evidence = allowed inputs; method = requirements decomposition and source-discipline fit; output = a requirements-to-evidence matrix with discipline fit, source caveats, minimization notes, and gaps; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **SIGINT legal-authority and communications-security governance exercise** as "Requirements-to-Evidence Lens confirms it" is not enough. The revision ties the claim to requirements decomposition and source-discipline fit, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **SIGINT legal-authority and communications-security governance exercise** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

13.2.4 SIGINT Fundamentals practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Requirements-to-Evidence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

Triangulation anchors. In module 7's practice-sequence section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare SIGINT legal-authority and communications-security governance exercise, WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise, Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Collection Management and Multi-INT Requirements Discipline** lane.
2. Frame	Answer the lens question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for SIGINT legal-authority and communications-security governance exercise: requirements matrix with source descriptors, caveats, and collection limits.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the signal-evidence minimization card fields for SIGINT legal-authority and communications-security governance exercise.	Unit profile note.	Evidence artifacts include authority boundary note, minimization field.
4. Challenge	Test the misconception that a named collection authority removes the minimization and retention limits on what may be kept.	Failure-mode note.	The artifact applies the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

13.2.4.1 SIGINT Fundamentals instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [258, 2026].

13.2.4.2 SIGINT Fundamentals extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 13; [255, 2026].

Have learners swap artifacts and apply the **Requirements-to-Evidence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

13.2.5 SIGINT Fundamentals knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 13; [255, 2026].

1. Explain how **SIGINT legal-authority and communications-security governance exercise** is defined here; name the source descriptor that supports the definition.

2. Contrast **SIGINT legal-authority and communications-security governance exercise** with **WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise** using the **Requirements-to-Evidence Lens** artifact fields.
3. Identify one failure mode from the **Collection Management and Multi-INT Requirements Discipline** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which gray-zone indicator changes the least-intrusive source choice without crossing into operational tasking?
5. Correct this misconception: that a named collection authority removes the minimization and retention limits on what may be kept.

13.2.5.1 SIGINT Fundamentals answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **SIGINT legal-authority and communications-security governance exercise** without source evidence, uncertainty, or a safe transfer task.

13.3 SIGINT Fundamentals assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 13; [255, 2026].

13.3.1 SIGINT Fundamentals evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 13; [255, 2026].

13.3.2 SIGINT Fundamentals transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 13; [255, 2026].

13.3.2.1 SIGINT Fundamentals lineage and source tradition: profile, concepts, and first anchors This sits in the **Collection Management and Multi-INT Requirements Discipline** lineage: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. [255, 2026]; [258, 2026].

13.3.2.2 SIGINT Fundamentals working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 13; [255, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**, with provenance and reviewability throughout.

13.3.2.3 SIGINT Fundamentals knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** accountable requirements, source-discipline choices, minimization rules, source-risk notes, and evaluation criteria. [255, 2026]; [258, 2026].
- **Transforms:** priority mapping, source-discipline fit, least-intrusive evidence selection, and feedback review.
- **Outputs:** requirements matrix, collection-limit note, source-quality card, and gap list.
- **Failure modes:** recruitment or interception drift, over-collection, weak minimization, and source exposure.

13.3.2.4 SIGINT Fundamentals transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 13; [255, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.
- **Evidence contract:** keep the **Collection Management and Multi-INT Requirements Discipline** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as requirements matrix, collection-limit note, source-quality card, and gap list that another reviewer can audit.

13.3.2.5 SIGINT Fundamentals profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 13; [255, 2026].

The matched profile emphasizes requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. The method stack is priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop; the local topic cluster is **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

13.3.3 SIGINT Fundamentals evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 13; [255, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Collection Management and Multi-INT Requirements Discipline** profile tells reviewers what evidence is strong enough for the module artifact built around **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

13.3.3.1 SIGINT Fundamentals guide source spine: inherited keys and local citation roles Primary guide citations: [255, 2026]; [258, 2026]; [261, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [035, 2026]; [036, 2026]; [037, 2026]; [038, 2026]; [039, 2026]; [040, 2026].

13.3.3.2 SIGINT Fundamentals verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [255, 2026]; [258, 2026].

Tier	What counts	How it is used
Source guide	[255, 2026]; [258, 2026]; [261, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [035, 2026]; [036, 2026]; [037, 2026]; [038, 2026]; [039, 2026]; [040, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 7's source-canon section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise** and [255, 2026]; [258, 2026], but only directly verified source URLs are encoded as citations.

13.3.3.3 SIGINT Fundamentals intelligence practice lens: evidence artifact and safety check Practice lens: **Requirements-to-Evidence Lens** for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [258, 2026].

Planning question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Evidence artifact: requirements matrix with source descriptors, caveats, and collection limits.

Validation rule: show priority, authority, minimization, corroboration, and source quality before any claim is reused. Applied to **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

Handoff contract: deliver metadata-rich evidence packets, not unscoped data piles or implicit targeting requests.

Safety check: exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure.

13.3.3.4 SIGINT Fundamentals runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 13; [255, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	7.99	7.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind SIGINT Fundamentals to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	7.101	7.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for SIGINT Fundamentals	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	7.102	7.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for SIGINT Fundamentals	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
SIGINT legal-authority and communications-security governance exercise	7.1	7.1 source title transformed into safe curriculum treatment; original: COMINT and ELINT: Definitions and Distinctions	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
SIGINT legal-authority and communications-security governance exercise	7.2	7.2 source title transformed into safe curriculum treatment; original: Historical Foundations: WWII Axis SIGINT (NSA Declassified 9 Volumes)	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
SIGINT legal-authority and communications-security governance exercise	7.3	7.3 source title transformed into safe curriculum treatment; original: Spartans in Darkness: SIGINT in the Indochina War, 1945–1975	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
SIGINT legal-authority and communications-security governance exercise	7.4	7.4 source title transformed into safe curriculum treatment; original: CIA–NSA SIGINT Relationship, 1947–1970	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
SIGINT legal-authority and communications-security governance exercise	7.5	7.5 source title transformed into safe curriculum treatment; original: NSA Basic Cryptography (Friedman Documents)	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought

13.3.3.5 SIGINT Fundamentals reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 13; [255, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
SIGINT legal-authority and communications-security governance exercise	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
CIA NSA SIGINT Relationship: SIGINT legal-authority and communications-security governance exercise	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
NSA Basic Cryptography: SIGINT legal-authority and communications-security governance exercise	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought

13.3.3.6 SIGINT Fundamentals annotated source ledger: real titles and local contribution Each source cited by this **Collection Management and Multi-INT Requirements Discipline** module is paired below with its real title and a one-line note on what it contributes to **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

Source	Cited work	What it contributes	Status
[255, 2026]	Web of Things (WoT) Architecture 1.1	The W3C Recommendation for Web of Things Architecture 1.1, published in December 2023, defining an abstract architecture for interoperability across diverse Internet of Things platforms. It introduces core concepts including Things described by machine-readable Thing Descriptions, reusable Thing Models, and Consumers that interpret descriptions to interact via Properties, Actions, and Events.	verified source-guide

Source	Cited work	What it contributes	Status
[258, 2026]	OpenAPI Specification	The official OpenAPI Initiative publications page, serving as a central index for the OpenAPI Specification and related standards including the Arazzo and Overlay specifications. It provides access to multiple specification versions (2.0, 3.0, 3.1, and 3.2) and their corresponding downloadable schemas identified by release date, along with a registry of extensions, formats, media types, and other resources.	verified source-guide
[261, 2026]	RFC 9110: HTTP Semantics	RFC 9110, the official IETF standards document defining the core semantics and architecture of HTTP, published in June 2022 and consolidating nine earlier RFCs. It establishes terminology and protocol aspects shared across HTTP versions, including methods, status codes, header fields, content negotiation, conditional and range requests, authentication, and the http and https URI schemes.	verified source-guide
[279, 2026]	Open Contracting Data Standard	The documentation homepage for the Open Contracting Data Standard, version 1.1.5, maintained by the Open Contracting Partnership to support disclosure of government contracting data across the procurement lifecycle. It provides a common data model spanning planning, tender, award, contract, and implementation stages, along with a primer, implementation guidance, technical schemas, and validation tooling.	verified source-guide
[282, 2026]	AI Research: Security and Resilience	A NIST page on AI research focused on security and resilience, framing these as core characteristics of trustworthy AI under the NIST AI Risk Management Framework.	verified source-guide
[284, 2026]	Verifiable Credential Data Integrity 1.0	The W3C Recommendation for Verifiable Credential Data Integrity 1.0, published May 2025, defining mechanisms for ensuring the authenticity and integrity of verifiable credentials using cryptographic proofs. It specifies a process of data transformation, hashing, and proof generation, and a corresponding verification procedure, along with a proof data model containing properties such as type, verification method, purpose, and proof value.	verified source-guide
[289, 2026]	Guidance for Organisations Using the Algorithmic Transparency Recording Standard	This is a GOV.UK guidance page published by the Government Digital Service that instructs public sector organizations on completing the Algorithmic Transparency Recording Standard (ATRS) template and publishing their records to the GOV.UK repository. It applies both to central government bodies required to publish under mandatory policy and to other public sector bodies doing so voluntarily.	verified source-guide

Source	Cited work	What it contributes	Status
[291, 2026]	Revised 508 Standards and 255 Guidelines	Official documentation from the U.S. Access Board on the Revised 508 Standards and 255 Guidelines for information and communication technology accessibility. It establishes mandatory accessibility requirements for federal agencies and voluntary guidelines for telecommunications manufacturers, covering hardware, software, websites, electronic documents, and support services.	verified source-guide
[296, 2026]	Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile	NIST AI 600-1, the Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile, a cross-sectoral companion resource to the NIST AI RMF 1.0 issued pursuant to Executive Order 14110. It identifies risks that are unique to or amplified by generative AI and organizes suggested actions for managing those risks, mapped to the AI RMF functions.	verified source-guide
[035, 2026]	Signals Intelligence (SIGINT) Overview	SIGINT is intelligence derived from electronic signals and systems used by foreign targets.	original source-guide
[036, 2026]	European Axis Signal Intelligence in World War II	Volumes 1 - 9 of the European Axis Signal Intelligence in WWII documentation.	original source-guide
[037, 2026]	NSA Releases History of American SIGINT and the Vietnam War	This Federation of American Scientists article reports on the NSA's declassification of a roughly 500-page historical study titled "Spartans in Darkness," which examines American signals intelligence during the Vietnam War from 1945 to 1975. Author Robert J. Hanyok documents that no second attack occurred during the 1964 Gulf of Tonkin Incident, contradicting prior official testimony, and also covers episodes such as the Tet Offensive and the Son Tay prison rescue.	verified source-guide
[038, 2026]	History of signals intelligence at the CIA - Open INT	A January 2018 blog post on Open INT recounting the CIA's role in signals intelligence from roughly 1947 to 1970, noting that SIGINT is often associated with the NSA but the CIA also participated. It distinguishes communications intelligence from electronic intelligence and references declassified Cold War operations including U-2 collection and a Berlin communications-tapping effort.	verified source-guide
[039, 2026]	The CIA and Signals Intelligence / National Security Archive	A 2015 briefing book from the National Security Archive, compiled by Jeffrey T. Richelson, presenting declassified documents on the CIA's signals intelligence activities from roughly 1947 to 1970. It documents the CIA's parallel SIGINT operations alongside the NSA during the Cold War, covering programs and collection efforts as well as recurring friction between the two agencies over mission overlap, budgets, and access to intelligence.	verified source-guide
[040, 2026]	BASIC CRYPTOGRAPHY	Codes will first be considered, but as they do not fulfill the conditions required of a means.	original source-guide

Where this sits. This module's overview is Section 13; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

13.3.4 SIGINT Fundamentals governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 13; [255, 2026].

13.3.5 SIGINT Fundamentals analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 7's governance-boundary section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Collection Management and Multi-INT Requirements Discipline** for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [258, 2026].

Curriculum topic spine: SIGINT legal-authority and communications-security governance exercise, **WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**, **Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise**. **Verified anchor cluster:** [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]; [Archives and Administration, 1981]; [Agency, 2026g]; [of the Director of National Intelligence, 2026d].

Conceptual depth: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit.

Method stack: priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop.

Composability contract: requirements, authorities, source disciplines, collection notes, retention limits, caveats, and evaluation metrics remain separable.

Known failure modes: opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority.

Defensive boundary: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures. Applied to **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

Anchor	Why it matters here
[Community, 2026]	Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026c]	Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation. Checked as of 2026-05-21; role: curriculum_anchor.
[of Staff, 2026]	Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026g]	Official NSA public explanation of FISA oversight for signals intelligence collection governed by statutory and court-authorized controls. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.

13.3.5.1 SIGINT Fundamentals evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Collection Management and Multi-INT Requirements Discipline** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [255, 2026]; [258, 2026].

13.3.6 SIGINT Fundamentals agentic boundary: assist, approve, block, and record

Evidence anchor. Section 13; [255, 2026].

AGEINT translation is bounded by the **Collection Management and Multi-INT Requirements Discipline** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

13.3.6.1 SIGINT Fundamentals permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 13; [255, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

13.3.6.2 SIGINT Fundamentals excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [255, 2026]; [258, 2026] and **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

13.3.7 SIGINT Fundamentals governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 13; [255, 2026].
Governance is practiced as a gate on the **Collection Management and Multi-INT Requirements Discipline** lane. Learners use the **Requirements-to-Evidence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

13.3.7.1 SIGINT Fundamentals governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [255, 2026]; [258, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Collection Management and Multi-INT Requirements Discipline** failure modes and the **Requirements-to-Evidence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

13.3.7.2 SIGINT Fundamentals evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 13; [255, 2026].
Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Requirements-to-Evidence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

13.3.7.3 SIGINT Fundamentals current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [258, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_intelligence_gov_how_ic_works` for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**?	How the IC Works; lane `governed_intelligence_cycle`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners.
What does the module inherit from `official_odni_icd_204` for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**?	Intelligence Community Directive 204: National Intelligence Priorities Framework; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation.
What does the module inherit from `official_joint_pub_2_0` for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**?	JP 2-0: Joint Intelligence; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments.
What does the module inherit from `official_ic_osint_strategy` for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 13; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

13.3.8 SIGINT Fundamentals assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 13; [255, 2026].

13.3.9 SIGINT Fundamentals assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 13; [255, 2026].

13.3.9.1 SIGINT Fundamentals capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise** and [255, 2026]; [258, 2026].

13.3.9.2 SIGINT Fundamentals instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise** and [255, 2026]; [258, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

13.3.9.3 SIGINT Fundamentals assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
SIGINT legal-authority and communications-security governance exercise	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Spartans in Darkness: SIGINT legal-authority and communications-security governance exercise	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

13.3.10 SIGINT Fundamentals refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [255, 2026]; [258, 2026] and **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**.

13.3.10.1 SIGINT Fundamentals refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**. The local signals begin with [255, 2026]; [258, 2026].

13.3.10.2 SIGINT Fundamentals claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**, and the source spine for these checks begins with [255, 2026]; [258, 2026].

13.3.11 SIGINT Fundamentals reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [255, 2026]; [258, 2026].

Triangulation anchors. In module 7's review-checklist section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [258, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.

- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

13.3.12 SIGINT Fundamentals learning-path links: module map, overview, and curriculum atlas

Read this module in sequence with the curriculum orientation, its parent unit, and the adjacent modules so the evidence behind **SIGINT legal-authority and communications-security governance exercise; WWII Axis SIGINT: SIGINT legal-authority and communications-security governance exercise** carries forward intact. Source anchors for this module begin at [255, 2026]; [258, 2026].

Section 2, Section 12, Section 14

14 Modern SIGINT and Cryptography

14.0.1 Modern SIGINT and Cryptography figures and course links: visual evidence, source flow, and navigation

The module uses Figure 44 and Figure 41 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 12, Section 13, Section 15.
This module teaches the **Collection Management and Multi-INT Requirements Discipline** lane through a bounded, source-backed coursebook chapter. [258, 2026]; [260, 2026].

14.1 Collection Management and Multi-INT Requirements Discipline frame for Modern SIGINT and Cryptography: source context, topic focus, and reader task

Evidence anchor. Section 14; [258, 2026].

14.1.1 Modern SIGINT and Cryptography orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 14; [258, 2026].

14.1.2 Modern SIGINT and Cryptography conceptual primer: source context, core model, and reader task

This chapter teaches collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The chapter uses **Requirements-to-Evidence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.
The central distinction is to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. Core topics include **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority; The Cryptographic Arms Race: E2E Encryption and Lawful Access**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [258, 2026]; [260, 2026].
Learners move from vocabulary and the **Requirements-to-Evidence Lens** distinction through topic lessons on **UKUSA and Five Eyes SIGINT Sharing** with evidence and misconception checks, then assemble a **requirements matrix with source descriptors, caveats, and collection limits** with safety and rights gates.

14.1.3 Modern SIGINT and Cryptography learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 14; [258, 2026].

- Connect **UKUSA and Five Eyes SIGINT Sharing and SIGINT metadata minimization and authority** to **Collection Management and Multi-INT Requirements Discipline** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **requirements matrix with source descriptors, caveats, and collection limits** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures.

14.1.4 Modern SIGINT and Cryptography core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 14; [258, 2026].

Term	Working definition
Priority	the relative importance of an intelligence question
Source discipline	a broad evidence channel such as HUMINT, SIGINT, GEOINT, OSINT, or FININT
Minimization	the rule that limits acquisition, retention, or use of unnecessary information
Source protection	the duty to reduce risk to people, methods, and sensitive relationships
Evaluation	the feedback step that tests whether the evidence satisfied the requirement
Gray-zone indicator	an observable signal of ambiguous coercion below armed conflict thresholds
Proxy pattern	a relationship suggesting indirect sponsorship without confirmed operational control
UKUSA and Five Eyes SIGINT Sharing	Key terms: UKUSA, Five, Eyes.
SIGINT metadata minimization and authority	Key terms: SIGINT, metadata, minimization.

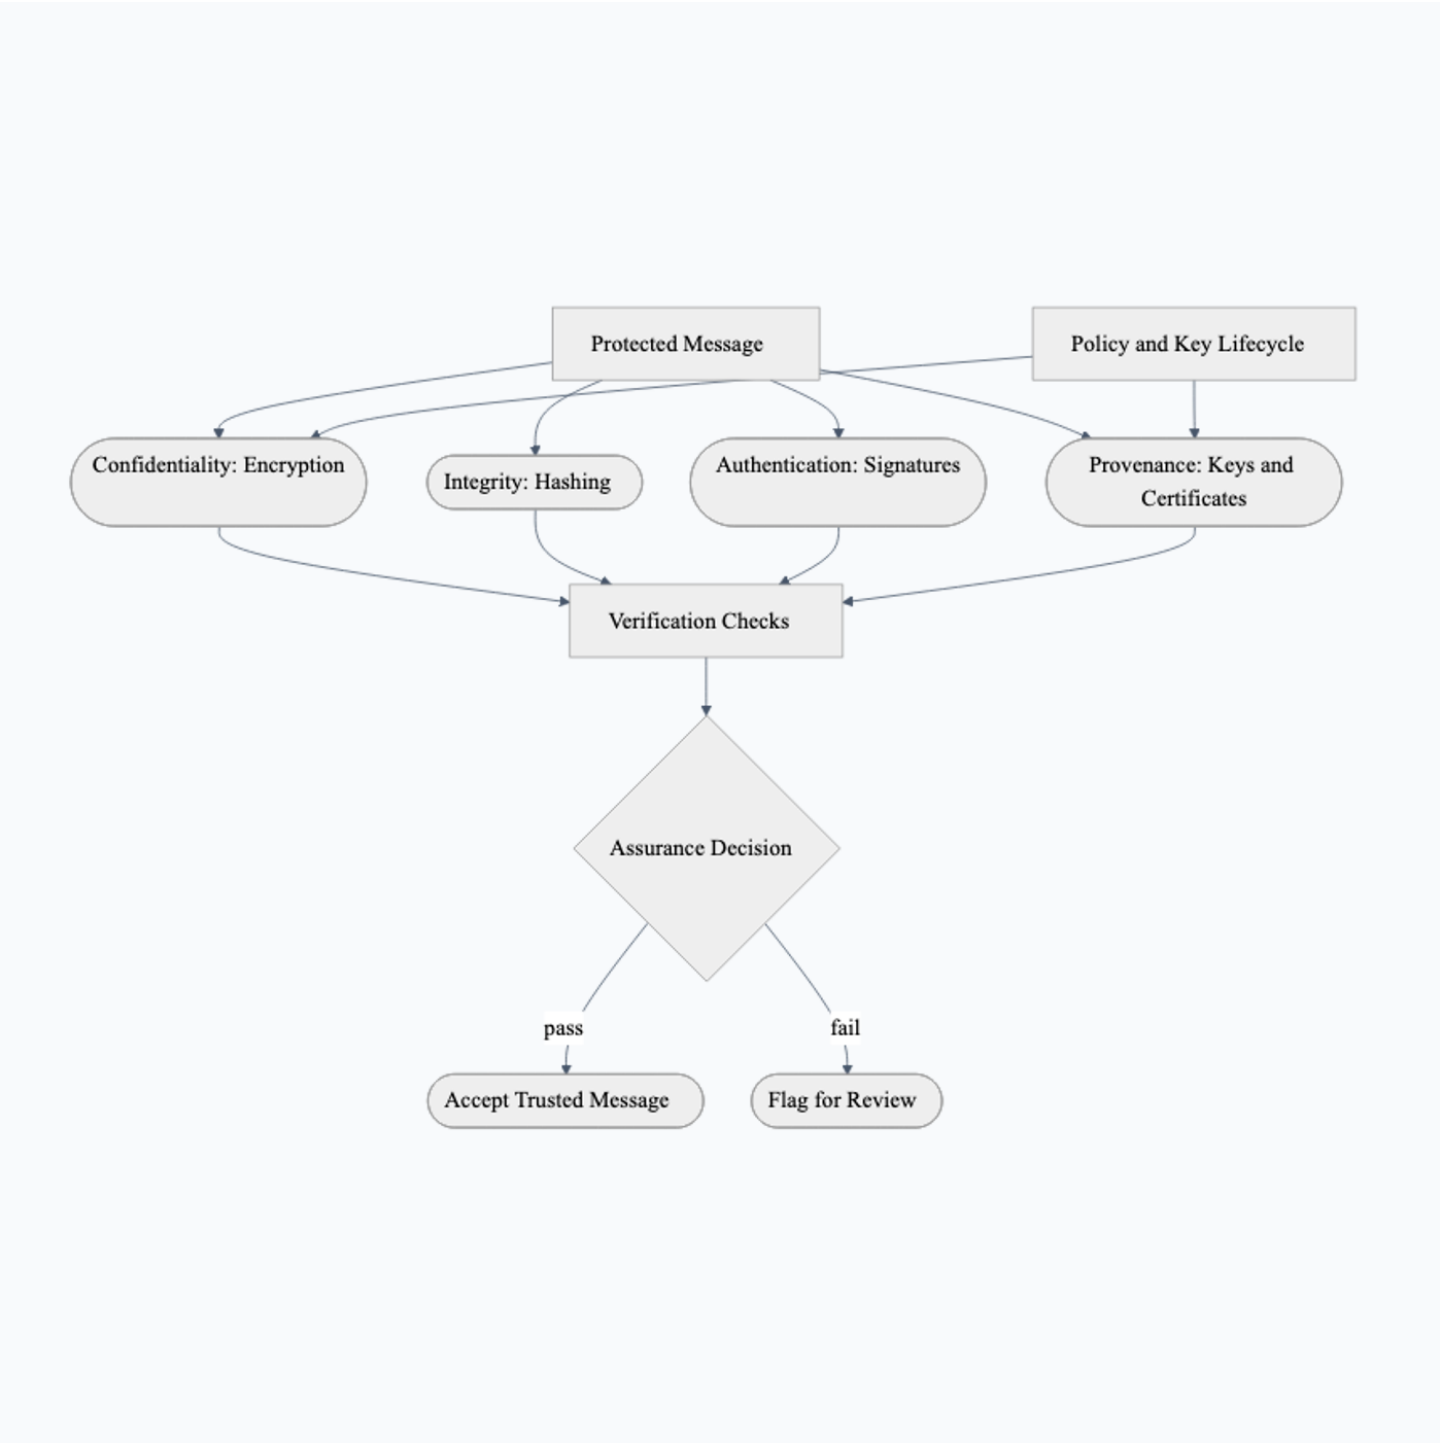

Figure 44: This diagram teaches the layered properties that together provide cryptographic assurance: confidentiality, integrity, authentication, and verifiable provenance. Its reader value is to make Protected Message, Verification Checks, and Policy and Key Lifecycle visible at a glance, with the signals intelligence sigint / modern sigint and cryptography section as the source section and defensive review as the boundary.

14.2 Requirements-to-Evidence Lens path for Modern SIGINT and Cryptography: lesson cluster, safe artifact, and review

Evidence anchor. Section 14; [258, 2026].

14.2.1 Modern SIGINT and Cryptography practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 14; [258, 2026].

14.2.2 Modern SIGINT and Cryptography topic lessons: source-backed concepts and transfer tasks

This module builds collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The sequence opens with **UKUSA and Five Eyes SIGINT Sharing**, **SIGINT metadata minimization and authority**, **The Cryptographic Arms Race: E2E Encryption and Lawful Access** and applies the **Requirements-to-Evidence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 41; module overview Section 14; curriculum atlas Section 2.

Triangulation anchors. In module 8's topic-lessons section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

14.2.2.1 Lesson 1: UKUSA and Five Eyes SIGINT Sharing

Concept. UKUSA and Five Eyes SIGINT Sharing frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. UKUSA and Five Eyes SIGINT Sharing matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; opportunistic collection is a common failure.

Source support. UKUSA and Five Eyes SIGINT Sharing rests on [041, 2026] and [042, 2026]. The most specific cited work observes: The materials, spanning 1945 to 2016, trace the development and functioning of the UKUSA Agreement underpinning intelligence cooperation among the US, UK, Canada, Australia, and New Zealand. Use them for the working definition that **UKUSA and Five Eyes SIGINT Sharing** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **UKUSA and Five Eyes SIGINT Sharing** in the evidence the row cites. [041, 2026] A collection page from Unredacted, a UK-based organization focused on declassified government records. It assembles over 70 documents obtained through a 2017 Freedom of Information Act legal challenge led by Privacy International, drawn from US agencies including the NSA, State Department, and Department of Defense. [042, 2026] A briefing from Unredacted examining previously classified Five Eyes documents released to Privacy International following a 2017 US freedom of information request. The materials, spanning 1945 to 2016, trace the development and functioning of the UKUSA Agreement underpinning intelligence cooperation among the US, UK, Canada, Australia, and New Zealand. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **UKUSA and Five Eyes SIGINT Sharing**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the source descriptor, the bounded claim about **UKUSA and Five Eyes SIGINT**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **signal-evidence minimization card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that UKUSA and Five Eyes SIGINT Sharing replaces human review whenever evidence looks plausible.

Transfer task. Transfer **UKUSA and Five Eyes SIGINT Sharing** to a second module by preserving requirements decomposition and source-discipline fit, changing the source evidence, and naming a new reviewer.

14.2.2.2 Lesson 2: SIGINT metadata minimization and authority

Concept. SIGINT metadata minimization and authority frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. SIGINT metadata minimization connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. SIGINT metadata minimization and authority rests on [298, 2026] and [297, 2026]. The lead source's own note reads: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the claim that **SIGINT metadata minimization and authority** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **SIGINT metadata minimization**, reason from the sources cited in this row. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **SIGINT metadata minimization**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape this subject work as a **signal-evidence minimization card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Transfer **SIGINT metadata minimization** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

14.2.2.3 Lesson 3: The Cryptographic Arms Race: E2E Encryption and Lawful Access

Concept. The Cryptographic Arms Race: E2E Encryption and Lawful Access frames encryption as a policy and assurance trade-off among confidentiality, lawful process, communications security, and trust.

Why it matters. The Cryptographic Arms Race matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; opportunistic collection is a common failure.

Source support. The Cryptographic Arms Race: E2E Encryption and Lawful Access rests on [297, 2026] and [298, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the claim that **The Cryptographic Arms Race: E2E**

Encryption and Lawful Access lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **The Cryptographic Arms Race** against the works cited for this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **The Cryptographic Arms Race**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the source descriptor, the bounded claim about **Cryptographic Arms Race**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **The Cryptographic Arms Race** work as a **signal-evidence minimization card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that The Cryptographic Arms Race: E2E Encryption and Lawful Access is optional whenever separate collection discipline concepts from operational recruitment, interception, or tasking procedures feels inconvenient.

Transfer task. Transfer **The Cryptographic Arms Race** to a second module by preserving requirements decomposition and source-discipline fit, changing the source evidence, and naming a new reviewer.

14.2.2.4 Lesson 4: Communications-security history and lawful-access boundary

Concept. Communications-security history and lawful-access boundary connects the technical term to authority, minimization, communications-security risk, and public doctrine rather than interception mechanics.

Why it matters. Analysts use **Communications-security history** to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. A defensible treatment names the judgment it enables for requirements decomposition and source-discipline fit review, the proof limit that opportunistic collection would otherwise hide, and the reviewer accountable for challenge.

Source support. Communications-security history and lawful-access boundary rests on [027, 2026] and [028, 2026]. Its anchor reference records: Learn a technique for communicating with your family in an emergency using a method used by spies. Use them for pinning down the scope of **Communications-security history and lawful-access boundary**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Communications-security history**, work from the cited evidence behind this row. [027, 2026] Learn a technique for communicating with your family in an emergency using a method used by spies. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **Communications-security history**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape this subject work as a **signal-evidence minimization card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Communications-security history**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Reuse the **Communications-security history** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

14.2.2.5 Lesson 5: RF-spectrum governance and communications-security

Concept. RF-spectrum governance and communications-security connects the technical term to authority, minimization, communications-security risk, and public doctrine rather than interception mechanics.

Why it matters. RF-spectrum governance connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. RF-spectrum governance and communications-security rests on [043, 2026] and [044, 2026]. The most specific cited work observes: An informational guide from Bastille Networks explaining Technical Surveillance Countermeasures (TSCM), defined as security measures aimed at detecting and neutralizing surveillance devices to protect sensitive communications. Use them for pinning down the scope of **RF-spectrum governance and communications-security**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **RF-spectrum governance**, reason from the sources cited in this row. [043, 2026] An informational guide from Bastille Networks explaining Technical Surveillance Countermeasures (TSCM), defined as security measures aimed at detecting and neutralizing surveillance devices to protect sensitive communications. It traces TSCM origins to World War II and Cold War intelligence work and catalogues threat types such as radio-frequency transmitters, hidden cameras, and acoustic eavesdropping. [044, 2026] A reference page from the Granite Island Group describing a ten-level taxonomy of technical surveillance threats and the corresponding technical surveillance countermeasures (TSCM) inspections used to detect them. It explains that detection difficulty increases by roughly an order of magnitude at each level, grouping threats into clusters and beginning with low-power consumer-grade devices. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **RF-spectrum governance**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape this subject work as a **signal-evidence minimization card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **RF-spectrum governance**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Reuse the **RF-spectrum governance** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

14.2.2.6 Lesson 6: SIGINT legal-authority and communications-security governance exercise

Concept. SIGINT legal-authority and communications-security governance exercise frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. SIGINT legal-authority matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; opportunistic collection is a common failure.

Source support. SIGINT legal-authority and communications-security governance exercise rests on [045, 2026] and [046, 2026]. The lead source's own note reads: A web page from Murray Associates, a counterespionage consulting firm, explaining the technical surveillance countermeasures (TSCM) inspection process used to detect eavesdropping and surveillance devices in buildings. Use them for pinning down the scope of **SIGINT legal-authority and communications-security governance exercise**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **SIGINT legal-authority** in the evidence the row cites. [045, 2026] A service page from Pinkerton describing technical surveillance countermeasures used to detect and prevent corporate eavesdropping and protect intellectual property. It outlines examination

methods including infrared spectrum analysis to find heat signatures of hidden devices, radio frequency analysis to identify wireless audio bugs, and physical inspection for tampered equipment or poor security practices. [046, 2026] A web page from Murray Associates, a counterespionage consulting firm, explaining the technical surveillance countermeasures (TSCM) inspection process used to detect eavesdropping and surveillance devices in buildings. It outlines a three-phase methodology: a pre-inspection planning discussion, an on-site evaluation combining visual examination, technical instrumentation, and information-security review, and a post-inspection written report with findings and recommendations. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **SIGINT legal-authority**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **SIGINT legal-authority and communications-security governance**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **SIGINT legal-authority** work as a **signal-evidence minimization card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **SIGINT legal-authority**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Transfer **SIGINT legal-authority** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

14.2.2.7 Lesson 7: Linear Junction Detectors RF Spectrum: RF-spectrum governance and communications-security

Concept. Linear Junction Detectors RF Spectrum: RF-spectrum governance and communications-security connects the technical term to authority, minimization, communications-security risk, and public doctrine rather than interception mechanics.

Why it matters. Analysts use **Linear Junction Detectors RF Spectrum** to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. A defensible treatment names the judgment it enables for requirements decomposition and source-discipline fit review, the proof limit that opportunistic collection would otherwise hide, and the reviewer accountable for challenge.

Source support. Linear Junction Detectors RF Spectrum: RF-spectrum governance and communications-security rests on [309, 2026], [310, 2026], and [300, 2026]. Its anchor reference records: The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. Use them for fixing what **Linear Junction Detectors RF Spectrum: RF-spectrum governance and communications-security** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **Linear Junction Detectors RF Spectrum** against the works cited for this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Linear Junction Detectors RF Spectrum**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **Linear Junction Detectors RF Spectrum**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **Linear Junction Detectors RF Spectrum** work as a **signal-evidence minimization card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Linear Junction Detectors RF Spectrum**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Apply this module's safe boundary for **Linear Junction Detectors RF Spectrum** to another artifact while keeping requirements decomposition and source-discipline fit and reviewer ownership explicit.

14.2.2.8 Lesson 8: Steganography detection-literacy and communications-security

Concept. Steganography detection-literacy and communications-security connects the technical term to authority, minimization, communications-security risk, and public doctrine rather than interception mechanics.

Why it matters. Analysts use **Steganography detection-literacy** to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. A defensible treatment names the judgment it enables for requirements decomposition and source-discipline fit review, the proof limit that opportunistic collection would otherwise hide, and the reviewer accountable for challenge.

Source support. Steganography detection-literacy and communications-security rests on [028, 2026]. Use it for the working definition that **Steganography detection-literacy and communications-security** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **Steganography detection-literacy** in the evidence the row cites. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **Steganography detection-literacy**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape this subject work as a **signal-evidence minimization card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Steganography detection-literacy**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Transfer **Steganography detection-literacy** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

14.2.2.9 Lesson 9: Signal Authentication in the Deepfake Era

Concept. Signal Authentication in the Deepfake Era applies Signal, Authentication, in within Collection Management and Multi-INT Requirements Discipline: learners use separate collection discipline concepts from operational recruitment, interception, or tasking procedures and requirements decomposition and source-discipline fit evidence before any judgment moves forward.

Why it matters. Without explicit treatment of **Signal Authentication**, opportunistic collection undermines requirements decomposition and source-discipline fit review; the lesson builds the habit to separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Source support. Signal Authentication in the Deepfake Era rests on [018, 2026]. Its anchor reference records: It argues that as AI makes deepfakes and synthetic communications easier, trust in digital channels erodes, paradoxically increasing the value of traditional human intelligence methods. Use it for fixing what **Signal Authentication in the Deepfake Era** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Ground **Signal Authentication** in the evidence the row cites. [018, 2026] A Nextgov article reporting on an essay in the CIA's Studies in Intelligence journal by RAND researcher Thomas Mulligan. It argues that as AI makes deepfakes and synthetic communications easier, trust in digital channels erodes, paradoxically increasing the value of traditional human intelligence methods. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Signal Authentication**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this requirements decomposition and source-discipline fit topic. The artifact must name the source descriptor, the bounded claim about **Signal Authentication in the Deepfake**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Signal Authentication** work as a **signal-evidence minimization card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Signal Authentication in the Deepfake Era replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Signal Authentication** to a second module by preserving requirements decomposition and source-discipline fit, changing the source evidence, and naming a new reviewer.

14.2.3 Modern SIGINT and Cryptography worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic policy cell compares public indicators of hybrid pressure against an approved collection plan for a benign border-disruption exercise. [258, 2026]; [260, 2026].

Triangulation anchors. In module 8's worked-example section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **signals-intelligence governance**. Learners use a **signal-evidence minimization card** and keep this boundary visible: No interception, decryption, surveillance target selection, or collection-expansion guidance.

Frame. The classroom question centers on **UKUSA and Five Eyes SIGINT Sharing**. Excluded actions stay explicit, and the **Requirements-to-Evidence Lens** planning question is: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Inputs. For the **UKUSA and Five Eyes SIGINT Sharing** scenario, use public notices, synthetic interview summaries, public logistics records, and an instructor scope card. The Requirements-to-Evidence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **UKUSA and Five Eyes SIGINT Sharing**, students rank requirements, choose the least intrusive source discipline, list excluded actions, and evaluate evidence quality. Pause whenever an inference about UKUSA and Five Eyes SIGINT Sharing appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **UKUSA and Five Eyes SIGINT Sharing** classroom scenario; unit artifact = signal-evidence minimization card; evidence = allowed inputs; method = requirements decomposition and source-discipline fit; output = a requirements-to-evidence matrix with discipline fit, source caveats, minimization notes, and gaps; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **UKUSA and Five Eyes SIGINT Sharing** as "Requirements-to-Evidence Lens confirms it" is not enough. The revision ties the claim to requirements decomposition and source-discipline fit, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **UKUSA and Five Eyes SIGINT Sharing** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

14.2.4 Modern SIGINT and Cryptography practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Requirements-to-Evidence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

Triangulation anchors. In module 8's practice-sequence section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare UKUSA and Five Eyes SIGINT Sharing, SIGINT metadata minimization and authority, The Cryptographic Arms Race: E2E Encryption and Lawful Access; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Collection Management and Multi-INT Requirements Discipline** lane.
2. Frame	Answer the lens question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for UKUSA and Five Eyes SIGINT Sharing: requirements matrix with source descriptors, caveats, and collection limits.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the signal-evidence minimization card fields for UKUSA and Five Eyes SIGINT Sharing.	Unit profile note.	Evidence artifacts include authority boundary note, minimization field.
4. Challenge	Test the misconception that UKUSA and Five Eyes SIGINT Sharing replaces human review whenever evidence looks plausible.	Failure-mode note.	The artifact applies the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures.

Move	Learner action	Output	Check
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

14.2.4.1 Modern SIGINT and Cryptography instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**. [258, 2026]; [260, 2026].

14.2.4.2 Modern SIGINT and Cryptography extension exercise: peer validation and refresh trigger review Evidence anchor. Section 14; [258, 2026].

Have learners swap artifacts and apply the **Requirements-to-Evidence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

14.2.5 Modern SIGINT and Cryptography knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 14; [258, 2026].

1. Explain how **UKUSA and Five Eyes SIGINT Sharing** is defined here; name the source descriptor that supports the definition.
2. Contrast **UKUSA and Five Eyes SIGINT Sharing** with **SIGINT metadata minimization and authority** using the **Requirements-to-Evidence Lens** artifact fields.
3. Identify one failure mode from the **Collection Management and Multi-INT Requirements Discipline** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which gray-zone indicator changes the least-intrusive source choice without crossing into operational tasking?
5. Correct this misconception: that UKUSA and Five Eyes SIGINT Sharing replaces human review whenever evidence looks plausible.

14.2.5.1 Modern SIGINT and Cryptography answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **UKUSA and Five Eyes SIGINT Sharing** without source evidence, uncertainty, or a safe transfer task.

14.3 Modern SIGINT and Cryptography assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 14; [258, 2026].

14.3.1 Modern SIGINT and Cryptography evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 14; [258, 2026].

14.3.2 Modern SIGINT and Cryptography transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 14; [258, 2026].

14.3.2.1 Modern SIGINT and Cryptography lineage and source tradition: profile, concepts, and first anchors This sits in the **Collection Management and Multi-INT Requirements Discipline** lineage: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. [258, 2026]; [260, 2026].

14.3.2.2 Modern SIGINT and Cryptography working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 14; [258, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**, with provenance and reviewability throughout.

14.3.2.3 Modern SIGINT and Cryptography knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** accountable requirements, source-discipline choices, minimization rules, source-risk notes, and evaluation criteria. [258, 2026]; [260, 2026].
- **Transforms:** priority mapping, source-discipline fit, least-intrusive evidence selection, and feedback review.
- **Outputs:** requirements matrix, collection-limit note, source-quality card, and gap list.
- **Failure modes:** recruitment or interception drift, over-collection, weak minimization, and source exposure.

14.3.2.4 Modern SIGINT and Cryptography transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 14; [258, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.
- **Evidence contract:** keep the **Collection Management and Multi-INT Requirements Discipline** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as requirements matrix, collection-limit note, source-quality card, and gap list that another reviewer can audit.

14.3.2.5 Modern SIGINT and Cryptography profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 14; [258, 2026].

The matched profile emphasizes requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. The method stack is priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop; the local topic cluster is **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

14.3.3 Modern SIGINT and Cryptography evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 14; [258, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Collection Management and Multi-INT Requirements Discipline** profile tells reviewers what evidence is strong enough for the module artifact built around **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

14.3.3.1 Modern SIGINT and Cryptography guide source spine: inherited keys and local citation roles Primary guide citations: [258, 2026]; [260, 2026]; [261, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [041, 2026]; [042, 2026]; [027, 2026]; [028, 2026]; [043, 2026]; [044, 2026]; [045, 2026]; [046, 2026]; [018, 2026]; [298, 2026]; [297, 2026]; [309, 2026]; [310, 2026]; [300, 2026].

14.3.3.2 Modern SIGINT and Cryptography verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [258, 2026]; [260, 2026].

Tier	What counts	How it is used
Source guide	[258, 2026]; [260, 2026]; [261, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [041, 2026]; [042, 2026]; [027, 2026]; [028, 2026]; [043, 2026]; [044, 2026]; [045, 2026]; [046, 2026]; [018, 2026]; [298, 2026]; [297, 2026]; [309, 2026]; [310, 2026]; [300, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 8's source-canon section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority** and [258, 2026]; [260, 2026], but only directly verified source URLs are encoded as citations.

14.3.3.3 Modern SIGINT and Cryptography intelligence practice lens: evidence artifact and safety check Practice lens: **Requirements-to-Evidence Lens** for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**. [258, 2026]; [260, 2026].

Planning question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Evidence artifact: requirements matrix with source descriptors, caveats, and collection limits.

Validation rule: show priority, authority, minimization, corroboration, and source quality before any claim is reused. Applied to **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

Handoff contract: deliver metadata-rich evidence packets, not unscoped data piles or implicit targeting requests.

Safety check: exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure.

14.3.3.4 Modern SIGINT and Cryptography runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 14; [258, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	8.99	8.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Modern SIGINT and Cryptography to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	8.101	8.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Modern SIGINT and Cryptography	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	8.102	8.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Modern SIGINT and Cryptography	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
UKUSA and Five Eyes SIGINT Sharing	8.1	8.1 UKUSA and Five Eyes SIGINT Sharing	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
SIGINT metadata minimization and authority	8.2	8.2 source title transformed into safe curriculum treatment; original: Bulk Collection, Metadata Analysis, and Legal Frameworks	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
The Cryptographic Arms Race: E2E Encryption and Lawful Access	8.3	8.3 The Cryptographic Arms Race: E2E Encryption and Lawful Access	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Communications-security history and lawful-access boundary	8.4	8.4 source title transformed into safe curriculum treatment; original: Covert Communications Tradecraft: OTPs, Burst Transmission, Digital Dead Drops	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
RF-spectrum governance and communications-security	8.5	8.5 source title transformed into safe curriculum treatment; original: Radio Frequency Intelligence (RFINT) and Technical Surveillance	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
SIGINT legal-authority and communications-security governance exercise	8.6	8.6 source title transformed into safe curriculum treatment; original: Technical Surveillance Countermeasures (TSCM): Threat Levels and Detection	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
RF-spectrum governance and communications-security	8.7	8.7 source title transformed into safe curriculum treatment; original: Non-Linear Junction Detectors, RF Spectrum Analysis, Infrared Imaging	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Steganography detection-literacy and communications-security	8.8	8.8 source title transformed into safe curriculum treatment; original: Steganography: LSB, DCT, and Network-Layer Methods	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Signal Authentication in the Deepfake Era	8.9	8.9 Signal Authentication in the Deepfake Era	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

14.3.3.5 Modern SIGINT and Cryptography reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 14; [258, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
UKUSA and Five Eyes SIGINT Sharing	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
SIGINT metadata minimization and authority	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
The Cryptographic Arms Race: E2E Encryption and Lawful Access	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Communications-security history and lawful-access boundary	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Lesson topic	Practice lens	Evidence artifact	Safety check
RF-spectrum governance and communications-security	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
SIGINT legal-authority and communications-security governance exercise	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
Linear Junction Detectors RF Spectrum: RF-spectrum governance and communications-security	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Steganography detection-literacy and communications-security	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Signal Authentication in the Deepfake Era	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

14.3.3.6 Modern SIGINT and Cryptography annotated source ledger: real titles and local contribution Each source cited by this **Collection Management and Multi-INT Requirements Discipline** module is paired below with its real title and a one-line note on what it contributes to **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

Source	Cited work	What it contributes	Status
[258, 2026]	OpenAPI Specification	The official OpenAPI Initiative publications page, serving as a central index for the OpenAPI Specification and related standards including the Arazzo and Overlay specifications. It provides access to multiple specification versions (2.0, 3.0, 3.1, and 3.2) and their corresponding downloadable schemas identified by release date, along with a registry of extensions, formats, media types, and other resources.	verified source-guide
[260, 2026]	Decentralized Identifiers (DIDs) v1.0	The W3C Recommendation for Decentralized Identifiers (DIDs) v1.0, published July 2022, defining a type of identifier that enables verifiable digital identity without reliance on a centralized registration authority. It specifies DID syntax (a scheme, method name, and method-specific identifier) and the DID document data model, which expresses verification methods, services, controllers, and verification relationships for authentication and assertion.	verified source-guide
[261, 2026]	RFC 9110: HTTP Semantics	RFC 9110, the official IETF standards document defining the core semantics and architecture of HTTP, published in June 2022 and consolidating nine earlier RFCs. It establishes terminology and protocol aspects shared across HTTP versions, including methods, status codes, header fields, content negotiation, conditional and range requests, authentication, and the http and https URI schemes.	verified source-guide
[275, 2026]	Fact Sheet: New Rule on the Accessibility of Web Content and Mobile Apps Provided by State and Local Governments	A US Department of Justice fact sheet explaining the 2024 ADA Title II rule requiring state and local governments to make their web content and mobile apps accessible. It establishes WCAG 2.1 Level AA as the technical standard, applies to entities such as schools, courts, libraries, and transit agencies, and sets compliance deadlines of April 2027 for larger jurisdictions and April 2028 for smaller ones.	verified source-guide

Source	Cited work	What it contributes	Status
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[283, 2026]	Recommendation of the Council on Open Government	An OECD legal instrument document reproducing the Recommendation of the Council on Open Government (OECD/LEGAL/0438), adopted on 14 December 2017. It defines open government as a culture of governance promoting transparency, integrity, accountability, and stakeholder participation in support of democracy and inclusive growth.	verified source-guide
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide
[293, 2026]	Inventory of NARA Artificial Intelligence (AI) Use Cases	The National Archives and Records Administration (NARA) official inventory of its artificial intelligence use cases, documenting 14 projects across deployed, pilot, and planned stages. Deployed efforts include workplace productivity tools, automated tagging for museum experiences, and historical record retrieval, while pilots cover PII detection and redaction, semantic search, and metadata generation, and planned work targets FOIA processing and public search.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[041, 2026]	Five Eyes FOIA disclosures	A collection page from Unredacted, a UK-based organization focused on declassified government records. It assembles over 70 documents obtained through a 2017 Freedom of Information Act legal challenge led by Privacy International, drawn from US agencies including the NSA, State Department, and Department of Defense.	verified source-guide

Source	Cited work	What it contributes	Status
[042, 2026]	Five Eyes FOIA disclosures: key documents	A briefing from Unredacted examining previously classified Five Eyes documents released to Privacy International following a 2017 US freedom of information request. The materials, spanning 1945 to 2016, trace the development and functioning of the UKUSA Agreement underpinning intelligence cooperation among the US, UK, Canada, Australia, and New Zealand.	verified source-guide
[027, 2026]	The Dead Drop: Design a Communications Method Like a Spy	Learn a technique for communicating with your family in an emergency using a method used by spies.	original source-guide
[028, 2026]	Cited source (see bibliography)	See bibliography for scope.	original source-guide
[043, 2026]	Technical Surveillance Countermeasures (TSCM) - Bastille Networks	An informational guide from Bastille Networks explaining Technical Surveillance Countermeasures (TSCM), defined as security measures aimed at detecting and neutralizing surveillance devices to protect sensitive communications. It traces TSCM origins to World War II and Cold War intelligence work and catalogues threat types such as radio-frequency transmitters, hidden cameras, and acoustic eavesdropping.	verified source-guide
[044, 2026]	Technical Surveillance Threat Levels - Granite Island Group	A reference page from the Granite Island Group describing a ten-level taxonomy of technical surveillance threats and the corresponding technical surveillance countermeasures (TSCM) inspections used to detect them. It explains that detection difficulty increases by roughly an order of magnitude at each level, grouping threats into clusters and beginning with low-power consumer-grade devices.	verified source-guide
[045, 2026]	TSCM / Technical Surveillance Countermeasures - Pinkerton	A service page from Pinkerton describing technical surveillance countermeasures used to detect and prevent corporate eavesdropping and protect intellectual property. It outlines examination methods including infrared spectrum analysis to find heat signatures of hidden devices, radio frequency analysis to identify wireless audio bugs, and physical inspection for tampered equipment or poor security practices.	verified source-guide
[046, 2026]	The TSCM Inspection Process / by Murray Associates TSCM	A web page from Murray Associates, a counterespionage consulting firm, explaining the technical surveillance countermeasures (TSCM) inspection process used to detect eavesdropping and surveillance devices in buildings. It outlines a three-phase methodology: a pre-inspection planning discussion, an on-site evaluation combining visual examination, technical instrumentation, and information-security review, and a post-inspection written report with findings and recommendations.	verified source-guide

Source	Cited work	What it contributes	Status
[018, 2026]	Old-school spycraft could make a comeback as AI undermines trust	A Nextgov article reporting on an essay in the CIA's Studies in Intelligence journal by RAND researcher Thomas Mulligan. It argues that as AI makes deepfakes and synthetic communications easier, trust in digital channels erodes, paradoxically increasing the value of traditional human intelligence methods.	verified source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[309, 2026]	STIX Version 2.1	An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection.	verified source-guide
[310, 2026]	TAXII Version 2.1	The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe).	verified source-guide
[300, 2026]	MITRE ATLAS	MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy.	original source-guide

Where this sits. This module's overview is Section 14; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

14.3.4 Modern SIGINT and Cryptography governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 14; [258, 2026].

14.3.5 Modern SIGINT and Cryptography analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 8's governance-boundary section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Collection Management and Multi-INT Requirements Discipline** for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**. [258, 2026]; [260, 2026].

Curriculum topic spine: UKUSA and Five Eyes SIGINT Sharing, **SIGINT metadata minimization and authority**, **The Cryptographic Arms Race: E2E Encryption and Lawful Access**. **Verified anchor cluster:** [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]; [Archives and Administration, 1981]; [Agency, 2026g]; [of the Director of National Intelligence, 2026d].

Conceptual depth: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit.

Method stack: priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop.

Composability contract: requirements, authorities, source disciplines, collection notes, retention limits, caveats, and evaluation metrics remain separable.

Known failure modes: opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority.

Defensive boundary: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures. Applied to **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

Anchor	Why it matters here
[Community, 2026]	Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026c]	Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation. Checked as of 2026-05-21; role: curriculum_anchor.
[of Staff, 2026]	Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026g]	Official NSA public explanation of FISA oversight for signals intelligence collection governed by statutory and court-authorized controls. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.

14.3.5.1 Modern SIGINT and Cryptography evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Collection Management and Multi-INT Requirements Discipline** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [258, 2026]; [260, 2026].

14.3.6 Modern SIGINT and Cryptography agentic boundary: assist, approve, block, and record

Evidence anchor. Section 14; [258, 2026].

AGEINT translation is bounded by the **Collection Management and Multi-INT Requirements Discipline** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

14.3.6.1 Modern SIGINT and Cryptography permitted defensive utility: curriculum uses and safe outputs Evidence anchor. Section 14; [258, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

14.3.6.2 Modern SIGINT and Cryptography excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [258, 2026]; [260, 2026] and **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

14.3.7 Modern SIGINT and Cryptography governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 14; [258, 2026].

Governance is practiced as a gate on the **Collection Management and Multi-INT Requirements Discipline** lane. Learners use the **Requirements-to-Evidence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain,

and when an agent-assisted artifact must stop for human review while using **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

14.3.7.1 Modern SIGINT and Cryptography governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [258, 2026]; [260, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Collection Management and Multi-INT Requirements Discipline** failure modes and the **Requirements-to-Evidence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

14.3.7.2 Modern SIGINT and Cryptography evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 14; [258, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Requirements-to-Evidence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

14.3.7.3 Modern SIGINT and Cryptography current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**. [258, 2026]; [260, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_intelligence_gov_how_ic_works` for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**?	How the IC Works; lane `governed_intelligence_cycle`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners.
What does the module inherit from `official_odni_icd_204` for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**?	Intelligence Community Directive 204: National Intelligence Priorities Framework; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation.
What does the module inherit from `official_joint_pub_2_0` for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**?	JP 2-0: Joint Intelligence; lane `collection_management`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments.
What does the module inherit from `official_ic_osint_strategy` for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 14; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

14.3.8 Modern SIGINT and Cryptography assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 14; [258, 2026].

14.3.9 Modern SIGINT and Cryptography assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 14; [258, 2026].

14.3.9.1 Modern SIGINT and Cryptography capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority** and [258, 2026]; [260, 2026].

14.3.9.2 Modern SIGINT and Cryptography instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority** and [258, 2026]; [260, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

14.3.9.3 Modern SIGINT and Cryptography assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
UKUSA and Five Eyes SIGINT Sharing	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
SIGINT metadata minimization and authority	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
The Cryptographic Arms Race: E2E Encryption and Lawful Access	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

14.3.10 Modern SIGINT and Cryptography refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [258, 2026]; [260, 2026] and **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**.

14.3.10.1 Modern SIGINT and Cryptography refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**. The local signals begin with [258, 2026]; [260, 2026].

14.3.10.2 Modern SIGINT and Cryptography claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**, and the source spine for these checks begins with [258, 2026]; [260, 2026].

14.3.11 Modern SIGINT and Cryptography reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [258, 2026]; [260, 2026].

Triangulation anchors. In module 8's review-checklist section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority**. [258, 2026]; [260, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

14.3.12 Modern SIGINT and Cryptography learning-path links: module map, overview, and curriculum atlas

Read this module in sequence with the curriculum orientation, its parent unit, and the adjacent modules so the evidence behind **UKUSA and Five Eyes SIGINT Sharing; SIGINT metadata minimization and authority** carries forward intact. Source anchors for this module begin at [258, 2026]; [260, 2026].

Section 2, Section 12, Section 13, Section 15

15 OPEN SOURCE INTELLIGENCE (OSINT)

15.1 OPEN SOURCE INTELLIGENCE (OSINT) learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 15; [251, 2026].

15.1.1 open-source intelligence governance discipline spine: domain question and learning focus

Evidence anchor. Section 15; [251, 2026].
This unit teaches **open-source intelligence governance**. OSINT work turns public availability into evaluated intelligence only after provenance, terms, reliability, minimization, and reproducibility are reviewed.

15.1.2 open-source intelligence governance source-use contract: citation roles and evidence limits

Evidence anchor. Section 15; [251, 2026].
Use IC OSINT strategy and tool-governance anchors for public-source quality, transparency, and ethics claims.

15.1.3 open-source intelligence governance practice artifact: recurring packet and retained evidence

Evidence anchor. Section 15; [251, 2026].
The recurring practice artifact is a **OSINT provenance and minimization matrix** that draws on provenance chain, terms-of-use note, corroboration matrix, and minimization decision. The unit keeps its learning spine explicit. Learners document source origin, recency, independence, transformation history, and what cannot be inferred.

15.1.4 open-source intelligence governance safety boundary: accountable, synthetic, and evidence-bounded limits

No exposed-service lookup, credentialed access, identity exposure, doxxing, or live collection expansion.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [251, 2026]; [253, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [251, 2026]; [253, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [251, 2026]; [253, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [251, 2026]; [253, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Open-Source and Geospatial Intelligence Integrity. Core anchors: [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]. Conceptual focus: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. Composability contract: collection notes, source metadata, transformations, caveats, and analytic judgments remain separately exportable. **Practice lens:** Requirements-to-Evidence Lens; What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit? [251, 2026]; [253, 2026].

15.1.5 OPEN SOURCE INTELLIGENCE (OSINT) visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 45 and Figure 46 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 14, Section 16.

15.1.6 OPEN SOURCE INTELLIGENCE (OSINT) module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
OSINT Foundations	Section 16	[251, 2026]; [253, 2026]; [269, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [047, 2026]; [048, 2026]; [049, 2026]; [301, 2026]; [298, 2026]; [297, 2026].
OSINT Techniques and Tools	Section 17	[251, 2026]; [252, 2026]; [269, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [050, 2026]; [051, 2026]; [052, 2026]; [053, 2026]; [054, 2026]; [055, 2026]; [056, 2026].

Module	Section reference	Source spine
GEOINT and Imagery Intelligence	Section 18	[253, 2026]; [255, 2026]; [270, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [057, 2026]; [058, 2026]; [059, 2026]; [060, 2026]; [301, 2026]; [298, 2026]; [302, 2026]; [297, 2026].

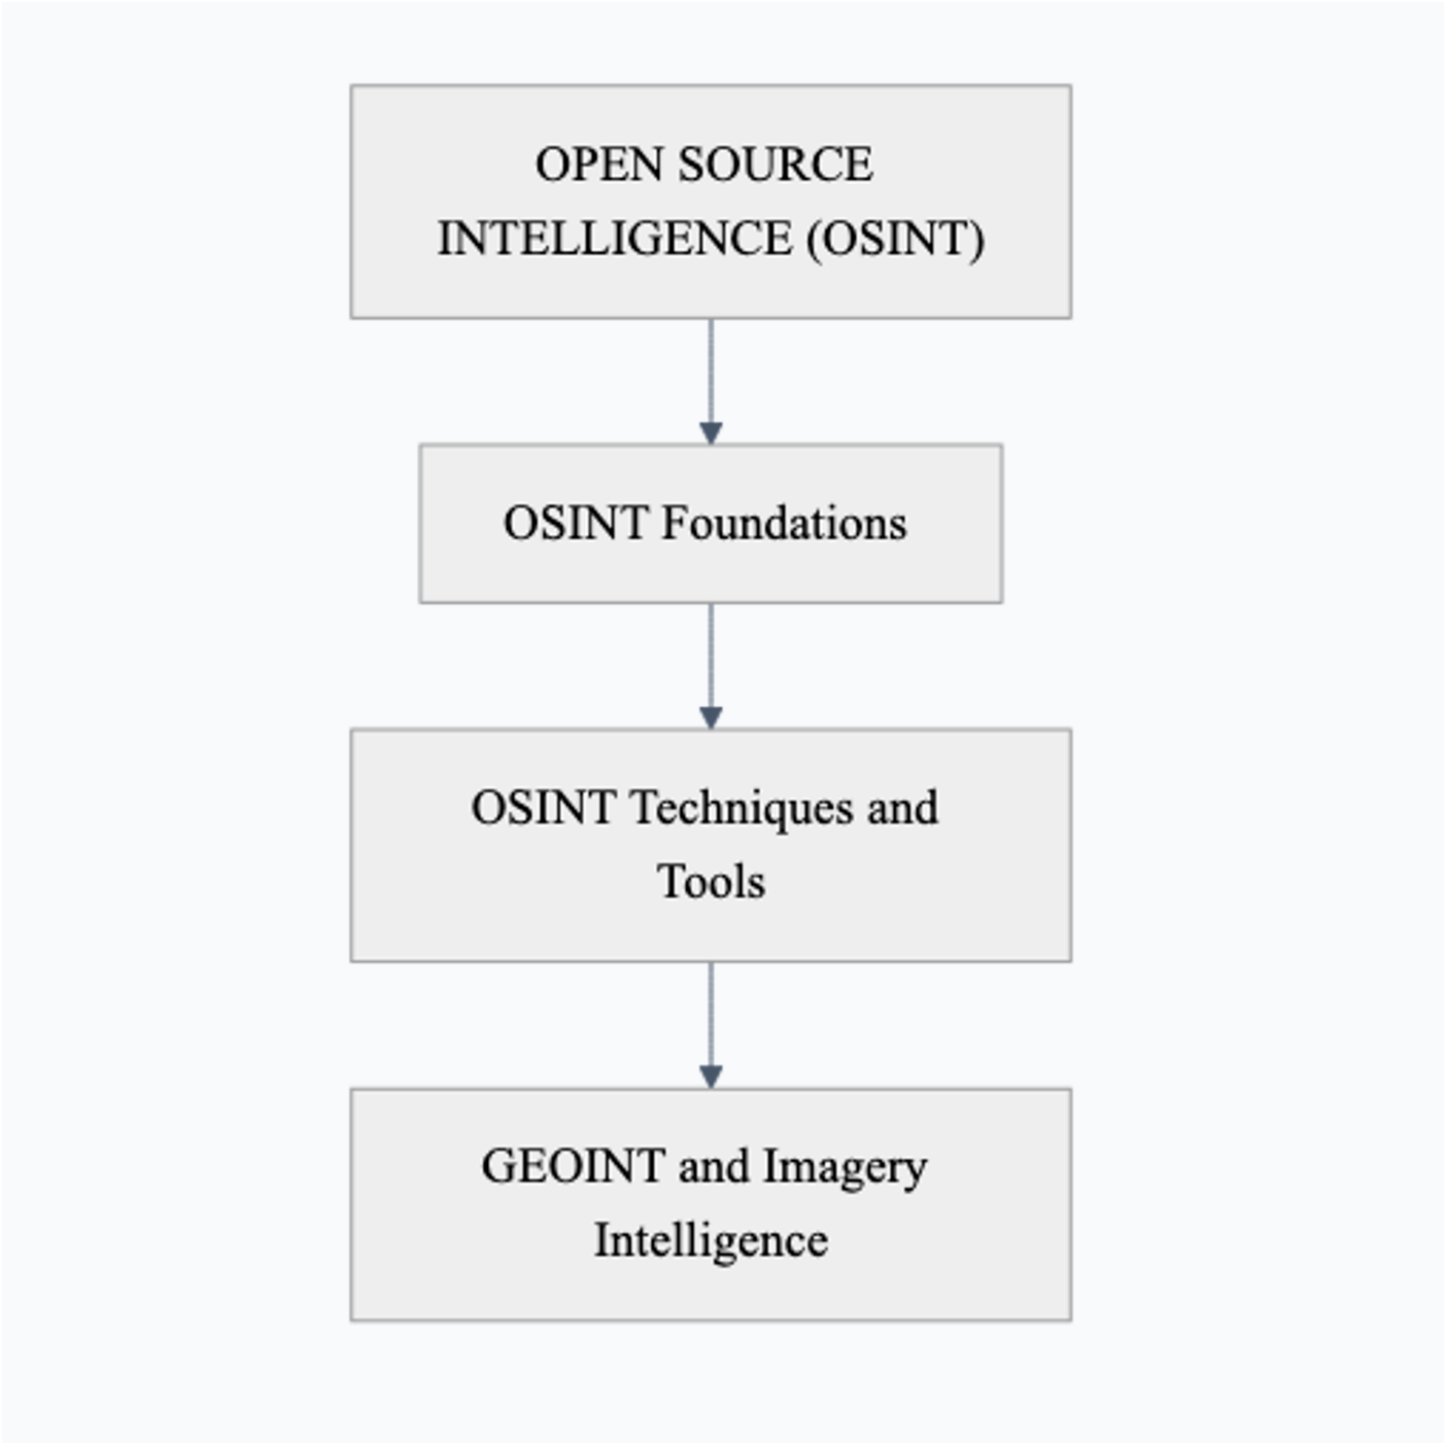

Figure 45: The unit module map traces the part's chapters as a linear reading sequence. It is anchored to the open source intelligence osint section; use it to inspect 3 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

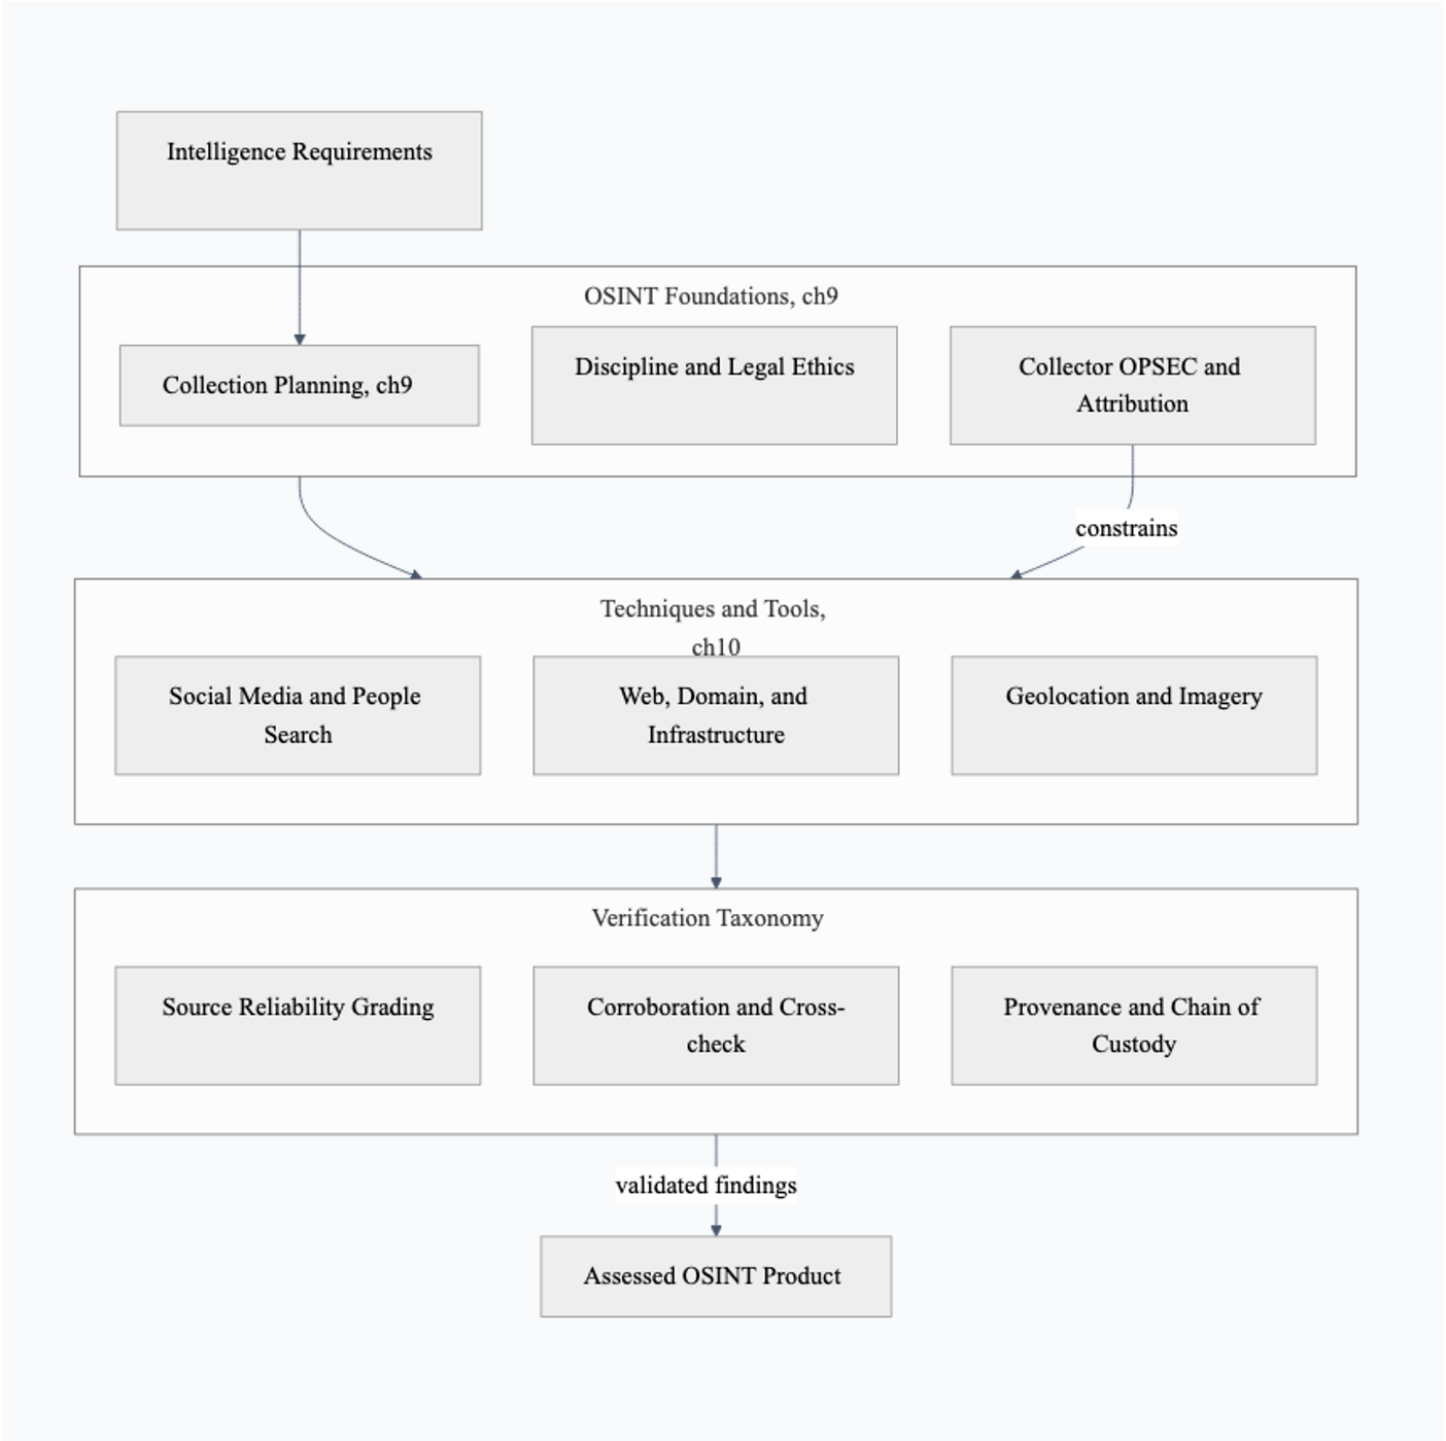

Figure 46: Part IV traces OSINT as a left-to-right pipeline from requirements through disciplined collection (ch9) and tooling (ch10) into a verification taxonomy that turns raw findings into an assessed product. Its reader value is to make Intelligence Requirements, Collection Planning, ch9, the module, ch9, and Discipline and Legal Ethics visible at a glance, with the open source intelligence osint section as the source section and defensive review as the boundary.

16 OSINT Foundations

16.0.1 OSINT Foundations figures and course links: visual evidence, source flow, and navigation

The module uses Figure 47 and Figure 45 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 15, Section 17.
This module teaches the **Open-Source and Geospatial Intelligence Integrity** lane through a bounded, source-backed coursebook chapter. [251, 2026]; [253, 2026].

16.1 Open-Source and Geospatial Intelligence Integrity frame for OSINT Foundations: source context, topic focus, and reader task

Evidence anchor. Section 16; [251, 2026].

16.1.1 OSINT Foundations orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 16; [251, 2026].

16.1.2 OSINT Foundations conceptual primer: source context, core model, and reader task

This chapter teaches OSINT and GEOINT as public-source reasoning disciplines: availability does not equal reliability, relevance, legality, or ethical reuse. The chapter uses **Requirements-to-Evidence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.
The central distinction is to separate discovery from collection expansion, and map or media interpretation from targeting. Core topics include **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026; OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [251, 2026]; [253, 2026].
Learners move from vocabulary and the **Requirements-to-Evidence Lens** distinction through topic lessons on **History and Rise of OSINT in the Intelligence Community** with evidence and misconception checks, then assemble a **requirements matrix with source descriptors, caveats, and collection limits** with safety and rights gates.

16.1.3 OSINT Foundations learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 16; [251, 2026].

- Connect **History and Rise of OSINT in the Intelligence Community and IC OSINT Strategy 2024–2026** to **Open-Source and Geospatial Intelligence Integrity** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **requirements matrix with source descriptors, caveats, and collection limits** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate discovery from collection expansion, and map or media interpretation from targeting; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as privacy drift, stale data, context collapse, platform bias, over-collection, and mistaking availability for reliability, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: OSINT work uses lawful public, owned-lab, or explicitly approved sources and avoids doxxing, harassment, live tracking, or operational targeting.

16.1.4 OSINT Foundations core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 16; [251, 2026].

Term	Working definition
Provenance	the origin, chain, and transformation history of a source
Corroboration	the comparison of independent sources before reuse
Recency	the time relationship between source creation, discovery, and claim
Geospatial quality	accuracy, completeness, temporal fitness, and usability of location data
Minimization	limiting retained information to what the accountable question requires
History and Rise of OSINT in the Intelligence…	Key terms: History, Rise, OSINT.
IC OSINT Strategy 2024–2026	Key terms: IC, OSINT, Strategy.

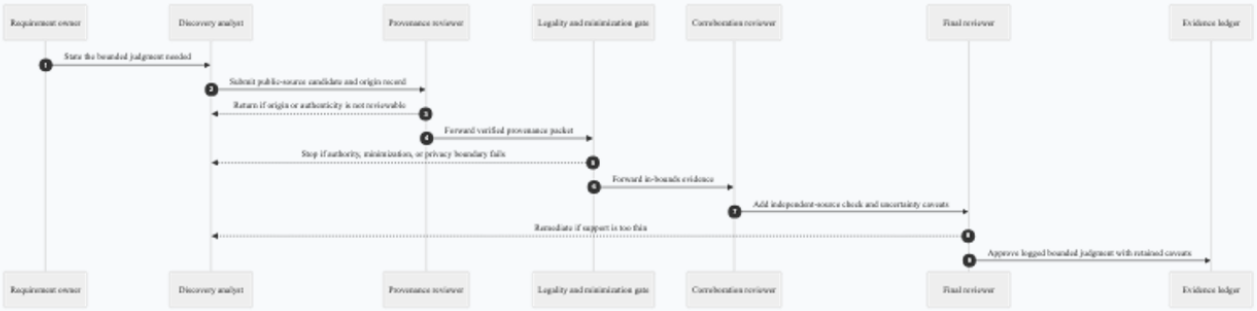

Figure 47: The OSINT sequence separates public-source discovery from claim reuse: each handoff records provenance, legality, minimization, corroboration, caveats, and reviewer disposition before a bounded judgment can be logged. In the open source intelligence osint / osint foundations section, it lets readers compare requirement owner, discovery analyst, provenance reviewer, legal and minimization gate, corroboration reviewer, final reviewer, logged bounded judgment, stop-and-retire path for unverifiable or out-of-bounds evidence so the visual functions as a traceable course aid rather than an unscoped assertion.

16.2 Requirements-to-Evidence Lens path for OSINT Foundations: lesson cluster, safe artifact, and review

Evidence anchor. Section 16; [251, 2026].

16.2.1 OSINT Foundations practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 16; [251, 2026].

16.2.2 OSINT Foundations topic lessons: source-backed concepts and transfer tasks

This module builds OSINT and GEOINT as public-source reasoning disciplines: availability does not equal reliability, relevance, legality, or ethical reuse. The sequence opens with **History and Rise of OSINT in the Intelligence Community**, **IC OSINT Strategy 2024–2026**, **OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion** and applies the **Requirements-to-Evidence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 45; module overview Section 16; curriculum atlas Section 2.

Triangulation anchors. In module 9's topic-lessons section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

16.2.2.1 Lesson 1: History and Rise of OSINT in the Intelligence Community

Concept. **History and Rise of OSINT in the Intelligence Community** maps the theory to institutions: priorities, feedback, incentives, review loops, and records shape what an intelligence community notices and ignores.

Why it matters. **History and Rise of OSINT in the Intelligence Community** connects classroom vocabulary to Open-Source and Geospatial Intelligence Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. **History and Rise of OSINT in the Intelligence Community** rests on [047, 2026]. The lead source's own note reads: Plans and strategies for improving open-source intelligence (OSINT) operations in the Intelligence. Use it for the working definition that **History and Rise of OSINT in the Intelligence Community** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Ground **History and Rise of OSINT in the Intelligence Community** in the evidence the row cites. [047, 2026] Plans and strategies for improving open-source intelligence (OSINT) operations in the Intelligence. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **History and Rise of OSINT in the Intelligence Community**, build an institutional feedback-loop map with incentives, review points, and oversight hooks. Shape this subject work as an **OSINT provenance and minimization matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that History and Rise of OSINT in the Intelligence Community can be used while ignoring the rule to separate discovery from collection expansion, and map or media interpretation from targeting.

Transfer task. Transfer **History and Rise of OSINT in the Intelligence Community** to a second module by preserving source-quality review and non-sensitive geospatial interpretation, changing the source evidence, and naming a new reviewer.

16.2.2.2 Lesson 2: IC OSINT Strategy 2024–2026

Concept. **IC OSINT Strategy 2024–2026** treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. **IC OSINT Strategy 2024–2026** matters in the **Open-Source and Geospatial Intelligence Integrity** lane because source-quality review and non-sensitive geospatial interpretation evidence must stay separate from judgment; privacy drift is a common failure.

Source support. **IC OSINT Strategy 2024–2026** rests on [048, 2026]. The lead source's own note reads: Tradecraft and training standards must be flexible and updated regularly to keep pace with changes. Use it for pinning down the scope of **IC OSINT Strategy 2024–2026**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **IC OSINT Strategy 2024–2026**, reason from the sources cited in this row. [048, 2026] Tradecraft and training standards must be flexible and updated regularly to keep pace with changes. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **IC OSINT Strategy 2024–2026**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must name the source descriptor, the bounded claim about **IC OSINT Strategy**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as an **OSINT provenance and minimization matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that IC OSINT Strategy 2024–2026 is optional whenever separate discovery from collection expansion, and map or media interpretation from targeting feels inconvenient.

Transfer task. Transfer **IC OSINT Strategy 2024–2026** to a second module by preserving source-quality review and non-sensitive geospatial interpretation, changing the source evidence, and naming a new reviewer.

16.2.2.3 Lesson 3: OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion

Concept. **OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion** treats human-source work as a governed relationship: validation, consent, reporting, source protection, and oversight—not contact activity.

Why it matters. **OSINT vs. HUMINT vs. SIGINT** connects classroom vocabulary to Open-Source and Geospatial Intelligence Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. **OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion** rests on [301, 2026] and [298, 2026]. The most specific cited work observes: Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. Use them for the claim that **OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **OSINT vs. HUMINT vs. SIGINT** against the works cited for this row. [301, 2026] Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **OSINT vs. HUMINT vs. SIGINT**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must name the source descriptor, the bounded claim about **OSINT vs HUMINT vs SIGINT**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **OSINT vs. HUMINT vs. SIGINT** work as an **OSINT provenance and minimization matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion establishes intent without reviewing alternative explanations.

Transfer task. Transfer **OSINT vs. HUMINT vs. SIGINT** to a second module by preserving source-quality review and non-sensitive geospatial interpretation, changing the source evidence, and naming a new reviewer.

16.2.2.4 Lesson 4: Legal and Ethical Constraints in OSINT Collection

Concept. Legal and Ethical Constraints in OSINT Collection treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Legal and Ethical Constraints in OSINT Collection matters in the **Open-Source and Geospatial Intelligence Integrity** lane because source-quality review and non-sensitive geospatial interpretation evidence must stay separate from judgment; privacy drift is a common failure.

Source support. Legal and Ethical Constraints in OSINT Collection rests on [298, 2026] and [297, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for pinning down the scope of **Legal and Ethical Constraints in OSINT Collection**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **Legal and Ethical Constraints in OSINT Collection** against the works cited for this row. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Legal and Ethical Constraints in OSINT Collection**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must name the source descriptor, the bounded claim about **Legal and Ethical Constraints in**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as an **OSINT provenance and minimization matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Legal and Ethical Constraints in OSINT Collection replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Legal and Ethical Constraints in OSINT Collection** to a second module by preserving source-quality review and non-sensitive geospatial interpretation, changing the source evidence, and naming a new reviewer.

16.2.2.5 Lesson 5: Identity-and-provenance ethics audit with no impersonation

Concept. Identity-and-provenance ethics audit with no impersonation treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Identity-and-provenance ethics audit connects classroom vocabulary to Open-Source and Geospatial Intelligence Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Identity-and-provenance ethics audit with no impersonation rests on [301, 2026] and [298, 2026]. Its anchor reference records: Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. Use them for fixing what **Identity-and-provenance ethics audit with no impersonation** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **Identity-and-provenance ethics audit**, work from the cited evidence behind this row. [301, 2026] Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Identity-and-provenance ethics audit**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must state the identity descriptor, the bounded claim about **Identity-and-provenance ethics audit**, the linkage caveat, the uncertainty note, the no-deanonymization boundary, and the reviewer who clears the record. Shape **Identity-and-provenance ethics audit** work as an **OSINT provenance and minimization matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a presented identity is an established one, when provenance requires tracing how that identity was created, verified, and could be forged.

Transfer task. Reuse the **Identity-and-provenance ethics audit** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

16.2.2.6 Lesson 6: Open Source Intelligence: Trends and Issues

Concept. Open Source Intelligence: Trends and Issues treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Open Source Intelligence matters in the **Open-Source and Geospatial Intelligence Integrity** lane because source-quality review and non-sensitive geospatial interpretation evidence must stay separate from judgment; privacy drift is a common failure.

Source support. Open Source Intelligence: Trends and Issues rests on [049, 2026]. The closest source to this row notes: The text explores OSINT's advantages and disadvantages in intelligence activities. Use it for fixing what **Open Source Intelligence: Trends and Issues** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **Open Source Intelligence** against the works cited for this row. [049, 2026] The text explores OSINT's advantages and disadvantages in intelligence activities. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Open Source Intelligence**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must name the source descriptor, the bounded claim about **Open Source Intelligence**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Open Source Intelligence** work as an **OSINT provenance and minimization matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Open Source Intelligence: Trends and Issues is optional whenever separate discovery from collection expansion, and map or media interpretation from targeting feels inconvenient.

Transfer task. Transfer **Open Source Intelligence** to a second module by preserving source-quality review and non-sensitive geospatial interpretation, changing the source evidence, and naming a new reviewer.

16.2.3 OSINT Foundations worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic public-resilience team checks whether open data supports a non-sensitive evacuation-route map. [251, 2026]; [253, 2026].

Triangulation anchors. In module 9's worked-example section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **open-source intelligence governance**. Learners use a **OSINT provenance and minimization matrix** and keep this boundary visible: No exposed-service lookup, credentialed access, identity exposure, doxxing, or live collection expansion.

Frame. The classroom question centers on **History and Rise of OSINT in the Intelligence Community**. Excluded actions stay explicit, and the **Requirements-to-Evidence Lens** planning question is: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Inputs. For the **History and Rise of OSINT in the Intelligence Community** scenario, use public road data, public weather notices, synthetic change examples, and instructor-provided metadata. The Requirements-to-Evidence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **History and Rise of OSINT in the Intelligence Community**, students record provenance, test recency, compare independent sources, mark uncertainty, and remove unnecessary identity data. Pause whenever an inference about History and Rise of OSINT in the Intelligence Community appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **History and Rise of OSINT in the Intelligence Community** classroom scenario; unit artifact = OSINT provenance and minimization matrix; evidence = allowed inputs; method = source-quality review and non-sensitive geospatial interpretation; output = a source-quality matrix and annotated map note with caveats and no tracking or targeting content; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **History and Rise of OSINT in the Intelligence Community** as "Requirements-to-Evidence Lens confirms it" is not enough. The revision ties the claim to source-quality review and non-sensitive geospatial interpretation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **History and Rise of OSINT in the Intelligence Community** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

16.2.4 OSINT Foundations practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Requirements-to-Evidence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

Triangulation anchors. In module 9's practice-sequence section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare History and Rise of OSINT in the Intelligence Community, IC OSINT Strategy 2024–2026, OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Open-Source and Geospatial Intelligence Integrity** lane.
2. Frame	Answer the lens question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for History and Rise of OSINT in the Intelligence Community: requirements matrix with source descriptors, caveats, and collection limits.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the OSINT provenance and minimization matrix fields for History and Rise of OSINT in the Intelligence Community.	Unit profile note.	Evidence artifacts include provenance chain, terms-of-use note.
4. Challenge	Test the misconception that History and Rise of OSINT in the Intelligence Community can be used while ignoring the rule to separate discovery from collection expansion, and map or media interpretation from targeting.	Failure-mode note.	The artifact applies the key distinction: separate discovery from collection expansion, and map or media interpretation from targeting.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

16.2.4.1 OSINT Foundations instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**. [251, 2026]; [253, 2026].

16.2.4.2 OSINT Foundations extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 16; [251, 2026].

Have learners swap artifacts and apply the **Requirements-to-Evidence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

16.2.5 OSINT Foundations knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 16; [251, 2026].

1. Explain how **History and Rise of OSINT in the Intelligence Community** is defined here; name the source descriptor that supports the definition.
2. Contrast **History and Rise of OSINT in the Intelligence Community** with **IC OSINT Strategy 2024–2026** using the **Requirements-to-Evidence Lens** artifact fields.
3. Identify one failure mode from the **Open-Source and Geospatial Intelligence Integrity** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which source is available but not reliable enough for the claim?
5. Correct this misconception: that History and Rise of OSINT in the Intelligence Community can be used while ignoring the rule to separate discovery from collection expansion, and map or media interpretation from targeting.

16.2.5.1 OSINT Foundations answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **History and Rise of OSINT in the Intelligence Community** without source evidence, uncertainty, or a safe transfer task.

16.3 OSINT Foundations assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 16; [251, 2026].

16.3.1 OSINT Foundations evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 16; [251, 2026].

16.3.2 OSINT Foundations transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 16; [251, 2026].

16.3.2.1 OSINT Foundations lineage and source tradition: profile, concepts, and first anchors This sits in the **Open-Source and Geospatial Intelligence Integrity** lineage: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. [251, 2026]; [253, 2026].

16.3.2.2 OSINT Foundations working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 16; [251, 2026].
The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**, with provenance and reviewability throughout.

16.3.2.3 OSINT Foundations knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [251, 2026]; [253, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

16.3.2.4 OSINT Foundations transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 16; [251, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.
- **Evidence contract:** keep the **Open-Source and Geospatial Intelligence Integrity** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

16.3.2.5 OSINT Foundations profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 16; [251, 2026].
The matched profile emphasizes public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. The method stack is source triage, provenance capture, corroboration matrix, recency audit, geospatial context review, and confidence calibration; the local topic cluster is **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

16.3.3 OSINT Foundations evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 16; [251, 2026].
Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Open-Source and Geospatial Intelligence Integrity** profile tells reviewers what evidence is strong enough for the module artifact built around **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

16.3.3.1 OSINT Foundations guide source spine: inherited keys and local citation roles Primary guide citations: [251, 2026]; [253, 2026]; [269, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [047, 2026]; [048, 2026]; [049, 2026]; [301, 2026]; [298, 2026]; [297, 2026].

16.3.3.2 OSINT Foundations verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [251, 2026]; [253, 2026].

Tier	What counts	How it is used
Source guide	[251, 2026]; [253, 2026]; [269, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [047, 2026]; [048, 2026]; [049, 2026]; [301, 2026]; [298, 2026]; [297, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 9's source-canon section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Maintenance rule: Perplexity may suggest candidates for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026** and [251, 2026]; [253, 2026], but only directly verified source URLs are encoded as citations.

16.3.3.3 OSINT Foundations intelligence practice lens: evidence artifact and safety check Practice lens: **Requirements-to-Evidence Lens** for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**. [251, 2026]; [253, 2026].
Planning question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?
Evidence artifact: requirements matrix with source descriptors, caveats, and collection limits.
Validation rule: show priority, authority, minimization, corroboration, and source quality before any claim is reused. Applied to **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.
Handoff contract: deliver metadata-rich evidence packets, not unscoped data piles or implicit targeting requests.
Safety check: exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure.

16.3.3.4 OSINT Foundations runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 16; [251, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	9.99	9.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind OSINT Foundations to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	9.101	9.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for OSINT Foundations	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	9.102	9.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for OSINT Foundations	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
History and Rise of OSINT in the Intelligence Community	9.1	9.1 History and Rise of OSINT in the Intelligence Community	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
IC OSINT Strategy 2024–2026	9.2	9.2 IC OSINT Strategy 2024–2026	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion	9.3	9.3 OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Legal and Ethical Constraints in OSINT Collection	9.4	9.4 Legal and Ethical Constraints in OSINT Collection	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Identity-and-provenance ethics audit with no impersonation	9.5	9.5 source title transformed into safe curriculum treatment; original: OPSEC for OSINT Operators: The Sock Puppet Problem	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Open Source Intelligence: Trends and Issues	9.6	9.6 Open Source Intelligence: Trends and Issues	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

16.3.3.5 OSINT Foundations reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 16; [251, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
History and Rise of OSINT in the Intelligence Community	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
IC OSINT Strategy 2024–2026	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Legal and Ethical Constraints in OSINT Collection	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Identity-and-provenance ethics audit with no impersonation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Open Source Intelligence: Trends and Issues	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

16.3.3.6 OSINT Foundations annotated source ledger: real titles and local contribution Each source cited by this **Open-Source and Geospatial Intelligence Integrity** module is paired below with its real title and a one-line note on what it contributes to **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

Source	Cited work	What it contributes	Status
[251, 2026]	European Data Governance Act	The European Commission page explaining the Data Governance Act, an EU regulation that became applicable in September 2023 to build trust in data sharing and ease reuse of data. It outlines four mechanisms: facilitating reuse of protected public-sector data, establishing trusted data intermediaries, enabling voluntary data sharing by citizens and businesses, and removing barriers to cross-sector and cross-border data use.	verified source-guide

Source	Cited work	What it contributes	Status
[253, 2026]	Common European Data Spaces	This is an official European Commission webpage describing the Common European Data Spaces initiative, part of the EU strategy to create interconnected, trustworthy data-sharing environments across strategic sectors. It explains that data spaces let organizations and individuals share data while retaining control, guided by principles of open participation, privacy protection, and fair access rules.	verified source-guide
[269, 2026]	Data on the Web Best Practices	A W3C Recommendation, "Data on the Web Best Practices," published January 31, 2017 by the Data on the Web Best Practices Working Group. It offers 35 best practices for publishing and consuming data on the Web, covering metadata, licensing and provenance, data quality, dataset versioning, persistent URIs, machine-readable formats, vocabulary reuse, access methods, preservation, and feedback.	verified source-guide
[273, 2026]	WCAG 2 Overview	The W3C Web Accessibility Initiative overview of the Web Content Accessibility Guidelines (WCAG), an international standard for making web content accessible to people with disabilities. It explains that WCAG is organized around four principles (perceivable, operable, understandable, robust) with testable success criteria at three conformance levels (A, AA, AAA), and covers versions 2.0, 2.1, and 2.2.	verified source-guide
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide
[275, 2026]	Fact Sheet: New Rule on the Accessibility of Web Content and Mobile Apps Provided by State and Local Governments	A US Department of Justice fact sheet explaining the 2024 ADA Title II rule requiring state and local governments to make their web content and mobile apps accessible. It establishes WCAG 2.1 Level AA as the technical standard, applies to entities such as schools, courts, libraries, and transit agencies, and sets compliance deadlines of April 2027 for larger jurisdictions and April 2028 for smaller ones.	verified source-guide

Source	Cited work	What it contributes	Status
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide
[047, 2026]	How the Intelligence Community Has Held Back Open-Source	Plans and strategies for improving open-source intelligence (OSINT) operations in the Intelligence.	original source-guide
[048, 2026]	The IC OSINT Strategy 2024-2026	Tradecraft and training standards must be flexible and updated regularly to keep pace with changes.	original source-guide
[049, 2026]	Open Source Intelligence (OSINT): issues and trends	The text explores OSINT's advantages and disadvantages in intelligence activities.	original source-guide
[301, 2026]	The IC OSINT Strategy 2024-2026	Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide

Where this sits. This module's overview is Section 16; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

16.3.4 OSINT Foundations governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 16; [251, 2026].

16.3.5 OSINT Foundations analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 9's governance-boundary section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Open-Source and Geospatial Intelligence Integrity** for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**. [251, 2026]; [253, 2026].
Curriculum topic spine: History and Rise of OSINT in the Intelligence Community, **IC OSINT Strategy 2024–2026**, **OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion**. **Verified anchor cluster:** [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]; [for Standardization, 2013]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015].
Conceptual depth: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests.
Method stack: source triage, provenance capture, corroboration matrix, recency audit, geospatial context review, and confidence calibration.
Composability contract: collection notes, source metadata, transformations, caveats, and analytic judgments remain separately exportable.
Known failure modes: privacy drift, stale data, context collapse, platform bias, over-collection, and mistaking availability for reliability.
Defensive boundary: OSINT work uses lawful public, owned-lab, or explicitly approved sources and avoids doxxing, harassment, live tracking, or operational targeting. Applied to **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

Anchor	Why it matters here
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[of State, 2024]	Official strategy source for lawful OSINT governance, discovery, validation, and dissemination. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026c]	Official NGA strategy anchor for GEOINT readiness, warning, partnership resilience, resource stewardship, and AI integration. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026b]	Official NGA source on GEOINT AI, data quality, model performance, interoperability, analyst interaction, and standards leadership. Checked as of 2026-05-21; role: curriculum_anchor.
[for Standardization, 2013]	International geospatial data-quality standard for completeness, logical consistency, positional accuracy, temporal quality, and usability framing. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.

16.3.5.1 OSINT Foundations evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Open-Source and Geospatial Intelligence Integrity** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [251, 2026]; [253, 2026].

16.3.6 OSINT Foundations agentic boundary: assist, approve, block, and record

Evidence anchor. Section 16; [251, 2026].
AGEINT translation is bounded by the **Open-Source and Geospatial Intelligence Integrity** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

16.3.6.1 OSINT Foundations permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 16; [251, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

16.3.6.2 OSINT Foundations excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [251, 2026]; [253, 2026] and **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

16.3.7 OSINT Foundations governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 16; [251, 2026].
Governance is practiced as a gate on the **Open-Source and Geospatial Intelligence Integrity** lane. Learners use the **Requirements-to-Evidence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

16.3.7.1 OSINT Foundations governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [251, 2026]; [253, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Open-Source and Geospatial Intelligence Integrity** failure modes and the **Requirements-to-Evidence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

16.3.7.2 OSINT Foundations evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 16; [251, 2026]. Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Requirements-to-Evidence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

16.3.7.3 OSINT Foundations current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**. [251, 2026]; [253, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_ic_osint_strategy` for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
What does the module inherit from `official_state_osint_strategy` for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**?	Open Source Intelligence Strategy; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official strategy source for lawful OSINT governance, discovery, validation, and dissemination.
What does the module inherit from `official_nga_strategy` for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**?	NGA Strategy; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official NGA strategy anchor for GEOINT readiness, warning, partnership resilience, resource stewardship, and AI integration.
What does the module inherit from `official_nga_geoint_ai` for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**?	GEOINT Artificial Intelligence; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official NGA source on GEOINT AI, data quality, model performance, interoperability, analyst interaction, and standards leadership.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 16; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

16.3.8 OSINT Foundations assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 16; [251, 2026].

16.3.9 OSINT Foundations assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 16; [251, 2026].

16.3.9.1 OSINT Foundations capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.
Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026** and [251, 2026]; [253, 2026].

16.3.9.2 OSINT Foundations instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026** and [251, 2026]; [253, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

16.3.9.3 OSINT Foundations assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
History and Rise of OSINT in the Intelligence Community	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
IC OSINT Strategy 2024–2026	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
OSINT vs. HUMINT vs. SIGINT: Comparative Value and Fusion	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

16.3.10 OSINT Foundations refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [251, 2026]; [253, 2026] and **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**.

16.3.10.1 OSINT Foundations refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**. The local signals begin with [251, 2026]; [253, 2026].

16.3.10.2 OSINT Foundations claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**, and the source spine for these checks begins with [251, 2026]; [253, 2026].

16.3.11 OSINT Foundations reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [251, 2026]; [253, 2026].
Triangulation anchors. In module 9's review-checklist section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026**. [251, 2026]; [253, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

16.3.12 OSINT Foundations learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **History and Rise of OSINT in the Intelligence Community; IC OSINT Strategy 2024–2026** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [251, 2026]; [253, 2026].
Section 2, Section 15, Section 17

17 OSINT Techniques and Tools

17.0.1 OSINT Techniques and Tools figures and course links: visual evidence, source flow, and navigation

The module uses Figure 48 and Figure 45 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 15, Section 16, Section 18.
This module teaches the **Open-Source and Geospatial Intelligence Integrity** lane through a bounded, source-backed coursebook chapter. [251, 2026]; [252, 2026].

17.1 Open-Source and Geospatial Intelligence Integrity frame for OSINT Techniques and Tools: source context, topic focus, and reader task

Evidence anchor. Section 17; [251, 2026].

17.1.1 OSINT Techniques and Tools orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 17; [251, 2026].

17.1.2 OSINT Techniques and Tools conceptual primer: source context, core model, and reader task

This chapter teaches OSINT and GEOINT as public-source reasoning disciplines: availability does not equal reliability, relevance, legality, or ethical reuse. The chapter uses **Requirements-to-Evidence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.
The central distinction is to separate discovery from collection expansion, and map or media interpretation from targeting. Core topics include **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records; Graph-analysis provenance review using instructor-provided records**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [251, 2026]; [252, 2026].
Learners move from vocabulary and the **Requirements-to-Evidence Lens** distinction through topic lessons on **Search-exposure provenance review using instructor-provided records** with evidence and misconception checks, then assemble a **requirements matrix with source descriptors, caveats, and collection limits** with safety and rights gates.

17.1.3 OSINT Techniques and Tools learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 17; [251, 2026].

- Connect **Search-exposure provenance review using instructor-provided records and Social-source provenance and minimization review using toy records** to **Open-Source and Geospatial Intelligence Integrity** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **requirements matrix with source descriptors, caveats, and collection limits** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate discovery from collection expansion, and map or media interpretation from targeting; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as privacy drift, stale data, context collapse, platform bias, over-collection, and mistaking availability for reliability, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: OSINT work uses lawful public, owned-lab, or explicitly approved sources and avoids doxxing, harassment, live tracking, or operational targeting.

17.1.4 OSINT Techniques and Tools core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 17; [251, 2026].

Term	Working definition
Provenance	the origin, chain, and transformation history of a source
Corroboration	the comparison of independent sources before reuse
Recency	the time relationship between source creation, discovery, and claim
Geospatial quality	accuracy, completeness, temporal fitness, and usability of location data
Minimization	limiting retained information to what the accountable question requires
Search-exposure provenance review using…	Key terms: Search, exposure, provenance.
Social-source provenance and minimization…	Key terms: Social, provenance, minimization.

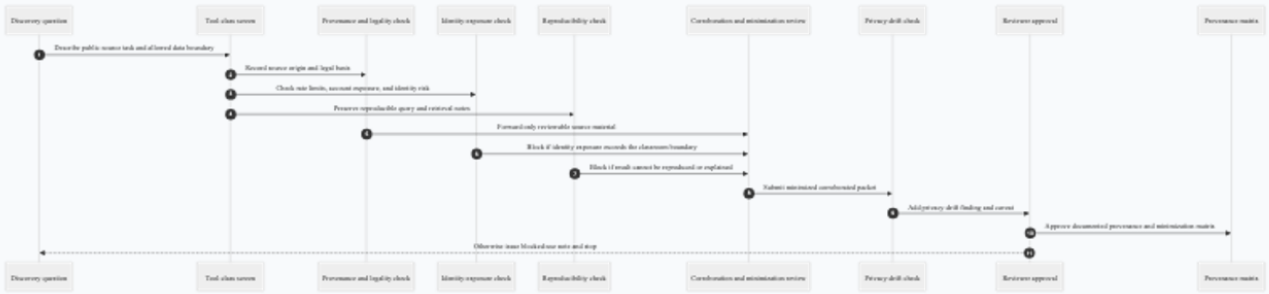

Figure 48: The OSINT provenance sequence makes the governance screen explicit: tool class, provenance, legality, identity exposure, reproducibility, minimization, privacy drift, and reviewer approval are checked before reuse. The captioned view belongs to the open source intelligence osint / osint techniques and tools section and should be read as a map of public-source question, tool-class governance screen, provenance and legality check, identity-exposure check, reproducibility check, corroboration and minimization review, privacy-drift check, reviewer approval, documented matrix or blocked-use note, not as a capability score or live-task instruction.

17.2 Requirements-to-Evidence Lens path for OSINT Techniques and Tools: lesson cluster, safe artifact, and review

Evidence anchor. Section 17; [251, 2026].

17.2.1 OSINT Techniques and Tools practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 17; [251, 2026].

17.2.2 OSINT Techniques and Tools topic lessons: source-backed concepts and transfer tasks

This module builds OSINT and GEOINT as public-source reasoning disciplines: availability does not equal reliability, relevance, legality, or ethical reuse. The sequence opens with **Search-exposure provenance review using instructor-provided records**, **Social-source provenance and minimization review using toy records**, **Graph-analysis provenance review using instructor-provided records** and applies the **Requirements-to-Evidence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 45; module overview Section 17; curriculum atlas Section 2.

Triangulation anchors. In module 10's topic-lessons section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

17.2.2.1 Lesson 1: Search-exposure provenance review using instructor-provided records

Concept. Search-exposure provenance review using instructor-provided records evaluates the tool class by provenance, legality, rate limits, identity exposure, and reproducibility before any public-source claim is reused.

Why it matters. Analysts use **Search-exposure provenance review** to separate discovery from collection expansion, and map or media interpretation from targeting. A defensible treatment names the judgment it enables for source-quality review and non-sensitive geospatial interpretation review, the proof limit that privacy drift would otherwise hide, and the reviewer accountable for challenge.

Source support. Search-exposure provenance review using instructor-provided records rests on [050, 2026] and [051, 2026]. The most specific cited work observes: Mike wrote he wants to make the OSINT investigator more self reliant, able to do his job without. Use them for pinning down the scope of **Search-exposure provenance review using instructor-provided records**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **Search-exposure provenance review** against the works cited for this row. [050, 2026] Mike wrote he wants to make the OSINT investigator more self reliant, able to do his job without. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Search-exposure provenance review**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must record the tool-and-terms descriptor, the bounded claim about **Search-exposure provenance review using instructor-provided**, the minimization caveat, the reproducibility uncertainty, the identity-exposure boundary, and the reviewer who approves the use. Shape **Search-exposure provenance review** work as an **OSINT provenance and minimization matrix** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Search-exposure provenance review**: that a source being publicly accessible means collecting it is unrestricted, ungoverned, and free of legal, ethical, and scoping limits.

Transfer task. Apply this module's safe boundary for **Search-exposure provenance review** to another artifact while keeping source-quality review and non-sensitive geospatial interpretation and reviewer ownership explicit.

17.2.2.2 Lesson 2: Social-source provenance and minimization review using toy records

Concept. Social-source provenance and minimization review using toy records treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Social-source provenance matters in the **Open-Source and Geospatial Intelligence Integrity** lane because source-quality review and non-sensitive geospatial interpretation evidence must stay separate from judgment; privacy drift is a common failure.

Source support. Social-source provenance and minimization review using toy records rests on [051, 2026] and [052, 2026]. Its anchor reference records: This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Use them for fixing what **Social-source provenance and minimization review using toy records** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **Social-source provenance**, work from the cited evidence behind this row. [052, 2026] This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Social-source provenance**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must record the tool-and-terms descriptor, the bounded claim about **Social-source provenance and minimization review**, the minimization caveat, the reproducibility uncertainty, the identity-exposure boundary, and the reviewer who approves the use. Shape **Social-source provenance** work as an **OSINT provenance and minimization matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Social-source provenance**: that a source being publicly accessible means collecting it is unrestricted, ungoverned, and free of legal, ethical, and scoping limits.

Transfer task. Reuse the **Social-source provenance** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

17.2.2.3 Lesson 3: Graph-analysis provenance review using instructor-provided records

Concept. Graph-analysis provenance review using instructor-provided records treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Graph-analysis provenance review connects classroom vocabulary to Open-Source and Geospatial Intelligence Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Graph-analysis provenance review using instructor-provided records rests on [051, 2026]. Use it for the claim that **Graph-analysis provenance review using instructor-provided records** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **Graph-analysis provenance review**, reason from the sources cited in this row. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Graph-analysis provenance review**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must record the tool-and-terms descriptor, the bounded claim about **Graph-analysis provenance review using instructor-provided**, the minimization caveat, the reproducibility uncertainty, the identity-exposure boundary, and the reviewer who approves the use. Shape **Graph-analysis provenance review** work as an **OSINT provenance and minimization matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Graph-analysis provenance review**: that a source being publicly accessible means collecting it is unrestricted, ungoverned, and free of legal, ethical, and scoping limits.

Transfer task. Transfer **Graph-analysis provenance review** from this module to a second motif by preserving source-quality review and non-sensitive geospatial interpretation, replacing action with audit, and naming the blocked use.

17.2.2.4 Lesson 4: Custom-source integration governance review using toy records

Concept. Custom-source integration governance review using toy records evaluates the tool class by provenance, legality, rate limits, identity exposure, and reproducibility before any public-source claim is reused.

Why it matters. Custom-source integration governance review connects classroom vocabulary to Open-Source and Geospatial Intelligence Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Custom-source integration governance review using toy records rests on [052, 2026] and [053, 2026]. The most specific cited work observes: This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Use them for pinning down the scope of **Custom-source integration governance review using toy records**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Ground **Custom-source integration governance review** in the evidence the row cites. [052, 2026] This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Custom-source integration governance review**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must record the tool-and-terms descriptor, the bounded claim about **Custom-source integration governance review using**, the minimization caveat, the reproducibility uncertainty, the identity-exposure boundary, and the reviewer who approves the use. Shape **Custom-source integration governance review** work as an **OSINT provenance and minimization matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Custom-source integration governance review**: that a source being publicly accessible means collecting it is unrestricted, ungoverned, and free of legal, ethical, and scoping limits.

Transfer task. Transfer **Custom-source integration governance review** from this module to a second motif by preserving source-quality review and non-sensitive geospatial interpretation, replacing action with audit, and naming the blocked use.

17.2.2.5 Lesson 5: Automated-source aggregation governance review using toy records

Concept. Automated-source aggregation governance review using toy records treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Without explicit treatment of **Automated-source aggregation governance review**, privacy drift undermines source-quality review and non-sensitive geospatial interpretation review; the lesson builds the habit to separate discovery from collection expansion, and map or media interpretation from targeting.

Source support. Automated-source aggregation governance review using toy records rests on [052, 2026]. Its anchor reference records: This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Use it for pinning down the scope of **Automated-source aggregation governance review using toy records**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **Automated-source aggregation governance review**, work from the cited evidence behind this row. [052, 2026] This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Automated-source aggregation governance review**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must record the tool-and-terms descriptor, the bounded claim about **Automated-source aggregation governance review using**, the minimization caveat, the reproducibility uncertainty, the identity-exposure boundary, and the reviewer who approves the use. Shape **Automated-source aggregation governance review** work as an **OSINT provenance and minimization matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Automated-source aggregation governance review**: that a source being publicly accessible means collecting it is unrestricted, ungoverned, and free of legal, ethical, and scoping limits.

Transfer task. Apply this module's safe boundary for **Automated-source aggregation governance review** to another artifact while keeping source-quality review and non-sensitive geospatial interpretation and reviewer ownership explicit.

17.2.2.6 Lesson 6: Identity-data minimization review using instructor-provided records

Concept. Identity-data minimization review using instructor-provided records evaluates the tool class by provenance, legality, rate limits, identity exposure, and reproducibility before any public-source claim is reused.

Why it matters. Analysts use **Identity-data minimization review** to separate discovery from collection expansion, and map or media interpretation from targeting. A defensible treatment names the judgment it enables for source-quality review and non-sensitive geospatial interpretation review, the proof limit that privacy drift would otherwise hide, and the reviewer accountable for challenge.

Source support. Identity-data minimization review using instructor-provided records rests on [054, 2026]. The closest source to this row notes: Top open source intelligence websites. Use it for the working definition that **Identity-data minimization review using instructor-provided records** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **Identity-data minimization review**, reason from the sources cited in this row. [054, 2026] Recommended OSINT tools and their benefits. Top open source intelligence websites. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Identity-data minimization review**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must record the tool-and-terms descriptor, the bounded claim about **Identity-data minimization review using instructor-provided**, the minimization caveat, the reproducibility uncertainty, the identity-exposure boundary, and the reviewer who approves the use. Shape **Identity-data minimization review** work as an **OSINT provenance and minimization matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Identity-data minimization review**: that a source being publicly accessible means collecting it is unrestricted, ungoverned, and free of legal, ethical, and scoping limits.

Transfer task. Transfer **Identity-data minimization review** from this module to a second motif by preserving source-quality review and non-sensitive geospatial interpretation, replacing action with audit, and naming the blocked use.

17.2.2.7 Lesson 7: OSINT Framework (osintframework.com): Module Taxonomy Concept. OSINT Framework (osintframework.com): Module Taxonomy treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. OSINT Framework (osintframework.com) matters in the **Open-Source and Geospatial Intelligence Integrity** lane because source-quality review and non-sensitive geospatial interpretation evidence must stay separate from judgment; privacy drift is a common failure.

Source support. OSINT Framework (osintframework.com): Module Taxonomy rests on [051, 2026] and [052, 2026]. The closest source to this row notes: This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Use them for the claim that **OSINT Framework (osintframework.com): Module Taxonomy** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **OSINT Framework (osintframework.com)**, reason from the sources cited in this row. [052, 2026] This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **OSINT Framework (osintframework.com)**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must name the source descriptor, the bounded claim about **OSINT Framework**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **OSINT Framework (osintframework.com)** work as an **OSINT provenance and minimization matrix** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that OSINT Framework (osintframework.com): Module Taxonomy is optional whenever separate discovery from collection expansion, and map or media interpretation from targeting feels inconvenient.

Transfer task. Transfer **OSINT Framework (osintframework.com)** to a second module by preserving source-quality review and non-sensitive geospatial interpretation, changing the source evidence, and naming a new reviewer.

17.2.2.8 Lesson 8: Offline OSINT Environments: VM Architecture and Isolation Concept. Offline OSINT Environments: VM Architecture and Isolation treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Offline OSINT Environments connects classroom vocabulary to Open-Source and Geospatial Intelligence Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Offline OSINT Environments: VM Architecture and Isolation rests on [051, 2026] and [052, 2026]. The closest source to this row notes: This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Use them for the claim that **Offline OSINT Environments: VM Architecture and Isolation** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **Offline OSINT Environments**, reason from the sources cited in this row. [052, 2026] This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Offline OSINT Environments**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must name the source descriptor, the bounded claim about **Offline OSINT Environments**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Offline OSINT Environments** work as an **OSINT provenance and minimization matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Offline OSINT Environments: VM Architecture and Isolation establishes intent without reviewing alternative explanations.

Transfer task. Transfer **Offline OSINT Environments** to a second module by preserving source-quality review and non-sensitive geospatial interpretation, changing the source evidence, and naming a new reviewer.

17.2.2.9 Lesson 9: IntelTechniques OSINT 11th Edition Methods and Workflows Concept. IntelTechniques OSINT 11th Edition Methods and Workflows treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Without explicit treatment of **IntelTechniques OSINT 11th Edition Methods**, privacy drift undermines source-quality review and non-sensitive geospatial interpretation review; the lesson builds the habit to separate discovery from collection expansion, and map or media interpretation from targeting.

Source support. IntelTechniques OSINT 11th Edition Methods and Workflows rests on [055, 2026] and [056, 2026]. The lead source's own note reads: Resources for Uncovering Online Information - 11th Edition (2024). Use them for the claim that **IntelTechniques OSINT 11th Edition Methods and Workflows** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **IntelTechniques OSINT 11th Edition Methods**, reason from the sources cited in this row. [055, 2026] OSINT Techniques. Resources for Uncovering Online Information - 11th Edition (2024). [056, 2026] All tutorials in this book were confirmed accurate as of November 1, 2024. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **IntelTechniques OSINT 11th Edition Methods**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must name the source descriptor, the bounded claim about **IntelTechniques OSINT 11th Edition Methods**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **IntelTechniques OSINT 11th Edition Methods** work as an **OSINT provenance and minimization matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that IntelTechniques OSINT 11th Edition Methods and Workflows replaces human review whenever evidence looks plausible.

Transfer task. Transfer **IntelTechniques OSINT 11th Edition Methods** to a second module by preserving source-quality review and non-sensitive geospatial interpretation, changing the source evidence, and naming a new reviewer.

17.2.3 OSINT Techniques and Tools worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic public-resilience team checks whether open data supports a non-sensitive evacuation-route map. [251, 2026]; [252, 2026].

Triangulation anchors. In module 10's worked-example section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **open-source intelligence governance**. Learners use a **OSINT provenance and minimization matrix** and keep this boundary visible: No exposed-service lookup, credentialed access, identity exposure, doxxing, or live collection expansion.

Frame. The classroom question centers on **Search-exposure provenance review using instructor-provided records**. Excluded actions stay explicit, and the **Requirements-to-Evidence Lens** planning question is: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Inputs. For the **Search-exposure provenance review using instructor-provided records** scenario, use public road data, public weather notices, synthetic change examples, and instructor-provided metadata. The Requirements-to-Evidence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Search-exposure provenance review using instructor-provided records**, students record provenance, test recency, compare independent sources, mark uncertainty, and remove unnecessary identity data. Pause whenever an inference about Search-exposure provenance review using instructor-provided records appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Search-exposure provenance review using instructor-provided records** classroom scenario; unit artifact = OSINT provenance and minimization matrix; evidence = allowed inputs; method = source-quality review and non-sensitive geospatial interpretation; output = a source-quality matrix and annotated map note with caveats and no tracking or targeting content; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Search-exposure provenance review using instructor-provided records** as "Requirements-to-Evidence Lens confirms it" is not enough. The revision ties the claim to source-quality review and non-sensitive geospatial interpretation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Search-exposure provenance review using instructor-provided records** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

17.2.4 OSINT Techniques and Tools practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Requirements-to-Evidence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

Triangulation anchors. In module 10's practice-sequence section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Search-exposure provenance review using instructor-provided records, Social-source provenance and minimization review using toy records, Graph-analysis provenance review using instructor-provided records; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Open-Source and Geospatial Intelligence Integrity** lane.
2. Frame	Answer the lens question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Search-exposure provenance review using instructor-provided records: requirements matrix with source descriptors, caveats, and collection limits.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the OSINT provenance and minimization matrix fields for Search-exposure provenance review using instructor-provided records.	Unit profile note.	Evidence artifacts include provenance chain, terms-of-use note.
4. Challenge	Test the misconception that a source being publicly accessible means collecting it is unrestricted, ungoverned, and free of legal, ethical, and scoping limits.	Failure-mode note.	The artifact applies the key distinction: separate discovery from collection expansion, and map or media interpretation from targeting.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

17.2.4.1 OSINT Techniques and Tools instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**. [251, 2026]; [252, 2026].

17.2.4.2 OSINT Techniques and Tools extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 17; [251, 2026].

Have learners swap artifacts and apply the **Requirements-to-Evidence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Search-exposure provenance review using instructor-provided records;**

Social-source provenance and minimization review using toy records.

17.2.5 OSINT Techniques and Tools knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 17; [251, 2026].

1. Explain how **Search-exposure provenance review using instructor-provided records** is defined here; name the source descriptor that supports the definition.
2. Contrast **Search-exposure provenance review using instructor-provided records** with **Social-source provenance and minimization review using toy records** using the **Requirements-to-Evidence Lens** artifact fields.
3. Identify one failure mode from the **Open-Source and Geospatial Intelligence Integrity** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which source is available but not reliable enough for the claim?
5. Correct this misconception: that a source being publicly accessible means collecting it is unrestricted, ungoverned, and free of legal, ethical, and scoping limits.

17.2.5.1 OSINT Techniques and Tools answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Search-exposure provenance review using instructor-provided records** without source evidence, uncertainty, or a safe transfer task.

17.3 OSINT Techniques and Tools assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 17; [251, 2026].

17.3.1 OSINT Techniques and Tools evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 17; [251, 2026].

17.3.2 OSINT Techniques and Tools transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 17; [251, 2026].

17.3.2.1 OSINT Techniques and Tools lineage and source tradition: profile, concepts, and first anchors This sits in the **Open-Source and Geospatial Intelligence Integrity** lineage: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. [251, 2026]; [252, 2026].

17.3.2.2 OSINT Techniques and Tools working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 17; [251, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**, with provenance and reviewability throughout.

17.3.2.3 OSINT Techniques and Tools knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [251, 2026]; [252, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

17.3.2.4 OSINT Techniques and Tools transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 17; [251, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.
- **Evidence contract:** keep the **Open-Source and Geospatial Intelligence Integrity** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

17.3.2.5 OSINT Techniques and Tools profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 17; [251, 2026].

The matched profile emphasizes public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. The method stack is source triage, provenance capture, corroboration matrix, recency audit, geospatial context review, and confidence calibration; the local topic cluster is **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

17.3.3 OSINT Techniques and Tools evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 17; [251, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Open-Source and Geospatial Intelligence Integrity** profile tells reviewers what evidence is strong enough for the module artifact built around **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

17.3.3.1 OSINT Techniques and Tools guide source spine: inherited keys and local citation roles Primary guide citations: [251, 2026]; [252, 2026]; [269, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [050, 2026]; [051, 2026]; [052, 2026]; [053, 2026]; [054, 2026]; [055, 2026]; [056, 2026].

17.3.3.2 OSINT Techniques and Tools verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [251, 2026]; [252, 2026].

Tier	What counts	How it is used
Source guide	[251, 2026]; [252, 2026]; [269, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [050, 2026]; [051, 2026]; [052, 2026]; [053, 2026]; [054, 2026]; [055, 2026]; [056, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 10's source-canon section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records** and [251, 2026]; [252, 2026], but only directly verified source URLs are encoded as citations.

17.3.3.3 OSINT Techniques and Tools intelligence practice lens: evidence artifact and safety check Practice lens: **Requirements-to-Evidence Lens** for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**. [251, 2026]; [252, 2026].

Planning question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Evidence artifact: requirements matrix with source descriptors, caveats, and collection limits.

Validation rule: show priority, authority, minimization, corroboration, and source quality before any claim is reused. Applied to **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

Handoff contract: deliver metadata-rich evidence packets, not unscoped data piles or implicit targeting requests.

Safety check: exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure.

17.3.3.4 OSINT Techniques and Tools runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 17; [251, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	10.99	10.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind OSINT Techniques and Tools to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	10.101	10.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for OSINT Techniques and Tools	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	10.102	10.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for OSINT Techniques and Tools	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Search-exposure provenance review using instructor-provided records	10.1	10.1 source title transformed into safe curriculum treatment; original: Search Engine Tradecraft: Google Dorking, Yandex, Bing, Shodan	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Social-source provenance and minimization review using toy records	10.2	10.2 source title transformed into safe curriculum treatment; original: Social Media OSINT: Scraping, Graph Analysis, Identity Verification	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Graph-analysis provenance review using instructor-provided records	10.3	10.3 source title transformed into safe curriculum treatment; original: Maltego: Graph-Based OSINT Investigation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Custom-source integration governance review using toy records	10.4	10.4 source title transformed into safe curriculum treatment; original: Recon-ng: Python-Based Reconnaissance Framework	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Automated-source aggregation governance review using toy records	10.5	10.5 source title transformed into safe curriculum treatment; original: SpiderFoot: Automated OSINT Collection	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Identity-data minimization review using instructor-provided records	10.6	10.6 source title transformed into safe curriculum treatment; original: FOCA, TheHarvester, Sherlock: Targeted Investigation Tools	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
OSINT Framework (osintframework.com): Module Taxonomy	10.7	10.7 OSINT Framework (osint-framework.com): Module Taxonomy	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Offline OSINT Environments: VM Architecture and Isolation	10.8	10.8 Offline OSINT Environments: VM Architecture and Isolation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
IntelTechniques OSINT 11th Edition Methods and Workflows	10.9	10.9 IntelTechniques OSINT 11th Edition Methods and Workflows	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

17.3.3.5 OSINT Techniques and Tools reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 17; [251, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Search-exposure provenance review using instructor-provided records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Social-source provenance and minimization review using toy records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Graph-analysis provenance review using instructor-provided records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Custom-source integration governance review using toy records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Automated-source aggregation governance review using toy records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Identity-data minimization review using instructor-provided records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Lesson topic	Practice lens	Evidence artifact	Safety check
OSINT Framework (osintframework.com): Module Taxonomy	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Offline OSINT Environments: VM Architecture and Isolation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
IntelTechniques OSINT 11th Edition Methods and Workflows	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

17.3.3.6 OSINT Techniques and Tools annotated source ledger: real titles and local contribution Each source cited by this **Open-Source and Geospatial Intelligence Integrity** module is paired below with its real title and a one-line note on what it contributes to **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

Source	Cited work	What it contributes	Status
[251, 2026]	European Data Governance Act	The European Commission page explaining the Data Governance Act, an EU regulation that became applicable in September 2023 to build trust in data sharing and ease reuse of data. It outlines four mechanisms: facilitating reuse of protected public-sector data, establishing trusted data intermediaries, enabling voluntary data sharing by citizens and businesses, and removing barriers to cross-sector and cross-border data use.	verified source-guide
[252, 2026]	Data Act Explained	An official European Commission explainer on the EU Data Act, which became applicable on 12 September 2025.	verified source-guide
[269, 2026]	Data on the Web Best Practices	A W3C Recommendation, "Data on the Web Best Practices," published January 31, 2017 by the Data on the Web Best Practices Working Group. It offers 35 best practices for publishing and consuming data on the Web, covering metadata, licensing and provenance, data quality, dataset versioning, persistent URIs, machine-readable formats, vocabulary reuse, access methods, preservation, and feedback.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[277, 2026]	Endorsed WP29 Guidelines	This is a European Data Protection Board webpage listing guidelines and documents originating from the Article 29 Working Party that the EDPB endorsed at its first plenary meeting. The catalogued materials relate to the GDPR and cover topics such as consent and transparency, data breach notification, automated decision-making and profiling, data protection impact assessments, data protection officers, and binding corporate rules.	verified source-guide

Source	Cited work	What it contributes	Status
[284, 2026]	Verifiable Credential Data Integrity 1.0	The W3C Recommendation for Verifiable Credential Data Integrity 1.0, published May 2025, defining mechanisms for ensuring the authenticity and integrity of verifiable credentials using cryptographic proofs. It specifies a process of data transformation, hashing, and proof generation, and a corresponding verification procedure, along with a proof data model containing properties such as type, verification method, purpose, and proof value.	verified source-guide
[288, 2026]	Algorithmic Transparency Recording Standard Hub	A GOV.UK collection page serving as the hub for the UK Algorithmic Transparency Recording Standard (ATRS), maintained by the Government Digital Service. It provides a standardized template for documenting public-sector use of algorithmic tools, completion guidance, policy on scope and compliance, and a searchable repository of published transparency records.	verified source-guide
[289, 2026]	Guidance for Organisations Using the Algorithmic Transparency Recording Standard	This is a GOV.UK guidance page published by the Government Digital Service that instructs public sector organizations on completing the Algorithmic Transparency Recording Standard (ATRS) template and publishing their records to the GOV.UK repository. It applies both to central government bodies required to publish under mandatory policy and to other public sector bodies doing so voluntarily.	verified source-guide
[293, 2026]	Inventory of NARA Artificial Intelligence (AI) Use Cases	The National Archives and Records Administration (NARA) official inventory of its artificial intelligence use cases, documenting 14 projects across deployed, pilot, and planned stages. Deployed efforts include workplace productivity tools, automated tagging for museum experiences, and historical record retrieval, while pilots cover PII detection and redaction, semantic search, and metadata generation, and planned work targets FOIA processing and public search.	verified source-guide
[050, 2026]	[Thoughts on Bazzell's New Book? Open Source Intelligence	Mike wrote he wants to make the OSINT investigator more self reliant, able to do his job without.	original source-guide
[051, 2026]	Cited source (see bibliography)	See bibliography for scope.	original source-guide
[052, 2026]	What is Open Source Intelligence & Top 10 Tools - Lampyre	This article defines open source intelligence as the practice of gathering information from publicly available data for security, business, and investigative purposes, drawing on websites, social media, government records, and public databases.	verified source-guide
[053, 2026]	A Guide to Choosing the Right Tool for Your Needs	See bibliography for scope.	verified practitioner context; secondary evidence only
[054, 2026]	What are your preferred OSINT tools? : r/hacking	Recommended OSINT tools and their benefits. Top open source intelligence websites.	original source-guide

[056, 2026]	IntelTechniques - OSINT 11 2025.04.02 .pdf - elhacker.INFO	All tutorials in this book were confirmed accurate as of November 1, 2024.	original source-guide

Where this sits. This module's overview is Section 17; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates

that govern this module.

17.3.4 OSINT Techniques and Tools governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 17; [251, 2026].

17.3.5 OSINT Techniques and Tools analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 10's governance-boundary section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Open-Source and Geospatial Intelligence Integrity** for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**. [251, 2026]; [252, 2026].
Curriculum topic spine: Search-exposure provenance review using instructor-provided records, **Social-source provenance and minimization review using toy records**, **Graph-analysis provenance review using instructor-provided records**. **Verified anchor cluster:** [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]; [for Standardization, 2013]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015].
Conceptual depth: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests.
Method stack: source triage, provenance capture, corroboration matrix, recency audit, geospatial context review, and confidence calibration.
Composability contract: collection notes, source metadata, transformations, caveats, and analytic judgments remain separately exportable.
Known failure modes: privacy drift, stale data, context collapse, platform bias, over-collection, and mistaking availability for reliability.
Defensive boundary: OSINT work uses lawful public, owned-lab, or explicitly approved sources and avoids doxxing, harassment, live tracking, or operational targeting. Applied to **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

Anchor	Why it matters here
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[of State, 2024]	Official strategy source for lawful OSINT governance, discovery, validation, and dissemination. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026c]	Official NGA strategy anchor for GEOINT readiness, warning, partnership resilience, resource stewardship, and AI integration. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026b]	Official NGA source on GEOINT AI, data quality, model performance, interoperability, analyst interaction, and standards leadership. Checked as of 2026-05-21; role: curriculum_anchor.
[for Standardization, 2013]	International geospatial data-quality standard for completeness, logical consistency, positional accuracy, temporal quality, and usability framing. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.

17.3.5.1 OSINT Techniques and Tools evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Open-Source and Geospatial Intelligence Integrity** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [251, 2026]; [252, 2026].

17.3.6 OSINT Techniques and Tools agentic boundary: assist, approve, block, and record

Evidence anchor. Section 17; [251, 2026].
AGEINT translation is bounded by the **Open-Source and Geospatial Intelligence Integrity** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

17.3.6.1 OSINT Techniques and Tools permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 17; [251, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

17.3.6.2 OSINT Techniques and Tools excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [251, 2026]; [252, 2026] and **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

17.3.7 OSINT Techniques and Tools governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 17; [251, 2026].
Governance is practiced as a gate on the **Open-Source and Geospatial Intelligence Integrity** lane. Learners use the **Requirements-to-Evidence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

17.3.7.1 OSINT Techniques and Tools governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [251, 2026]; [252, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Open-Source and Geospatial Intelligence Integrity** failure modes and the **Requirements-to-Evidence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

17.3.7.2 OSINT Techniques and Tools evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 17; [251, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Requirements-to-Evidence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

17.3.7.3 OSINT Techniques and Tools current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**. [251, 2026]; [252, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_ic_osint_strategy` for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
What does the module inherit from `official_state_osint_strategy` for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**?	Open Source Intelligence Strategy; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official strategy source for lawful OSINT governance, discovery, validation, and dissemination.
What does the module inherit from `official_nga_strategy` for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**?	NGA Strategy; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official NGA strategy anchor for GEOINT readiness, warning, partnership resilience, resource stewardship, and AI integration.
What does the module inherit from `official_nga_geoint_ai` for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**?	GEOINT Artificial Intelligence; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official NGA source on GEOINT AI, data quality, model performance, interoperability, analyst interaction, and standards leadership.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 17; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

17.3.8 OSINT Techniques and Tools assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 17; [251, 2026].

17.3.9 OSINT Techniques and Tools assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 17; [251, 2026].

17.3.9.1 OSINT Techniques and Tools capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records** and [251, 2026]; [252, 2026].

17.3.9.2 OSINT Techniques and Tools instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records** and [251, 2026]; [252, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

17.3.9.3 OSINT Techniques and Tools assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Search-exposure provenance review using instructor-provided records	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Social-source provenance and minimization review using toy records	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Graph-analysis provenance review using instructor-provided records	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

17.3.10 OSINT Techniques and Tools refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [251, 2026]; [252, 2026] and **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**.

17.3.10.1 OSINT Techniques and Tools refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**. The local signals begin with [251, 2026]; [252, 2026].

17.3.10.2 OSINT Techniques and Tools claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**, and the source spine for these checks begins with [251, 2026]; [252, 2026].

17.3.11 OSINT Techniques and Tools reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [251, 2026]; [252, 2026].

Triangulation anchors. In module 10's review-checklist section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records**. [251, 2026]; [252, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

17.3.12 OSINT Techniques and Tools learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **Search-exposure provenance review using instructor-provided records; Social-source provenance and minimization review using toy records** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [251, 2026]; [252, 2026].

Section 2, Section 15, Section 16, Section 18

18 GEOINT and Imagery Intelligence

18.0.1 GEOINT and Imagery Intelligence figures and course links: visual evidence, source flow, and navigation

The module uses Figure 49, Figure 50, Figure 51, and Figure 45 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 15, Section 17, Section 19.
This module teaches the **Open-Source and Geospatial Intelligence Integrity** lane through a bounded, source-backed coursebook chapter. [253, 2026]; [255, 2026].

18.1 Open-Source and Geospatial Intelligence Integrity frame for GEOINT and Imagery Intelligence: source context, topic focus, and reader task

Evidence anchor. Section 18; [253, 2026].

18.1.1 GEOINT and Imagery Intelligence orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 18; [253, 2026].

18.1.2 GEOINT and Imagery Intelligence conceptual primer: source context, core model, and reader task

This chapter teaches OSINT and GEOINT as public-source reasoning disciplines: availability does not equal reliability, relevance, legality, or ethical reuse. The chapter uses **Requirements-to-Evidence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.
The central distinction is to separate discovery from collection expansion, and map or media interpretation from targeting. Core topics include **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples; Imagery collection-platform literacy: resolution and revisit tradeoffs**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [253, 2026]; [255, 2026].
Learners move from vocabulary and the **Requirements-to-Evidence Lens** distinction through topic lessons on **Imagery quality literacy: resolution, temporal fit, and uncertainty** with evidence and misconception checks, then assemble a **requirements matrix with source descriptors, caveats, and collection limits** with safety and rights gates.

18.1.3 GEOINT and Imagery Intelligence learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 18; [253, 2026].

- Connect **Imagery quality literacy: resolution, temporal fit, and uncertainty and GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** to **Open-Source and Geospatial Intelligence Integrity** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **requirements matrix with source descriptors, caveats, and collection limits** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate discovery from collection expansion, and map or media interpretation from targeting; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as privacy drift, stale data, context collapse, platform bias, over-collection, and mistaking availability for reliability, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: OSINT work uses lawful public, owned-lab, or explicitly approved sources and avoids doxxing, harassment, live tracking, or operational targeting.

18.1.4 GEOINT and Imagery Intelligence core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 18; [253, 2026].

Term	Working definition
Provenance	the origin, chain, and transformation history of a source
Corroboration	the comparison of independent sources before reuse
Recency	the time relationship between source creation, discovery, and claim
Geospatial quality	accuracy, completeness, temporal fitness, and usability of location data
Minimization	limiting retained information to what the accountable question requires
Imagery quality literacy: resolution, temporal…	Key terms: Imagery, quality, literacy.
GEOINT data-quality audit using provided…	Key terms: GEOINT, data, quality.

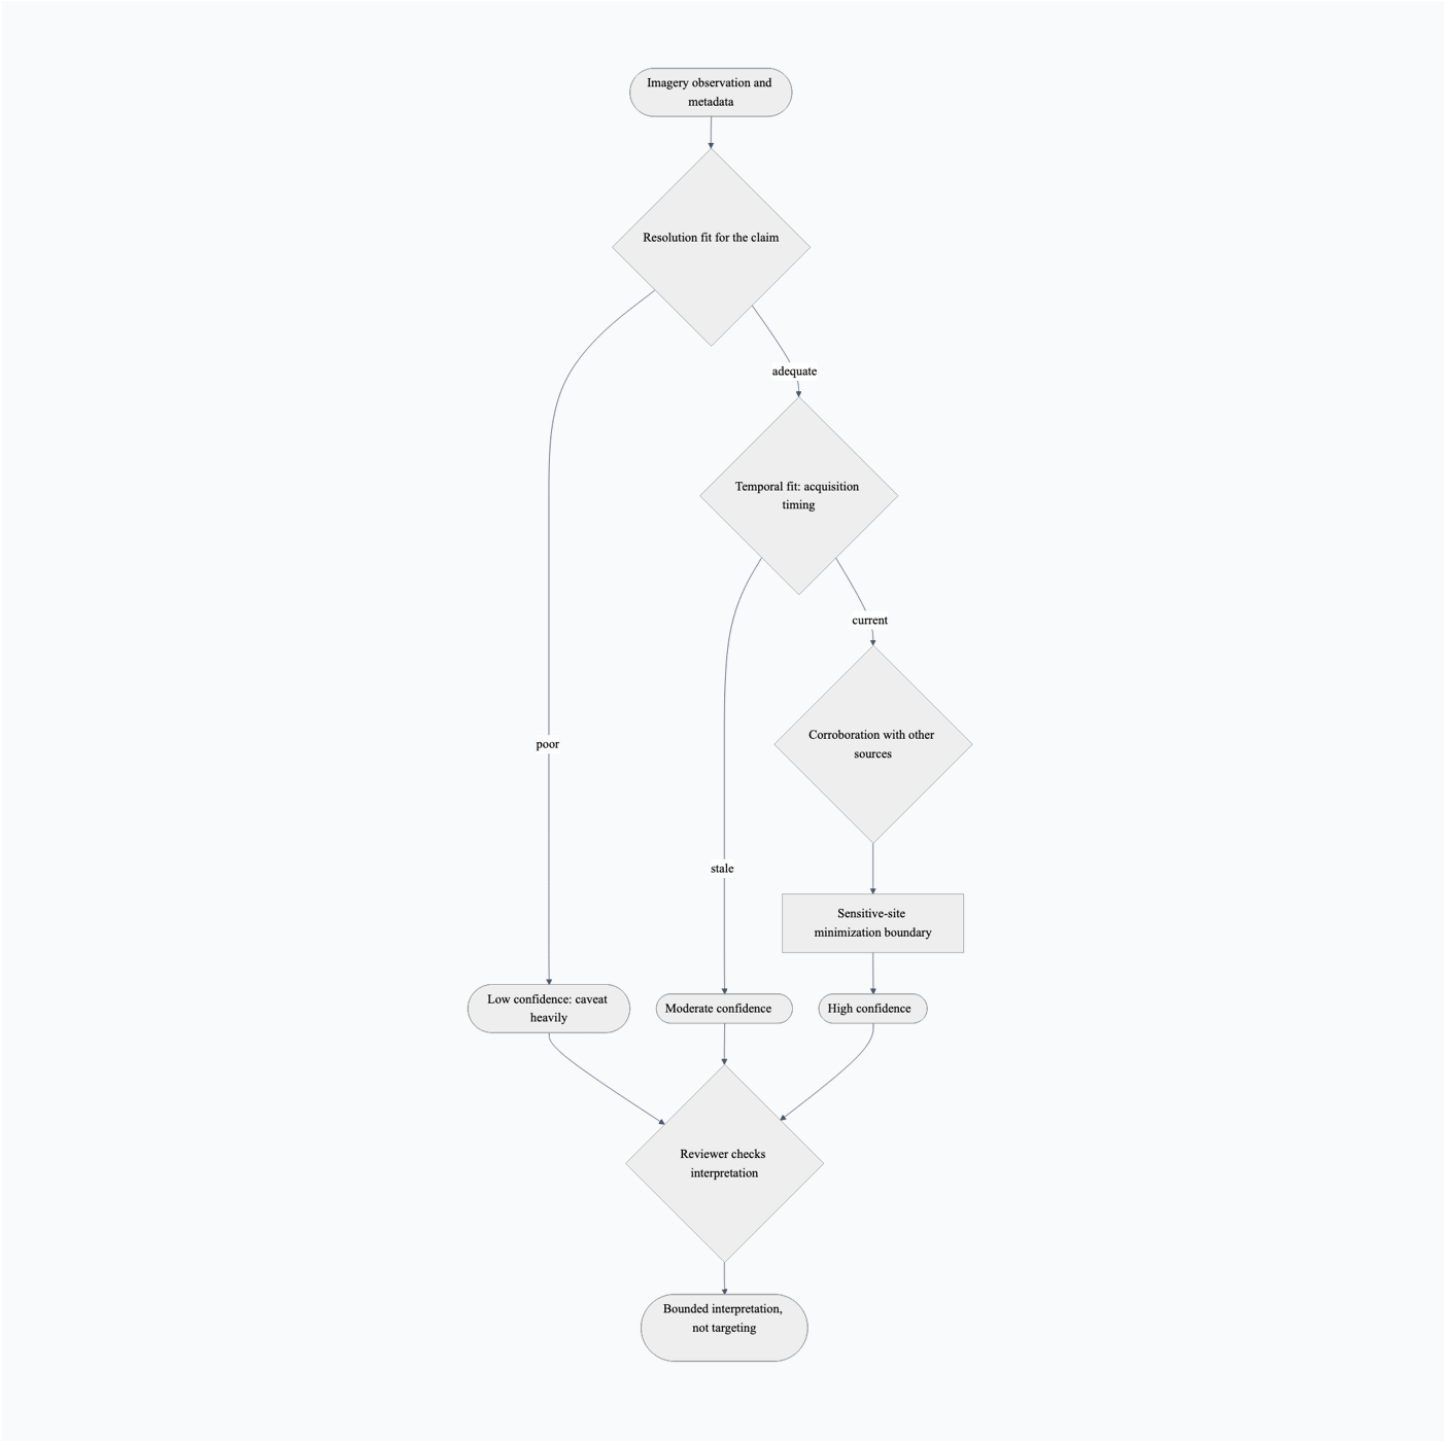

Figure 49: This diagram presents a confidence ladder that ties an imagery interpretation's defensibility to resolution fit, temporal fit, corroboration, and an explicit sensitive-site boundary that separates map reading from targeting or attribution. In the open source intelligence osint / geoint and imagery intelligence section, it lets readers compare Imagery observation and metadata, Sensitive-site minimization boundary, Low confidence: caveat heavily, and Moderate confidence so the visual functions as a traceable course aid rather than an unscoped assertion.

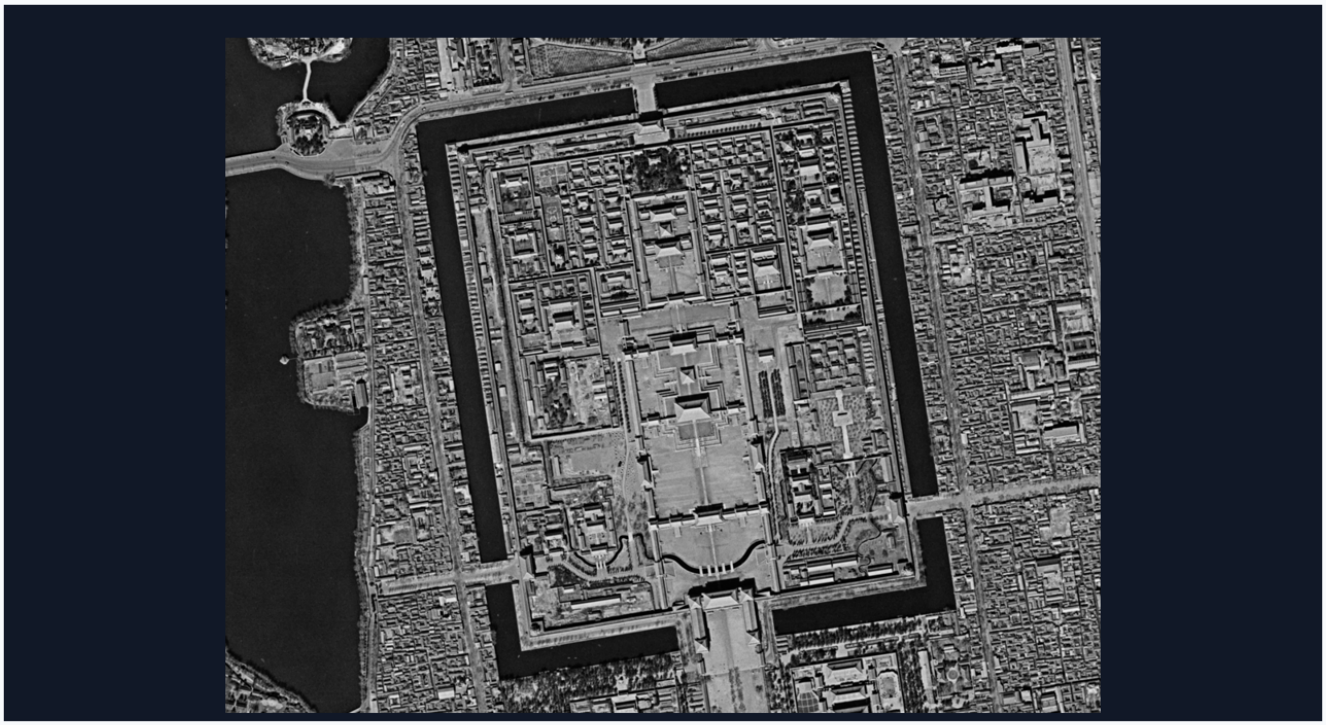

Figure 50: Public-domain USGS EROS declassified imagery of the Forbidden City as a local historical image for GEOINT source-provenance discussion. Its reader value is to make U.S. Geological Survey provenance, 1966 approx. collection context, public-domain status, and analytic reuse boundary visible at a glance, with the open source intelligence osint / geoint and imagery intelligence section as the source section and defensive review as the boundary.

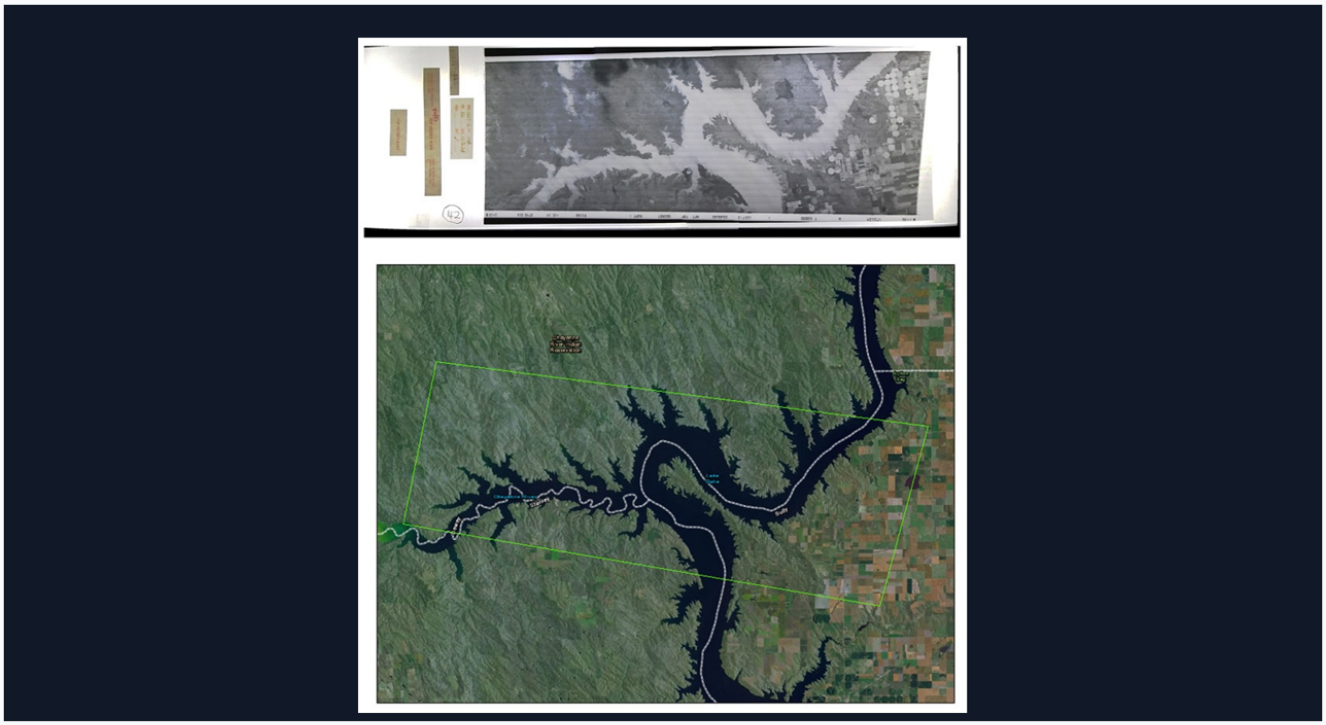

Figure 51: Public-domain USGS EROS KH-9 image used as a historical example of declassified remote-sensing material with explicit provenance. It is anchored to the open source intelligence osint / geoint and imagery intelligence section; use it to inspect U.S. Geological Survey provenance, 1982-07-22 collection context, public-domain status, and analytic reuse boundary while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

18.2 Requirements-to-Evidence Lens path for GEOINT and Imagery Intelligence: lesson cluster, safe artifact, and review

Evidence anchor. Section 18; [253, 2026].

18.2.1 GEOINT and Imagery Intelligence practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 18; [253, 2026].

18.2.2 GEOINT and Imagery Intelligence topic lessons: source-backed concepts and transfer tasks

This module builds OSINT and GEOINT as public-source reasoning disciplines: availability does not equal reliability, relevance, legality, or ethical reuse. The sequence opens with **Imagery quality literacy: resolution, temporal fit, and uncertainty**, **GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**, **Imagery collection-platform literacy: resolution and revisit tradeoffs** and applies the **Requirements-to-Evidence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 45; module overview Section 18; curriculum atlas Section 2.

Triangulation anchors. In module 11's topic-lessons section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

18.2.2.1 Lesson 1: Imagery quality literacy: resolution, temporal fit, and uncertainty

Concept. Imagery quality literacy: resolution, temporal fit, and uncertainty treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. Analysts use **Imagery quality literacy** to separate discovery from collection expansion, and map or media interpretation from targeting. A defensible treatment names the judgment it enables for source-quality review and non-sensitive geospatial interpretation review, the proof limit that privacy drift would otherwise hide, and the reviewer accountable for challenge.

Source support. Imagery quality literacy: resolution, temporal fit, and uncertainty rests on [057, 2026]. Its anchor reference records: MCRP 2-10B.4 in the source guide links to the Marines GEOINT manual, not a reconnaissance manual. Use it for pinning down the scope of **Imagery quality literacy: resolution, temporal fit, and uncertainty**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Ground **Imagery quality literacy** in the evidence the row cites. [057, 2026] MCRP 2-10B.4 in the source guide links to the Marines GEOINT manual, not a reconnaissance manual. The linked PDF is 'Geospatial Intelligence Support to Operations'; verify the intended citation before reuse. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Imagery quality literacy**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **Imagery quality literacy**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **Imagery quality literacy** work as an **OSINT provenance and minimization matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Imagery quality literacy**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Transfer **Imagery quality literacy** from this module to a second motif by preserving source-quality review and non-sensitive geospatial interpretation, replacing action with audit, and naming the blocked use.

18.2.2.2 Lesson 2: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples

Concept. GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples treats metadata as a distinct evidence class with its own minimization, correlation limits, and legal review requirements.

Why it matters. Analysts use **GEOINT data-quality audit** to separate discovery from collection expansion, and map or media interpretation from targeting. A defensible treatment names the judgment it enables for source-quality review and non-sensitive geospatial interpretation review, the proof limit that privacy drift would otherwise hide, and the reviewer accountable for challenge.

Source support. GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples rests on [058, 2026]. The closest source to this row notes: First developed in 2014 and revised with community input, it defines the competencies, standards, and learning objectives needed to succeed in the geospatial intelligence discipline. Use it for pinning down the scope of **GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **GEOINT data-quality audit**, reason from the sources cited in this row. [058, 2026] The GEOINT Essential Body of Knowledge (Version 2.0, 2019), published by the United States Geospatial Intelligence Foundation (USGIF). First developed in 2014 and revised with community input, it defines the competencies, standards, and learning objectives needed to succeed in the geospatial intelligence discipline. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **GEOINT data-quality audit**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **GEOINT data-quality audit using provided**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **GEOINT data-quality audit** work as an **OSINT provenance and minimization matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **GEOINT data-quality audit**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Transfer **GEOINT data-quality audit** from this module to a second motif by preserving source-quality review and non-sensitive geospatial interpretation, replacing action with audit, and naming the blocked use.

18.2.2.3 Lesson 3: Imagery collection-platform literacy: resolution and revisit tradeoffs

Concept. Imagery collection-platform literacy: resolution and revisit tradeoffs treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. Imagery collection-platform literacy connects classroom vocabulary to Open-Source and Geospatial Intelligence Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Imagery collection-platform literacy: resolution and revisit tradeoffs rests on [059, 2026]. The most specific cited work observes: It curates open-source resources organized into categories including satellite imagery, mapping, infrastructure and transport tracking, weather and environmental monitoring, shadow and sun-position tools for time-of-day analysis, crisis and conflict mapping, image forensics, and geocoding utilities. Use it for the working definition that **Imagery collection-platform literacy: resolution and revisit tradeoffs** can defend, where that

scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **Imagery collection-platform literacy**, work from the cited evidence behind this row. [059, 2026] A GitHub repository describing itself as a reference toolkit for geolocation and chronolocation in digital investigations. It curates open-source resources organized into categories including satellite imagery, mapping, infrastructure and transport tracking, weather and environmental monitoring, shadow and sun-position tools for time-of-day analysis, crisis and conflict mapping, image forensics, and geocoding utilities. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Imagery collection-platform literacy**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **Imagery collection-platform literacy**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **Imagery collection-platform literacy** work as an **OSINT provenance and minimization matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Imagery collection-platform literacy**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Transfer **Imagery collection-platform literacy** from this module to a second motif by preserving source-quality review and non-sensitive geospatial interpretation, replacing action with audit, and naming the blocked use.

18.2.2.4 Lesson 4: Claim-ledger memory exercise that tracks evidence changes rather than people

Concept. Claim-ledger memory exercise that tracks evidence changes rather than people treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. Analysts use **Claim-ledger memory exercise that tracks evidence changes rather than people** to separate discovery from collection expansion, and map or media interpretation from targeting. A defensible treatment names the judgment it enables for source-quality review and non-sensitive geospatial interpretation review, the proof limit that privacy drift would otherwise hide, and the reviewer accountable for challenge.

Source support. Claim-ledger memory exercise that tracks evidence changes rather than people rests on [302, 2026] and [297, 2026]. The lead source's own note reads: The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Use them for the working definition that **Claim-ledger memory exercise that tracks evidence changes rather than people** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **Claim-ledger memory exercise that tracks evidence changes rather than people**, reason from the sources cited in this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Claim-ledger memory exercise that tracks evidence changes rather than people**, build a claim-ledger memory card with source descriptor, source-change event, retention rule, contamination check, and reviewer disposition; it must not track real people, assets, or behavioral patterns. Shape this subject work as an **OSINT provenance and minimization matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Claim-ledger memory exercise that tracks evidence changes rather than people**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Reuse the **Claim-ledger memory exercise that tracks evidence changes rather than people** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

18.2.2.5 Lesson 5: GEOINT in Counterinsurgency and Strike: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples

Concept. GEOINT in Counterinsurgency and Strike: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples treats metadata as a distinct evidence class with its own minimization, correlation limits, and legal review requirements.

Why it matters. Without explicit treatment of **GEOINT in Counterinsurgency and Strike**, privacy drift undermines source-quality review and non-sensitive geospatial interpretation review; the lesson builds the habit to separate discovery from collection expansion, and map or media interpretation from targeting.

Source support. GEOINT in Counterinsurgency and Strike: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples rests on [302, 2026] and [297, 2026]. The closest source to this row notes: It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. Use them for the working definition that **GEOINT in Counterinsurgency and Strike: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **GEOINT in Counterinsurgency and Strike** against the works cited for this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **GEOINT in Counterinsurgency and Strike**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **GEOINT in Counterinsurgency and Strike**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **GEOINT in Counterinsurgency and Strike** work as an **OSINT provenance and minimization matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **GEOINT in Counterinsurgency and Strike**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Transfer **GEOINT in Counterinsurgency and Strike** from this module to a second motif by preserving source-quality review and non-sensitive geospatial interpretation, replacing action with audit, and naming the blocked use.

18.2.2.6 Lesson 6: DoD GEOINT Accreditation and Training: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples

Concept. DoD GEOINT Accreditation and Training: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples treats metadata as a distinct evidence class with its own minimization, correlation limits, and legal review requirements.

Why it matters. DoD GEOINT Accreditation and Training connects classroom vocabulary to Open-Source and Geospatial Intelligence Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. DoD GEOINT Accreditation and Training: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples rests on [060, 2026]. Use it for fixing what **DoD GEOINT Accreditation and Training: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Ground **DoD GEOINT Accreditation and Training** in the evidence the row cites. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **DoD GEOINT Accreditation and Training**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **DoD GEOINT Accreditation and Training**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **DoD GEOINT Accreditation and Training** work as an **OSINT provenance and minimization matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **DoD GEOINT Accreditation and Training**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Transfer **DoD GEOINT Accreditation and Training** from this module to a second motif by preserving source-quality review and non-sensitive geospatial interpretation, replacing action with audit, and naming the blocked use.

18.2.2.7 Lesson 7: MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples

Concept. MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples treats metadata as a distinct evidence class with its own minimization, correlation limits, and legal review requirements.

Why it matters. Without explicit treatment of **MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**, privacy drift undermines source-quality review and non-sensitive geospatial interpretation review; the lesson builds the habit to separate discovery from collection expansion, and map or media interpretation from targeting.

Source support. MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples rests on [057, 2026]. The most specific cited work observes: MCRP 2-10B.4 in the source guide links to the Marines GEOINT manual, not a reconnaissance manual. Use it for the working definition that **MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** against the works cited for this row. [057, 2026] MCRP 2-10B.4 in the source guide links to the Marines GEOINT manual, not a reconnaissance manual. The linked PDF is 'Geospatial Intelligence Support to Operations'; verify the intended citation before reuse. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **MCRP 2-10B 4**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **MCRP 2-10B 4**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** work as an **OSINT provenance and minimization matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Reuse the **MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

18.2.2.8 Lesson 8: AI-Assisted Satellite Image Analysis: Imagery collection-platform literacy: resolution and revisit tradeoffs

Concept. AI-Assisted Satellite Image Analysis: Imagery collection-platform literacy: resolution and revisit tradeoffs treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. AI-Assisted Satellite Image Analysis matters in the **Open-Source and Geospatial Intelligence Integrity** lane because source-quality review and non-sensitive geospatial interpretation evidence must stay separate from judgment; privacy drift is a common failure.

Source support. AI-Assisted Satellite Image Analysis: Imagery collection-platform literacy: resolution and revisit tradeoffs rests on [302, 2026] and [297, 2026]. Its anchor reference records: The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Use them for the working definition that **AI-Assisted Satellite Image Analysis: Imagery collection-platform literacy: resolution and revisit tradeoffs** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **AI-Assisted Satellite Image Analysis** against the works cited for this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **AI-Assisted Satellite Image Analysis**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **AI-Assisted Satellite Image Analysis**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **AI-Assisted Satellite Image Analysis** work as an **OSINT provenance and minimization matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **AI-Assisted Satellite Image Analysis**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Apply this module's safe boundary for **AI-Assisted Satellite Image Analysis** to another artifact while keeping source-quality review and non-sensitive geospatial interpretation and reviewer ownership explicit.

18.2.2.9 Lesson 9: Open-Source Geospatial Intelligence Library: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples

Concept. Open-Source Geospatial Intelligence Library: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples treats metadata as a distinct evidence class with its own minimization, correlation limits, and legal review requirements.

Why it matters. Without explicit treatment of **Open-Source Geospatial Intelligence Library**, privacy drift undermines source-quality review and non-sensitive geospatial interpretation review; the lesson builds the habit to separate discovery from collection expansion, and map or media interpretation from targeting.

Source support. Open-Source Geospatial Intelligence Library: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples rests on [059, 2026]. The most specific cited work observes: It curates open-source resources organized

into categories including satellite imagery, mapping, infrastructure and transport tracking, weather and environmental monitoring, shadow and sun-position tools for time-of-day analysis, crisis and conflict mapping, image forensics, and geocoding utilities. Use it for the claim that **Open-Source Geospatial Intelligence Library: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **Open-Source Geospatial Intelligence Library** against the works cited for this row. [059, 2026] A GitHub repository describing itself as a reference toolkit for geolocation and chronolocation in digital investigations. It curates open-source resources organized into categories including satellite imagery, mapping, infrastructure and transport tracking, weather and environmental monitoring, shadow and sun-position tools for time-of-day analysis, crisis and conflict mapping, image forensics, and geocoding utilities. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Open-Source Geospatial Intelligence Library**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **Open-Source Geospatial Intelligence Library**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **Open-Source Geospatial Intelligence Library** work as an **OSINT provenance and minimization matrix** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Open-Source Geospatial Intelligence Library**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Apply this module's safe boundary for **Open-Source Geospatial Intelligence Library** to another artifact while keeping source-quality review and non-sensitive geospatial interpretation and reviewer ownership explicit.

18.2.3 GEOINT and Imagery Intelligence worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic public-resilience team checks whether open data supports a non-sensitive evacuation-route map. [253, 2026]; [255, 2026].

Triangulation anchors. In module 11's worked-example section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **open-source intelligence governance**. Learners use a **OSINT provenance and minimization matrix** and keep this boundary visible: No exposed-service lookup, credentialed access, identity exposure, doxxing, or live collection expansion.

Frame. The classroom question centers on **Imagery quality literacy: resolution, temporal fit, and uncertainty**. Excluded actions stay explicit, and the **Requirements-to-Evidence Lens** planning question is: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Inputs. For the **Imagery quality literacy: resolution, temporal fit, and uncertainty** scenario, use public road data, public weather notices, synthetic change examples, and instructor-provided metadata. The Requirements-to-Evidence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Imagery quality literacy: resolution, temporal fit, and uncertainty**, students record provenance, test recency, compare independent sources, mark uncertainty, and remove unnecessary identity data. Pause whenever an inference about Imagery quality literacy: resolution, temporal fit, and uncertainty appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Imagery quality literacy: resolution, temporal fit, and uncertainty** classroom scenario; unit artifact = OSINT provenance and minimization matrix; evidence = allowed inputs; method = source-quality review and non-sensitive geospatial interpretation; output = a source-quality matrix and annotated map note with caveats and no tracking or targeting content; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Imagery quality literacy: resolution, temporal fit, and uncertainty** as "Requirements-to-Evidence Lens confirms it" is not enough. The revision ties the claim to source-quality review and non-sensitive geospatial interpretation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Imagery quality literacy: resolution, temporal fit, and uncertainty** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

18.2.4 GEOINT and Imagery Intelligence practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Requirements-to-Evidence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

Triangulation anchors. In module 11's practice-sequence section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Imagery quality literacy: resolution, temporal fit, and uncertainty, GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples, Imagery collection-platform literacy: resolution and revisit tradeoffs; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Open-Source and Geospatial Intelligence Integrity** lane.
2. Frame	Answer the lens question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Imagery quality literacy: resolution, temporal fit, and uncertainty: requirements matrix with source descriptors, caveats, and collection limits.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.

Move	Learner action	Output	Check
3a. Unit artifact	Add the OSINT provenance and minimization matrix fields for Imagery quality literacy: resolution, temporal fit, and uncertainty.	Unit profile note.	Evidence artifacts include provenance chain, terms-of-use note.
4. Challenge	Test the misconception that a visible feature is enough for a confident geospatial claim.	Failure-mode note.	The artifact applies the key distinction: separate discovery from collection expansion, and map or media interpretation from targeting.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

18.2.4.1 GEOINT and Imagery Intelligence instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**. [253, 2026]; [255, 2026].

18.2.4.2 GEOINT and Imagery Intelligence extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 18; [253, 2026].
Have learners swap artifacts and apply the **Requirements-to-Evidence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

18.2.5 GEOINT and Imagery Intelligence knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 18; [253, 2026].

1. Explain how **Imagery quality literacy: resolution, temporal fit, and uncertainty** is defined here; name the source descriptor that supports the definition.
2. Contrast **Imagery quality literacy: resolution, temporal fit, and uncertainty** with **GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** using the **Requirements-to-Evidence Lens** artifact fields.
3. Identify one failure mode from the **Open-Source and Geospatial Intelligence Integrity** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which source is available but not reliable enough for the claim?
5. Correct this misconception: that a visible feature is enough for a confident geospatial claim.

18.2.5.1 GEOINT and Imagery Intelligence answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Imagery quality literacy: resolution, temporal fit, and uncertainty** without source evidence, uncertainty, or a safe transfer task.

18.3 GEOINT and Imagery Intelligence assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 18; [253, 2026].

18.3.1 GEOINT and Imagery Intelligence evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 18; [253, 2026].

18.3.2 GEOINT and Imagery Intelligence transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 18; [253, 2026].

18.3.2.1 GEOINT and Imagery Intelligence lineage and source tradition: profile, concepts, and first anchors This sits in the **Open-Source and Geospatial Intelligence Integrity** lineage: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. [253, 2026]; [255, 2026].

18.3.2.2 GEOINT and Imagery Intelligence working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 18; [253, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**, with provenance and reviewability throughout.

18.3.2.3 GEOINT and Imagery Intelligence knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [253, 2026]; [255, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

18.3.2.4 GEOINT and Imagery Intelligence transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 18; [253, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.
- **Evidence contract:** keep the **Open-Source and Geospatial Intelligence Integrity** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

18.3.2.5 GEOINT and Imagery Intelligence profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 18; [253, 2026].

The matched profile emphasizes public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. The method stack is source triage, provenance capture, corroboration matrix, recency audit, geospatial context review, and confidence calibration; the local topic cluster is **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

18.3.3 GEOINT and Imagery Intelligence evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 18; [253, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Open-Source and Geospatial Intelligence Integrity** profile tells reviewers what evidence is strong enough for the module artifact built around **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

18.3.3.1 GEOINT and Imagery Intelligence guide source spine: inherited keys and local citation roles Primary guide citations: [253, 2026]; [255, 2026]; [270, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [057, 2026]; [058, 2026]; [059, 2026]; [060, 2026]; [301, 2026]; [298, 2026]; [302, 2026]; [297, 2026].

18.3.3.2 GEOINT and Imagery Intelligence verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [253, 2026]; [255, 2026].

Tier	What counts	How it is used
Source guide	[253, 2026]; [255, 2026]; [270, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [057, 2026]; [058, 2026]; [059, 2026]; [060, 2026]; [301, 2026]; [298, 2026]; [302, 2026]; [297, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 11's source-canon section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** and [253, 2026]; [255, 2026], but only directly verified source URLs are encoded as citations.

18.3.3.3 GEOINT and Imagery Intelligence intelligence practice lens: evidence artifact and safety check Practice lens: **Requirements-to-Evidence Lens** for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**. [253, 2026]; [255, 2026].

Planning question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Evidence artifact: requirements matrix with source descriptors, caveats, and collection limits.

Validation rule: show priority, authority, minimization, corroboration, and source quality before any claim is reused. Applied to **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

Handoff contract: deliver metadata-rich evidence packets, not unscoped data piles or implicit targeting requests.

Safety check: exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure.

18.3.3.4 GEOINT and Imagery Intelligence runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 18; [253, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	11.99	11.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind GEOINT and Imagery Intelligence to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	11.101	11.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for GEOINT and Imagery Intelligence	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	11.102	11.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for GEOINT and Imagery Intelligence	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Imagery quality literacy: resolution, temporal fit, and uncertainty	11.1	11.1 source title transformed into safe curriculum treatment; original: Geospatial Intelligence Fundamentals: IMINT, GEOINT, Mapping	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	11.2	11.2 source title transformed into safe curriculum treatment; original: GEOINT Essential Body of Knowledge (USGIF)	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Imagery collection-platform literacy: resolution and revisit tradeoffs	11.3	11.3 source title transformed into safe curriculum treatment; original: Commercial Satellite Platforms: Maxar, Planet, Sentinel-1/2	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Claim-ledger memory exercise that tracks evidence changes rather than people	11.4	11.4 source title transformed into safe curriculum treatment; original: Change Detection and Pattern-of-Life Imagery Analysis	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	11.5	11.5 source title transformed into safe curriculum treatment; original: GEOINT in Counterinsurgency and Strike Operations	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	11.6	11.6 source title transformed into safe curriculum treatment; original: DoD GEOINT Accreditation and Training Standards	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	11.7	11.7 source title transformed into safe curriculum treatment; original: MCRP 2-10B.4: USMC GEOINT Manual	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Imagery collection-platform literacy: resolution and revisit tradeoffs	11.8	11.8 source title transformed into safe curriculum treatment; original: AI-Assisted Satellite Image Analysis: Object Detection and Chronolocation	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	11.9	11.9 source title transformed into safe curriculum treatment; original: Open-Source Geospatial Intelligence Library	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

18.3.3.5 GEOINT and Imagery Intelligence reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 18; [253, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Imagery quality literacy: resolution, temporal fit, and uncertainty	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Imagery collection-platform literacy: resolution and revisit tradeoffs	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Claim-ledger memory exercise that tracks evidence changes rather than people	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
GEOINT in Counterinsurgency and Strike: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Lesson topic	Practice lens	Evidence artifact	Safety check
DoD GEOINT Accreditation and Training: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
MCRP 2-10B 4: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
AI-Assisted Satellite Image Analysis: Imagery collection-platform literacy: resolution and revisit tradeoffs	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Open-Source Geospatial Intelligence Library: GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

18.3.3.6 GEOINT and Imagery Intelligence annotated source ledger: real titles and local contribution Each source cited by this **Open-Source and Geospatial Intelligence Integrity** module is paired below with its real title and a one-line note on what it contributes to **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

Source	Cited work	What it contributes	Status
[253, 2026]	Common European Data Spaces	This is an official European Commission webpage describing the Common European Data Spaces initiative, part of the EU strategy to create interconnected, trustworthy data-sharing environments across strategic sectors. It explains that data spaces let organizations and individuals share data while retaining control, guided by principles of open participation, privacy protection, and fair access rules.	verified source-guide
[255, 2026]	Web of Things (WoT) Architecture 1.1	The W3C Recommendation for Web of Things Architecture 1.1, published in December 2023, defining an abstract architecture for interoperability across diverse Internet of Things platforms. It introduces core concepts including Things described by machine-readable Thing Descriptions, reusable Thing Models, and Consumers that interpret descriptions to interact via Properties, Actions, and Events.	verified source-guide
[270, 2026]	NIST Big Data Interoperability Framework	NIST Special Publication 1500-1 (revised edition by Chang and Grady) establishes foundational terminology and consensus definitions for Big Data through the NIST Big Data Public Working Group. The volume defines Big Data characteristics, taxonomy, and a reference architecture assigning roles to Application Providers, Data Consumers, Data Providers, and System Orchestrators.	verified source-guide

Source	Cited work	What it contributes	Status
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide
[279, 2026]	Open Contracting Data Standard	The documentation homepage for the Open Contracting Data Standard, version 1.1.5, maintained by the Open Contracting Partnership to support disclosure of government contracting data across the procurement lifecycle. It provides a common data model spanning planning, tender, award, contract, and implementation stages, along with a primer, implementation guidance, technical schemas, and validation tooling.	verified source-guide
[283, 2026]	Recommendation of the Council on Open Government	An OECD legal instrument document reproducing the Recommendation of the Council on Open Government (OECD/LEGAL/0438), adopted on 14 December 2017. It defines open government as a culture of governance promoting transparency, integrity, accountability, and stakeholder participation in support of democracy and inclusive growth.	verified source-guide
[290, 2026]	NIST SP 800-218A: Secure Software Development Practices for Generative AI and Dual-Use Foundation Models	NIST Special Publication 800-218A (July 2024), which augments the Secure Software Development Framework with practices specific to AI model development across the software lifecycle. Produced in response to Executive Order 14110, it addresses AI model producers, developers building on those models, and acquirers of AI systems, and is designed to be used alongside NIST SP 800-218.	verified source-guide
[291, 2026]	Revised 508 Standards and 255 Guidelines	Official documentation from the U.S. Access Board on the Revised 508 Standards and 255 Guidelines for information and communication technology accessibility. It establishes mandatory accessibility requirements for federal agencies and voluntary guidelines for telecommunications manufacturers, covering hardware, software, websites, electronic documents, and support services.	verified source-guide
[294, 2026]	M-25-21: Accelerating Federal Use of AI through Innovation, Governance, and Public Trust	An April 2025 Office of Management and Budget memorandum (M-25-21) directing executive branch agencies on federal use of artificial intelligence. Issued under Executive Order 14179, it instructs agencies to accelerate adoption of AI to improve public services and government efficiency while maintaining safeguards for civil rights, civil liberties, and privacy.	verified source-guide

[302, 2026]	National Geospatial-Intelligence Agency About Us	The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety.	verified source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide

Where this sits. This module's overview is Section 18; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

18.3.4 GEOINT and Imagery Intelligence governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 18; [253, 2026].

18.3.5 GEOINT and Imagery Intelligence analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 11's governance-boundary section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Open-Source and Geospatial Intelligence Integrity** for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**. [253, 2026]; [255, 2026].
Curriculum topic spine: Imagery quality literacy: resolution, temporal fit, and uncertainty, **GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**, **Imagery collection-platform literacy: resolution and revisit tradeoffs**. **Verified anchor cluster:** [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]; [for Standardization, 2013]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015].
Conceptual depth: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests.
Method stack: source triage, provenance capture, corroboration matrix, recency audit, geospatial context review, and confidence calibration.
Composability contract: collection notes, source metadata, transformations, caveats, and analytic judgments remain separately exportable.
Known failure modes: privacy drift, stale data, context collapse, platform bias, over-collection, and mistaking availability for reliability.
Defensive boundary: OSINT work uses lawful public, owned-lab, or explicitly approved sources and avoids doxxing, harassment, live tracking, or operational targeting. Applied to **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

Anchor	Why it matters here
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[of State, 2024]	Official strategy source for lawful OSINT governance, discovery, validation, and dissemination. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026c]	Official NGA strategy anchor for GEOINT readiness, warning, partnership resilience, resource stewardship, and AI integration. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026b]	Official NGA source on GEOINT AI, data quality, model performance, interoperability, analyst interaction, and standards leadership. Checked as of 2026-05-21; role: curriculum_anchor.
[for Standardization, 2013]	International geospatial data-quality standard for completeness, logical consistency, positional accuracy, temporal quality, and usability framing. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.

18.3.5.1 GEOINT and Imagery Intelligence evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Open-Source and Geospatial Intelligence Integrity** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [253, 2026]; [255, 2026].

18.3.6 GEOINT and Imagery Intelligence agentic boundary: assist, approve, block, and record

Evidence anchor. Section 18; [253, 2026].
AGEINT translation is bounded by the **Open-Source and Geospatial Intelligence Integrity** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

18.3.6.1 GEOINT and Imagery Intelligence permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 18; [253, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

18.3.6.2 GEOINT and Imagery Intelligence excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [253, 2026]; [255, 2026] and **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

18.3.7 GEOINT and Imagery Intelligence governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 18; [253, 2026].
Governance is practiced as a gate on the **Open-Source and Geospatial Intelligence Integrity** lane. Learners use the **Requirements-to-Evidence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

18.3.7.1 GEOINT and Imagery Intelligence governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [253, 2026]; [255, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Open-Source and Geospatial Intelligence Integrity** failure modes and the **Requirements-to-Evidence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

18.3.7.2 GEOINT and Imagery Intelligence evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 18; [253, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Requirements-to-Evidence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

18.3.7.3 GEOINT and Imagery Intelligence current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**. [253, 2026]; [255, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_ic_osint_strategy` for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
What does the module inherit from `official_state_osint_strategy` for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**?	Open Source Intelligence Strategy; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official strategy source for lawful OSINT governance, discovery, validation, and dissemination.
What does the module inherit from `official_nga_strategy` for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**?	NGA Strategy; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official NGA strategy anchor for GEOINT readiness, warning, partnership resilience, resource stewardship, and AI integration.
What does the module inherit from `official_nga_geoint_ai` for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**?	GEOINT Artificial Intelligence; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official NGA source on GEOINT AI, data quality, model performance, interoperability, analyst interaction, and standards leadership.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 18; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

18.3.8 GEOINT and Imagery Intelligence assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 18; [253, 2026].

18.3.9 GEOINT and Imagery Intelligence assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 18; [253, 2026].

18.3.9.1 GEOINT and Imagery Intelligence capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** and [253, 2026]; [255, 2026].

18.3.9.2 GEOINT and Imagery Intelligence instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** and [253, 2026]; [255, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

18.3.9.3 GEOINT and Imagery Intelligence assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Imagery quality literacy: resolution, temporal fit, and uncertainty	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Imagery collection-platform literacy: resolution and revisit tradeoffs	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

18.3.10 GEOINT and Imagery Intelligence refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [253, 2026]; [255, 2026] and **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**.

18.3.10.1 GEOINT and Imagery Intelligence refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**. The local signals begin with [253, 2026]; [255, 2026].

18.3.10.2 GEOINT and Imagery Intelligence claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**, and the source spine for these checks begins with [253, 2026]; [255, 2026].

18.3.11 GEOINT and Imagery Intelligence reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [253, 2026]; [255, 2026].

Triangulation anchors. In module 11's review-checklist section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples**. [253, 2026]; [255, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

18.3.12 GEOINT and Imagery Intelligence learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **Imagery quality literacy: resolution, temporal fit, and uncertainty; GEOINT data-quality audit using provided imagery metadata and non-sensitive synthetic change examples** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [253, 2026]; [255, 2026].
Section 2, Section 15, Section 17, Section 19

19 TECHNICAL INTELLIGENCE AND CYBER OPERATIONS

19.1 TECHNICAL INTELLIGENCE AND CYBER OPERATIONS learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 19; [258, 2026].

19.1.1 defensive cyber intelligence normalization discipline spine: domain question and learning focus

Evidence anchor. Section 19; [258, 2026].
This unit teaches **defensive cyber intelligence normalization**. Technical intelligence lessons normalize incidents, indicators, TTPs, supply-chain evidence, and sharing rules for defense and assurance.

19.1.2 defensive cyber intelligence normalization source-use contract: citation roles and evidence limits

Evidence anchor. Section 19; [258, 2026].
Use MITRE, NIST, CISA, STIX, and TAXII anchors for defensive taxonomy, secure development, sharing, and incident learning.

19.1.3 defensive cyber intelligence normalization practice artifact: recurring packet and retained evidence

Evidence anchor. Section 19; [258, 2026].
The recurring practice artifact is a **defensive CTI evidence packet** that draws on indicator context, TTP mapping, handling rule, and remediation owner. The unit keeps its learning spine explicit. Learners classify evidence defensively, state confidence, map controls, and preserve sharing restrictions.

19.1.4 defensive cyber intelligence normalization safety boundary: accountable, synthetic, and evidence-bounded limits

No exploit, persistence, evasion, scanning, or production response instructions.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [258, 2026]; [261, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [258, 2026]; [261, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [258, 2026]; [261, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [258, 2026]; [261, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Governed Intelligence Cycle and Dissemination Architecture. Core anchors: [Community, 2026]; [of the Director of National Intelligence, 2015]; [of the Director of National Intelligence, 2026c]. Conceptual focus: treating the intelligence cycle as a governed information system whose collection, processing, analysis, dissemination, evaluation, marking, and records obligations stay explicit. Composability contract: requirements, data provenance, analytic judgments, markings, dissemination permissions, records obligations, and feedback remain separable artifacts. **Practice lens:** Dissemination-and-Marking Control Lens; Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact? [258, 2026]; [261, 2026].

19.1.5 TECHNICAL INTELLIGENCE AND CYBER OPERATIONS visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 52 and Figure 53 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 18, Section 20.

19.1.6 TECHNICAL INTELLIGENCE AND CYBER OPERATIONS module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
Cyber Intelligence Fundamentals	Section 20	[258, 2026]; [261, 2026]; [266, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [061, 2026]; [062, 2026]; [063, 2026]; [064, 2026]; [065, 2026]; [300, 2026]; [303, 2026]; [304, 2026]; [066, 2026]; [067, 2026]; [068, 2026]; [069, 2026]; [009, 2026]; [070, 2026]; [071, 2026].

Module	Section reference	Source spine
Advanced Persistent Threats (APTs)	Section 21	[237, 2026]; [258, 2026]; [261, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [072, 2026]; [069, 2026]; [071, 2026]; [300, 2026]; [303, 2026]; [304, 2026]; [309, 2026]; [310, 2026].
Supply Chain Intelligence Attacks	Section 22	[258, 2026]; [266, 2026]; [268, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [073, 2026]; [074, 2026]; [075, 2026]; [076, 2026]; [077, 2026]; [297, 2026]; [298, 2026]; [300, 2026]; [304, 2026]; [306, 2026].
Electronic and Emanations Intelligence	Section 23	[255, 2026]; [256, 2026]; [261, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [035, 2026]; [078, 2026]; [300, 2026]; [303, 2026]; [304, 2026]; [305, 2026]; [302, 2026]; [297, 2026].

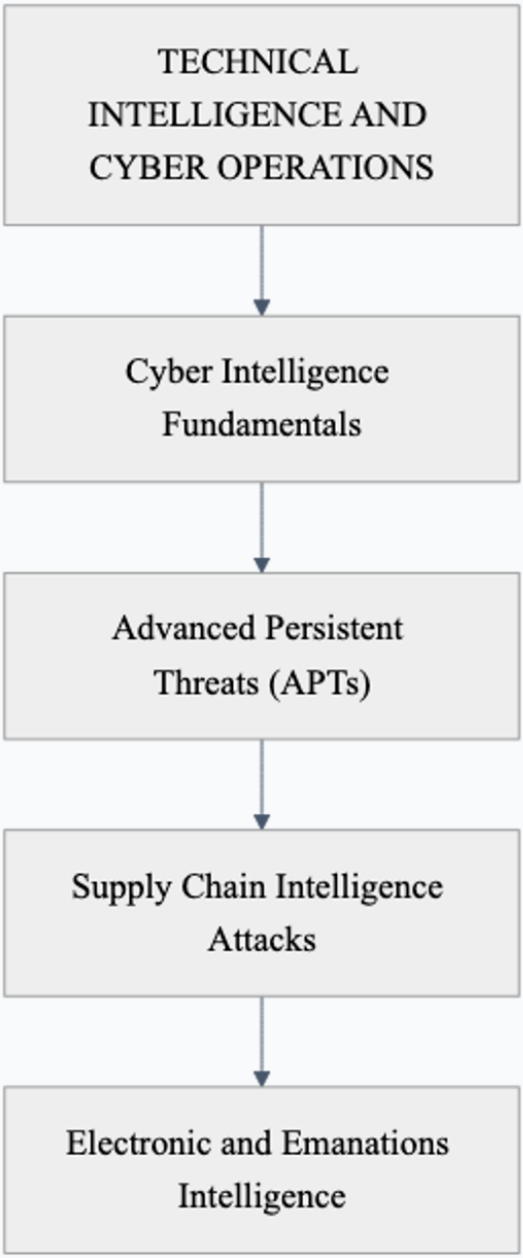

Figure 52: The unit module map traces the part's chapters as a linear reading sequence. It is anchored to the technical intelligence and cyber operations section; use it to inspect 4 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

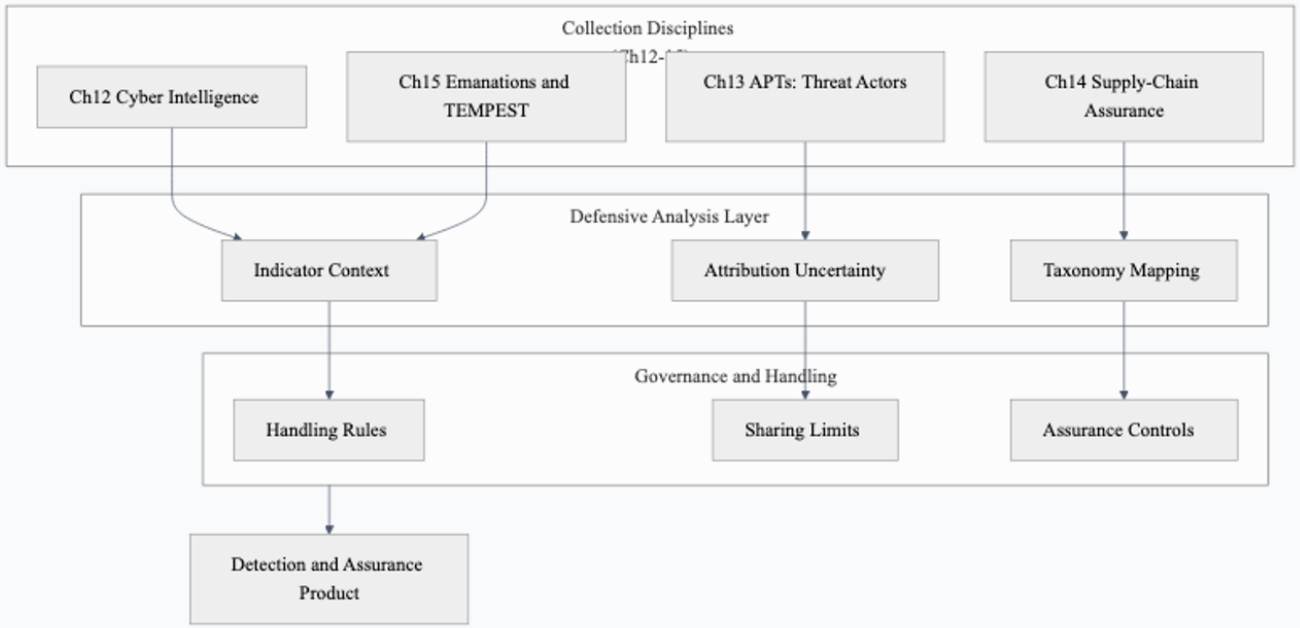

Figure 53: Each technical-collection discipline in this Part feeds a shared defensive pipeline that turns raw signals into governed detection, attribution, and assurance products. Its reader value is to make Collection Disciplines (Ch12-15), Ch12 Cyber Intelligence, Ch13 APTs: Threat Actors, and Ch14 Supply-Chain Assurance visible at a glance, with the technical intelligence and cyber operations section as the source section and defensive review as the boundary.

20 Cyber Intelligence Fundamentals

20.0.1 Cyber Intelligence Fundamentals figures and course links: visual evidence, source flow, and navigation

The module uses Figure 54 and Figure 52 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.

Navigation links: Section 2, Section 19, Section 21.

This module teaches the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane through a bounded, source-backed coursebook chapter. [258, 2026]; [261, 2026].

20.1 Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense frame for Cyber Intelligence Fundamentals: source context, topic focus, and reader task

Evidence anchor. Section 20; [258, 2026].

20.1.1 Cyber Intelligence Fundamentals orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 20; [258, 2026].

20.1.2 Cyber Intelligence Fundamentals conceptual primer: source context, core model, and reader task

This chapter teaches cyber threat intelligence as defensive normalization: incidents, indicators, TTPs, vendor risks, and sharing rules become useful only when scoped and validated. The chapter uses **Defensive Cyber-Intelligence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

The central distinction is to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. Core topics include **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts; Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published labels and fabricated alerts**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.

Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [258, 2026]; [261, 2026].

Learners move from vocabulary and the **Defensive Cyber-Intelligence Lens** distinction through topic lessons on **Cyber defensive taxonomy mapping using published labels and fabricated alerts** with evidence and misconception checks, then assemble a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with safety and rights gates.

20.1.3 Cyber Intelligence Fundamentals learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 20; [258, 2026].

- Connect **Cyber defensive taxonomy mapping using published labels and fabricated alerts and MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts** to **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate defensive mapping and incident learning from exploit, persistence, or evasion instruction; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as indicator fixation, unvetted sharing, vendor-assurance drift, weak incident scoping, and treating CTI as a feed instead of a workflow, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: cyber material stays defensive and tabletop-based; it does not provide exploit, persistence, evasion, or live-response instructions.

20.1.4 Cyber Intelligence Fundamentals core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 20; [258, 2026].

Term	Working definition
Indicator	an observable signal that may support defensive detection or investigation
TTP	a tactic, technique, or procedure used for structured defensive mapping
Sighting	a bounded observation of a possible indicator in a given context
Handling rule	a sharing, marking, or retention limit for threat information
Lessons learned	the post-incident evidence that changes controls or playbooks
Cyber defensive taxonomy mapping using…	Key terms: Cyber, defensive, taxonomy.
MITRE ATT&CK Framework: Cyber defensive…	Key terms: MITRE, ATT, CK.

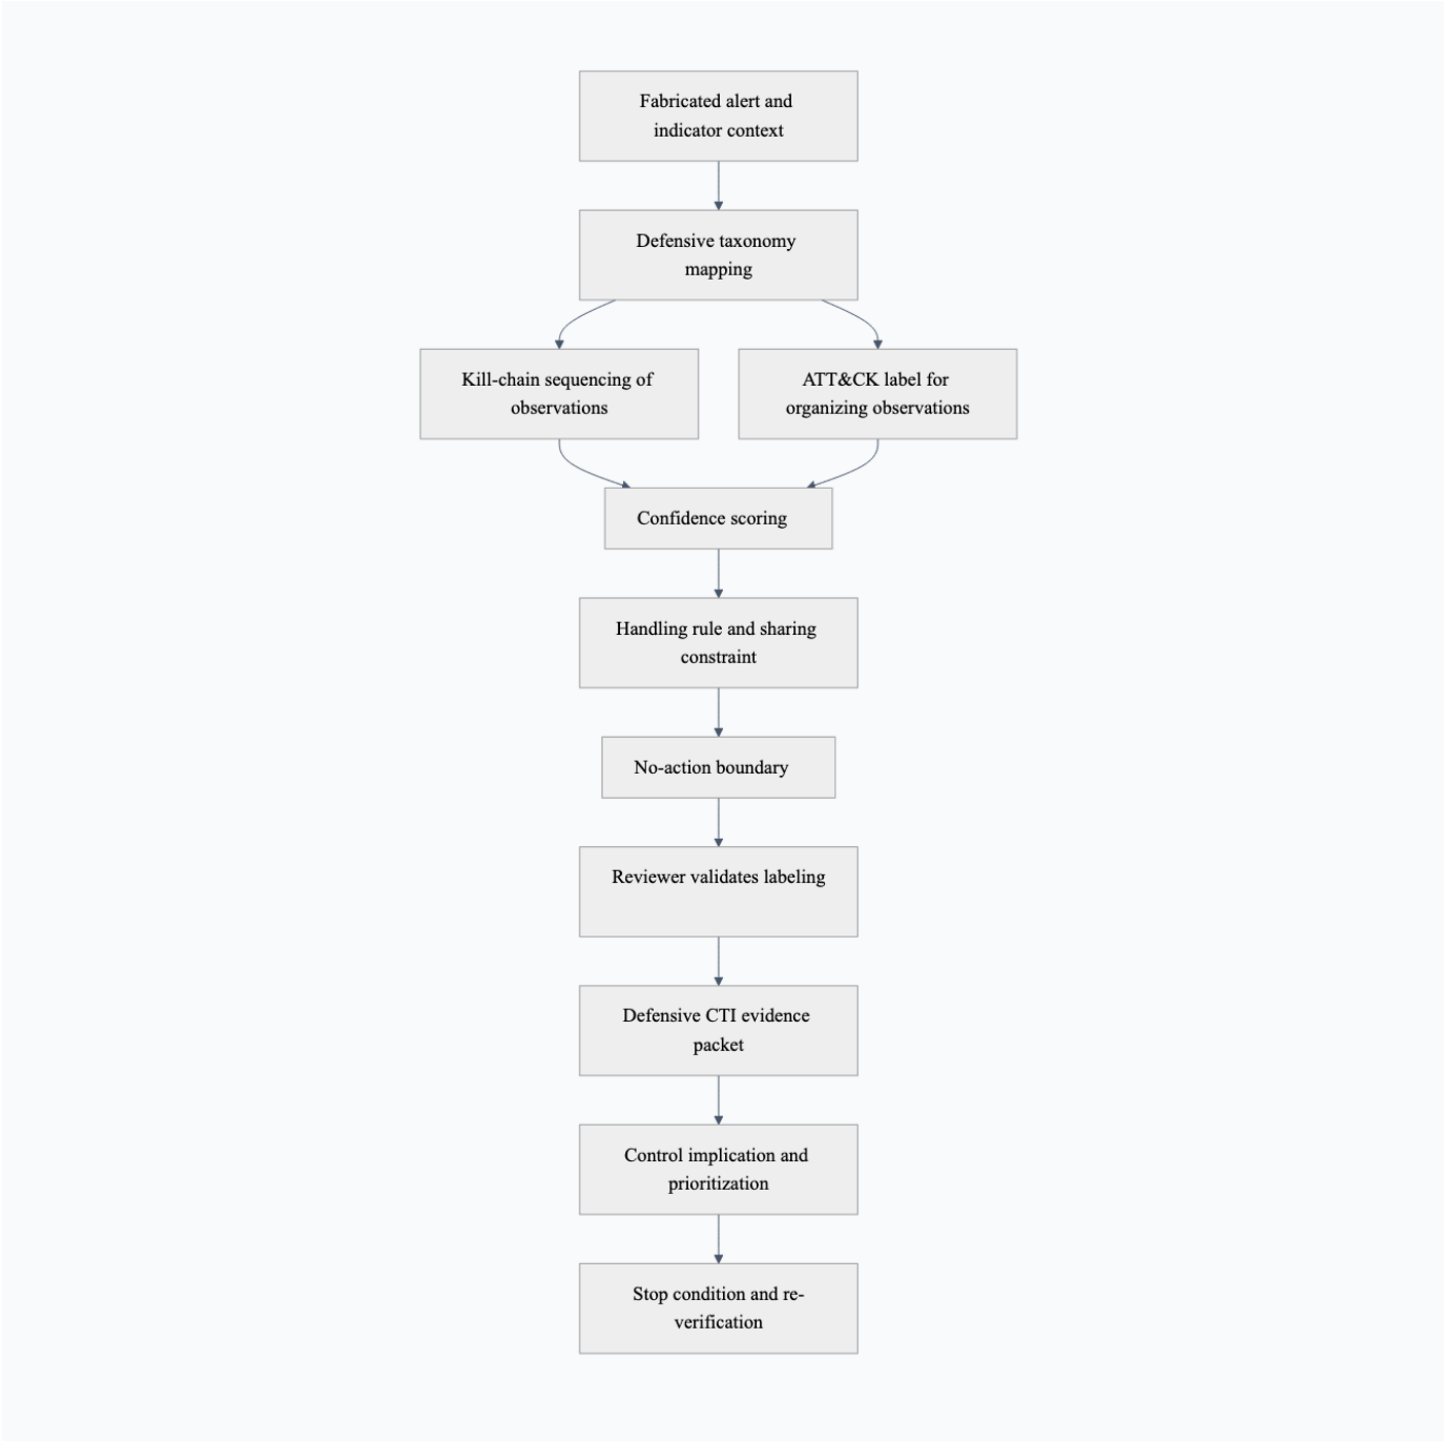

Figure 54: How fabricated alerts and published taxonomies are normalized into a defensive intelligence packet with confidence and control implications, never an action sequence. In the technical intelligence and cyber operations / cyber intelligence fundamentals section, it lets readers compare Fabricated alert and indicator context, Defensive taxonomy mapping, Kill-chain sequencing of observations, and ATT&CK label for organizing observations so the visual functions as a traceable course aid rather than an unscoped assertion.

20.2 Defensive Cyber-Intelligence Lens path for Cyber Intelligence Fundamentals: lesson cluster, safe artifact, and review

Evidence anchor. Section 20; [258, 2026].

20.2.1 Cyber Intelligence Fundamentals practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 20; [258, 2026].

20.2.2 Cyber Intelligence Fundamentals topic lessons: source-backed concepts and transfer tasks

This module builds cyber threat intelligence as defensive normalization: incidents, indicators, TTPs, vendor risks, and sharing rules become useful only when scoped and validated. The sequence opens with **Cyber defensive taxonomy mapping using published labels and fabricated alerts**, **MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**, **Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published labels and fabricated alerts** and applies the **Defensive Cyber-Intelligence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 52; module overview Section 20; curriculum atlas Section 2.

Triangulation anchors. In module 12's topic-lessons section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

20.2.2.1 Lesson 1: Cyber defensive taxonomy mapping using published labels and fabricated alerts **Concept. Cyber defensive taxonomy mapping using published labels and fabricated alerts** uses the model as defensive vocabulary for sequencing observations, not as a checklist of adversary actions.

Why it matters. Analysts use **Cyber defensive taxonomy mapping** to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. A defensible treatment names the judgment it enables for defensive CTI normalization and tabletop incident learning review, the proof limit that treating defensive taxonomy labels as an action sequence would otherwise hide, and the reviewer accountable for challenge.

Source support. Cyber defensive taxonomy mapping using published labels and fabricated alerts rests on [061, 2026] and [062, 2026]. The most specific cited work observes: This Lockheed Martin webpage describes the Cyber Kill Chain framework, a methodology for identifying and preventing cyber intrusions as part of the company's Intelligence Driven Defense model. Use them for the claim that **Cyber defensive taxonomy mapping using published labels and fabricated alerts** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Cyber defensive taxonomy mapping**, work from the cited evidence behind this row. [061, 2026] This Lockheed Martin webpage describes the Cyber Kill Chain framework, a methodology for identifying and preventing cyber intrusions as part of the company's Intelligence Driven Defense model. It outlines the sequence of steps an adversary must complete to achieve an objective, and is intended to help analysts understand attacker tactics and procedures. [062, 2026] A Wikipedia article describing the cyber kill chain, a framework adapted by Lockheed Martin from a military concept to model how cyberattacks progress through distinct phases. It outlines seven stages from reconnaissance through actions on objectives, along with defensive countermeasures organizations can apply at each stage. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Cyber defensive taxonomy mapping**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Cyber defensive taxonomy mapping using**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Cyber defensive taxonomy mapping** work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a defensive taxonomy is an instruction sequence.

Transfer task. Transfer **Cyber defensive taxonomy mapping** from this module to a second motif by preserving defensive CTI normalization and tabletop incident learning, replacing action with audit, and naming the blocked use.

20.2.2.2 Lesson 2: MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts **Concept. MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts** uses the taxonomy label to organize fabricated defensive observations, confidence, and control implications without describing adversary execution.

Why it matters. Without explicit treatment of **MITRE ATT&CK Framework**, treating defensive taxonomy labels as an action sequence undermines defensive CTI normalization and tabletop incident learning review; the lesson builds the habit to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Source support. MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts rests on [063, 2026] and [064, 2026]. The lead source's own note reads: The official MITRE ATT&CK Enterprise Matrix, a curated knowledge base of adversary tactics and techniques observed in real-world intrusions. Use them for fixing what **MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **MITRE ATT&CK Framework** in the evidence the row cites. [063, 2026] The official MITRE ATT&CK Enterprise Matrix, a curated knowledge base of adversary tactics and techniques observed in real-world intrusions. It organizes activity into fifteen sequential tactics, from reconnaissance and resource development through initial access, persistence, privilege escalation, defense evasion, credential access, lateral movement, command and control, exfiltration, and impact. [064, 2026] MITRE ATT&CK is a globally accessible knowledge base that catalogs adversary tactics and techniques drawn from real-world observations of cyber intrusions. The framework is organized into matrices covering Enterprise, Mobile, and Industrial Control Systems environments, with tactics representing adversary objectives and techniques describing specific methods used to achieve them. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **MITRE ATT&CK Framework**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **MITRE ATT&CK Framework**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **MITRE ATT&CK Framework** work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Transfer **MITRE ATT&CK Framework** from this module to a second motif by preserving defensive CTI normalization and tabletop incident learning, replacing action with audit, and naming the blocked use.

20.2.2.3 Lesson 3: Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published labels and fabricated alerts **Concept. Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published**

labels and fabricated alerts uses the taxonomy label to organize fabricated defensive observations, confidence, and control implications without describing adversary execution.

Why it matters. Analysts use **Reconnaissance through Resource Development** to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. A defensible treatment names the judgment it enables for defensive CTI normalization and tabletop incident learning review, the proof limit that treating defensive taxonomy labels as an action sequence would otherwise hide, and the reviewer accountable for challenge.

Source support. Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published labels and fabricated alerts rests on [063, 2026]. Its anchor reference records: The official MITRE ATT&CK Enterprise Matrix, a curated knowledge base of adversary tactics and techniques observed in real-world intrusions. Use it for the working definition that **Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published labels and fabricated alerts** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Reconnaissance through Resource Development**, work from the cited evidence behind this row. [063, 2026] The official MITRE ATT&CK Enterprise Matrix, a curated knowledge base of adversary tactics and techniques observed in real-world intrusions. It organizes activity into fifteen sequential tactics, from reconnaissance and resource development through initial access, persistence, privilege escalation, defense evasion, credential access, lateral movement, command and control, exfiltration, and impact. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Reconnaissance through Resource Development**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Reconnaissance through Resource Development**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Reconnaissance through Resource Development** work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Apply this module's safe boundary for **Reconnaissance through Resource Development** to another artifact while keeping defensive CTI normalization and tabletop incident learning and reviewer ownership explicit.

20.2.2.4 Lesson 4: Cyber access-and-execution taxonomy review using fabricated alerts

Concept. Cyber access-and-execution taxonomy review using fabricated alerts uses the taxonomy label to organize fabricated defensive observations, confidence, and control implications without describing adversary execution.

Why it matters. Analysts use **Cyber access-and-execution taxonomy review** to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. A defensible treatment names the judgment it enables for defensive CTI normalization and tabletop incident learning review, the proof limit that treating defensive taxonomy labels as an action sequence would otherwise hide, and the reviewer accountable for challenge.

Source support. Cyber access-and-execution taxonomy review using fabricated alerts rests on [065, 2026]. The most specific cited work observes: The Enterprise Techniques page of the MITRE ATT&CK framework, a cybersecurity knowledge base maintained by MITRE Corporation. Use it for fixing what **Cyber access-and-execution taxonomy review using fabricated alerts** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Cyber access-and-execution taxonomy review**, reason from the sources cited in this row. [065, 2026] The Enterprise Techniques page of the MITRE ATT&CK framework, a cybersecurity knowledge base maintained by MITRE Corporation. It documents 222 enterprise techniques and 475 sub-techniques describing how adversaries achieve tactical goals across the attack lifecycle, organized by tactics such as initial access, persistence, privilege escalation, defense evasion, credential access, discovery, and impact. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Cyber access-and-execution taxonomy review**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Cyber access-and-execution taxonomy review using**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Cyber access-and-execution taxonomy review** work as a **defensive CTI evidence packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Cyber access-and-execution taxonomy review**: that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Apply this module's safe boundary for **Cyber access-and-execution taxonomy review** to another artifact while keeping defensive CTI normalization and tabletop incident learning and reviewer ownership explicit.

20.2.2.5 Lesson 5: Cyber credential-and-movement taxonomy review using fabricated alerts

Concept. Cyber credential-and-movement taxonomy review using fabricated alerts uses the taxonomy label to organize fabricated defensive observations, confidence, and control implications without describing adversary execution.

Why it matters. Cyber credential-and-movement taxonomy review connects classroom vocabulary to Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Cyber credential-and-movement taxonomy review using fabricated alerts rests on [300, 2026], [303, 2026], and [304, 2026]. The most specific cited work observes: An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. Use them for the working definition that **Cyber credential-and-movement taxonomy review using fabricated alerts** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Cyber credential-and-movement taxonomy review**, reason from the sources cited in this row. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Cyber credential-and-movement taxonomy review**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Cyber credential-and-movement taxonomy review using**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Cyber credential-and-movement taxonomy review** work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Cyber credential-and-movement taxonomy review**: that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Transfer **Cyber credential-and-movement taxonomy review** from this module to a second motif by preserving defensive CTI normalization and tabletop incident learning, replacing action with audit, and naming the blocked use.

20.2.2.6 Lesson 6: Cyber command, data-loss, and impact taxonomy review using fabricated alerts

Concept. Cyber command, data-loss, and impact taxonomy review using fabricated alerts uses the taxonomy label to organize fabricated defensive observations, confidence, and control implications without describing adversary execution.

Why it matters. Cyber command, data-loss, and impact taxonomy review using fabricated alerts matters in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane because defensive CTI normalization and tabletop incident learning evidence must stay separate from judgment; treating defensive taxonomy labels as an action sequence is a common failure.

Source support. Cyber command, data-loss, and impact taxonomy review using fabricated alerts rests on [062, 2026] and [063, 2026]. Its anchor reference records: The official MITRE ATT&CK Enterprise Matrix, a curated knowledge base of adversary tactics and techniques observed in real-world intrusions. Use them for pinning down the scope of **Cyber command, data-loss, and impact taxonomy review using fabricated alerts**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Cyber command, data-loss, and impact taxonomy review using fabricated alerts**, work from the cited evidence behind this row. [062, 2026] A Wikipedia article describing the cyber kill chain, a framework adapted by Lockheed Martin from a military concept to model how cyberattacks progress through distinct phases. It outlines seven stages from reconnaissance through actions on objectives, along with defensive countermeasures organizations can apply at each stage. [063, 2026] The official MITRE ATT&CK Enterprise Matrix, a curated knowledge base of adversary tactics and techniques observed in real-world intrusions. It organizes activity into fifteen sequential tactics, from reconnaissance and resource development through initial access, persistence, privilege escalation, defense evasion, credential access, lateral movement, command and control, exfiltration, and impact. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Cyber command, data-loss, and impact taxonomy review using fabricated alerts**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Cyber command data-loss and impact**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape this subject work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Cyber command, data-loss, and impact taxonomy review using fabricated alerts**: that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Apply this module's safe boundary for **Cyber command, data-loss, and impact taxonomy review using fabricated alerts** to another artifact while keeping defensive CTI normalization and tabletop incident learning and reviewer ownership explicit.

20.2.2.7 Lesson 7: Unified Kill Chain: Cyber defensive taxonomy mapping using published labels and fabricated alerts

Concept. Unified Kill Chain: Cyber defensive taxonomy mapping using published labels and fabricated alerts uses the model as defensive vocabulary for sequencing observations, not as a checklist of adversary actions.

Why it matters. Unified Kill Chain matters in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane because defensive CTI normalization and tabletop incident learning evidence must stay separate from judgment; treating defensive taxonomy labels as an action sequence is a common failure.

Source support. Unified Kill Chain: Cyber defensive taxonomy mapping using published labels and fabricated alerts rests on [062, 2026]. The closest source to this row notes: It outlines seven stages from reconnaissance through actions on objectives, along with defensive countermeasures organizations can apply at each stage. Use it for fixing what **Unified Kill Chain: Cyber defensive taxonomy mapping using published labels and fabricated alerts** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Unified Kill Chain**, work from the cited evidence behind this row. [062, 2026] A Wikipedia article describing the cyber kill chain, a framework adapted by Lockheed Martin from a military concept to model how cyberattacks progress through distinct phases. It outlines seven stages from reconnaissance through actions on objectives, along with defensive countermeasures organizations can apply at each stage. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Unified Kill Chain**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Unified Kill Chain**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Unified Kill Chain** work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a defensive taxonomy is an instruction sequence.

Transfer task. Transfer **Unified Kill Chain** from this module to a second motif by preserving defensive CTI normalization and tabletop incident learning, replacing action with audit, and naming the blocked use.

20.2.2.8 Lesson 8: Threat Intelligence Sharing: Cyber defensive taxonomy mapping using published labels and fabricated alerts

Concept. Threat Intelligence Sharing: Cyber defensive taxonomy mapping using published labels and fabricated alerts uses sharing standards to document indicator context, handling, confidence, and consumer responsibilities—not raw indicator hoarding.

Why it matters. Without explicit treatment of **Threat Intelligence Sharing**, treating defensive taxonomy labels as an action sequence undermines defensive CTI normalization and tabletop incident learning review; the lesson builds the habit to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Source support. Threat Intelligence Sharing: Cyber defensive taxonomy mapping using published labels and fabricated alerts rests on [066, 2026], [067, 2026], and [068, 2026]. The most specific cited work observes: STIX defines a structured language for representing threat information, while TAXII specifies how that information is transported and exchanged between systems. Use them for fixing what **Threat Intelligence Sharing: Cyber defensive taxonomy mapping using published labels and fabricated alerts** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **Threat Intelligence Sharing** in the evidence the row cites. [066, 2026] A Cloudflare Learning Center explainer describing STIX and TAXII as complementary standards for cyber threat intelligence. STIX defines a structured language for representing threat information, while TAXII specifies how that information is transported and exchanged between systems. Together they form a framework that lets organizations share and consume threat intelligence in a consistent, machine-readable way to improve collective defense. [067, 2026] An introductory page from the OASIS CTI documentation explaining STIX (Structured Threat Information Expression), an open-source language and serialization format used to exchange cyber threat intelligence. It describes how STIX 2.1 models intelligence using 18 domain objects (such as attack patterns, malware, threat actors, and vulnerabilities) and 2 relationship objects, all represented as JSON. [068, 2026] The official committee page for the OASIS Cyber Threat Intelligence (CTI) Technical Committee, a standards body that develops formats for sharing cyber threat intelligence. It maintains the STIX (Structured Threat Information Expression) data model and the TAXII exchange protocol, both approved as OASIS standards in 2021, and organizes subcommittees for STIX, TAXII, and interoperability. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Threat Intelligence Sharing**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Threat Intelligence Sharing**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Threat Intelligence Sharing** work as a **defensive CTI evidence packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Transfer **Threat Intelligence Sharing** from this module to a second motif by preserving defensive CTI normalization and tabletop incident learning, replacing action with audit, and naming the blocked use.

20.2.2.9 Lesson 9: Nation-State Cyber Espionage: Cyber defensive taxonomy mapping using published labels and fabricated alerts

Concept. Nation-State Cyber Espionage: Cyber defensive taxonomy mapping using published labels and fabricated alerts uses the taxonomy label to organize fabricated defensive observations, confidence, and control implications without describing adversary execution.

Why it matters. Nation-State Cyber Espionage connects classroom vocabulary to Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Nation-State Cyber Espionage: Cyber defensive taxonomy mapping using published labels and fabricated alerts rests on [069, 2026]. The closest source to this row notes: They found that the most common cyberattacks initiated by nation-states were espionage focused. Use it for pinning down the scope of **Nation-State Cyber Espionage: Cyber defensive taxonomy mapping using published labels and fabricated alerts**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Nation-State Cyber Espionage**, work from the cited evidence behind this row. [069, 2026] They found that the most common cyberattacks initiated by nation-states were espionage focused. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Nation-State Cyber Espionage**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Nation-State Cyber Espionage**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Nation-State Cyber Espionage** work as a **defensive CTI evidence packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Transfer **Nation-State Cyber Espionage** from this module to a second motif by preserving defensive CTI normalization and tabletop incident learning, replacing action with audit, and naming the blocked use.

20.2.2.10 Lesson 10: Chinese State-Affiliated Hacking: Cyber defensive taxonomy mapping using published labels and fabricated alerts

Concept. Chinese State-Affiliated Hacking: Cyber defensive taxonomy mapping using published labels and fabricated alerts uses the taxonomy label to organize fabricated defensive observations, confidence, and control implications without describing adversary execution.

Why it matters. Analysts use **Chinese State-Affiliated Hacking** to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. A defensible treatment names the judgment it enables for defensive CTI normalization and tabletop incident learning review, the proof limit that treating defensive taxonomy labels as an action sequence would otherwise hide, and the reviewer accountable for challenge.

Source support. Chinese State-Affiliated Hacking: Cyber defensive taxonomy mapping using published labels and fabricated alerts rests on [009, 2026] and [070, 2026]. The most specific cited work observes: Organized in three parts, it surveys China-US relations in the cyber domain and the policy dilemmas of attribution and shared terminology, presents a case study of the APT1 hacker group linked to PLA Unit 61398, and reviews broader trends in the context of the 2015 US-China Cyber Agreement. Use them for the working definition that **Chinese State-Affiliated Hacking: Cyber defensive taxonomy mapping using published labels and fabricated alerts** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **Chinese State-Affiliated Hacking** in the evidence the row cites. [009, 2026] A November 2023 report from MERICS (Mercator Institute for China Studies) analyzing Chinese state-affiliated cyber intrusions aimed at strategic goals. It argues that Chinese actors pursue long-term, persistent access to European technology firms and critical infrastructure for espionage rather than disruption, with targeting aligned to government priorities such as semiconductors, pharmaceuticals, and advanced manufacturing. [070, 2026] A 2016 student security paper by Winnona DeSombre (Tufts Comp116) analyzing the evolution of China's cyber espionage campaigns against the United States. Organized in three parts, it surveys China-US relations in the cyber domain and the policy dilemmas of attribution and shared terminology, presents a case study of the APT1 hacker group linked to PLA Unit 61398, and reviews broader trends in the context of the 2015 US-China Cyber Agreement. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Chinese State-Affiliated Hacking**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Chinese State-Affiliated Hacking**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Chinese State-Affiliated Hacking** work as a **defensive CTI evidence packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Apply this module's safe boundary for **Chinese State-Affiliated Hacking** to another artifact while keeping defensive CTI normalization and tabletop incident learning and reviewer ownership explicit.

20.2.2.11 Lesson 11: Russian Cyber Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts

Concept. Russian Cyber Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts uses the taxonomy label to organize fabricated defensive observations, confidence, and control implications without describing adversary execution.

Why it matters. Russian Cyber Operations connects classroom vocabulary to Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Russian Cyber Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts rests on [300, 2026], [303, 2026], and [304, 2026]. The closest source to this row notes: It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. Use them for pinning down the scope of **Russian Cyber Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Read **Russian Cyber Operations** against the works cited for this row. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats

such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Russian Cyber Operations**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Russian Cyber Operations**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Russian Cyber Operations** work as a **defensive CTI evidence packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Reuse the **Russian Cyber Operations** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

20.2.2.12 Lesson 12: Living-Off-The-Land Techniques in APT Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts Concept. Living-Off-The-Land Techniques in APT Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts

Living-Off-The-Land Techniques in APT Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts studies APT reporting as attribution and confidence literacy: technical similarity, context, caveats, and geopolitical inference stay separate.

Why it matters. Analysts use **Living-Off-The-Land Techniques in APT Operations** to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. A defensible treatment names the judgment it enables for defensive CTI normalization and tabletop incident learning review, the proof limit that treating defensive taxonomy labels as an action sequence would otherwise hide, and the reviewer accountable for challenge.

Source support. Living-Off-The-Land Techniques in APT Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts rests on [071, 2026]. Its anchor reference records: Attribution becomes harder when its open-source … Use it for the working definition that **Living-Off-The-Land Techniques in APT Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **Living-Off-The-Land Techniques in APT Operations** in the evidence the row cites. [071, 2026] Attribution becomes harder when its open-source … Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Living-Off-The-Land Techniques in APT Operations**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Living-Off-The-Land Techniques in APT Operations**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Living-Off-The-Land Techniques in APT Operations** work as a **defensive CTI evidence packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Reuse the **Living-Off-The-Land Techniques in APT Operations** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

20.2.3 Cyber Intelligence Fundamentals worked safe example: synthetic inputs, evidence, and review

Worked example: a sample campus SOC reviews fabricated alert records after a tabletop incident. [258, 2026]; [261, 2026].

Triangulation anchors. In module 12's worked-example section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **defensive cyber intelligence normalization**. Learners use a **defensive CTI evidence packet** and keep this boundary visible: No exploit, persistence, evasion, scanning, or production response instructions.

Frame. The classroom question centers on **Cyber defensive taxonomy mapping using published labels and fabricated alerts**. Excluded actions stay explicit, and the **Defensive Cyber-Intelligence Lens** planning question is: Which defensive observation, confidence level, handling rule, and control implication can be stated without teaching adversary action?

Inputs. For the **Cyber defensive taxonomy mapping using published labels and fabricated alerts** scenario, use toy alerts, synthetic asset names, public ATT&CK technique descriptions, and a sharing-policy card. The Defensive Cyber-Intelligence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Cyber defensive taxonomy mapping using published labels and fabricated alerts**, students normalize indicators, map TTPs defensively, rate confidence, mark sharing limits, and record lessons learned. Pause whenever an inference about Cyber defensive taxonomy mapping using published labels and fabricated alerts appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Cyber defensive taxonomy mapping using published labels and fabricated alerts** classroom scenario; unit artifact = defensive CTI evidence packet; evidence = allowed inputs; method = defensive CTI normalization and tabletop incident learning; output = a CTI packet with indicators, TTP mapping, confidence, handling rule, and remediation owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Cyber defensive taxonomy mapping using published labels and fabricated alerts** as "Defensive Cyber-Intelligence Lens confirms it" is not enough. The revision ties the claim to defensive CTI normalization and tabletop incident learning, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Cyber defensive taxonomy mapping using published labels and fabricated alerts** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

20.2.4 Cyber Intelligence Fundamentals practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Defensive Cyber-Intelligence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

Triangulation anchors. In module 12's practice-sequence section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Cyber defensive taxonomy mapping using published labels and fabricated alerts, MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts, Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published labels and fabricated alerts; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane.
2. Frame	Answer the lens question: Which defensive observation, confidence level, handling rule, and control implication can be stated without teaching adversary action?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Cyber defensive taxonomy mapping using published labels and fabricated alerts: defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the defensive CTI evidence packet fields for Cyber defensive taxonomy mapping using published labels and fabricated alerts.	Unit profile note.	Evidence artifacts include indicator context, TTP mapping.
4. Challenge	Test the misconception that a defensive taxonomy is an instruction sequence.	Failure-mode note.	The artifact applies the key distinction: separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

20.2.4.1 Cyber Intelligence Fundamentals instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**. [258, 2026]; [261, 2026].

20.2.4.2 Cyber Intelligence Fundamentals extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 20; [258, 2026].

Have learners swap artifacts and apply the **Defensive Cyber-Intelligence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

20.2.5 Cyber Intelligence Fundamentals knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 20; [258, 2026].

1. Explain how **Cyber defensive taxonomy mapping using published labels and fabricated alerts** is defined here; name the source descriptor that supports the definition.
2. Contrast **Cyber defensive taxonomy mapping using published labels and fabricated alerts** with **MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts** using the **Defensive Cyber-Intelligence Lens** artifact fields.
3. Identify one failure mode from the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which indicator is useful only after context and confidence are added?
5. Correct this misconception: that a defensive taxonomy is an instruction sequence.

20.2.5.1 Cyber Intelligence Fundamentals answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Cyber defensive taxonomy mapping using published labels and fabricated alerts** without source evidence, uncertainty, or a safe transfer task.

20.3 Cyber Intelligence Fundamentals assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 20; [258, 2026].

20.3.1 Cyber Intelligence Fundamentals evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 20; [258, 2026].

20.3.2 Cyber Intelligence Fundamentals transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 20; [258, 2026].

20.3.2.1 Cyber Intelligence Fundamentals lineage and source tradition: profile, concepts, and first anchors This sits in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lineage: turning indicators, TTPs, incidents, vendor risk, and response lessons into shareable defensive intelligence with clear handling rules. [258, 2026]; [261, 2026].

20.3.2.2 Cyber Intelligence Fundamentals working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 20; [258, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**, with provenance and reviewability throughout.

20.3.2.3 Cyber Intelligence Fundamentals knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** fabricated alerts, public taxonomy labels, incident context, supplier evidence, and handling rules. [258, 2026]; [261, 2026].
- **Transforms:** indicator normalization, TTP mapping, confidence scoring, sharing review, and control-gap analysis.
- **Outputs:** defensive CTI packet, handling note, control implication, and incident-learning memo.
- **Failure modes:** exploit detail leakage, indicator fixation, unvetted sharing, and unsupported attribution.

20.3.2.4 Cyber Intelligence Fundamentals transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 20; [258, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.
- **Evidence contract:** keep the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as defensive CTI packet, handling note, control implication, and incident-learning memo that another reviewer can audit.

20.3.2.5 Cyber Intelligence Fundamentals profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 20; [258, 2026].

The matched profile emphasizes turning indicators, TTPs, incidents, vendor risk, and response lessons into shareable defensive intelligence with clear handling rules. The method stack is threat-information sharing goals, indicator/TTP normalization, incident-response review, supply-chain risk assessment, and lessons learned; the local topic cluster is **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

20.3.3 Cyber Intelligence Fundamentals evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 20; [258, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** profile tells reviewers what evidence is strong enough for the module artifact built around **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

20.3.3.1 Cyber Intelligence Fundamentals guide source spine: inherited keys and local citation roles Primary guide citations: [258, 2026]; [261, 2026]; [266, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [061, 2026]; [062, 2026]; [063, 2026]; [064, 2026]; [065, 2026]; [300, 2026]; [303, 2026]; [304, 2026]; [066, 2026]; [067, 2026]; [068, 2026]; [069, 2026]; [009, 2026]; [070, 2026]; [071, 2026].

20.3.3.2 Cyber Intelligence Fundamentals verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [258, 2026]; [261, 2026].

Tier	What counts	How it is used
Source guide	[258, 2026]; [261, 2026]; [266, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [061, 2026]; [062, 2026]; [063, 2026]; [064, 2026]; [065, 2026]; [300, 2026]; [303, 2026]; [304, 2026]; [066, 2026]; [067, 2026]; [068, 2026]; [069, 2026]; [009, 2026]; [070, 2026]; [071, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 12's source-canon section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts** and [258, 2026]; [261, 2026], but only directly verified source URLs are encoded as citations.

20.3.3.3 Cyber Intelligence Fundamentals intelligence practice lens: evidence artifact and safety check Practice lens: **Defensive Cyber-Intelligence Lens** for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**. [258, 2026]; [261, 2026].

Planning question: Which defensive observation, confidence level, handling rule, and control implication can be stated without teaching adversary action?

Evidence artifact: defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication.

Validation rule: verify that taxonomy labels are descriptive, indicators are contextualized, incident categories are reviewable, and outputs remain detection or assurance oriented. Applied to **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

Handoff contract: handoff separates observations, taxonomy labels, confidence, sharing limits, and defensive control recommendations.

Safety check: exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions.

20.3.3.4 Cyber Intelligence Fundamentals runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 20; [258, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	12.99	12.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Cyber Intelligence Fundamentals to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	12.101	12.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Cyber Intelligence Fundamentals	Cyber-Physical Readiness Lens	tabletop packet with OT asset inventory, architecture record, consequences, injects, and debrief rubric	keep exercises lab-only or tabletop; exclude exploitation, process manipulation, unsafe actuation, and live-control actions
Model-card, recoverability, retention, and learner-support evidence package	12.102	12.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Cyber Intelligence Fundamentals	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber defensive taxonomy mapping using published labels and fabricated alerts	12.1	12.1 source title transformed into safe curriculum treatment; original: The Cyber Kill Chain (Lockheed Martin)	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Cyber defensive taxonomy mapping using published labels and fabricated alerts	12.2	12.2 source title transformed into safe curriculum treatment; original: MITRE ATT&CK Framework: Enterprise Matrix v19	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber defensive taxonomy mapping using published labels and fabricated alerts	12.2.1	12.2.1 source title transformed into safe curriculum treatment; original: Reconnaissance through Resource Development	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber access-and-execution taxonomy review using fabricated alerts	12.2.2	12.2.2 source title transformed into safe curriculum treatment; original: Initial Access, Execution, Persistence, Privilege Escalation	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber credential-and-movement taxonomy review using fabricated alerts	12.2.3	12.2.3 source title transformed into safe curriculum treatment; original: Defense Evasion, Credential Access, Discovery, Lateral Movement	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber command, data-loss, and impact taxonomy review using fabricated alerts	12.2.4	12.2.4 source title transformed into safe curriculum treatment; original: Collection, Command & Control, Exfiltration, Impact	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Cyber defensive taxonomy mapping using published labels and fabricated alerts	12.3	12.3 source title transformed into safe curriculum treatment; original: Unified Kill Chain: Extending Lockheed + MITRE	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber defensive taxonomy mapping using published labels and fabricated alerts	12.4	12.4 source title transformed into safe curriculum treatment; original: Threat Intelligence Sharing: STIX/TAXII Standards	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber defensive taxonomy mapping using published labels and fabricated alerts	12.5	12.5 source title transformed into safe curriculum treatment; original: Nation-State Cyber Espionage: Motivations and Methods	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber defensive taxonomy mapping using published labels and fabricated alerts	12.6	12.6 source title transformed into safe curriculum treatment; original: Chinese State-Affiliated Hacking: APT10, APT41, Volt Typhoon	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber defensive taxonomy mapping using published labels and fabricated alerts	12.7	12.7 source title transformed into safe curriculum treatment; original: Russian Cyber Operations: Sandworm, Cozy Bear, Fancy Bear	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber defensive taxonomy mapping using published labels and fabricated alerts	12.8	12.8 source title transformed into safe curriculum treatment; original: Living-Off-The-Land (LOTL) Techniques in APT Operations	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

20.3.3.5 Cyber Intelligence Fundamentals reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 20; [258, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Cyber defensive taxonomy mapping using published labels and fabricated alerts	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber access-and-execution taxonomy review using fabricated alerts	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber credential-and-movement taxonomy review using fabricated alerts	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber command, data-loss, and impact taxonomy review using fabricated alerts	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Unified Kill Chain: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions
Threat Intelligence Sharing: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions
Nation-State Cyber Espionage: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Chinese State-Affiliated Hacking: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Russian Cyber Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Living-Off-The-Land Techniques in APT Operations: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions

20.3.3.6 Cyber Intelligence Fundamentals annotated source ledger: real titles and local contribution Each source cited by this **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** module is paired below with its real title and a one-line note on what it contributes to **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

Source	Cited work	What it contributes	Status
[258, 2026]	OpenAPI Specification	The official OpenAPI Initiative publications page, serving as a central index for the OpenAPI Specification and related standards including the Arazzo and Overlay specifications. It provides access to multiple specification versions (2.0, 3.0, 3.1, and 3.2) and their corresponding downloadable schemas identified by release date, along with a registry of extensions, formats, media types, and other resources.	verified source-guide

Source	Cited work	What it contributes	Status
[261, 2026]	RFC 9110: HTTP Semantics	RFC 9110, the official IETF standards document defining the core semantics and architecture of HTTP, published in June 2022 and consolidating nine earlier RFCs. It establishes terminology and protocol aspects shared across HTTP versions, including methods, status codes, header fields, content negotiation, conditional and range requests, authentication, and the http and https URI schemes.	verified source-guide
[266, 2026]	PROV Overview	A W3C Working Group Note from 2013 that provides an overview and roadmap for the PROV family of specifications for representing and exchanging provenance information on the web. It defines provenance as information about the entities, activities, and people involved in producing data, used to assess quality, reliability, and trustworthiness.	verified source-guide
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide
[281, 2026]	Artificial Intelligence Cybersecurity Challenges	An ENISA (European Union Agency for Cybersecurity) report published December 15, 2020 mapping the cybersecurity challenges of artificial intelligence. It defines AI scope through a lifecycle approach, identifies the assets requiring protection within AI ecosystems, and develops a threat taxonomy classified across lifecycle stages and asset categories.	verified source-guide
[282, 2026]	AI Research: Security and Resilience	A NIST page on AI research focused on security and resilience, framing these as core characteristics of trustworthy AI under the NIST AI Risk Management Framework.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide

Source	Cited work	What it contributes	Status
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[296, 2026]	Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile	NIST AI 600-1, the Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile, a cross-sectoral companion resource to the NIST AI RMF 1.0 issued pursuant to Executive Order 14110. It identifies risks that are unique to or amplified by generative AI and organizes suggested actions for managing those risks, mapped to the AI RMF functions.	verified source-guide
[061, 2026]	Cyber Kill Chain®	This Lockheed Martin webpage describes the Cyber Kill Chain framework, a methodology for identifying and preventing cyber intrusions as part of the company's Intelligence Driven Defense model. It outlines the sequence of steps an adversary must complete to achieve an objective, and is intended to help analysts understand attacker tactics and procedures.	verified source-guide
[062, 2026]	Cyber kill chain	A Wikipedia article describing the cyber kill chain, a framework adapted by Lockheed Martin from a military concept to model how cyberattacks progress through distinct phases. It outlines seven stages from reconnaissance through actions on objectives, along with defensive countermeasures organizations can apply at each stage.	verified source-guide context; do not use as primary analytic support
[063, 2026]	Enterprise Matrix - MITRE ATT&CK®	The official MITRE ATT&CK Enterprise Matrix, a curated knowledge base of adversary tactics and techniques observed in real-world intrusions. It organizes activity into fifteen sequential tactics, from reconnaissance and resource development through initial access, persistence, privilege escalation, defense evasion, credential access, lateral movement, command and control, exfiltration, and impact.	verified source-guide
[064, 2026]	MITRE ATT&CK®	MITRE ATT&CK is a globally accessible knowledge base that catalogs adversary tactics and techniques drawn from real-world observations of cyber intrusions. The framework is organized into matrices covering Enterprise, Mobile, and Industrial Control Systems environments, with tactics representing adversary objectives and techniques describing specific methods used to achieve them.	verified source-guide

Source	Cited work	What it contributes	Status
[065, 2026]	Enterprise Techniques - MITRE ATT&CK®	The Enterprise Techniques page of the MITRE ATT&CK framework, a cybersecurity knowledge base maintained by MITRE Corporation. It documents 222 enterprise techniques and 475 sub-techniques describing how adversaries achieve tactical goals across the attack lifecycle, organized by tactics such as initial access, persistence, privilege escalation, defense evasion, credential access, discovery, and impact.	verified source-guide
[300, 2026]	MITRE ATLAS	MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy.	original source-guide
[303, 2026]	Software Security in Supply Chains	An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation.	verified source-guide
[304, 2026]	Secure Software Development Framework (SSDF) Version 1.1: Recommendations for Mitigating the Risk of Software Vulnerabilities	NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences.	verified source-guide
[066, 2026]	What is STIX/TAXII? - Cloudflare	A Cloudflare Learning Center explainer describing STIX and TAXII as complementary standards for cyber threat intelligence. STIX defines a structured language for representing threat information, while TAXII specifies how that information is transported and exchanged between systems. Together they form a framework that lets organizations share and consume threat intelligence in a consistent, machine-readable way to improve collective defense.	verified source-guide
[067, 2026]	Introduction to STIX	An introductory page from the OASIS CTI documentation explaining STIX (Structured Threat Information Expression), an open-source language and serialization format used to exchange cyber threat intelligence. It describes how STIX 2.1 models intelligence using 18 domain objects (such as attack patterns, malware, threat actors, and vulnerabilities) and 2 relationship objects, all represented as JSON.	verified source-guide

Source	Cited work	What it contributes	Status
[068, 2026]	OASIS Cyber Threat Intelligence (CTI) TC	The official committee page for the OASIS Cyber Threat Intelligence (CTI) Technical Committee, a standards body that develops formats for sharing cyber threat intelligence. It maintains the STIX (Structured Threat Information Expression) data model and the TAXII exchange protocol, both approved as OASIS standards in 2021, and organizes subcommittees for STIX, TAXII, and interoperability.	verified source-guide
[069, 2026]	Assessing nation-state-sponsored cyberattacks using aspects	They found that the most common cyberattacks initiated by nation-states were espionage focused.	original source-guide
[009, 2026]	"Here to stay" – Chinese state-affiliated hacking for strategic goals	A November 2023 report from MERICS (Mercator Institute for China Studies) analyzing Chinese state-affiliated cyber intrusions aimed at strategic goals. It argues that Chinese actors pursue long-term, persistent access to European technology firms and critical infrastructure for espionage rather than disruption, with targeting aligned to government priorities such as semiconductors, pharmaceuticals, and advanced manufacturing.	verified source-guide
[070, 2026]	Getting Harder to Catch Analyzing the Evolution of China's Cyber	A 2016 student security paper by Winnona DeSombre (Tufts Comp116) analyzing the evolution of China's cyber espionage campaigns against the United States. Organized in three parts, it surveys China-US relations in the cyber domain and the policy dilemmas of attribution and shared terminology, presents a case study of the APT1 hacker group linked to PLA Unit 61398, and reviews broader trends in the context of the 2015 US-China Cyber Agreement.	verified source-guide
[071, 2026]	I Led IR on Nation-State Attacks at Mandiant, FireEye & CrowdStrike	Attribution becomes harder when its open-source …	original source-guide

Where this sits. This module's overview is Section 20; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

20.3.4 Cyber Intelligence Fundamentals governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 20; [258, 2026].

20.3.5 Cyber Intelligence Fundamentals analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 12's governance-boundary section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**. [258, 2026]; [261, 2026].
Curriculum topic spine: Cyber defensive taxonomy mapping using published labels and fabricated alerts, **MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**, **Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published labels and fabricated alerts**. **Verified anchor cluster:** [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]; [Cybersecurity and Agency, 2026d]; [of Standards and Technology, 2025c]; [for Economic Co-operation and Development, 2025a].
Conceptual depth: turning indicators, TTPs, incidents, vendor risk, and response lessons into shareable defensive intelligence with clear handling rules.
Method stack: threat-information sharing goals, indicator/TTP normalization, incident-response review, supply-chain risk assessment, and lessons learned.
Composability contract: indicators, TTP mappings, affected assets, supplier evidence, response actions, and sharing constraints remain independently reusable.
Known failure modes: indicator fixation, unvetted sharing, vendor-assurance drift, weak incident scoping, and treating CTI as a feed instead of a workflow.
Defensive boundary: cyber material stays defensive and tabletop-based; it does not provide exploit, persistence, evasion, or live-response instructions.
Applied to **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

Anchor	Why it matters here
[of Standards and Technology, 2016]	Official guidance for establishing threat-information sharing goals, communities, distribution rules, and defensive use of indicators and TTPs. Checked as of 2026-05-21; role: curriculum_anchor.
[Committee, 2025]	OASIS CTI standard for expressing cyber threat and observable information with structured objects, relationships, sightings, and markings. Checked as of 2026-05-21; role: curriculum_anchor.
[Committee, 2021]	OASIS CTI transport standard for defensive threat-intelligence exchange channels, collections, discovery, and API contracts. Checked as of 2026-05-21; role: curriculum_anchor.
[MITRE, 2026b]	Threat-informed enterprise matrix for defensive TTP mapping, coverage analysis, detection engineering, and analytic normalization. Checked as of 2026-05-21; role: curriculum_anchor.
[Cybersecurity and Agency, 2026d]	Official catalog for prioritizing known exploited vulnerabilities as defensive triage inputs, not as exploitation instructions. Checked as of 2026-05-21; role: curriculum_anchor.
[of Standards and Technology, 2025c]	Official incident-response profile for preparation, detection, response, recovery, and continuous improvement under CSF 2.0. Checked as of 2026-05-21; role: curriculum_anchor.
[for Economic Co-operation and Development, 2025a]	OECD policy paper proposing a common AI incident reporting framework for jurisdictions and sectors, including criteria for impact and risk characterization. Checked as of 2026-05-24; role: curriculum_anchor.

20.3.5.1 Cyber Intelligence Fundamentals evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [258, 2026]; [261, 2026].

20.3.6 Cyber Intelligence Fundamentals agentic boundary: assist, approve, block, and record

Evidence anchor. Section 20; [258, 2026].
AGEINT translation is bounded by the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

20.3.6.1 Cyber Intelligence Fundamentals permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 20; [258, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

20.3.6.2 Cyber Intelligence Fundamentals excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [258, 2026]; [261, 2026] and **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

20.3.7 Cyber Intelligence Fundamentals governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 20; [258, 2026].
Governance is practiced as a gate on the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane. Learners use the **Defensive Cyber-Intelligence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

20.3.7.1 Cyber Intelligence Fundamentals governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [258, 2026]; [261, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** failure modes and the **Defensive Cyber-Intelligence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

20.3.7.2 Cyber Intelligence Fundamentals evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 20; [258, 2026].
Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Defensive Cyber-Intelligence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

20.3.7.3 Cyber Intelligence Fundamentals current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**. [258, 2026]; [261, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_nist_sp_800_150` for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**?	Guide to Cyber Threat Information Sharing, NIST SP 800-150; lane `cyber_threat_intelligence`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; Official guidance for establishing threat-information sharing goals, communities, distribution rules, and defensive use of indicators and TTPs.
What does the module inherit from `official_oasis_stix_21` for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**?	STIX Version 2.1; lane `cyber_threat_intelligence`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; OASIS CTI standard for expressing cyber threat and observable information with structured objects, relationships, sightings, and markings.
What does the module inherit from `official_oasis_taxii_21` for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**?	TAXII Version 2.1; lane `cyber_threat_intelligence`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; OASIS CTI transport standard for defensive threat-intelligence exchange channels, collections, discovery, and API contracts.
What does the module inherit from `official_mitre_attack_enterprise` for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**?	MITRE ATT&CK Enterprise Matrix; lane `cyber_threat_intelligence`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; Threat-informed enterprise matrix for defensive TTP mapping, coverage analysis, detection engineering, and analytic normalization.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 20; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

20.3.8 Cyber Intelligence Fundamentals assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 20; [258, 2026].

20.3.9 Cyber Intelligence Fundamentals assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 20; [258, 2026].

20.3.9.1 Cyber Intelligence Fundamentals capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.
Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts** and [258, 2026]; [261, 2026].

20.3.9.2 Cyber Intelligence Fundamentals instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts** and [258, 2026]; [261, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

20.3.9.3 Cyber Intelligence Fundamentals assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Cyber defensive taxonomy mapping using published labels and fabricated alerts	Completed **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Completed **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Reconnaissance through Resource Development: Cyber defensive taxonomy mapping using published labels and fabricated alerts	Completed **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

20.3.10 Cyber Intelligence Fundamentals refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [258, 2026]; [261, 2026] and **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**.

20.3.10.1 Cyber Intelligence Fundamentals refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**. The local signals begin with [258, 2026]; [261, 2026].

20.3.10.2 Cyber Intelligence Fundamentals claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**, and the source spine for these checks begins with [258, 2026]; [261, 2026].

20.3.11 Cyber Intelligence Fundamentals reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [258, 2026]; [261, 2026].
Triangulation anchors. In module 12's review-checklist section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts**. [258, 2026]; [261, 2026].

- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

20.3.12 Cyber Intelligence Fundamentals learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **Cyber defensive taxonomy mapping using published labels and fabricated alerts; MITRE ATT&CK Framework: Cyber defensive taxonomy mapping using published labels and fabricated alerts** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [258, 2026]; [261, 2026].
Section 2, Section 19, Section 21

21 Advanced Persistent Threats (APTs)

21.0.1 Advanced Persistent Threats (APTs) figures and course links: visual evidence, source flow, and navigation

The module uses Figure 55 and Figure 52 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.

Navigation links: Section 2, Section 19, Section 20, Section 22.

This module teaches the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane through a bounded, source-backed coursebook chapter. [237, 2026]; [258, 2026].

21.1 Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense frame for Advanced Persistent Threats (APTs): source context, topic focus, and reader task

Evidence anchor. Section 21; [237, 2026].

21.1.1 Advanced Persistent Threats (APTs) orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 21; [237, 2026].

21.1.2 Advanced Persistent Threats (APTs) conceptual primer: source context, core model, and reader task

This chapter teaches cyber threat intelligence as defensive normalization: incidents, indicators, TTPs, vendor risks, and sharing rules become useful only when scoped and validated. The chapter uses **Defensive Cyber-Intelligence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

The central distinction is to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. Core topics include **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis; Nation-State vs. Ideological Actor Attack Patterns**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.

Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [237, 2026]; [258, 2026].

Learners move from vocabulary and the **Defensive Cyber-Intelligence Lens** distinction through topic lessons on **APT Definitions, Lifecycle, and Attribution** with evidence and misconception checks, then assemble a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with safety and rights gates.

21.1.3 Advanced Persistent Threats (APTs) learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 21; [237, 2026].

- Connect **APT Definitions, Lifecycle, and Attribution and APT Risk Propagation Models: ATT&CK-Based Analysis** to **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate defensive mapping and incident learning from exploit, persistence, or evasion instruction; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as indicator fixation, unvetted sharing, vendor-assurance drift, weak incident scoping, and treating CTI as a feed instead of a workflow, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: cyber material stays defensive and tabletop-based; it does not provide exploit, persistence, evasion, or live-response instructions.

21.1.4 Advanced Persistent Threats (APTs) core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 21; [237, 2026].

Term	Working definition
Indicator	an observable signal that may support defensive detection or investigation
TTP	a tactic, technique, or procedure used for structured defensive mapping
Sighting	a bounded observation of a possible indicator in a given context
Handling rule	a sharing, marking, or retention limit for threat information
Lessons learned	the post-incident evidence that changes controls or playbooks
APT Definitions, Lifecycle, and Attribution	Key terms: APT, Definitions, Lifecycle.
APT Risk Propagation Models: ATT&CK-Based…	Key terms: APT, Risk, Propagation.

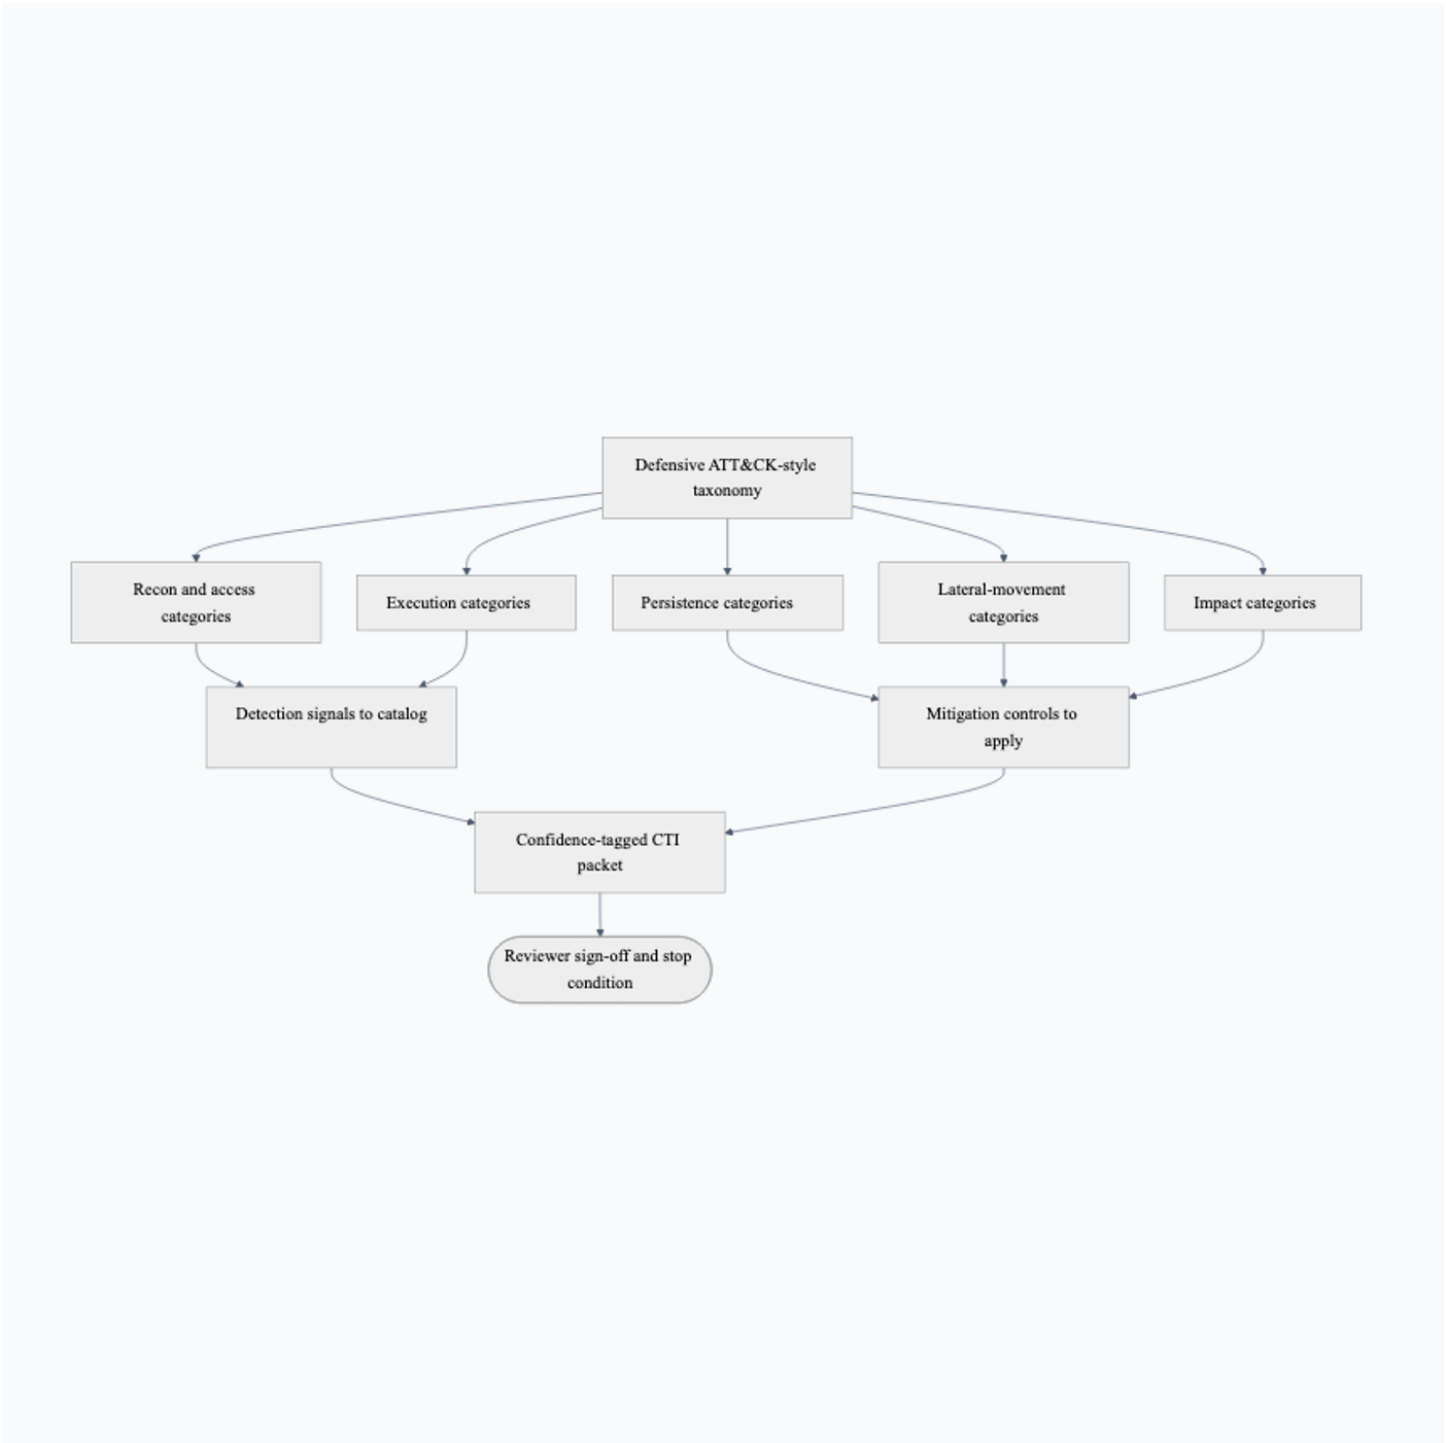

Figure 55: This diagram organizes the ATT&CK-style adversary tactic categories purely as a defensive taxonomy, mapping each phase to the detection signals and mitigation controls a defender catalogs, never to attack instructions. It is anchored to the technical intelligence and cyber operations / advanced persistent threats apts section; use it to inspect Defensive ATT&CK-style taxonomy, Recon and access categories, Execution categories, and Persistence categories while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

21.2 Defensive Cyber-Intelligence Lens path for Advanced Persistent Threats (APTs): lesson cluster, safe artifact, and review

Evidence anchor. Section 21; [237, 2026].

21.2.1 Advanced Persistent Threats (APTs) practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 21; [237, 2026].

21.2.2 Advanced Persistent Threats (APTs) topic lessons: source-backed concepts and transfer tasks

This module builds cyber threat intelligence as defensive normalization: incidents, indicators, TTPs, vendor risks, and sharing rules become useful only when scoped and validated. The sequence opens with **APT Definitions, Lifecycle, and Attribution**, **APT Risk Propagation Models: ATT&CK-Based Analysis**, **Nation-State vs. Ideological Actor Attack Patterns** and applies the **Defensive Cyber-Intelligence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 52; module overview Section 21; curriculum atlas Section 2.

Triangulation anchors. In module 13's topic-lessons section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

21.2.2.1 Lesson 1: APT Definitions, Lifecycle, and Attribution **Concept. APT Definitions, Lifecycle, and Attribution** studies APT reporting as attribution and confidence literacy: technical similarity, context, caveats, and geopolitical inference stay separate.

Why it matters. Analysts use **APT Definitions, Lifecycle, and Attribution** to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. A defensible treatment names the judgment it enables for defensive CTI normalization and tabletop incident learning review, the proof limit that indicator fixation would otherwise hide, and the reviewer accountable for challenge.

Source support. APT Definitions, Lifecycle, and Attribution rests on [072, 2026]. The lead source's own note reads: The Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK) Framework introduced. Use it for the claim that **APT Definitions, Lifecycle, and Attribution** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **APT Definitions, Lifecycle, and Attribution**, reason from the sources cited in this row. [072, 2026] The Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK) Framework introduced. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **APT Definitions, Lifecycle, and Attribution**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **APT Definitions Lifecycle and Attribution**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that APT Definitions, Lifecycle, and Attribution can be used while ignoring the rule to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Transfer task. Transfer **APT Definitions, Lifecycle, and Attribution** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

21.2.2.2 Lesson 2: APT Risk Propagation Models: ATT&CK-Based Analysis **Concept. APT Risk Propagation Models: ATT&CK-Based Analysis** studies APT reporting as attribution and confidence literacy: technical similarity, context, caveats, and geopolitical inference stay separate.

Why it matters. APT Risk Propagation Models matters in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane because defensive CTI normalization and tabletop incident learning evidence must stay separate from judgment; indicator fixation is a common failure.

Source support. APT Risk Propagation Models: ATT&CK-Based Analysis rests on [072, 2026]. The most specific cited work observes: The Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK) Framework introduced. Use it for the working definition that **APT Risk Propagation Models: ATT&CK-Based Analysis** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **APT Risk Propagation Models** in the evidence the row cites. [072, 2026] The Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK) Framework introduced. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **APT Risk Propagation Models**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **APT Risk Propagation Models**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **APT Risk Propagation Models** work as a **defensive CTI evidence packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that APT Risk Propagation Models: ATT&CK-Based Analysis is optional whenever separate defensive mapping and incident learning from exploit, persistence, or evasion instruction feels inconvenient.

Transfer task. Transfer **APT Risk Propagation Models** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

21.2.2.3 Lesson 3: Nation-State vs. Ideological Actor Attack Patterns **Concept. Nation-State vs. Ideological Actor Attack Patterns** applies Nation, State, Ideological within Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense: learners use separate defensive mapping and incident learning from exploit, persistence, or evasion instruction and defensive CTI normalization and tabletop incident learning evidence before any judgment moves forward.

Why it matters. Analysts use **Nation-State vs. Ideological Actor Attack Patterns** to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. A defensible treatment names the judgment it enables for defensive CTI normalization and tabletop incident learning review, the proof limit that indicator fixation would otherwise hide, and the reviewer accountable for challenge.

Source support. Nation-State vs. Ideological Actor Attack Patterns rests on [069, 2026]. Its anchor reference records: They found that the most common cyberattacks initiated by nation-states were espionage focused. Use it for pinning down the scope of **Nation-State vs. Ideological Actor Attack Patterns**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Nation-State vs. Ideological Actor Attack Patterns**, reason from the sources cited in this row. [069, 2026] They found that the most common cyberattacks initiated by nation-states were espionage focused. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Nation-State vs. Ideological Actor Attack Patterns**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **Nation-State vs Ideological Actor Attack**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **defensive CTI evidence packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Nation-State vs. Ideological Actor Attack Patterns establishes intent without reviewing alternative explanations.

Transfer task. Transfer **Nation-State vs. Ideological Actor Attack Patterns** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

21.2.2.4 Lesson 4: Cyber infrastructure-abuse indicator review using fabricated records

Concept. Cyber infrastructure-abuse indicator review using fabricated records studies APT reporting as attribution and confidence literacy: technical similarity, context, caveats, and geopolitical inference stay separate.

Why it matters. Cyber infrastructure-abuse indicator review matters in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane because defensive CTI normalization and tabletop incident learning evidence must stay separate from judgment; treating defensive taxonomy labels as an action sequence is a common failure.

Source support. Cyber infrastructure-abuse indicator review using fabricated records rests on [300, 2026], [303, 2026], and [304, 2026]. The most specific cited work observes: It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. Use them for the working definition that **Cyber infrastructure-abuse indicator review using fabricated records** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Read **Cyber infrastructure-abuse indicator review** against the works cited for this row. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Cyber infrastructure-abuse indicator review**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must map the indicator descriptor, the bounded claim about **Cyber infrastructure-abuse indicator review using**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Cyber infrastructure-abuse indicator review** work as a **defensive CTI evidence packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Cyber infrastructure-abuse indicator review**: that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Apply this module's safe boundary for **Cyber infrastructure-abuse indicator review** to another artifact while keeping defensive CTI normalization and tabletop incident learning and reviewer ownership explicit.

21.2.2.5 Lesson 5: Incident Response on Nation-State Intrusions: Mandiant Methodology

Concept. Incident Response on Nation-State Intrusions: Mandiant Methodology maps incident phases to evidence preservation, stakeholder notification, learning loops, and defensive control updates.

Why it matters. Incident Response on Nation-State Intrusions connects classroom vocabulary to Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Incident Response on Nation-State Intrusions: Mandiant Methodology rests on [071, 2026]. The closest source to this row notes: Attribution becomes harder when its open-source … Use it for the working definition that **Incident Response on Nation-State Intrusions: Mandiant Methodology** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Read **Incident Response on Nation-State Intrusions** against the works cited for this row. [071, 2026] Attribution becomes harder when its open-source … From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Incident Response on Nation-State Intrusions**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **Incident Response on Nation-State Intrusions**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Incident Response on Nation-State Intrusions** work as a **defensive CTI evidence packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Incident Response on Nation-State Intrusions: Mandiant Methodology can be used while ignoring the rule to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Transfer task. Transfer **Incident Response on Nation-State Intrusions** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

21.2.2.6 Lesson 6: Threat Hunting Against APT Actors

Concept. Threat Hunting Against APT Actors studies APT reporting as attribution and confidence literacy: technical similarity, context, caveats, and geopolitical inference stay separate.

Why it matters. Threat Hunting Against APT Actors matters in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane because defensive CTI normalization and tabletop incident learning evidence must stay separate from judgment; indicator fixation is a common failure.

Source support. Threat Hunting Against APT Actors rests on [300, 2026], [303, 2026], and [304, 2026]. The closest source to this row notes: It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. Use them for fixing what **Threat Hunting Against APT Actors** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **Threat Hunting Against APT Actors** in the evidence the row cites. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating

security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **Threat Hunting Against APT Actors**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **defensive CTI evidence packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Threat Hunting Against APT Actors is optional whenever separate defensive mapping and incident learning from exploit, persistence, or evasion instruction feels inconvenient.

Transfer task. Transfer **Threat Hunting Against APT Actors** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

21.2.2.7 Lesson 7: APT Attribution: Technical Indicators vs. Geopolitical Context

Concept. APT Attribution: Technical Indicators vs. Geopolitical Context studies APT reporting as attribution and confidence literacy: technical similarity, context, caveats, and geopolitical inference stay separate.

Why it matters. APT Attribution: Technical Indicators vs. Geopolitical Context connects classroom vocabulary to Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. APT Attribution: Technical Indicators vs. Geopolitical Context rests on [309, 2026], [310, 2026], and [300, 2026]. Its anchor reference records: The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. Use them for fixing what **APT Attribution: Technical Indicators vs. Geopolitical Context** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **APT Attribution: Technical Indicators vs. Geopolitical Context** in the evidence the row cites. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **APT Attribution**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **APT Attribution**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **APT Attribution: Technical Indicators vs. Geopolitical Context** work as a **defensive CTI evidence packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that APT Attribution: Technical Indicators vs. Geopolitical Context establishes intent without reviewing alternative explanations.

Transfer task. Transfer **APT Attribution: Technical Indicators vs. Geopolitical Context** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

21.2.3 Advanced Persistent Threats (APTs) worked safe example: synthetic inputs, evidence, and review

Worked example: a sample campus SOC reviews fabricated alert records after a tabletop incident. [237, 2026]; [258, 2026].

Triangulation anchors. In module 13's worked-example section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **defensive cyber intelligence normalization**. Learners use a **defensive CTI evidence packet** and keep this boundary visible: No exploit, persistence, evasion, scanning, or production response instructions.

Frame. The classroom question centers on **APT Definitions, Lifecycle, and Attribution**. Excluded actions stay explicit, and the **Defensive Cyber-Intelligence Lens** planning question is: Which defensive observation, confidence level, handling rule, and control implication can be stated without teaching adversary action?

Inputs. For the **APT Definitions, Lifecycle, and Attribution** scenario, use toy alerts, synthetic asset names, public ATT&CK technique descriptions, and a sharing-policy card. The Defensive Cyber-Intelligence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **APT Definitions, Lifecycle, and Attribution**, students normalize indicators, map TTPs defensively, rate confidence, mark sharing limits, and record lessons learned. Pause whenever an inference about APT Definitions, Lifecycle, and Attribution appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **APT Definitions, Lifecycle, and Attribution** classroom scenario; unit artifact = defensive CTI evidence packet; evidence = allowed inputs; method = defensive CTI normalization and tabletop incident learning; output = a CTI packet with indicators, TTP mapping, confidence, handling rule, and remediation owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **APT Definitions, Lifecycle, and Attribution** as "Defensive Cyber-Intelligence Lens confirms it" is not enough. The revision ties the claim to defensive CTI normalization and tabletop incident learning, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **APT Definitions, Lifecycle, and Attribution** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

21.2.4 Advanced Persistent Threats (APTs) practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Defensive Cyber-Intelligence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

Triangulation anchors. In module 13's practice-sequence section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare APT Definitions, Lifecycle, and Attribution, APT Risk Propagation Models: ATT&CK-Based Analysis, Nation-State vs. Ideological Actor Attack Patterns; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane.
2. Frame	Answer the lens question: Which defensive observation, confidence level, handling rule, and control implication can be stated without teaching adversary action?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for APT Definitions, Lifecycle, and Attribution: defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the defensive CTI evidence packet fields for APT Definitions, Lifecycle, and Attribution.	Unit profile note.	Evidence artifacts include indicator context, TTP mapping.
4. Challenge	Test the misconception that APT Definitions, Lifecycle, and Attribution can be used while ignoring the rule to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.	Failure-mode note.	The artifact applies the key distinction: separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

21.2.4.1 Advanced Persistent Threats (APTs) instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**. [237, 2026]; [258, 2026].

21.2.4.2 Advanced Persistent Threats (APTs) extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 21; [237, 2026].
Have learners swap artifacts and apply the **Defensive Cyber-Intelligence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

21.2.5 Advanced Persistent Threats (APTs) knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 21; [237, 2026].

1. Explain how **APT Definitions, Lifecycle, and Attribution** is defined here; name the source descriptor that supports the definition.
2. Contrast **APT Definitions, Lifecycle, and Attribution** with **APT Risk Propagation Models: ATT&CK-Based Analysis** using the **Defensive Cyber-Intelligence Lens** artifact fields.
3. Identify one failure mode from the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which indicator is useful only after context and confidence are added?
5. Correct this misconception: that APT Definitions, Lifecycle, and Attribution can be used while ignoring the rule to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

21.2.5.1 Advanced Persistent Threats (APTs) answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **APT Definitions, Lifecycle, and Attribution** without source evidence, uncertainty, or a safe transfer task.

21.3 Advanced Persistent Threats (APTs) assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 21; [237, 2026].

21.3.1 Advanced Persistent Threats (APTs) evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 21; [237, 2026].

21.3.2 Advanced Persistent Threats (APTs) transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 21; [237, 2026].

21.3.2.1 Advanced Persistent Threats (APTs) lineage and source tradition: profile, concepts, and first anchors This sits in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lineage: turning indicators, TTPs, incidents, vendor risk, and response lessons into shareable defensive intelligence with clear handling rules. [237, 2026]; [258, 2026].

21.3.2.2 Advanced Persistent Threats (APTs) working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 21; [237, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**, with provenance and reviewability throughout.

21.3.2.3 Advanced Persistent Threats (APTs) knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** fabricated alerts, public taxonomy labels, incident context, supplier evidence, and handling rules. [237, 2026]; [258, 2026].
- **Transforms:** indicator normalization, TTP mapping, confidence scoring, sharing review, and control-gap analysis.
- **Outputs:** defensive CTI packet, handling note, control implication, and incident-learning memo.
- **Failure modes:** exploit detail leakage, indicator fixation, unvetted sharing, and unsupported attribution.

21.3.2.4 Advanced Persistent Threats (APTs) transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 21; [237, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.
- **Evidence contract:** keep the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as defensive CTI packet, handling note, control implication, and incident-learning memo that another reviewer can audit.

21.3.2.5 Advanced Persistent Threats (APTs) profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 21; [237, 2026].

The matched profile emphasizes turning indicators, TTPs, incidents, vendor risk, and response lessons into shareable defensive intelligence with clear handling rules. The method stack is threat-information sharing goals, indicator/TTP normalization, incident-response review, supply-chain risk assessment, and lessons learned; the local topic cluster is **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

21.3.3 Advanced Persistent Threats (APTs) evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 21; [237, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** profile tells reviewers what evidence is strong enough for the module artifact built around **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

21.3.3.1 Advanced Persistent Threats (APTs) guide source spine: inherited keys and local citation roles Primary guide citations: [237, 2026]; [258, 2026]; [261, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [072, 2026]; [069, 2026]; [071, 2026]; [300, 2026]; [303, 2026]; [304, 2026]; [309, 2026]; [310, 2026].

21.3.3.2 Advanced Persistent Threats (APTs) verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [237, 2026]; [258, 2026].

Tier	What counts	How it is used
Source guide	[237, 2026]; [258, 2026]; [261, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [072, 2026]; [069, 2026]; [071, 2026]; [300, 2026]; [303, 2026]; [304, 2026]; [309, 2026]; [310, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 13's source-canon section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis** and [237, 2026]; [258, 2026], but only directly verified source URLs are encoded as citations.

21.3.3.3 Advanced Persistent Threats (APTs) intelligence practice lens: evidence artifact and safety check Practice lens: **Defensive Cyber-Intelligence Lens** for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**. [237, 2026]; [258, 2026].

Planning question: Which defensive observation, confidence level, handling rule, and control implication can be stated without teaching adversary action?

Evidence artifact: defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication.

Validation rule: verify that taxonomy labels are descriptive, indicators are contextualized, incident categories are reviewable, and outputs remain detection or assurance oriented. Applied to **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

Handoff contract: handoff separates observations, taxonomy labels, confidence, sharing limits, and defensive control recommendations.

Safety check: exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions.

21.3.3.4 Advanced Persistent Threats (APTs) runtime-to-reader map: generated sections and verifier surfaces **Evidence anchor.** Section 21; [237, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	13.99	13.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Advanced Persistent Threats (APTs) to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	13.101	13.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Advanced Persistent Threats (APTs)	Cyber-Physical Readiness Lens	tabletop packet with OT asset inventory, architecture record, consequences, injects, and debrief rubric	keep exercises lab-only or tabletop; exclude exploitation, process manipulation, unsafe actuation, and live-control actions
Model-card, recoverability, retention, and learner-support evidence package	13.102	13.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Advanced Persistent Threats (APTs)	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
APT Definitions, Lifecycle, and Attribution	13.1	13.1 APT Definitions, Lifecycle, and Attribution	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions
APT Risk Propagation Models: ATT&CK-Based Analysis	13.2	13.2 APT Risk Propagation Models: ATT&CK-Based Analysis	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Nation-State vs. Ideological Actor Attack Patterns	13.3	13.3 Nation-State vs. Ideological Actor Attack Patterns	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber infrastructure-abuse indicator review using fabricated records	13.4	13.4 source title transformed into safe curriculum treatment; original: APT Infrastructure: C2 Frameworks, Domain Fronting, Bulletproof Hosting	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Incident Response on Nation-State Intrusions: Mandiant Methodology	13.5	13.5 Incident Response on Nation-State Intrusions: Mandiant Methodology	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions
Threat Hunting Against APT Actors	13.6	13.6 Threat Hunting Against APT Actors	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions
APT Attribution: Technical Indicators vs. Geopolitical Context	13.7	13.7 APT Attribution: Technical Indicators vs. Geopolitical Context	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions

21.3.3.5 Advanced Persistent Threats (APTs) reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 21; [237, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
APT Definitions, Lifecycle, and Attribution	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions
APT Risk Propagation Models: ATT&CK-Based Analysis	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Nation-State vs. Ideological Actor Attack Patterns	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Cyber infrastructure-abuse indicator review using fabricated records	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Incident Response on Nation-State Intrusions: Mandiant Methodology	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions
Threat Hunting Against APT Actors	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions

Lesson topic	Practice lens	Evidence artifact	Safety check
APT Attribution: Technical Indicators vs. Geopolitical Context	Defensive Cyber-Intelligence Lens	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication	exclude exploit steps, evasion instructions, malware construction, credential misuse, phishing instructions, and live response actions

21.3.3.6 Advanced Persistent Threats (APTs) annotated source ledger: real titles and local contribution Each source cited by this **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** module is paired below with its real title and a one-line note on what it contributes to **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

Source	Cited work	What it contributes	Status
[237, 2026]	Artificial Intelligence: An Accountability Framework for Federal Agencies and Other Entities	Official GAO AI accountability framework.	original source-guide
[258, 2026]	OpenAPI Specification	The official OpenAPI Initiative publications page, serving as a central index for the OpenAPI Specification and related standards including the Arazzo and Overlay specifications. It provides access to multiple specification versions (2.0, 3.0, 3.1, and 3.2) and their corresponding downloadable schemas identified by release date, along with a registry of extensions, formats, media types, and other resources.	verified source-guide
[261, 2026]	RFC 9110: HTTP Semantics	RFC 9110, the official IETF standards document defining the core semantics and architecture of HTTP, published in June 2022 and consolidating nine earlier RFCs. It establishes terminology and protocol aspects shared across HTTP versions, including methods, status codes, header fields, content negotiation, conditional and range requests, authentication, and the http and https URI schemes.	verified source-guide
[273, 2026]	WCAG 2 Overview	The W3C Web Accessibility Initiative overview of the Web Content Accessibility Guidelines (WCAG), an international standard for making web content accessible to people with disabilities. It explains that WCAG is organized around four principles (perceivable, operable, understandable, robust) with testable success criteria at three conformance levels (A, AA, AAA), and covers versions 2.0, 2.1, and 2.2.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[285, 2026]	NIST AI Resource Center	The NIST AI Resource Center (AIRC), a government platform supporting implementation of the NIST AI Risk Management Framework, a voluntary framework for managing AI risk. It provides the core framework along with a playbook of practical actions, profiles tailored to specific sectors and technologies, use cases, and crosswalks linking the framework to other governance structures.	verified source-guide

Source	Cited work	What it contributes	Status
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide
[290, 2026]	NIST SP 800-218A: Secure Software Development Practices for Generative AI and Dual-Use Foundation Models	NIST Special Publication 800-218A (July 2024), which augments the Secure Software Development Framework with practices specific to AI model development across the software lifecycle. Produced in response to Executive Order 14110, it addresses AI model producers, developers building on those models, and acquirers of AI systems, and is designed to be used alongside NIST SP 800-218.	verified source-guide
[294, 2026]	M-25-21: Accelerating Federal Use of AI through Innovation, Governance, and Public Trust	An April 2025 Office of Management and Budget memorandum (M-25-21) directing executive branch agencies on federal use of artificial intelligence. Issued under Executive Order 14179, it instructs agencies to accelerate adoption of AI to improve public services and government efficiency while maintaining safeguards for civil rights, civil liberties, and privacy.	verified source-guide
[072, 2026]	ATT&CK-based Advanced Persistent Threat attacks risk propagation	The Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK) Framework introduced.	original source-guide
[069, 2026]	Assessing nation-state-sponsored cyberattacks using aspects	They found that the most common cyberattacks initiated by nation-states were espionage focused.	original source-guide
[071, 2026]	I Led IR on Nation-State Attacks at Mandiant, FireEye & CrowdStrike	Attribution becomes harder when its open-source …	original source-guide
[300, 2026]	MITRE ATLAS	MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy.	original source-guide
[303, 2026]	Software Security in Supply Chains	An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation.	verified source-guide

Source	Cited work	What it contributes	Status
[304, 2026]	Secure Software Development Framework (SSDF) Version 1.1: Recommendations for Mitigating the Risk of Software Vulnerabilities	NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences.	verified source-guide
[309, 2026]	STIX Version 2.1	An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection.	verified source-guide
[310, 2026]	TAXII Version 2.1	The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe).	verified source-guide

Where this sits. This module's overview is Section 21; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

21.3.4 Advanced Persistent Threats (APTs) governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 21; [237, 2026].

21.3.5 Advanced Persistent Threats (APTs) analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 13's governance-boundary section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**. [237, 2026]; [258, 2026].
Curriculum topic spine: APT Definitions, Lifecycle, and Attribution, **APT Risk Propagation Models: ATT&CK-Based Analysis**, **Nation-State vs. Ideological Actor Attack Patterns**. **Verified anchor cluster:** [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]; [Cybersecurity and Agency, 2026d]; [of Standards and Technology, 2025c]; [for Economic Co-operation and Development, 2025a].
Conceptual depth: turning indicators, TTPs, incidents, vendor risk, and response lessons into shareable defensive intelligence with clear handling rules.
Method stack: threat-information sharing goals, indicator/TTP normalization, incident-response review, supply-chain risk assessment, and lessons learned.
Composability contract: indicators, TTP mappings, affected assets, supplier evidence, response actions, and sharing constraints remain independently reusable.
Known failure modes: indicator fixation, unvetted sharing, vendor-assurance drift, weak incident scoping, and treating CTI as a feed instead of a workflow.
Defensive boundary: cyber material stays defensive and tabletop-based; it does not provide exploit, persistence, evasion, or live-response instructions.
Applied to **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

Anchor	Why it matters here
[of Standards and Technology, 2016]	Official guidance for establishing threat-information sharing goals, communities, distribution rules, and defensive use of indicators and TTPs. Checked as of 2026-05-21; role: curriculum_anchor.
[Committee, 2025]	OASIS CTI standard for expressing cyber threat and observable information with structured objects, relationships, sightings, and markings. Checked as of 2026-05-21; role: curriculum_anchor.
[Committee, 2021]	OASIS CTI transport standard for defensive threat-intelligence exchange channels, collections, discovery, and API contracts. Checked as of 2026-05-21; role: curriculum_anchor.
[MITRE, 2026b]	Threat-informed enterprise matrix for defensive TTP mapping, coverage analysis, detection engineering, and analytic normalization. Checked as of 2026-05-21; role: curriculum_anchor.
[Cybersecurity and Agency, 2026d]	Official catalog for prioritizing known exploited vulnerabilities as defensive triage inputs, not as exploitation instructions. Checked as of 2026-05-21; role: curriculum_anchor.
[of Standards and Technology, 2025c]	Official incident-response profile for preparation, detection, response, recovery, and continuous improvement under CSF 2.0. Checked as of 2026-05-21; role: curriculum_anchor.
[for Economic Co-operation and Development, 2025a]	OECD policy paper proposing a common AI incident reporting framework for jurisdictions and sectors, including criteria for impact and risk characterization. Checked as of 2026-05-24; role: curriculum_anchor.

21.3.5.1 Advanced Persistent Threats (APTs) evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [237, 2026]; [258, 2026].

21.3.6 Advanced Persistent Threats (APTs) agentic boundary: assist, approve, block, and record

Evidence anchor. Section 21; [237, 2026].
AGEINT translation is bounded by the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

21.3.6.1 Advanced Persistent Threats (APTs) permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 21; [237, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

21.3.6.2 Advanced Persistent Threats (APTs) excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [237, 2026]; [258, 2026] and **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

21.3.7 Advanced Persistent Threats (APTs) governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 21; [237, 2026].
Governance is practiced as a gate on the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane. Learners use the **Defensive Cyber-Intelligence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues

remain, and when an agent-assisted artifact must stop for human review while using **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

21.3.7.1 Advanced Persistent Threats (APTs) governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [237, 2026]; [258, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** failure modes and the **Defensive Cyber-Intelligence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

21.3.7.2 Advanced Persistent Threats (APTs) evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 21; [237, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Defensive Cyber-Intelligence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

21.3.7.3 Advanced Persistent Threats (APTs) current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**. [237, 2026]; [258, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_nist_sp_800_150` for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**?	Guide to Cyber Threat Information Sharing, NIST SP 800-150; lane `cyber_threat_intelligence`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; Official guidance for establishing threat-information sharing goals, communities, distribution rules, and defensive use of indicators and TTPs.
What does the module inherit from `official_oasis_stix_21` for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**?	STIX Version 2.1; lane `cyber_threat_intelligence`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; OASIS CTI standard for expressing cyber threat and observable information with structured objects, relationships, sightings, and markings.
What does the module inherit from `official_oasis_taxii_21` for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**?	TAXII Version 2.1; lane `cyber_threat_intelligence`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; OASIS CTI transport standard for defensive threat-intelligence exchange channels, collections, discovery, and API contracts.
What does the module inherit from `official_mitre_attack_enterprise` for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**?	MITRE ATT&CK Enterprise Matrix; lane `cyber_threat_intelligence`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; Threat-informed enterprise matrix for defensive TTP mapping, coverage analysis, detection engineering, and analytic normalization.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 21; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

21.3.8 Advanced Persistent Threats (APTs) assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 21; [237, 2026].

21.3.9 Advanced Persistent Threats (APTs) assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 21; [237, 2026].

21.3.9.1 Advanced Persistent Threats (APTs) capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis** and [237, 2026]; [258, 2026].

21.3.9.2 Advanced Persistent Threats (APTs) instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis** and [237, 2026]; [258, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

21.3.9.3 Advanced Persistent Threats (APTs) assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
APT Definitions, Lifecycle, and Attribution	Completed **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
APT Risk Propagation Models: ATT&CK-Based Analysis	Completed **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Nation-State vs. Ideological Actor Attack Patterns	Completed **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

21.3.10 Advanced Persistent Threats (APTs) refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [237, 2026]; [258, 2026] and **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**.

21.3.10.1 Advanced Persistent Threats (APTs) refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**. The local signals begin with [237, 2026]; [258, 2026].

21.3.10.2 Advanced Persistent Threats (APTs) claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**, and the source spine for these checks begins with [237, 2026]; [258, 2026].

21.3.11 Advanced Persistent Threats (APTs) reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [237, 2026]; [258, 2026].

Triangulation anchors. In module 13's review-checklist section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis**. [237, 2026]; [258, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

21.3.12 Advanced Persistent Threats (APTs) learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **APT Definitions, Lifecycle, and Attribution; APT Risk Propagation Models: ATT&CK-Based Analysis** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [237, 2026]; [258, 2026].

Section 2, Section 19, Section 20, Section 22

22 Supply Chain Intelligence Attacks

22.0.1 Supply Chain Intelligence Attacks figures and course links: visual evidence, source flow, and navigation

The module uses Figure 56 and Figure 52 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.

Navigation links: Section 2, Section 19, Section 21, Section 23.

This module teaches the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane through a bounded, source-backed coursebook chapter. [258, 2026]; [266, 2026].

22.1 Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense frame for Supply Chain Intelligence Attacks: source context, topic focus, and reader task

Evidence anchor. Section 22; [258, 2026].

22.1.1 Supply Chain Intelligence Attacks orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 22; [258, 2026].

22.1.2 Supply Chain Intelligence Attacks conceptual primer: source context, core model, and reader task

This chapter teaches cyber threat intelligence as defensive normalization: incidents, indicators, TTPs, vendor risks, and sharing rules become useful only when scoped and validated. The chapter uses **Software-Supply-Chain Assurance Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

The central distinction is to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. Core topics include **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation; XZ Utils maintainer-trust case review for software supply-chain governance**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.

Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [258, 2026]; [266, 2026].

Learners move from vocabulary and the **Software-Supply-Chain Assurance Lens** distinction through topic lessons on **Supply Chain Operations as Strategic Intelligence Tradecraft** with evidence and misconception checks, then assemble a **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** with safety and rights gates.

22.1.3 Supply Chain Intelligence Attacks learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 22; [258, 2026].

- Connect **Supply Chain Operations as Strategic Intelligence Tradecraft and SolarWinds/SUNBURST: The Six-Month Patient Operation** to **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate defensive mapping and incident learning from exploit, persistence, or evasion instruction; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as indicator fixation, unvetted sharing, vendor-assurance drift, weak incident scoping, and treating CTI as a feed instead of a workflow, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: cyber material stays defensive and tabletop-based; it does not provide exploit, persistence, evasion, or live-response instructions.

22.1.4 Supply Chain Intelligence Attacks core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 22; [258, 2026].

Term	Working definition
Indicator	an observable signal that may support defensive detection or investigation
TTP	a tactic, technique, or procedure used for structured defensive mapping
Sighting	a bounded observation of a possible indicator in a given context
Handling rule	a sharing, marking, or retention limit for threat information
Lessons learned	the post-incident evidence that changes controls or playbooks
Supply Chain Operations as Strategic…	Key terms: Supply, Chain, Operations.
SolarWinds/SUNBURST: The Six-Month Patient…	Key terms: SolarWinds, SUNBURST, Six.

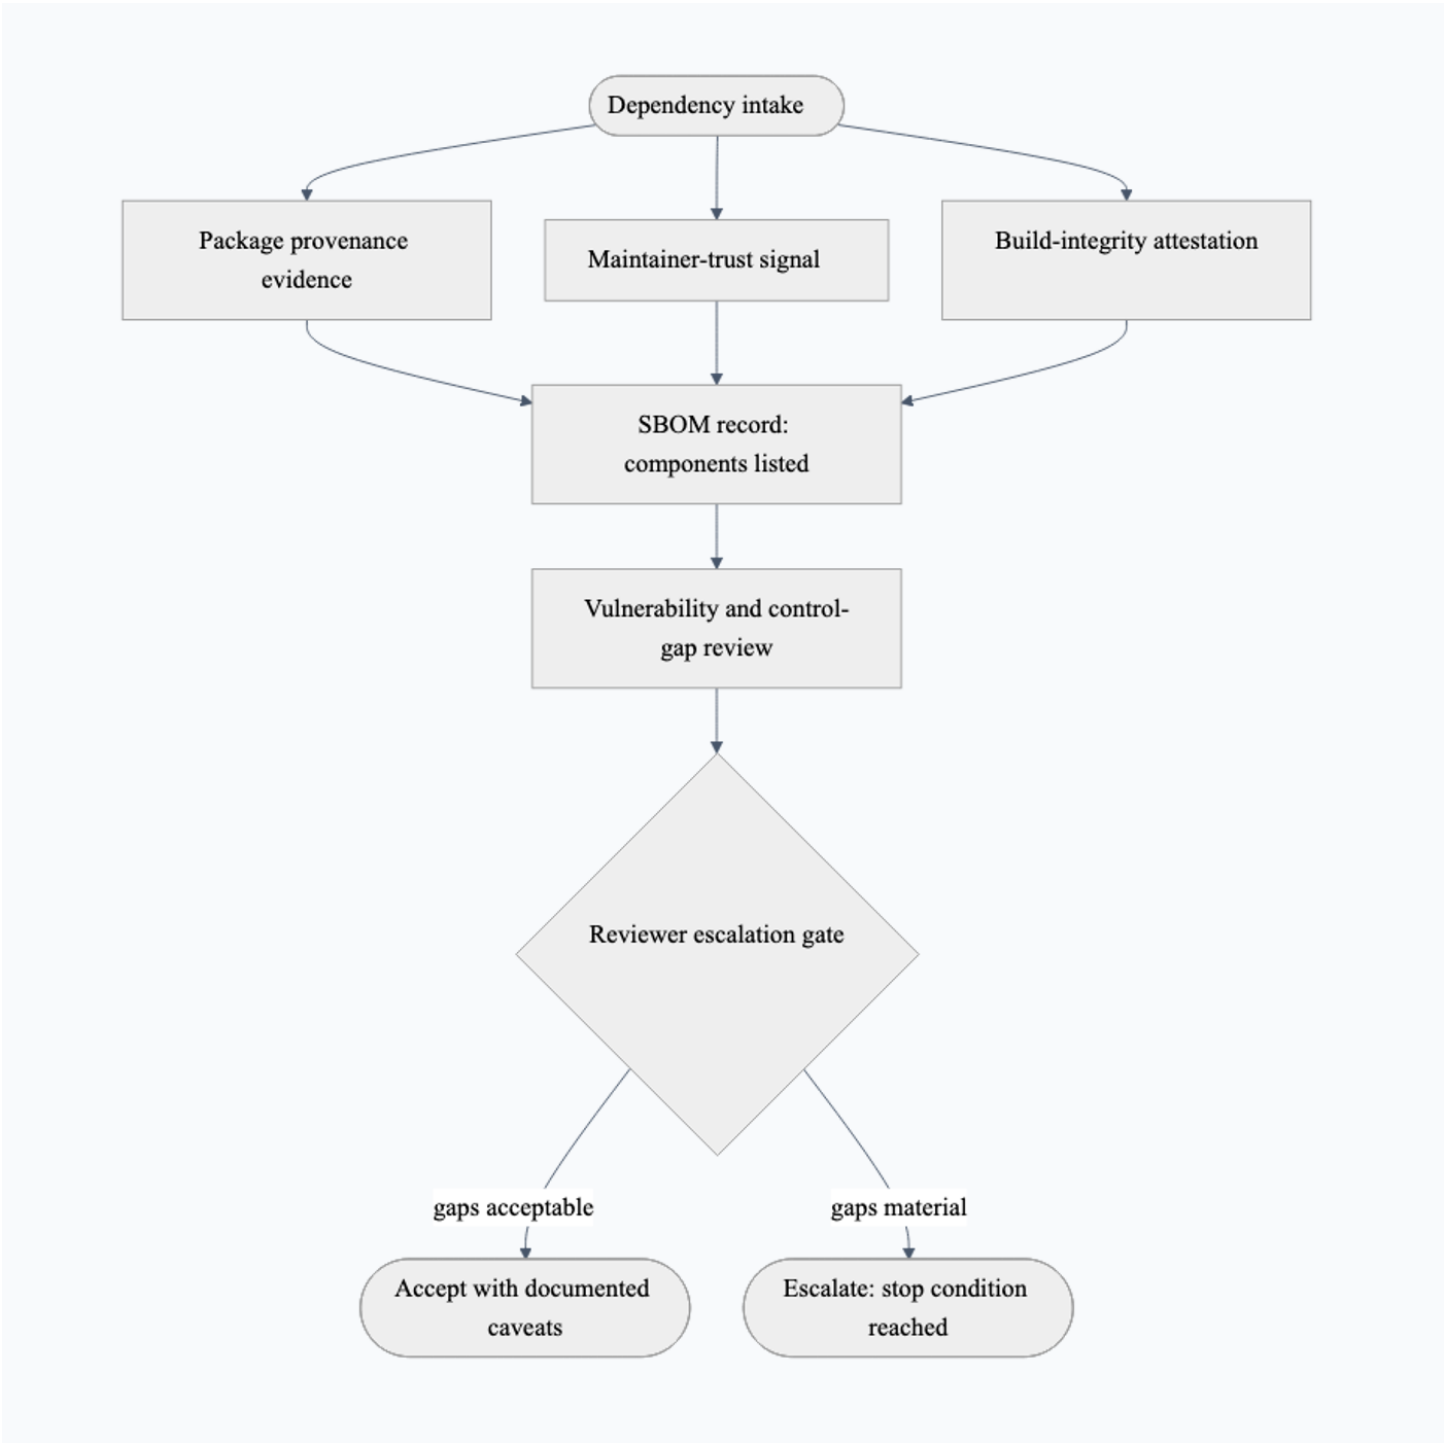

Figure 56: This diagram traces how package provenance, maintainer-trust signals, build integrity, and an SBOM converge into a reviewable assurance packet that names control gaps and an escalation boundary. It is anchored to the technical intelligence and cyber operations / supply chain intelligence attacks section; use it to inspect Dependency intake, Package provenance evidence, Maintainer-trust signal, and Build-integrity attestation while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

22.2 Software-Supply-Chain Assurance Lens path for Supply Chain Intelligence Attacks: lesson cluster, safe artifact, and review

Evidence anchor. Section 22; [258, 2026].

22.2.1 Supply Chain Intelligence Attacks practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 22; [258, 2026].

22.2.2 Supply Chain Intelligence Attacks topic lessons: source-backed concepts and transfer tasks

This module builds cyber threat intelligence as defensive normalization: incidents, indicators, TTPs, vendor risks, and sharing rules become useful only when scoped and validated. The sequence opens with **Supply Chain Operations as Strategic Intelligence Tradecraft**, **SolarWinds/SUNBURST: The Six-Month Patient Operation**, **XZ Utils maintainer-trust case review for software supply-chain governance** and applies the **Software-Supply-Chain Assurance Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 52; module overview Section 22; curriculum atlas Section 2.

Triangulation anchors. In module 14's topic-lessons section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

22.2.2.1 Lesson 1: Supply Chain Operations as Strategic Intelligence Tradecraft **Concept. Supply Chain Operations as Strategic Intelligence Tradecraft** shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Without explicit treatment of **Supply Chain Operations**, indicator fixation undermines defensive CTI normalization and tabletop incident learning review; the lesson builds the habit to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Source support. Supply Chain Operations as Strategic Intelligence Tradecraft rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for fixing what **Supply Chain Operations as Strategic Intelligence Tradecraft** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **Supply Chain Operations** in the evidence the row cites. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Supply Chain Operations**, build a **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **Supply Chain Operations as Strategic**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Supply Chain Operations** work as a **defensive CTI evidence packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Supply Chain Operations as Strategic Intelligence Tradecraft replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Supply Chain Operations** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

22.2.2.2 Lesson 2: SolarWinds/SUNBURST: The Six-Month Patient Operation **Concept. SolarWinds/SUNBURST: The Six-Month Patient Operation** shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Analysts use **SolarWinds/SUNBURST** to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. A defensible treatment names the judgment it enables for defensive CTI normalization and tabletop incident learning review, the proof limit that indicator fixation would otherwise hide, and the reviewer accountable for challenge.

Source support. SolarWinds/SUNBURST: The Six-Month Patient Operation rests on [073, 2026]. Its anchor reference records: It explains how attackers compromised SolarWinds' Orion monitoring software with malicious code that spread to roughly 18,000 customers through software updates beginning in early 2020, and notes the attack's extended timeline and impact on U.S. Use it for fixing what **SolarWinds/SUNBURST: The Six-Month Patient Operation** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Read **SolarWinds/SUNBURST** against the works cited for this row. [073, 2026] This Fortinet cybersecurity glossary page provides educational material about the SolarWinds supply chain attack. It explains how attackers compromised SolarWinds' Orion monitoring software with malicious code that spread to roughly 18,000 customers through software updates beginning in early 2020, and notes the attack's extended timeline and impact on U.S. federal agencies and major companies. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **SolarWinds/SUNBURST**, build a **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **SolarWinds/SUNBURST**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **SolarWinds/SUNBURST** work as a **defensive CTI evidence packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that SolarWinds/SUNBURST: The Six-Month Patient Operation can be used while ignoring the rule to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Transfer task. Transfer **SolarWinds/SUNBURST** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

22.2.2.3 Lesson 3: XZ Utils maintainer-trust case review for software supply-chain governance **Concept. XZ Utils maintainer-trust case review for software supply-chain governance** shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. XZ Utils maintainer-trust case review connects classroom vocabulary to Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. XZ Utils maintainer-trust case review for software supply-chain governance rests on [074, 2026], [075, 2026], and [076, 2026]. The closest source to this row notes: It describes how malicious code was hidden in test files and assembled only during compilation, potentially enabling unauthenticated remote code execution via OpenSSH, and how a long-term contributor gradually gained maintainer trust before inserting it. Use them for fixing what **XZ Utils maintainer-trust case review for software supply-chain governance** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **XZ Utils maintainer-trust case review** in the evidence the row cites. [074, 2026] A Vectra AI blog post from April 2024 analyzing the XZ Utils backdoor, a malicious commit discovered on March 29, 2024 in a widely used open-source compression library that could compromise affected systems via SSH. The article frames the incident as a supply chain compromise affecting both open-source and commercial software, drawing comparison to SolarWinds. [075, 2026] An Invicti Security blog post from April 2024 analyzing the xz-utils backdoor, a software supply chain compromise discovered in versions 5.6.0 and 5.6.1 of the compression library. It describes how malicious code was hidden in test files and assembled only during compilation, potentially enabling unauthenticated remote code execution via OpenSSH, and how a long-term contributor gradually gained maintainer trust before inserting it. [076, 2026] In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. The perpetrator, operating under the pseudonym Jia Tan, spent over two years building trust as a contributor before inserting the exploit, which received a maximum CVSS score of 10.0. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **XZ Utils maintainer-trust case review**, build a maintainer-trust evidence card with provenance, communication-risk signal, uncertainty, and escalation boundary. Shape **XZ Utils maintainer-trust case review** work as a **defensive CTI evidence packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a familiar maintainer name or popular package is a substitute for verifying provenance, integrity, and the chain of trust.

Transfer task. Transfer **XZ Utils maintainer-trust case review** from this module to a second motif by preserving defensive CTI normalization and tabletop incident learning, replacing action with audit, and naming the blocked use.

22.2.2.4 Lesson 4: Maintainer-contact provenance review for software supply-chain governance

Concept. Maintainer-contact provenance review for software supply-chain governance treats human-source work as a governed relationship: validation, consent, reporting, source protection, and oversight—not contact activity.

Why it matters. Without explicit treatment of **Maintainer-contact provenance review**, indicator fixation undermines defensive CTI normalization and tabletop incident learning review; the lesson builds the habit to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Source support. Maintainer-contact provenance review for software supply-chain governance rests on [076, 2026]. The closest source to this row notes: In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. Use it for the claim that **Maintainer-contact provenance review for software supply-chain governance** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Maintainer-contact provenance review**, reason from the sources cited in this row. [076, 2026] In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. The perpetrator, operating under the pseudonym Jia Tan, spent over two years building trust as a contributor before inserting the exploit, which received a maximum CVSS score of 10.0. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Maintainer-contact provenance review**, build a maintainer-trust evidence card with provenance, communication-risk signal, uncertainty, and escalation boundary. Shape **Maintainer-contact provenance review** work as a **defensive CTI evidence packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a familiar maintainer name or popular package is a substitute for verifying provenance, integrity, and the chain of trust.

Transfer task. Apply this module's safe boundary for **Maintainer-contact provenance review** to another artifact while keeping defensive CTI normalization and tabletop incident learning and reviewer ownership explicit.

22.2.2.5 Lesson 5: CVE-2024-3094: CVSS 10.0 Backdoor Mechanism

Concept. CVE-2024-3094: CVSS 10.0 Backdoor Mechanism treats the vulnerability record as an assurance case: severity, affected component, provenance, mitigation status, and uncertainty stay separate.

Why it matters. CVE-2024-3094 matters in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane because defensive CTI normalization and tabletop incident learning evidence must stay separate from judgment; indicator fixation is a common failure.

Source support. CVE-2024-3094: CVSS 10.0 Backdoor Mechanism rests on [076, 2026]. The most specific cited work observes: In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. Use it for the working definition that **CVE-2024-3094: CVSS 10.0 Backdoor Mechanism** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **CVE-2024-3094** in the evidence the row cites. [076, 2026] In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. The perpetrator, operating under the pseudonym Jia Tan, spent over two years building trust as a contributor before inserting the exploit, which received a maximum CVSS score of 10.0. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **CVE-2024-3094**, build a **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **CVE**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **CVE-2024-3094** work as a **defensive CTI evidence packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that CVE-2024-3094: CVSS 10.0 Backdoor Mechanism replaces human review whenever evidence looks plausible.

Transfer task. Transfer **CVE-2024-3094** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

22.2.2.6 Lesson 6: Attribution Indicators: APT29/SVR Pattern Similarities

Concept. Attribution Indicators: APT29/SVR Pattern Similarities uses attribution indicators cautiously by separating technical similarity, context, confidence, and geopolitical inference.

Why it matters. Attribution Indicators connects classroom vocabulary to Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Attribution Indicators: APT29/SVR Pattern Similarities rests on [076, 2026]. The lead source's own note reads: In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable

unauthorized remote code execution via OpenSSH using an Ed448 private key. Use it for the claim that **Attribution Indicators: APT29/SVR Pattern Similarities** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Attribution Indicators**, reason from the sources cited in this row. [076, 2026] In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. The perpetrator, operating under the pseudonym Jia Tan, spent over two years building trust as a contributor before inserting the exploit, which received a maximum CVSS score of 10.0. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Attribution Indicators**, build a **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **Attribution Indicators**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Attribution Indicators** work as a **defensive CTI evidence packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Attribution Indicators: APT29/SVR Pattern Similarities can be used while ignoring the rule to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Transfer task. Transfer **Attribution Indicators** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

22.2.2.7 Lesson 7: Maintainer-pressure communication signature review for software supply-chain governance

Concept. Maintainer-pressure communication signature review for software supply-chain governance teaches defensive recognition of manipulation attempts using sample messages, consent boundaries, and reporting duties.

Why it matters. Analysts use **Maintainer-pressure communication signature review** to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction. A defensible treatment names the judgment it enables for defensive CTI normalization and tabletop incident learning review, the proof limit that indicator fixation would otherwise hide, and the reviewer accountable for challenge.

Source support. Maintainer-pressure communication signature review for software supply-chain governance rests on [076, 2026]. The most specific cited work observes: In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. Use it for fixing what **Maintainer-pressure communication signature review for software supply-chain governance** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Read **Maintainer-pressure communication signature review** against the works cited for this row. [076, 2026] In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. The perpetrator, operating under the pseudonym Jia Tan, spent over two years building trust as a contributor before inserting the exploit, which received a maximum CVSS score of 10.0. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Maintainer-pressure communication signature review**, build a maintainer-trust evidence card with provenance, communication-risk signal, uncertainty, and escalation boundary. Shape **Maintainer-pressure communication signature review** work as a **defensive CTI evidence packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a familiar maintainer name or popular package is a substitute for verifying provenance, integrity, and the chain of trust.

Transfer task. Reuse the **Maintainer-pressure communication signature review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

22.2.2.8 Lesson 8: Maintainer-risk escalation review for software supply-chain governance

Concept. Maintainer-risk escalation review for software supply-chain governance analyzes how trust, maintainer contact, and package provenance become supply-chain assurance evidence without contacting or profiling real maintainers.

Why it matters. Without explicit treatment of **Maintainer-risk escalation review**, indicator fixation undermines defensive CTI normalization and tabletop incident learning review; the lesson builds the habit to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Source support. Maintainer-risk escalation review for software supply-chain governance rests on [076, 2026]. The lead source's own note reads: In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. Use it for the working definition that **Maintainer-risk escalation review for software supply-chain governance** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Read **Maintainer-risk escalation review** against the works cited for this row. [076, 2026] In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. The perpetrator, operating under the pseudonym Jia Tan, spent over two years building trust as a contributor before inserting the exploit, which received a maximum CVSS score of 10.0. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Maintainer-risk escalation review**, build a maintainer-trust evidence card with provenance, communication-risk signal, uncertainty, and escalation boundary. Shape **Maintainer-risk escalation review** work as a **defensive CTI evidence packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a familiar maintainer name or popular package is a substitute for verifying provenance, integrity, and the chain of trust.

Transfer task. Reuse the **Maintainer-risk escalation review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

22.2.2.9 Lesson 9: Countermeasures: SBOM, SLSA Framework, Sigstore

Concept. Countermeasures: SBOM, SLSA Framework, Sigstore shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Without explicit treatment of **Countermeasures: SBOM, SLSA Framework, Sigstore**, indicator fixation undermines defensive CTI normalization and tabletop incident learning review; the lesson builds the habit to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Source support. Countermeasures: SBOM, SLSA Framework, Sigstore rests on [300, 2026], [304, 2026], and [306, 2026]. Its anchor reference records: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for the claim that **Countermeasures: SBOM, SLSA Framework, Sigstore** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. Ground **Countermeasures: SBOM, SLSA Framework, Sigstore** in the evidence the row cites. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Countermeasures**, build a **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **Countermeasures**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Countermeasures: SBOM, SLSA Framework, Sigstore** work as a **defensive CTI evidence packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Countermeasures: SBOM, SLSA Framework, Sigstore replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Countermeasures: SBOM, SLSA Framework, Sigstore** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

22.2.2.10 Lesson 10: Threat Intelligence Sharing for ICS Supply Chain (arXiv Survey)

Concept. Threat Intelligence Sharing for ICS Supply Chain (arXiv Survey) shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Threat Intelligence Sharing matters in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane because defensive CTI normalization and tabletop incident learning evidence must stay separate from judgment; indicator fixation is a common failure.

Source support. Threat Intelligence Sharing for ICS Supply Chain (arXiv Survey) rests on [077, 2026]. The closest source to this row notes: An arXiv research paper presenting an evidence-driven analysis of why threat information sharing for industrial control systems remains ineffective. Use it for pinning down the scope of **Threat Intelligence Sharing for ICS Supply Chain (arXiv Survey)**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of Standards and Technology, 2016]; [Committee, 2025].

Evidence to inspect. For **Threat Intelligence Sharing**, reason from the sources cited in this row. [077, 2026] An arXiv research paper presenting an evidence-driven analysis of why threat information sharing for industrial control systems remains ineffective. Drawing on three major ICS attacks and a review of 196 procedure examples across 22 malware families, it identifies limitations including incomplete support in the STIX sharing standard, reliance on proprietary undocumented protocols, and insufficient technical detail in threat and vulnerability reports. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Threat Intelligence Sharing**, build a **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** for this defensive CTI normalization and tabletop incident learning topic. The artifact must name the source descriptor, the bounded claim about **Threat Intelligence Sharing for ICS**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Threat Intelligence Sharing** work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Threat Intelligence Sharing for ICS Supply Chain (arXiv Survey) can be used while ignoring the rule to separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.

Transfer task. Transfer **Threat Intelligence Sharing** to a second module by preserving defensive CTI normalization and tabletop incident learning, changing the source evidence, and naming a new reviewer.

22.2.3 Supply Chain Intelligence Attacks worked safe example: synthetic inputs, evidence, and review

Worked example: a sample campus SOC reviews fabricated alert records after a tabletop incident. [258, 2026]; [266, 2026].

Triangulation anchors. In module 14's worked-example section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **defensive cyber intelligence normalization**. Learners use a **defensive CTI evidence packet** and keep this boundary visible: No exploit, persistence, evasion, scanning, or production response instructions.

Frame. The classroom question centers on **Supply Chain Operations as Strategic Intelligence Tradecraft**. Excluded actions stay explicit, and the **Software-Supply-Chain Assurance Lens** planning question is: Which package, maintainer signal, build artifact, provenance claim, and assurance control needs review?

Inputs. For the **Supply Chain Operations as Strategic Intelligence Tradecraft** scenario, use toy alerts, synthetic asset names, public ATT&CK technique descriptions, and a sharing-policy card. The Software-Supply-Chain Assurance Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Supply Chain Operations as Strategic Intelligence Tradecraft**, students normalize indicators, map TTPs defensively, rate confidence, mark sharing limits, and record lessons learned. Pause whenever an inference about Supply Chain Operations as Strategic Intelligence Tradecraft appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Supply Chain Operations as Strategic Intelligence Tradecraft** classroom scenario; unit artifact = defensive CTI evidence packet; evidence = allowed inputs; method = defensive CTI normalization and tabletop incident learning; output = a CTI packet with indicators, TTP mapping, confidence, handling rule, and remediation owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Supply Chain Operations as Strategic Intelligence Tradecraft** as "Software-Supply-Chain Assurance Lens confirms it" is not enough. The revision ties the claim to defensive CTI normalization and tabletop incident learning, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Supply Chain Operations as Strategic Intelligence Tradecraft** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

22.2.4 Supply Chain Intelligence Attacks practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Software-Supply-Chain Assurance Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

Triangulation anchors. In module 14's practice-sequence section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Supply Chain Operations as Strategic Intelligence Tradecraft, SolarWinds/SUNBURST: The Six-Month Patient Operation, XZ Utils maintainer-trust case review for software supply-chain governance; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane.
2. Frame	Answer the lens question: Which package, maintainer signal, build artifact, provenance claim, and assurance control needs review?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Supply Chain Operations as Strategic Intelligence Tradecraft: software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the defensive CTI evidence packet fields for Supply Chain Operations as Strategic Intelligence Tradecraft.	Unit profile note.	Evidence artifacts include indicator context, TTP mapping.
4. Challenge	Test the misconception that Supply Chain Operations as Strategic Intelligence Tradecraft replaces human review whenever evidence looks plausible.	Failure-mode note.	The artifact applies the key distinction: separate defensive mapping and incident learning from exploit, persistence, or evasion instruction.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

22.2.4.1 Supply Chain Intelligence Attacks instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**. [258, 2026]; [266, 2026].

22.2.4.2 Supply Chain Intelligence Attacks extension exercise: peer validation and refresh trigger review Evidence anchor. Section 22; [258, 2026].

Have learners swap artifacts and apply the **Software-Supply-Chain Assurance Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

22.2.5 Supply Chain Intelligence Attacks knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 22; [258, 2026].

1. Explain how **Supply Chain Operations as Strategic Intelligence Tradecraft** is defined here; name the source descriptor that supports the definition.
2. Contrast **Supply Chain Operations as Strategic Intelligence Tradecraft** with **SolarWinds/SUNBURST: The Six-Month Patient Operation** using the **Software-Supply-Chain Assurance Lens** artifact fields.
3. Identify one failure mode from the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which indicator is useful only after context and confidence are added?
5. Correct this misconception: that Supply Chain Operations as Strategic Intelligence Tradecraft replaces human review whenever evidence looks plausible.

22.2.5.1 Supply Chain Intelligence Attacks answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Supply Chain Operations as Strategic Intelligence Tradecraft** without source evidence, uncertainty, or a safe transfer task.

22.3 Supply Chain Intelligence Attacks assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 22; [258, 2026].

22.3.1 Supply Chain Intelligence Attacks evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 22; [258, 2026].

22.3.2 Supply Chain Intelligence Attacks transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 22; [258, 2026].

22.3.2.1 Supply Chain Intelligence Attacks lineage and source tradition: profile, concepts, and first anchors This sits in the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lineage: turning indicators, TTPs, incidents, vendor risk, and response lessons into shareable defensive intelligence with clear handling rules. [258, 2026]; [266, 2026].

22.3.2.2 Supply Chain Intelligence Attacks working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 22; [258, 2026].
The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**, with provenance and reviewability throughout.

22.3.2.3 Supply Chain Intelligence Attacks knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** fabricated alerts, public taxonomy labels, incident context, supplier evidence, and handling rules. [258, 2026]; [266, 2026].
- **Transforms:** indicator normalization, TTP mapping, confidence scoring, sharing review, and control-gap analysis.
- **Outputs:** defensive CTI packet, handling note, control implication, and incident-learning memo.
- **Failure modes:** exploit detail leakage, indicator fixation, unvetted sharing, and unsupported attribution.

22.3.2.4 Supply Chain Intelligence Attacks transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 22; [258, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.
- **Evidence contract:** keep the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as defensive CTI packet, handling note, control implication, and incident-learning memo that another reviewer can audit.

22.3.2.5 Supply Chain Intelligence Attacks profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 22; [258, 2026].
The matched profile emphasizes turning indicators, TTPs, incidents, vendor risk, and response lessons into shareable defensive intelligence with clear handling rules. The method stack is threat-information sharing goals, indicator/TTP normalization, incident-response review, supply-chain risk assessment, and lessons learned; the local topic cluster is **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

22.3.3 Supply Chain Intelligence Attacks evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 22; [258, 2026].
Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** profile tells reviewers what evidence is strong enough for the module artifact built around **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

22.3.3.1 Supply Chain Intelligence Attacks guide source spine: inherited keys and local citation roles Primary guide citations: [258, 2026]; [266, 2026]; [268, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [073, 2026]; [074, 2026]; [075, 2026]; [076, 2026]; [077, 2026]; [297, 2026]; [298, 2026]; [300, 2026]; [304, 2026]; [306, 2026].

22.3.3.2 Supply Chain Intelligence Attacks verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [258, 2026]; [266, 2026].

Tier	What counts	How it is used
Source guide	[258, 2026]; [266, 2026]; [268, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [073, 2026]; [074, 2026]; [075, 2026]; [076, 2026]; [077, 2026]; [297, 2026]; [298, 2026]; [300, 2026]; [304, 2026]; [306, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 14's source-canon section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Maintenance rule: Perplexity may suggest candidates for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation** and [258, 2026]; [266, 2026], but only directly verified source URLs are encoded as citations.

22.3.3.3 Supply Chain Intelligence Attacks intelligence practice lens: evidence artifact and safety check Practice lens: **Software-Supply-Chain Assurance Lens** for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**. [258, 2026]; [266, 2026].

Planning question: Which package, maintainer signal, build artifact, provenance claim, and assurance control needs review?

Evidence artifact: software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps.

Validation rule: separate provenance evidence, social-trust signals, build controls, vulnerability claims, and attribution uncertainty. Applied to **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

Handoff contract: handoff preserves package identity, source evidence, build evidence, review owner, uncertainty, and remediation priority as separate fields.

Safety check: exclude exploit reproduction, maintainer targeting, backdoor mechanics, credential hunting, and live repository interference.

22.3.3.4 Supply Chain Intelligence Attacks runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 22; [258, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	14.99	14.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Supply Chain Intelligence Attacks to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	14.101	14.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Supply Chain Intelligence Attacks	Cyber-Physical Readiness Lens	tabletop packet with OT asset inventory, architecture record, consequences, injects, and debrief rubric	keep exercises lab-only or tabletop; exclude exploitation, process manipulation, unsafe actuation, and live-control actions
Model-card, recoverability, retention, and learner-support evidence package	14.102	14.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Supply Chain Intelligence Attacks	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Supply Chain Operations as Strategic Intelligence Tradecraft	14.1	14.1 Supply Chain Operations as Strategic Intelligence Tradecraft	Software-Supply-Chain Assurance Lens	software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps	exclude exploit reproduction, maintainer targeting, backdoor mechanics, credential hunting, and live repository interference

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check

Countermeasures: SBOM, SLSA Framework, Sigstore	Software-Supply-Chain Assurance Lens	software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps	exclude exploit reproduction, maintainer targeting, backdoor mechanics, credential hunting, and live repository interference
Threat Intelligence Sharing for ICS Supply Chain (arXiv Survey)	Cyber-Physical Readiness Lens	tabletop packet with OT asset inventory, architecture record, consequences, injects, and debrief rubric	keep exercises lab-only or tabletop; exclude exploitation, process manipulation, unsafe actuation, and live-control actions

22.3.3.6 Supply Chain Intelligence Attacks annotated source ledger: real titles and local contribution Each source cited by this **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** module is paired below with its real title and a one-line note on what it contributes to **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

Source	Cited work	What it contributes	Status
[258, 2026]	OpenAPI Specification	The official OpenAPI Initiative publications page, serving as a central index for the OpenAPI Specification and related standards including the Arazzo and Overlay specifications. It provides access to multiple specification versions (2.0, 3.0, 3.1, and 3.2) and their corresponding downloadable schemas identified by release date, along with a registry of extensions, formats, media types, and other resources.	verified source-guide
[266, 2026]	PROV Overview	A W3C Working Group Note from 2013 that provides an overview and roadmap for the PROV family of specifications for representing and exchanging provenance information on the web. It defines provenance as information about the entities, activities, and people involved in producing data, used to assess quality, reliability, and trustworthiness.	verified source-guide

Source	Cited work	What it contributes	Status
[268, 2026]	Data Catalog Vocabulary (DCAT) Version 3	DCAT Version 3 is a W3C RDF vocabulary designed to facilitate interoperability between data catalogs published on the web, enabling organizations to describe datasets and data services using standardized terminology for improved discoverability and federated search. The specification organizes catalog metadata around seven core classes including Catalog, Dataset, Distribution, Data Service, and Dataset Series, drawing on established vocabularies such as Dublin Core and FOAF.	verified source-guide
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide

Source	Cited work	What it contributes	Status
[288, 2026]	Algorithmic Transparency Recording Standard Hub	A GOV.UK collection page serving as the hub for the UK Algorithmic Transparency Recording Standard (ATRS), maintained by the Government Digital Service. It provides a standardized template for documenting public-sector use of algorithmic tools, completion guidance, policy on scope and compliance, and a searchable repository of published transparency records.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[073, 2026]	SolarWinds Supply Chain Attack - Fortinet	This Fortinet cybersecurity glossary page provides educational material about the SolarWinds supply chain attack. It explains how attackers compromised SolarWinds' Orion monitoring software with malicious code that spread to roughly 18,000 customers through software updates beginning in early 2020, and notes the attack's extended timeline and impact on U.S. federal agencies and major companies.	verified source-guide
[074, 2026]	How to Protect Against a Supply Chain Compromise - Vectra AI	A Vectra AI blog post from April 2024 analyzing the XZ Utils backdoor, a malicious commit discovered on March 29, 2024 in a widely used open-source compression library that could compromise affected systems via SSH. The article frames the incident as a supply chain compromise affecting both open-source and commercial software, drawing comparison to SolarWinds.	verified source-guide
[075, 2026]	The Xz-Utils Backdoor: The Supply Chain RCE That Got Caught	An Invicti Security blog post from April 2024 analyzing the xz-utils backdoor, a software supply chain compromise discovered in versions 5.6.0 and 5.6.1 of the compression library. It describes how malicious code was hidden in test files and assembled only during compilation, potentially enabling unauthenticated remote code execution via OpenSSH, and how a long-term contributor gradually gained maintainer trust before inserting it.	verified source-guide
[076, 2026]	XZ Utils backdoor	In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. The perpetrator, operating under the pseudonym Jia Tan, spent over two years building trust as a contributor before inserting the exploit, which received a maximum CVSS score of 10.0.	verified source-guide context; do not use as primary analytic support

[306, 2026]	Artificial Intelligence	Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support.	original source-guide

Where this sits. This module's overview is Section 22; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

22.3.4 Supply Chain Intelligence Attacks governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 22; [258, 2026].

22.3.5 Supply Chain Intelligence Attacks analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 14's governance-boundary section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**. [258, 2026]; [266, 2026].
Curriculum topic spine: Supply Chain Operations as Strategic Intelligence Tradecraft, **SolarWinds/SUNBURST: The Six-Month Patient Operation**, **XZ Utils maintainer-trust case review for software supply-chain governance**. **Verified anchor cluster:** [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]; [Cybersecurity and Agency, 2026d]; [of Standards and Technology, 2025c]; [for Economic Co-operation and Development, 2025a].
Conceptual depth: turning indicators, TTPs, incidents, vendor risk, and response lessons into shareable defensive intelligence with clear handling rules.
Method stack: threat-information sharing goals, indicator/TTP normalization, incident-response review, supply-chain risk assessment, and lessons learned.
Composability contract: indicators, TTP mappings, affected assets, supplier evidence, response actions, and sharing constraints remain independently reusable.
Known failure modes: indicator fixation, unvetted sharing, vendor-assurance drift, weak incident scoping, and treating CTI as a feed instead of a workflow.
Defensive boundary: cyber material stays defensive and tabletop-based; it does not provide exploit, persistence, evasion, or live-response instructions. Applied to **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

Anchor	Why it matters here
[of Standards and Technology, 2016]	Official guidance for establishing threat-information sharing goals, communities, distribution rules, and defensive use of indicators and TTPs. Checked as of 2026-05-21; role: curriculum_anchor.
[Committee, 2025]	OASIS CTI standard for expressing cyber threat and observable information with structured objects, relationships, sightings, and markings. Checked as of 2026-05-21; role: curriculum_anchor.
[Committee, 2021]	OASIS CTI transport standard for defensive threat-intelligence exchange channels, collections, discovery, and API contracts. Checked as of 2026-05-21; role: curriculum_anchor.
[MITRE, 2026b]	Threat-informed enterprise matrix for defensive TTP mapping, coverage analysis, detection engineering, and analytic normalization. Checked as of 2026-05-21; role: curriculum_anchor.
[Cybersecurity and Agency, 2026d]	Official catalog for prioritizing known exploited vulnerabilities as defensive triage inputs, not as exploitation instructions. Checked as of 2026-05-21; role: curriculum_anchor.
[of Standards and Technology, 2025c]	Official incident-response profile for preparation, detection, response, recovery, and continuous improvement under CSF 2.0. Checked as of 2026-05-21; role: curriculum_anchor.
[for Economic Co-operation and Development, 2025a]	OECD policy paper proposing a common AI incident reporting framework for jurisdictions and sectors, including criteria for impact and risk characterization. Checked as of 2026-05-24; role: curriculum_anchor.

22.3.5.1 Supply Chain Intelligence Attacks evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [258, 2026]; [266, 2026].

22.3.6 Supply Chain Intelligence Attacks agentic boundary: assist, approve, block, and record

Evidence anchor. Section 22; [258, 2026].
AGEINT translation is bounded by the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

22.3.6.1 Supply Chain Intelligence Attacks permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 22; [258, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

22.3.6.2 Supply Chain Intelligence Attacks excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [258, 2026]; [266, 2026] and **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

22.3.7 Supply Chain Intelligence Attacks governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 22; [258, 2026].

Governance is practiced as a gate on the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane. Learners use the **Software-Supply-Chain Assurance Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

22.3.7.1 Supply Chain Intelligence Attacks governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [258, 2026]; [266, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** failure modes and the **Software-Supply-Chain Assurance Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

22.3.7.2 Supply Chain Intelligence Attacks evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 22; [258, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Software-Supply-Chain Assurance Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

22.3.7.3 Supply Chain Intelligence Attacks current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**. [258, 2026]; [266, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_nist_sp_800_150` for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**?	Guide to Cyber Threat Information Sharing, NIST SP 800-150; lane `cyber_threat_intelligence`; checked 2026-05-21.	software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps; Official guidance for establishing threat-information sharing goals, communities, distribution rules, and defensive use of indicators and TTPs.
What does the module inherit from `official_oasis_stix_21` for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**?	STIX Version 2.1; lane `cyber_threat_intelligence`; checked 2026-05-21.	software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps; OASIS CTI standard for expressing cyber threat and observable information with structured objects, relationships, sightings, and markings.
What does the module inherit from `official_oasis_taxii_21` for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**?	TAXII Version 2.1; lane `cyber_threat_intelligence`; checked 2026-05-21.	software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps; OASIS CTI transport standard for defensive threat-intelligence exchange channels, collections, discovery, and API contracts.
What does the module inherit from `official_mitre_attack_enterprise` for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**?	MITRE ATT&CK Enterprise Matrix; lane `cyber_threat_intelligence`; checked 2026-05-21.	software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps; Threat-informed enterprise matrix for defensive TTP mapping, coverage analysis, detection engineering, and analytic normalization.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 22; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

22.3.8 Supply Chain Intelligence Attacks assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 22; [258, 2026].

22.3.9 Supply Chain Intelligence Attacks assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 22; [258, 2026].

22.3.9.1 Supply Chain Intelligence Attacks capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation** and [258, 2026]; [266, 2026].

22.3.9.2 Supply Chain Intelligence Attacks instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation** and [258, 2026]; [266, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

22.3.9.3 Supply Chain Intelligence Attacks assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Supply Chain Operations as Strategic Intelligence Tradecraft	Completed **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
SolarWinds/SUNBURST: The Six-Month Patient Operation	Completed **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
XZ Utils maintainer-trust case review for software supply-chain governance	Completed **software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

22.3.10 Supply Chain Intelligence Attacks refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [258, 2026]; [266, 2026] and **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**.

22.3.10.1 Supply Chain Intelligence Attacks refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**. The local signals begin with [258, 2026]; [266, 2026].

22.3.10.2 Supply Chain Intelligence Attacks claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**, and the source spine for these checks begins with [258, 2026]; [266, 2026].

22.3.11 Supply Chain Intelligence Attacks reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [258, 2026]; [266, 2026].

Triangulation anchors. In module 14's review-checklist section, directly verified anchors for the **Cyber Threat Intelligence, Incident Response, and Supply-Chain Defense** lane include [of Standards and Technology, 2016]; [Committee, 2025]; [Committee, 2021]; [MITRE, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation**. [258, 2026]; [266, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.

- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

22.3.12 Supply Chain Intelligence Attacks learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **Supply Chain Operations as Strategic Intelligence Tradecraft; SolarWinds/SUNBURST: The Six-Month Patient Operation** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [258, 2026]; [266, 2026].

Section 2, Section 19, Section 21, Section 23

23 Electronic and Emanations Intelligence

23.0.1 Electronic and Emanations Intelligence figures and course links: visual evidence, source flow, and navigation

The module uses Figure 57 and Figure 52 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 19, Section 22, Section 24.
This module teaches the **Collection Management and Multi-INT Requirements Discipline** lane through a bounded, source-backed coursebook chapter. [255, 2026]; [256, 2026].

23.1 Collection Management and Multi-INT Requirements Discipline frame for Electronic and Emanations Intelligence: source context, topic focus, and reader task

Evidence anchor. Section 23; [255, 2026].

23.1.1 Electronic and Emanations Intelligence orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 23; [255, 2026].

23.1.2 Electronic and Emanations Intelligence conceptual primer: source context, core model, and reader task

This chapter teaches collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The chapter uses **Dissemination-and-Marking Control Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.
The central distinction is to separate collection discipline concepts from operational recruitment, interception, or tasking procedures. Core topics include **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise; Tempest and Van Eck Radiation: SIGINT legal-authority and communications-security governance exercise**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [255, 2026]; [256, 2026].
Learners move from vocabulary and the **Dissemination-and-Marking Control Lens** distinction through topic lessons on **SIGINT legal-authority and communications-security governance exercise** with evidence and misconception checks, then assemble a **dissemination map with audience, caveat, marking, records, and feedback fields** with safety and rights gates.

23.1.3 Electronic and Emanations Intelligence learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 23; [255, 2026].

- Connect **SIGINT legal-authority and communications-security governance exercise and EMINT: SIGINT legal-authority and communications-security governance exercise** to **Collection Management and Multi-INT Requirements Discipline** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **dissemination map with audience, caveat, marking, records, and feedback fields** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures.

23.1.4 Electronic and Emanations Intelligence core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 23; [255, 2026].

Term	Working definition
Priority	the relative importance of an intelligence question
Source discipline	a broad evidence channel such as HUMINT, SIGINT, GEOINT, OSINT, or FININT
Minimization	the rule that limits acquisition, retention, or use of unnecessary information
Source protection	the duty to reduce risk to people, methods, and sensitive relationships
Evaluation	the feedback step that tests whether the evidence satisfied the requirement
Gray-zone indicator	an observable signal of ambiguous coercion below armed conflict thresholds
Proxy pattern	a relationship suggesting indirect sponsorship without confirmed operational control
SIGINT legal-authority and…	Key terms: SIGINT, legal, authority.
EMINT: SIGINT legal-authority and…	Key terms: EMINT, SIGINT, legal.

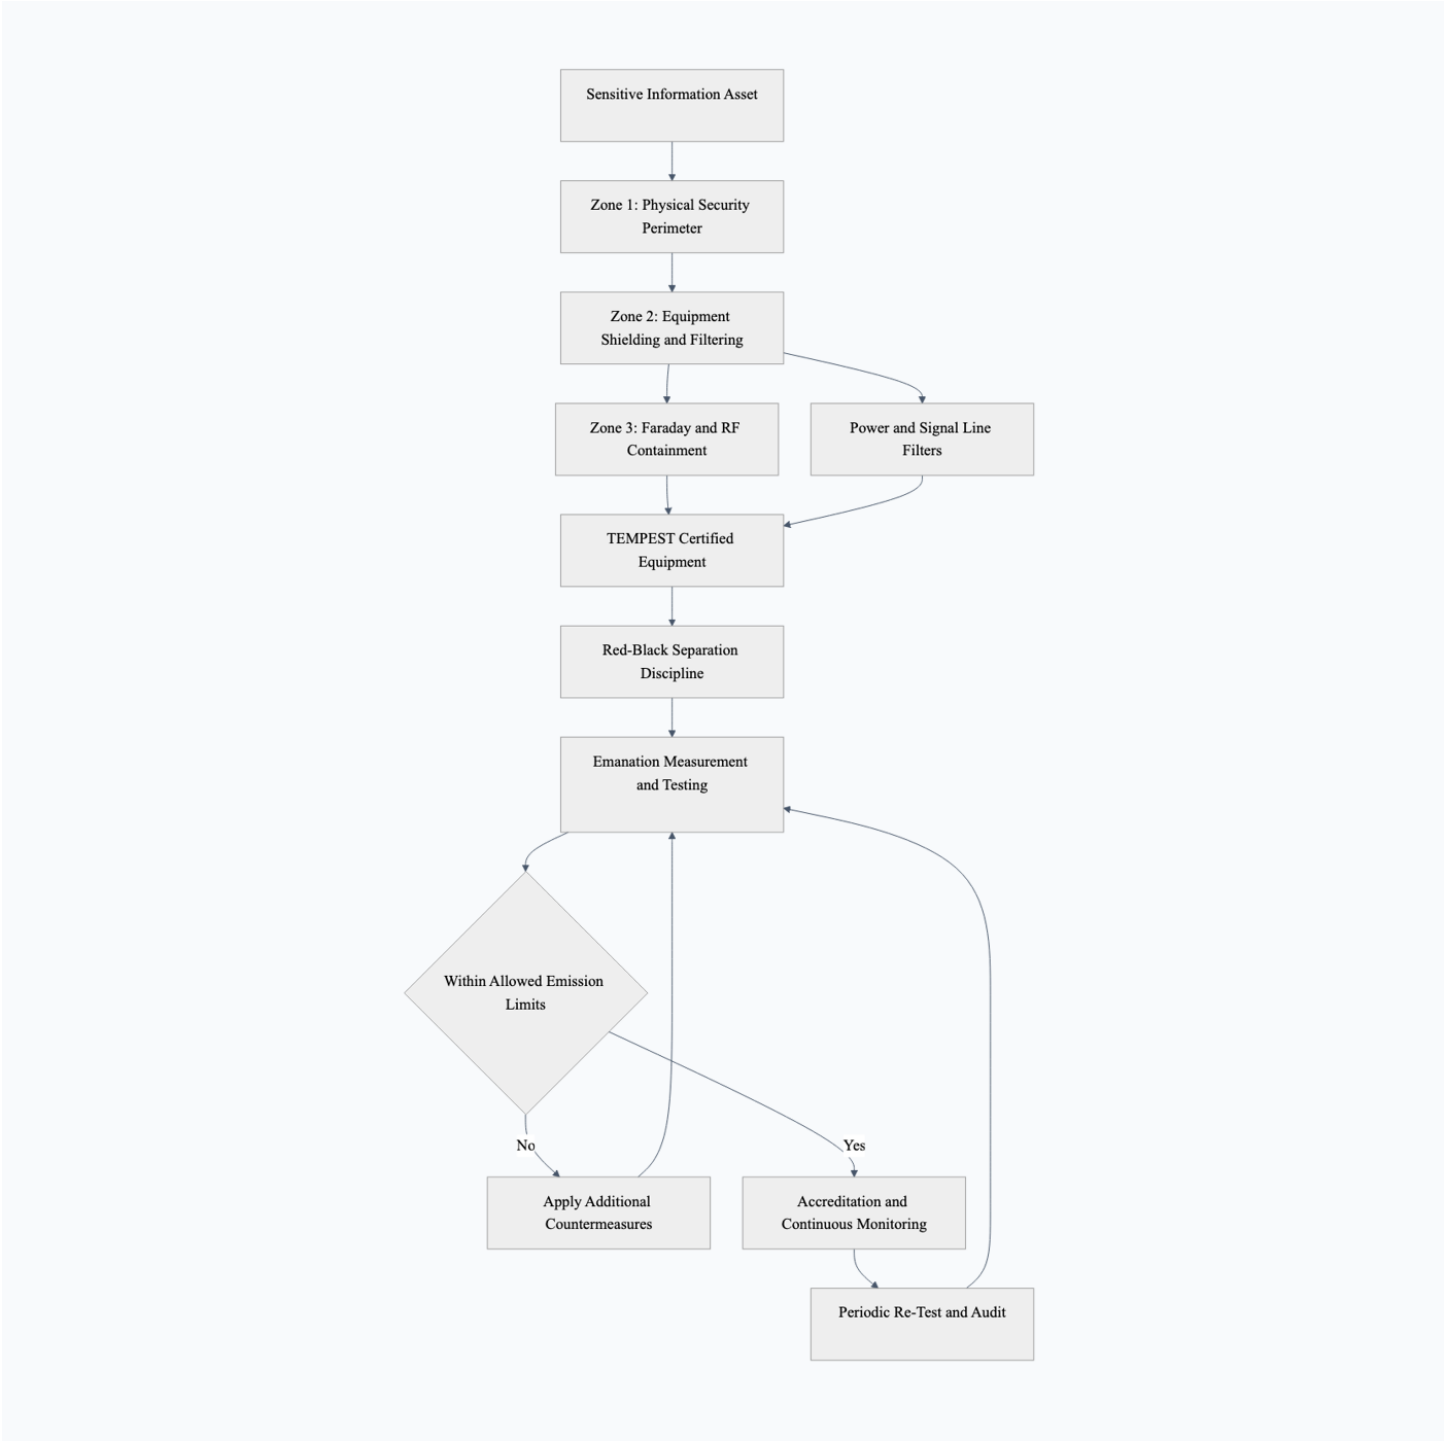

Figure 57: A defensive layered model showing how facilities contain compromising electromagnetic emanations through zoning, shielding, filtering, and continuous emission testing. The captioned view belongs to the technical intelligence and cyber operations / electronic and emanations intelligence section and should be read as a map of Sensitive Information Asset, Zone 1: Physical Security Perimeter, Zone 2: Equipment Shielding and Filtering, and Zone 3: Faraday and RF Containment, not as a capability score or live-task instruction.

23.2 Dissemination-and-Marking Control Lens path for Electronic and Emanations Intelligence: lesson cluster, safe artifact, and review

Evidence anchor. Section 23; [255, 2026].

23.2.1 Electronic and Emanations Intelligence practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 23; [255, 2026].

23.2.2 Electronic and Emanations Intelligence topic lessons: source-backed concepts and transfer tasks

This module builds collection management as requirements discipline: a source method is considered only after the priority, authority, minimization rule, source risk, and evaluation plan are explicit. The sequence opens with **SIGINT legal-authority and communications-security governance exercise**, **EMINT: SIGINT legal-authority and communications-security governance exercise**, **Tempest and Van Eck Radiation: SIGINT legal-authority and communications-security governance exercise** and applies the **Dissemination-and-Marking Control Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 52; module overview Section 23; curriculum atlas Section 2.

Triangulation anchors. In module 15's topic-lessons section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

23.2.2.1 Lesson 1: SIGINT legal-authority and communications-security governance exercise

Concept. SIGINT legal-authority and communications-security governance exercise distinguishes communications content from electronic signatures by evidence type, authority, minimization, and uncertainty.

Why it matters. SIGINT legal-authority connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. SIGINT legal-authority and communications-security governance exercise rests on [035, 2026]. The closest source to this row notes: SIGINT is intelligence derived from electronic signals and systems used by foreign targets. Use it for pinning down the scope of **SIGINT legal-authority and communications-security governance exercise**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **SIGINT legal-authority** against the works cited for this row. [035, 2026] SIGINT is intelligence derived from electronic signals and systems used by foreign targets. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **SIGINT legal-authority**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **SIGINT legal-authority and communications-security governance**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **SIGINT legal-authority** work as a **defensive CTI evidence packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **SIGINT legal-authority**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Transfer **SIGINT legal-authority** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

23.2.2.2 Lesson 2: EMINT: SIGINT legal-authority and communications-security governance exercise

Concept. EMINT: SIGINT legal-authority and communications-security governance exercise frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. EMINT: SIGINT legal-authority and communications-security governance exercise connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. EMINT: SIGINT legal-authority and communications-security governance exercise rests on [078, 2026]. The lead source's own note reads: The book examines tradecraft, defined as the methods, practices, and techniques used in espionage and clandestine investigations. Use it for pinning down the scope of **EMINT: SIGINT legal-authority and communications-security governance exercise**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. Read **EMINT: SIGINT legal-authority and communications-security governance exercise** against the works cited for this row. [078, 2026] A Barnes & Noble listing for Advanced Criminal Investigations and Intelligence Operations by Robert J. Girod. The book examines tradecraft, defined as the methods, practices, and techniques used in espionage and clandestine investigations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **EMINT**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **EMINT**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **EMINT: SIGINT legal-authority and communications-security governance exercise** work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **EMINT: SIGINT legal-authority and communications-security governance exercise**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Apply this module's safe boundary for **EMINT: SIGINT legal-authority and communications-security governance exercise** to another artifact while keeping requirements decomposition and source-discipline fit and reviewer ownership explicit.

23.2.2.3 Lesson 3: Tempest and Van Eck Radiation: SIGINT legal-authority and communications-security governance exercise

Concept. Tempest and Van Eck Radiation: SIGINT legal-authority and communications-security governance exercise frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. Tempest and Van Eck Radiation matters in the **Collection Management and Multi-INT Requirements Discipline** lane because requirements decomposition and source-discipline fit evidence must stay separate from judgment; opportunistic collection is a common failure.

Source support. Tempest and Van Eck Radiation: SIGINT legal-authority and communications-security governance exercise rests on [300, 2026], [303, 2026], and [304, 2026]. The most specific cited work observes: It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. Use them for the working definition that **Tempest and Van Eck Radiation: SIGINT legal-authority**

and communications-security governance exercise can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **Tempest and Van Eck Radiation**, reason from the sources cited in this row. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Tempest and Van Eck Radiation**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **Tempest and Van Eck Radiation**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **Tempest and Van Eck Radiation** work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Tempest and Van Eck Radiation**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Transfer **Tempest and Van Eck Radiation** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

23.2.2.4 Lesson 4: RF-spectrum governance and communications-security

Concept. RF-spectrum governance and communications-security connects the technical term to authority, minimization, communications-security risk, and public doctrine rather than interception mechanics.

Why it matters. RF-spectrum governance connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. RF-spectrum governance and communications-security rests on [303, 2026], [304, 2026], and [305, 2026]. Its anchor reference records: An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. Use them for the claim that **RF-spectrum governance and communications-security** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **RF-spectrum governance**, work from the cited evidence behind this row. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **RF-spectrum governance**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape this subject work as a **defensive CTI evidence packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **RF-spectrum governance**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Transfer **RF-spectrum governance** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

23.2.2.5 Lesson 5: RF Mapping and Spectrum Intelligence: RF-spectrum governance and communications-security

Concept. RF Mapping and Spectrum Intelligence: RF-spectrum governance and communications-security connects the technical term to authority, minimization, communications-security risk, and public doctrine rather than interception mechanics.

Why it matters. RF Mapping and Spectrum Intelligence connects classroom vocabulary to Collection Management and Multi-INT Requirements Discipline practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. RF Mapping and Spectrum Intelligence: RF-spectrum governance and communications-security rests on [302, 2026] and [297, 2026]. The most specific cited work observes: The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Use them for pinning down the scope of **RF Mapping and Spectrum Intelligence: RF-spectrum governance and communications-security**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Community, 2026]; [of the Director of National Intelligence, 2026c].

Evidence to inspect. For **RF Mapping and Spectrum Intelligence**, work from the cited evidence behind this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **RF Mapping and Spectrum Intelligence**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this requirements decomposition and source-discipline fit topic. The artifact must state the authority descriptor, the bounded claim about **RF Mapping and Spectrum Intelligence**, the minimization caveat, the uncertainty note, the collection boundary, and the reviewer accountable for the authorization. Shape **RF Mapping and Spectrum Intelligence** work as a **defensive CTI evidence packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **RF Mapping and Spectrum Intelligence**: that a named collection authority removes the minimization and retention limits on what may be kept.

Transfer task. Transfer **RF Mapping and Spectrum Intelligence** from this module to a second motif by preserving requirements decomposition and source-discipline fit, replacing action with audit, and naming the blocked use.

23.2.3 Electronic and Emanations Intelligence worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic policy cell compares public indicators of hybrid pressure against an approved collection plan for a benign border-disruption exercise. [255, 2026]; [256, 2026].

Triangulation anchors. In module 15's worked-example section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **defensive cyber intelligence normalization**. Learners use a **defensive CTI evidence packet** and keep this boundary visible: No exploit, persistence, evasion, scanning, or production response instructions.

Frame. The classroom question centers on **SIGINT legal-authority and communications-security governance exercise**. Excluded actions stay explicit, and the **Dissemination-and-Marking Control Lens** planning question is: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Inputs. For the **SIGINT legal-authority and communications-security governance exercise** scenario, use public notices, synthetic interview summaries, public logistics records, and an instructor scope card. The Dissemination-and-Marking Control Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **SIGINT legal-authority and communications-security governance exercise**, students rank requirements, choose the least intrusive source discipline, list excluded actions, and evaluate evidence quality. Pause whenever an inference about SIGINT legal-authority and communications-security governance exercise appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **SIGINT legal-authority and communications-security governance exercise** classroom scenario; unit artifact = defensive CTI evidence packet; evidence = allowed inputs; method = requirements decomposition and source-discipline fit; output = a requirements-to-evidence matrix with discipline fit, source caveats, minimization notes, and gaps; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **SIGINT legal-authority and communications-security governance exercise** as "Dissemination-and-Marking Control Lens confirms it" is not enough. The revision ties the claim to requirements decomposition and source-discipline fit, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **SIGINT legal-authority and communications-security governance exercise** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

23.2.4 Electronic and Emanations Intelligence practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Dissemination-and-Marking Control Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

Triangulation anchors. In module 15's practice-sequence section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare SIGINT legal-authority and communications-security governance exercise, EMINT: SIGINT legal-authority and communications-security governance exercise, Tempest and Van Eck Radiation: SIGINT legal-authority and communications-security governance exercise; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Collection Management and Multi-INT Requirements Discipline** lane.
2. Frame	Answer the lens question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for SIGINT legal-authority and communications-security governance exercise: dissemination map with audience, caveat, marking, records, and feedback fields.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the defensive CTI evidence packet fields for SIGINT legal-authority and communications-security governance exercise.	Unit profile note.	Evidence artifacts include indicator context, TTP mapping.
4. Challenge	Test the misconception that a named collection authority removes the minimization and retention limits on what may be kept.	Failure-mode note.	The artifact applies the key distinction: separate collection discipline concepts from operational recruitment, interception, or tasking procedures.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

23.2.4.1 Electronic and Emanations Intelligence instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or

a human review point. Keep the focus on **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [256, 2026].

23.2.4.2 Electronic and Emanations Intelligence extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 23; [255, 2026].
Have learners swap artifacts and apply the **Dissemination-and-Marking Control Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

23.2.5 Electronic and Emanations Intelligence knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 23; [255, 2026].

1. Explain how **SIGINT legal-authority and communications-security governance exercise** is defined here; name the source descriptor that supports the definition.
2. Contrast **SIGINT legal-authority and communications-security governance exercise** with **EMINT: SIGINT legal-authority and communications-security governance exercise** using the **Dissemination-and-Marking Control Lens** artifact fields.
3. Identify one failure mode from the **Collection Management and Multi-INT Requirements Discipline** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which gray-zone indicator changes the least-intrusive source choice without crossing into operational tasking?
5. Correct this misconception: that a named collection authority removes the minimization and retention limits on what may be kept.

23.2.5.1 Electronic and Emanations Intelligence answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **SIGINT legal-authority and communications-security governance exercise** without source evidence, uncertainty, or a safe transfer task.

23.3 Electronic and Emanations Intelligence assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 23; [255, 2026].

23.3.1 Electronic and Emanations Intelligence evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 23; [255, 2026].

23.3.2 Electronic and Emanations Intelligence transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 23; [255, 2026].

23.3.2.1 Electronic and Emanations Intelligence lineage and source tradition: profile, concepts, and first anchors This sits in the **Collection Management and Multi-INT Requirements Discipline** lineage: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. [255, 2026]; [256, 2026].

23.3.2.2 Electronic and Emanations Intelligence working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 23; [255, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**, with provenance and reviewability throughout.

23.3.2.3 Electronic and Emanations Intelligence knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** accountable requirements, source-discipline choices, minimization rules, source-risk notes, and evaluation criteria. [255, 2026]; [256, 2026].
- **Transforms:** priority mapping, source-discipline fit, least-intrusive evidence selection, and feedback review.
- **Outputs:** requirements matrix, collection-limit note, source-quality card, and gap list.
- **Failure modes:** recruitment or interception drift, over-collection, weak minimization, and source exposure.

23.3.2.4 Electronic and Emanations Intelligence transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 23; [255, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.
- **Evidence contract:** keep the **Collection Management and Multi-INT Requirements Discipline** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as requirements matrix, collection-limit note, source-quality card, and gap list that another reviewer can audit.

23.3.2.5 Electronic and Emanations Intelligence profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 23; [255, 2026].

The matched profile emphasizes requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit. The method stack is priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop; the local topic cluster is **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

23.3.3 Electronic and Emanations Intelligence evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 23; [255, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Collection Management and Multi-INT Requirements Discipline** profile tells reviewers what evidence is strong enough for the module artifact built around **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

23.3.3.1 Electronic and Emanations Intelligence guide source spine: inherited keys and local citation roles Primary guide citations: [255, 2026]; [256, 2026]; [261, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [035, 2026]; [078, 2026]; [300, 2026]; [303, 2026]; [304, 2026]; [305, 2026]; [302, 2026]; [297, 2026].

23.3.3.2 Electronic and Emanations Intelligence verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [255, 2026]; [256, 2026].

Tier	What counts	How it is used
Source guide	[255, 2026]; [256, 2026]; [261, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [035, 2026]; [078, 2026]; [300, 2026]; [303, 2026]; [304, 2026]; [305, 2026]; [302, 2026]; [297, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 15's source-canon section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise** and [255, 2026]; [256, 2026], but only directly verified source URLs are encoded as citations.

23.3.3.3 Electronic and Emanations Intelligence intelligence practice lens: evidence artifact and safety check Practice lens: **Dissemination-and-Marking Control Lens** for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [256, 2026].

Planning question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Evidence artifact: dissemination map with audience, caveat, marking, records, and feedback fields.

Validation rule: verify source authority, public/classification status, CAPCO-safe vocabulary, audience need, and records disposition before reuse. Applied to **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

Handoff contract: deliver release-neutral summaries, source metadata, marking rationale, and review ownership as separate fields.

Safety check: exclude classified content, live release decisions, source-method exposure, and improvised control markings.

23.3.3.4 Electronic and Emanations Intelligence runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 23; [255, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	15.99	15.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Electronic and Emanations Intelligence to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	15.101	15.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Electronic and Emanations Intelligence	Cyber-Physical Readiness Lens	tabletop packet with OT asset inventory, architecture record, consequences, injects, and debrief rubric	keep exercises lab-only or tabletop; exclude exploitation, process manipulation, unsafe actuation, and live-control actions
Model-card, recoverability, retention, and learner-support evidence package	15.102	15.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Electronic and Emanations Intelligence	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
SIGINT legal-authority and communications-security governance exercise	15.1	15.1 source title transformed into safe curriculum treatment; original: ELINT: Radar Signatures and Weapons Systems Emissions	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
SIGINT legal-authority and communications-security governance exercise	15.2	15.2 source title transformed into safe curriculum treatment; original: EMINT: C4I System Emanations	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
SIGINT legal-authority and communications-security governance exercise	15.3	15.3 source title transformed into safe curriculum treatment; original: Tempest and Van Eck Radiation: Standards and Countermeasures	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
RF-spectrum governance and communications-security	15.4	15.4 source title transformed into safe curriculum treatment; original: Software-Defined Radio (SDR) for Intelligence Applications	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
RF-spectrum governance and communications-security	15.5	15.5 source title transformed into safe curriculum treatment; original: RF Mapping and Spectrum Intelligence	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse

23.3.3.5 Electronic and Emanations Intelligence reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 23; [255, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
SIGINT legal-authority and communications-security governance exercise	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
EMINT: SIGINT legal-authority and communications-security governance exercise	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
Tempest and Van Eck Radiation: SIGINT legal-authority and communications-security governance exercise	Oversight-and-Rights Lens	authority-and-impact register with approvals, limits, public notice, audit owners, and review dates	reject authority laundering, privacy overreach, unmanaged retention, and governance-as-afterthought
RF-spectrum governance and communications-security	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
RF Mapping and Spectrum Intelligence: RF-spectrum governance and communications-security	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse

23.3.3.6 Electronic and Emanations Intelligence annotated source ledger: real titles and local contribution Each source cited by this **Collection Management and Multi-INT Requirements Discipline** module is paired below with its real title and a one-line note on what it contributes to **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

Source	Cited work	What it contributes	Status
[255, 2026]	Web of Things (WoT) Architecture 1.1	The W3C Recommendation for Web of Things Architecture 1.1, published in December 2023, defining an abstract architecture for interoperability across diverse Internet of Things platforms. It introduces core concepts including Things described by machine-readable Thing Descriptions, reusable Thing Models, and Consumers that interpret descriptions to interact via Properties, Actions, and Events.	verified source-guide
[256, 2026]	Web of Things (WoT) Thing Description 1.1	The W3C WoT Thing Description 1.1 is a formal information model and standardized representation format enabling IoT devices to describe their metadata and interaction capabilities in a machine-readable way, facilitating interoperability across diverse ecosystems.	verified source-guide
[261, 2026]	RFC 9110: HTTP Semantics	RFC 9110, the official IETF standards document defining the core semantics and architecture of HTTP, published in June 2022 and consolidating nine earlier RFCs. It establishes terminology and protocol aspects shared across HTTP versions, including methods, status codes, header fields, content negotiation, conditional and range requests, authentication, and the http and https URI schemes.	verified source-guide
[279, 2026]	Open Contracting Data Standard	The documentation homepage for the Open Contracting Data Standard, version 1.1.5, maintained by the Open Contracting Partnership to support disclosure of government contracting data across the procurement lifecycle. It provides a common data model spanning planning, tender, award, contract, and implementation stages, along with a primer, implementation guidance, technical schemas, and validation tooling.	verified source-guide
[282, 2026]	AI Research: Security and Resilience	A NIST page on AI research focused on security and resilience, framing these as core characteristics of trustworthy AI under the NIST AI Risk Management Framework.	verified source-guide
[284, 2026]	Verifiable Credential Data Integrity 1.0	The W3C Recommendation for Verifiable Credential Data Integrity 1.0, published May 2025, defining mechanisms for ensuring the authenticity and integrity of verifiable credentials using cryptographic proofs. It specifies a process of data transformation, hashing, and proof generation, and a corresponding verification procedure, along with a proof data model containing properties such as type, verification method, purpose, and proof value.	verified source-guide

Where this sits. This module's overview is Section 23; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

23.3.4 Electronic and Emanations Intelligence governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 23; [255, 2026].

23.3.5 Electronic and Emanations Intelligence analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 15's governance-boundary section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Collection Management and Multi-INT Requirements Discipline** for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [256, 2026].

Curriculum topic spine: SIGINT legal-authority and communications-security governance exercise, **EMINT: SIGINT legal-authority and communications-security governance exercise**, **Tempest and Van Eck Radiation: SIGINT legal-authority and communications-security governance exercise**. **Verified anchor cluster:** [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]; [Archives and Administration, 1981]; [Agency, 2026g]; [of the Director of National Intelligence, 2026d].

Conceptual depth: requirements-driven, authority-bounded collection where priorities, legal basis, minimization, source protection, and evaluation are explicit.

Method stack: priority mapping, requirement decomposition, source-discipline fit, coverage-gap review, legal-authority check, and collection-feedback loop.

Composability contract: requirements, authorities, source disciplines, collection notes, retention limits, caveats, and evaluation metrics remain separable.

Known failure modes: opportunistic collection, priority drift, over-collection, weak minimization, source exposure, and confusing availability with authority.

Defensive boundary: collection material remains doctrinal and governance-oriented; it does not teach recruitment, interception, surveillance, or tasking procedures. Applied to **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

Anchor	Why it matters here
[Community, 2026]	Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026c]	Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation. Checked as of 2026-05-21; role: curriculum_anchor.
[of Staff, 2026]	Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026g]	Official NSA public explanation of FISA oversight for signals intelligence collection governed by statutory and court-authorized controls. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.

23.3.5.1 Electronic and Emanations Intelligence evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Collection Management and Multi-INT Requirements Discipline** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [255, 2026]; [256, 2026].

23.3.6 Electronic and Emanations Intelligence agentic boundary: assist, approve, block, and record

Evidence anchor. Section 23; [255, 2026].

AGEINT translation is bounded by the **Collection Management and Multi-INT Requirements Discipline** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

23.3.6.1 Electronic and Emanations Intelligence permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 23; [255, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

23.3.6.2 Electronic and Emanations Intelligence excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [255, 2026]; [256, 2026] and **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

23.3.7 Electronic and Emanations Intelligence governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 23; [255, 2026].
Governance is practiced as a gate on the **Collection Management and Multi-INT Requirements Discipline** lane. Learners use the **Dissemination-and-Marking Control Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

23.3.7.1 Electronic and Emanations Intelligence governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [255, 2026]; [256, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Collection Management and Multi-INT Requirements Discipline** failure modes and the **Dissemination-and-Marking Control Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

23.3.7.2 Electronic and Emanations Intelligence evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 23; [255, 2026].
Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Dissemination-and-Marking Control Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

23.3.7.3 Electronic and Emanations Intelligence current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [256, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_intelligence_gov_how_ic_works` for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**?	How the IC Works; lane `governed_intelligence_cycle`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official public explanation of the intelligence cycle, collection disciplines, dissemination, evaluation, oversight, and partners.
What does the module inherit from `official_odni_icd_204` for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**?	Intelligence Community Directive 204: National Intelligence Priorities Framework; lane `collection_management`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official prioritization directive for translating national intelligence priorities into collection, analysis, risk management, and responsiveness evaluation.
What does the module inherit from `official_joint_pub_2_0` for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**?	JP 2-0: Joint Intelligence; lane `collection_management`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official joint-doctrine landing page for the keystone publication on joint intelligence principles, products, services, and assessments.
What does the module inherit from `official_ic_osint_strategy` for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 23; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

23.3.8 Electronic and Emanations Intelligence assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 23; [255, 2026].

23.3.9 Electronic and Emanations Intelligence assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 23; [255, 2026].

23.3.9.1 Electronic and Emanations Intelligence capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise** and [255, 2026]; [256, 2026].

23.3.9.2 Electronic and Emanations Intelligence instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise** and [255, 2026]; [256, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

23.3.9.3 Electronic and Emanations Intelligence assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
SIGINT legal-authority and communications-security governance exercise	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
EMINT: SIGINT legal-authority and communications-security governance exercise	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Tempest and Van Eck Radiation: SIGINT legal-authority and communications-security governance exercise	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

23.3.10 Electronic and Emanations Intelligence refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [255, 2026]; [256, 2026] and **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**.

23.3.10.1 Electronic and Emanations Intelligence refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**. The local signals begin with [255, 2026]; [256, 2026].

23.3.10.2 Electronic and Emanations Intelligence claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**, and the source spine for these checks begins with [255, 2026]; [256, 2026].

23.3.11 Electronic and Emanations Intelligence reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [255, 2026]; [256, 2026].

Triangulation anchors. In module 15's review-checklist section, directly verified anchors for the **Collection Management and Multi-INT Requirements Discipline** lane include [Community, 2026]; [of the Director of National Intelligence, 2026c]; [of Staff, 2026]; [of the Director of National Intelligence and Agency, 2024]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise**. [255, 2026]; [256, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.

- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

23.3.12 Electronic and Emanations Intelligence learning-path links: module map, overview, and curriculum atlas

Follow the cross-links to move between **SIGINT legal-authority and communications-security governance exercise; EMINT: SIGINT legal-authority and communications-security governance exercise** and the rest of the curriculum without losing the source spine: orientation first, then the parent unit, then the modules on either side. Primary sources: [255, 2026]; [256, 2026].
Section 2, Section 19, Section 22, Section 24

24 IMAGERY AND FINANCIAL INTELLIGENCE

24.1 IMAGERY AND FINANCIAL INTELLIGENCE learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 24; [253, 2026].

24.1.1 geospatial and financial intelligence uncertainty discipline spine: domain question and learning focus

Evidence anchor. Section 24; [253, 2026].
This unit teaches **geospatial and financial intelligence uncertainty**. GEOINT and FININT lessons teach spatial, temporal, and entity-risk reasoning while preserving uncertainty and compliance boundaries.

24.1.2 geospatial and financial intelligence uncertainty source-use contract: citation roles and evidence limits

Evidence anchor. Section 24; [253, 2026].
Use NGA definition and official compliance or due-diligence anchors for location quality, source limits, sanctions, ownership, and escalation claims.

24.1.3 geospatial and financial intelligence uncertainty practice artifact: recurring packet and retained evidence

Evidence anchor. Section 24; [253, 2026].
The recurring practice artifact is a **location-and-entity evidence ledger** that draws on geospatial quality note, temporal caveat, ownership uncertainty field, and escalation threshold. The unit keeps its learning spine explicit. Learners assess geospatial fitness, entity uncertainty, red flags, and the evidence needed before escalation.

24.1.4 geospatial and financial intelligence uncertainty safety boundary: accountable, synthetic, and evidence-bounded limits

No facility targeting, pattern-of-life inference, evasion advice, or attribution certainty beyond evidence.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [253, 2026]; [269, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [253, 2026]; [269, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [253, 2026]; [269, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [253, 2026]; [269, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Open-Source and Geospatial Intelligence Integrity. Core anchors: [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]. Conceptual focus: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. Composability contract: collection notes, source metadata, transformations, caveats, and analytic judgments remain separately exportable. **Practice lens:** Requirements-to-Evidence Lens; What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit? [253, 2026]; [269, 2026].

24.1.5 IMAGERY AND FINANCIAL INTELLIGENCE visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 58 and Figure 59 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 23, Section 25.

24.1.6 IMAGERY AND FINANCIAL INTELLIGENCE module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
Imagery Intelligence (IMINT)	Section 25	[253, 2026]; [269, 2026]; [270, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [302, 2026]; [297, 2026]; [309, 2026]; [310, 2026]; [300, 2026].
Financial Intelligence (FININT)	Section 26	[251, 2026]; [252, 2026]; [254, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [079, 2026]; [080, 2026]; [081, 2026]; [082, 2026]; [302, 2026]; [297, 2026].

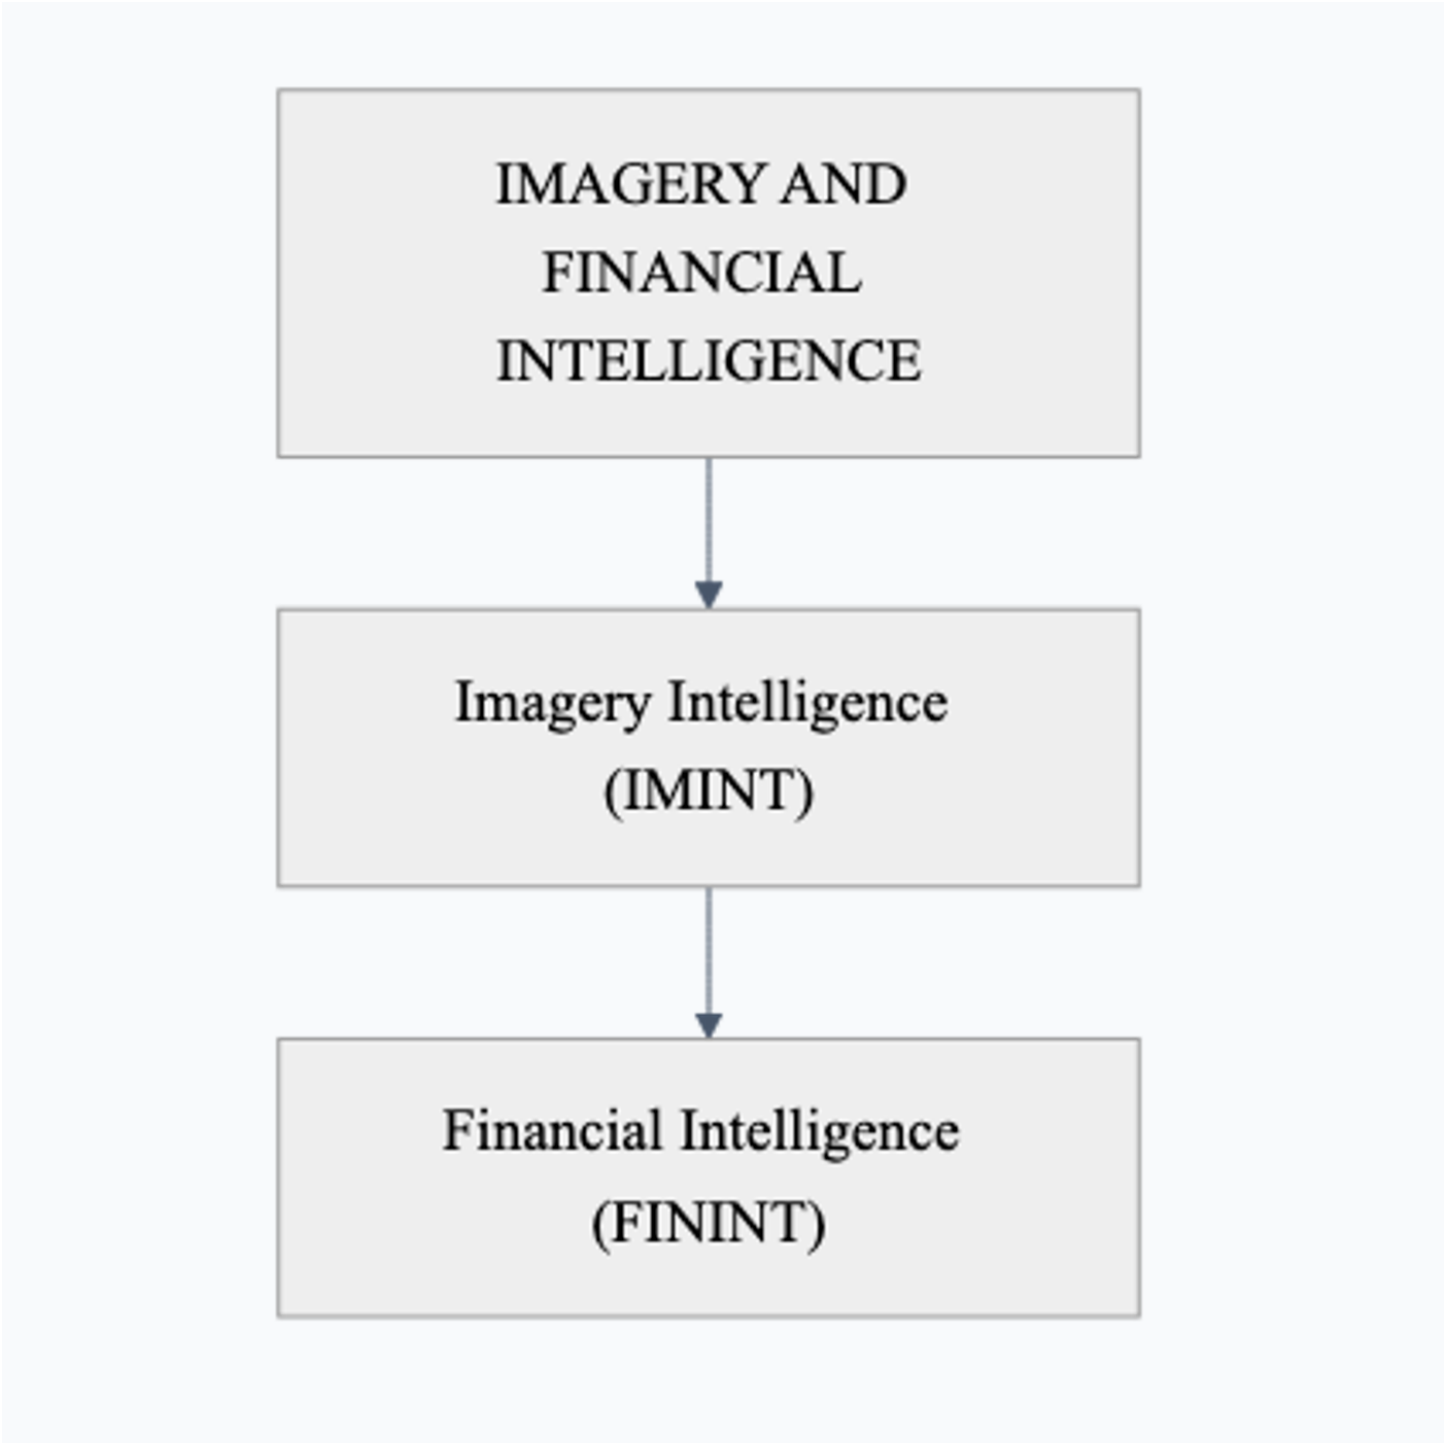

Figure 58: The unit module map traces the part's chapters as a linear reading sequence. Its reader value is to make 2 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last visible at a glance, with the imagery and financial intelligence section as the source section and defensive review as the boundary.

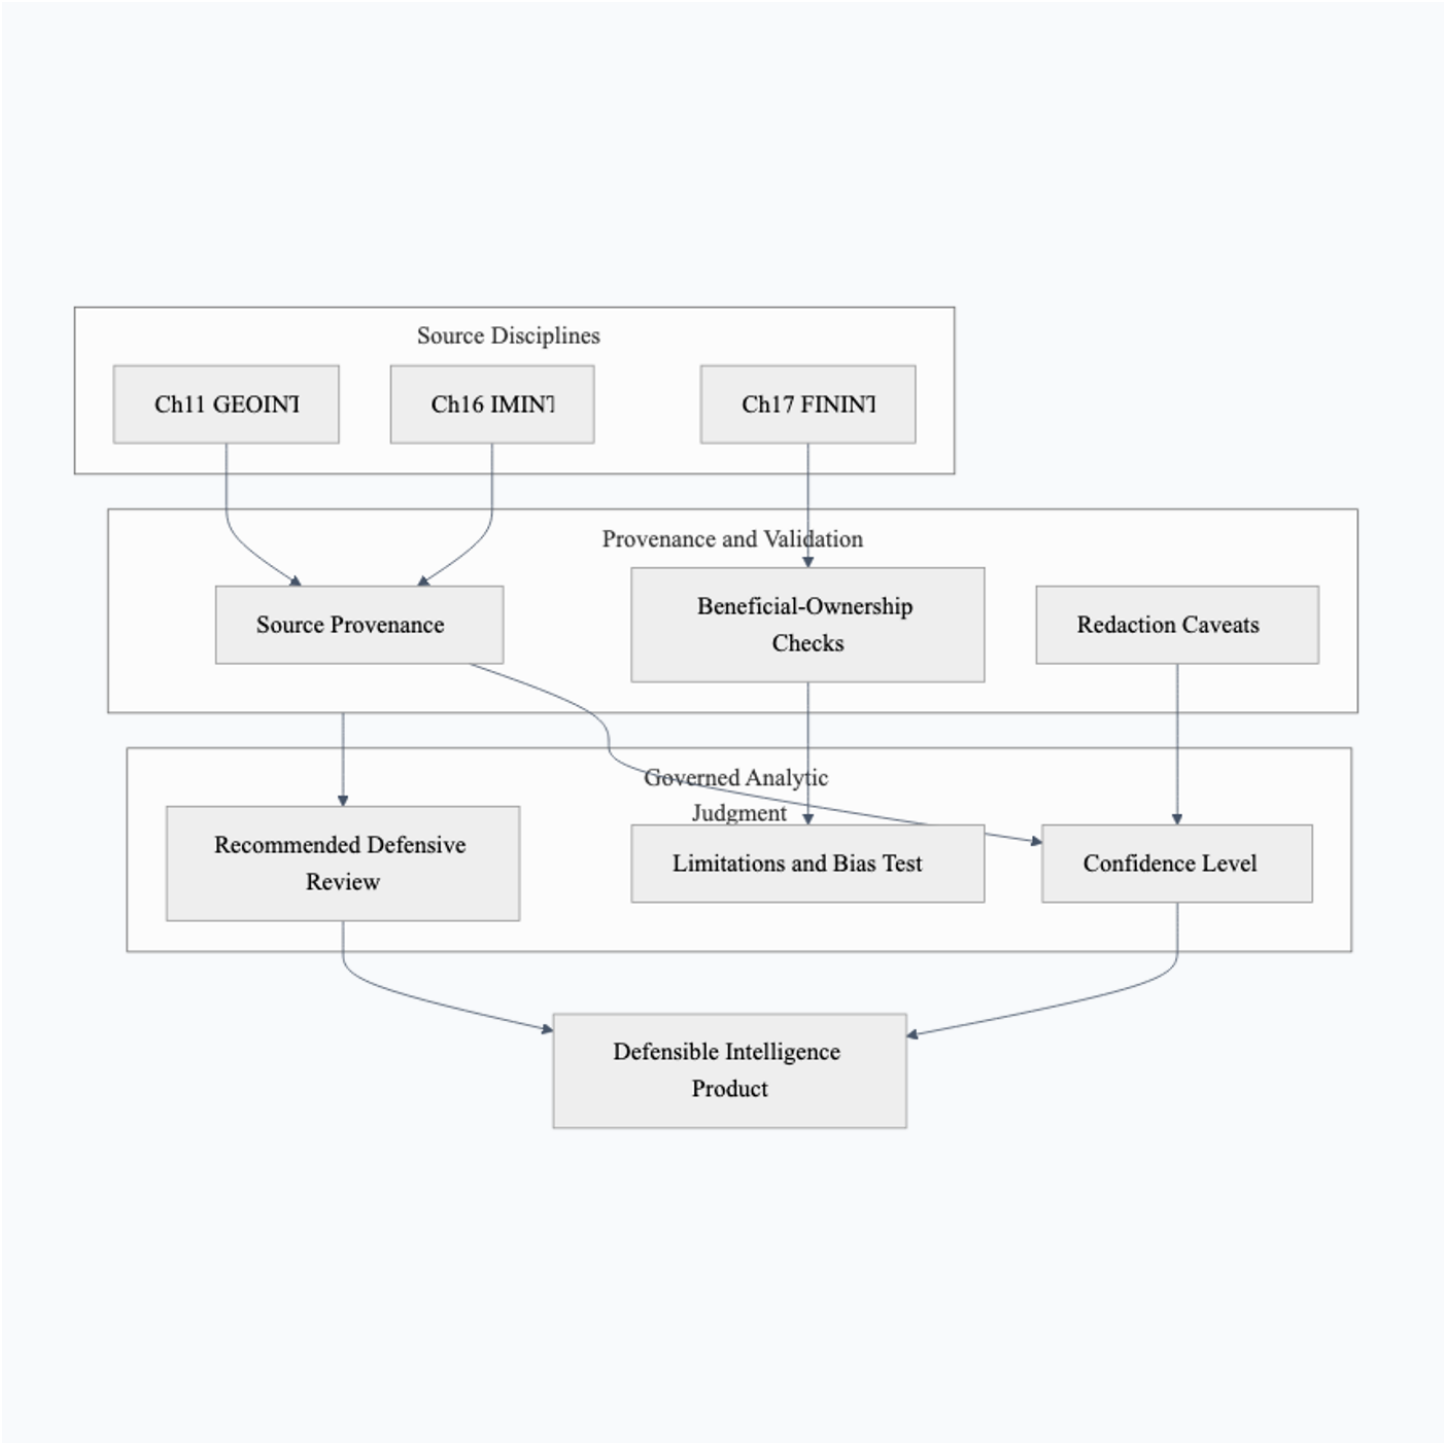

Figure 59: This Part traces how imagery and financial sources move left-to-right through provenance verification and validation gates before becoming a defensible analytic judgment. In the imagery and financial intelligence section, it lets readers compare Source Disciplines, Ch11 GEOINT, Ch16 IMINT, and Ch17 FININT so the visual functions as a traceable course aid rather than an unscoped assertion.

25 Imagery Intelligence (IMINT)

25.0.1 Imagery Intelligence (IMINT) figures and course links: visual evidence, source flow, and navigation

The module uses Figure 60, Figure 61, Figure 62, and Figure 58 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 24, Section 26.
This module teaches the **Open-Source and Geospatial Intelligence Integrity** lane through a bounded, source-backed coursebook chapter. [253, 2026]; [269, 2026].

25.1 Open-Source and Geospatial Intelligence Integrity frame for Imagery Intelligence (IMINT): source context, topic focus, and reader task

Evidence anchor. Section 25; [253, 2026].

25.1.1 Imagery Intelligence (IMINT) orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 25; [253, 2026].

25.1.2 Imagery Intelligence (IMINT) conceptual primer: source context, core model, and reader task

This chapter teaches OSINT and GEOINT as public-source reasoning disciplines: availability does not equal reliability, relevance, legality, or ethical reuse. The chapter uses **Requirements-to-Evidence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.
The central distinction is to separate discovery from collection expansion, and map or media interpretation from targeting. Core topics include **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs; Photo-interpretation literacy: resolution, uncertainty, and scale**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [253, 2026]; [269, 2026].
Learners move from vocabulary and the **Requirements-to-Evidence Lens** distinction through topic lessons on **Imagery modality literacy: resolution, scale, and sensor-fit** with evidence and misconception checks, then assemble a **requirements matrix with source descriptors, caveats, and collection limits** with safety and rights gates.

25.1.3 Imagery Intelligence (IMINT) learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 25; [253, 2026].

- Connect **Imagery modality literacy: resolution, scale, and sensor-fit and Imagery collection-platform literacy: resolution and revisit tradeoffs** to **Open-Source and Geospatial Intelligence Integrity** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **requirements matrix with source descriptors, caveats, and collection limits** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate discovery from collection expansion, and map or media interpretation from targeting; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as privacy drift, stale data, context collapse, platform bias, over-collection, and mistaking availability for reliability, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: OSINT work uses lawful public, owned-lab, or explicitly approved sources and avoids doxxing, harassment, live tracking, or operational targeting.

25.1.4 Imagery Intelligence (IMINT) core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 25; [253, 2026].

Term	Working definition
Provenance	the origin, chain, and transformation history of a source
Corroboration	the comparison of independent sources before reuse
Recency	the time relationship between source creation, discovery, and claim
Geospatial quality	accuracy, completeness, temporal fitness, and usability of location data
Minimization	limiting retained information to what the accountable question requires
Imagery modality literacy: resolution, scale,…	Key terms: Imagery, modality, literacy.
Imagery collection-platform literacy:…	Key terms: Imagery, collection, platform.

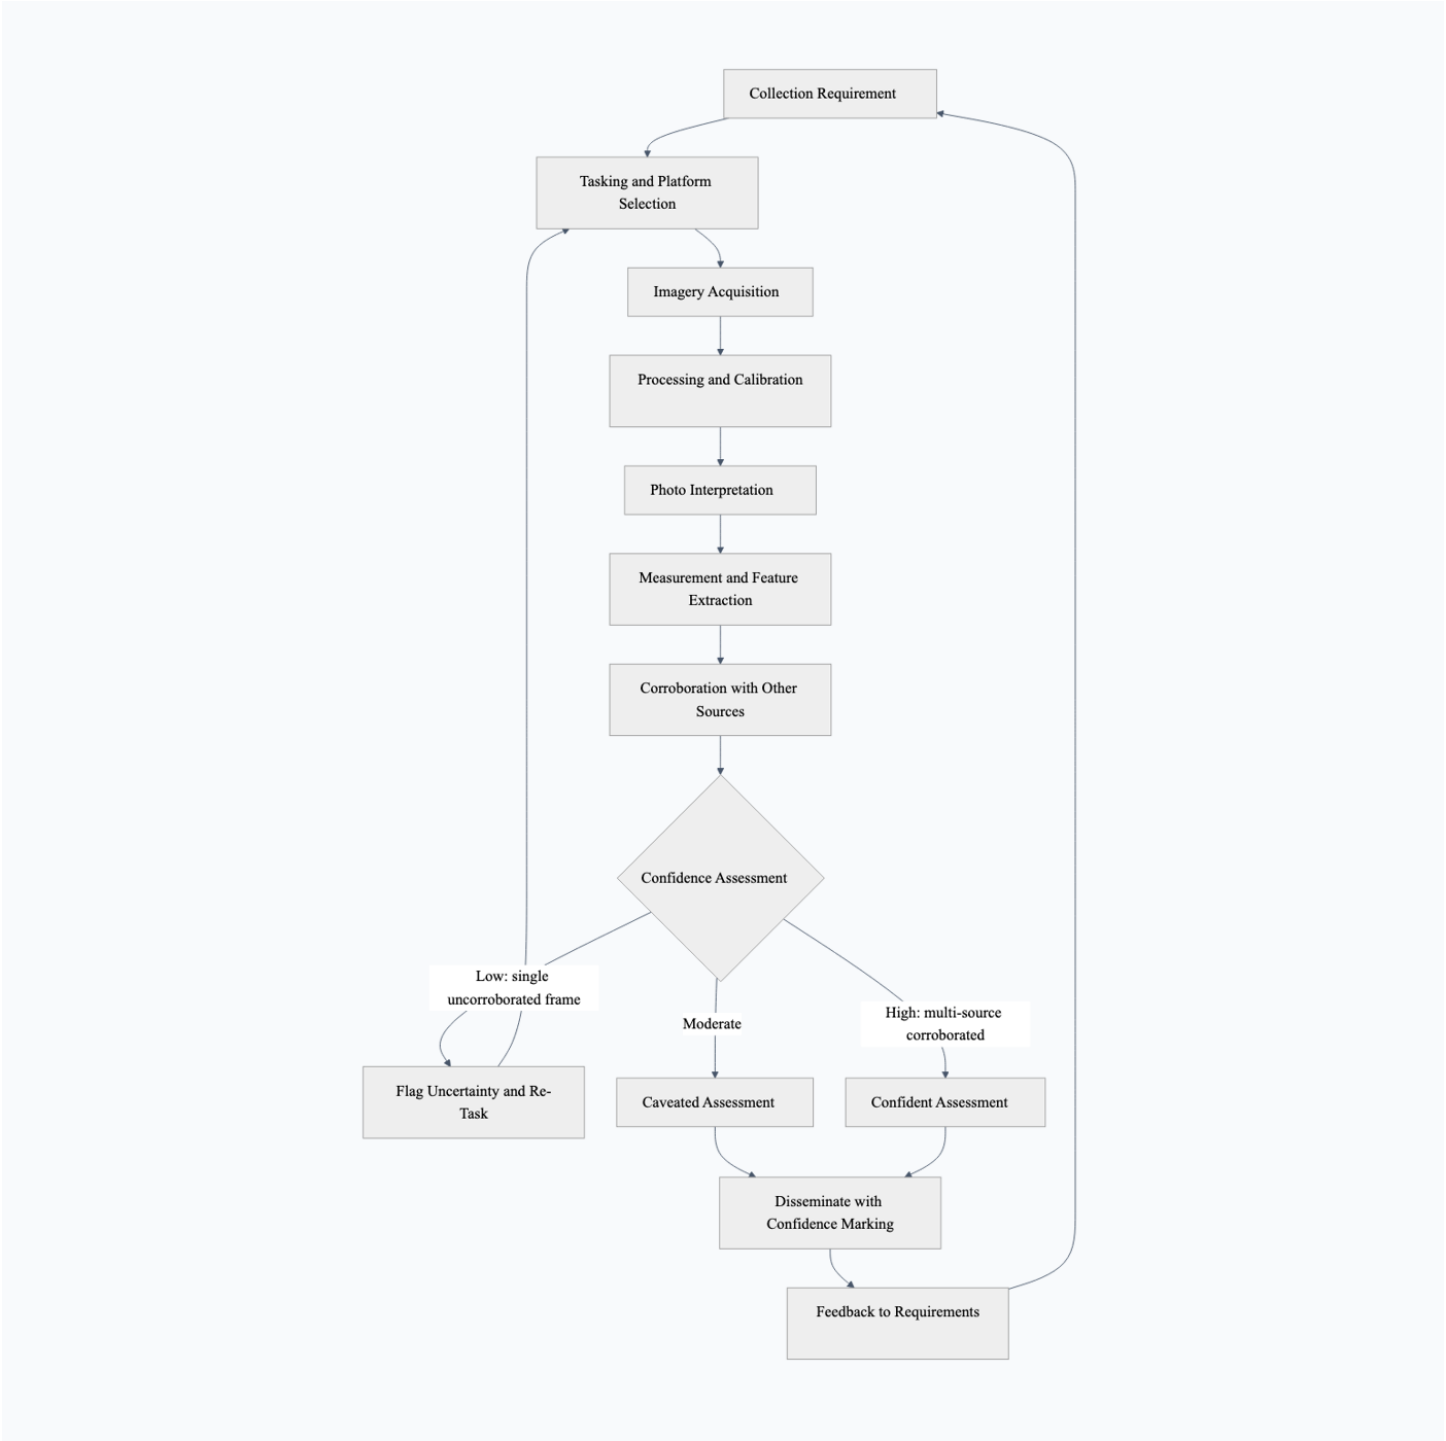

Figure 60: A requirements-to-evidence pipeline showing how imagery moves from tasking through interpretation to a graded confidence assessment before caveated dissemination. Its reader value is to make Collection Requirement, Tasking and Platform Selection, Imagery Acquisition, and Processing and Calibration visible at a glance, with the imagery and financial intelligence / imagery intelligence imint section as the source section and defensive review as the boundary.

Figure 61: Public-domain USGS EROS declassified HEXAGON image used as a historical example of imagery becoming a governed analytic source. Its reader value is to make U.S. Geological Survey provenance, 1973-03-20 collection context, public-domain status, and analytic reuse boundary visible at a glance, with the imagery and financial intelligence / imagery intelligence imint section as the source section and defensive review as the boundary.

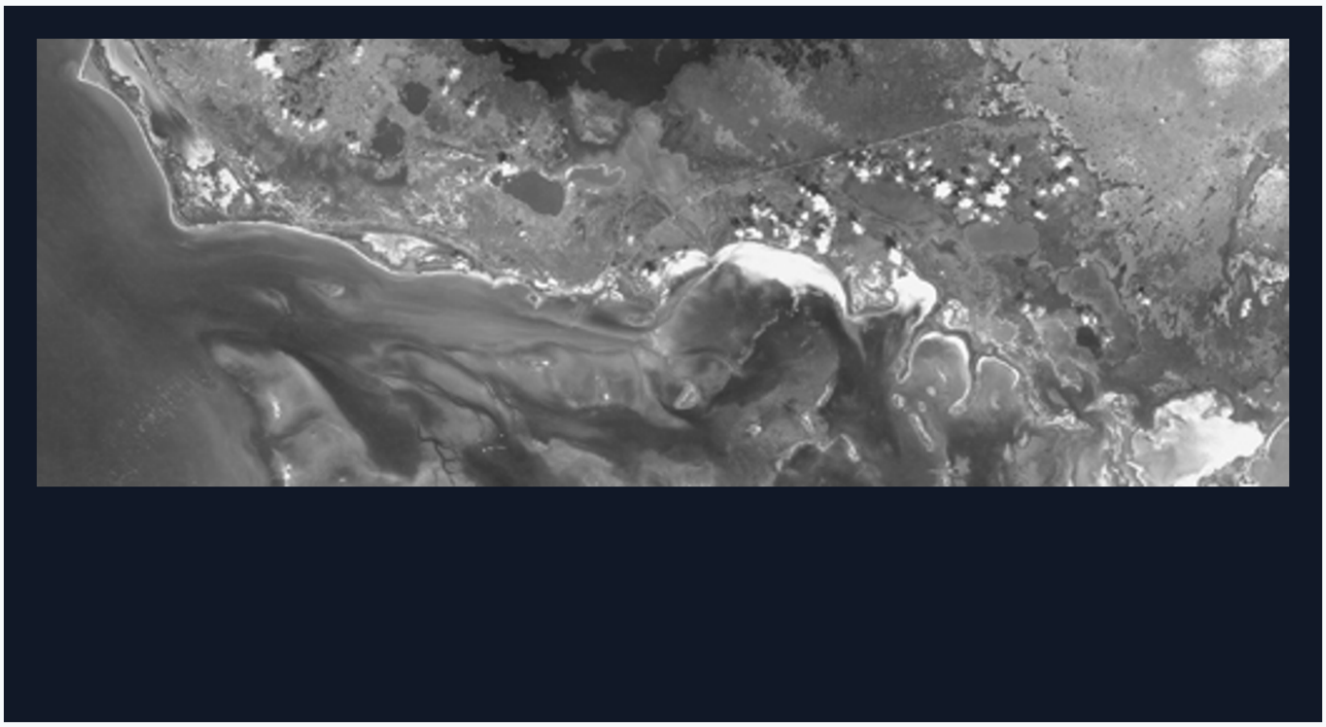

Figure 62: Public-domain USGS EROS KH-7 image used to show how historical collection becomes reproducible open-source imagery analysis. In the imagery and financial intelligence / imagery intelligence imint section, it lets readers compare U.S. Geological Survey provenance, 1966 approx. collection context, public-domain status, and analytic reuse boundary so the visual functions as a traceable course aid rather than an unscoped assertion.

25.2 Requirements-to-Evidence Lens path for Imagery Intelligence (IMINT): lesson cluster, safe artifact, and review

Evidence anchor. Section 25; [253, 2026].

25.2.1 Imagery Intelligence (IMINT) practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 25; [253, 2026].

25.2.2 Imagery Intelligence (IMINT) topic lessons: source-backed concepts and transfer tasks

This module builds OSINT and GEOINT as public-source reasoning disciplines: availability does not equal reliability, relevance, legality, or ethical reuse. The sequence opens with **Imagery modality literacy: resolution, scale, and sensor-fit**, **Imagery collection-platform literacy: resolution and revisit tradeoffs**, **Photo-interpretation literacy: resolution, uncertainty, and scale** and applies the **Requirements-to-Evidence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 58; module overview Section 25; curriculum atlas Section 2.

Triangulation anchors. In module 16's topic-lessons section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

25.2.2.1 Lesson 1: Imagery modality literacy: resolution, scale, and sensor-fit

Concept. Imagery modality literacy: resolution, scale, and sensor-fit treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. Analysts use **Imagery modality literacy** to separate discovery from collection expansion, and map or media interpretation from targeting. A defensible treatment names the judgment it enables for source-quality review and non-sensitive geospatial interpretation review, the proof limit that privacy drift would otherwise hide, and the reviewer accountable for challenge.

Source support. Imagery modality literacy: resolution, scale, and sensor-fit rests on [302, 2026] and [297, 2026]. The closest source to this row notes: Department of Defense and intelligence community organization. Use them for fixing what **Imagery modality literacy: resolution, scale, and sensor-fit** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **Imagery modality literacy** against the works cited for this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Imagery modality literacy**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **Imagery modality literacy**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **Imagery modality literacy** work as a **location-and-entity evidence ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Imagery modality literacy**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Apply this module's safe boundary for **Imagery modality literacy** to another artifact while keeping source-quality review and non-sensitive geospatial interpretation and reviewer ownership explicit.

25.2.2.2 Lesson 2: Imagery collection-platform literacy: resolution and revisit tradeoffs

Concept. Imagery collection-platform literacy: resolution and revisit tradeoffs treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. Imagery collection-platform literacy matters in the **Open-Source and Geospatial Intelligence Integrity** lane because source-quality review and non-sensitive geospatial interpretation evidence must stay separate from judgment; privacy drift is a common failure.

Source support. Imagery collection-platform literacy: resolution and revisit tradeoffs rests on [309, 2026], [310, 2026], and [300, 2026]. The lead source's own note reads: The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. Use them for pinning down the scope of **Imagery collection-platform literacy: resolution and revisit tradeoffs**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Ground **Imagery collection-platform literacy** in the evidence the row cites. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Imagery collection-platform literacy**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **Imagery collection-platform literacy**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **Imagery collection-platform literacy** work as a **location-and-entity evidence ledger** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Imagery collection-platform literacy**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Transfer **Imagery collection-platform literacy** from this module to a second motif by preserving source-quality review and non-sensitive geospatial interpretation, replacing action with audit, and naming the blocked use.

25.2.2.3 Lesson 3: Photo-interpretation literacy: resolution, uncertainty, and scale

Concept. Photo-interpretation literacy: resolution, uncertainty, and scale treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. Without explicit treatment of **Photo-interpretation literacy**, privacy drift undermines source-quality review and non-sensitive geospatial interpretation review; the lesson builds the habit to separate discovery from collection expansion, and map or media interpretation from targeting.

Source support. Photo-interpretation literacy: resolution, uncertainty, and scale rests on [302, 2026] and [297, 2026]. The closest source to this row notes: It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. Use them for the working definition that **Photo-interpretation literacy: resolution, uncertainty, and scale** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. For **Photo-interpretation literacy**, reason from the sources cited in this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Photo-interpretation literacy**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **Photo-interpretation literacy**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **Photo-interpretation literacy** work as a **location-and-entity evidence ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Photo-interpretation literacy**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Apply this module's safe boundary for **Photo-interpretation literacy** to another artifact while keeping source-quality review and non-sensitive geospatial interpretation and reviewer ownership explicit.

25.2.2.4 Lesson 4: Commercial imagery literacy: resolution tiers, licensing, and provenance

Concept. Commercial imagery literacy: resolution tiers, licensing, and provenance treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. Commercial imagery literacy connects classroom vocabulary to Open-Source and Geospatial Intelligence Integrity practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Commercial imagery literacy: resolution tiers, licensing, and provenance rests on [302, 2026] and [297, 2026]. The most specific cited work observes: It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. Use them for fixing what **Commercial imagery literacy: resolution tiers, licensing, and provenance** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Read **Commercial imagery literacy** against the works cited for this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Commercial imagery literacy**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **Commercial imagery literacy**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **Commercial imagery literacy** work as a **location-and-entity evidence ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Commercial imagery literacy**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Reuse the **Commercial imagery literacy** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

25.2.2.5 Lesson 5: Open-source geolocation literacy: resolution, corroboration, and uncertainty

Concept. Open-source geolocation literacy: resolution, corroboration, and uncertainty compares resolution, accuracy, and temporal fitness before drawing a geospatial conclusion from imagery or map products.

Why it matters. Open-source geolocation literacy matters in the **Open-Source and Geospatial Intelligence Integrity** lane because source-quality review and non-sensitive geospatial interpretation evidence must stay separate from judgment; privacy drift is a common failure.

Source support. Open-source geolocation literacy: resolution, corroboration, and uncertainty rests on [302, 2026] and [297, 2026]. The most specific cited work observes: Department of Defense and intelligence community organization. Use them for the claim that **Open-source geolocation literacy: resolution, corroboration, and uncertainty** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [of the Director of National Intelligence and Agency, 2024]; [of State, 2024].

Evidence to inspect. Ground **Open-source geolocation literacy** in the evidence the row cites. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Open-source geolocation literacy**, build a **requirements matrix with source descriptors, caveats, and collection limits** for this source-quality review and non-sensitive geospatial interpretation topic. The artifact must list the imagery descriptor, the bounded claim about **Open-source geolocation literacy**, the resolution caveat, the uncertainty note, the sensitive-site boundary, and the reviewer who checks the interpretation. Shape **Open-source geolocation literacy** work as a **location-and-entity evidence ledger** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Open-source geolocation literacy**: that a visible feature in imagery is enough for confident attribution without resolution, timing, and provenance caveats.

Transfer task. Apply this module's safe boundary for **Open-source geolocation literacy** to another artifact while keeping source-quality review and non-sensitive geospatial interpretation and reviewer ownership explicit.

25.2.3 Imagery Intelligence (IMINT) worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic public-resilience team checks whether open data supports a non-sensitive evacuation-route map. [253, 2026]; [269, 2026].

Triangulation anchors. In module 16's worked-example section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **geospatial and financial intelligence uncertainty**. Learners use a **location-and-entity evidence ledger** and keep this boundary visible: No facility targeting, pattern-of-life inference, evasion advice, or attribution certainty beyond evidence.

Frame. The classroom question centers on **Imagery modality literacy: resolution, scale, and sensor-fit**. Excluded actions stay explicit, and the **Requirements-to-Evidence Lens** planning question is: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Inputs. For the **Imagery modality literacy: resolution, scale, and sensor-fit** scenario, use public road data, public weather notices, synthetic change examples, and instructor-provided metadata. The Requirements-to-Evidence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Imagery modality literacy: resolution, scale, and sensor-fit**, students record provenance, test recency, compare independent sources, mark uncertainty, and remove unnecessary identity data. Pause whenever an inference about Imagery modality literacy: resolution, scale, and sensor-fit appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Imagery modality literacy: resolution, scale, and sensor-fit** classroom scenario; unit artifact = location-and-entity evidence ledger; evidence = allowed inputs; method = source-quality review and non-sensitive geospatial interpretation; output = a source-quality matrix and annotated map note with caveats and no tracking or targeting content; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Imagery modality literacy: resolution, scale, and sensor-fit** as "Requirements-to-Evidence Lens confirms it" is not enough. The revision ties the claim to source-quality review and non-sensitive geospatial interpretation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Imagery modality literacy: resolution, scale, and sensor-fit** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

25.2.4 Imagery Intelligence (IMINT) practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Requirements-to-Evidence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

Triangulation anchors. In module 16's practice-sequence section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Imagery modality literacy: resolution, scale, and sensor-fit, Imagery collection-platform literacy: resolution and revisit tradeoffs, Photo-interpretation literacy: resolution, uncertainty, and scale; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Open-Source and Geospatial Intelligence Integrity** lane.
2. Frame	Answer the lens question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Imagery modality literacy: resolution, scale, and sensor-fit: requirements matrix with source descriptors, caveats, and collection limits.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the location-and-entity evidence ledger fields for Imagery modality literacy: resolution, scale, and sensor-fit.	Unit profile note.	Evidence artifacts include geospatial quality note, temporal caveat.
4. Challenge	Test the misconception that a visible feature is enough for a confident geospatial claim.	Failure-mode note.	The artifact applies the key distinction: separate discovery from collection expansion, and map or media interpretation from targeting.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

25.2.4.1 Imagery Intelligence (IMINT) instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**. [253, 2026]; [269, 2026].

25.2.4.2 Imagery Intelligence (IMINT) extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 25; [253, 2026].

Have learners swap artifacts and apply the **Requirements-to-Evidence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

25.2.5 Imagery Intelligence (IMINT) knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 25; [253, 2026].

1. Explain how **Imagery modality literacy: resolution, scale, and sensor-fit** is defined here; name the source descriptor that supports the definition.
2. Contrast **Imagery modality literacy: resolution, scale, and sensor-fit** with **Imagery collection-platform literacy: resolution and revisit tradeoffs** using the **Requirements-to-Evidence Lens** artifact fields.
3. Identify one failure mode from the **Open-Source and Geospatial Intelligence Integrity** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which source is available but not reliable enough for the claim?
5. Correct this misconception: that a visible feature is enough for a confident geospatial claim.

25.2.5.1 Imagery Intelligence (IMINT) answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Imagery modality literacy: resolution, scale, and sensor-fit** without source evidence, uncertainty, or a safe transfer task.

25.3 Imagery Intelligence (IMINT) assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 25; [253, 2026].

25.3.1 Imagery Intelligence (IMINT) evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 25; [253, 2026].

25.3.2 Imagery Intelligence (IMINT) transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 25; [253, 2026].

25.3.2.1 Imagery Intelligence (IMINT) lineage and source tradition: profile, concepts, and first anchors This sits in the **Open-Source and Geospatial Intelligence Integrity** lineage: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. [253, 2026]; [269, 2026].

25.3.2.2 Imagery Intelligence (IMINT) working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 25; [253, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**, with provenance and reviewability throughout.

25.3.2.3 Imagery Intelligence (IMINT) knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [253, 2026]; [269, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

25.3.2.4 Imagery Intelligence (IMINT) transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 25; [253, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.
- **Evidence contract:** keep the **Open-Source and Geospatial Intelligence Integrity** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

25.3.2.5 Imagery Intelligence (IMINT) profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 25; [253, 2026].

The matched profile emphasizes public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests. The method stack is source triage, provenance capture, corroboration matrix, recency audit, geospatial context review, and confidence calibration; the local topic cluster is **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

25.3.3 Imagery Intelligence (IMINT) evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 25; [253, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Open-Source and Geospatial Intelligence Integrity** profile tells reviewers what evidence is strong enough for the module artifact built around **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

25.3.3.1 Imagery Intelligence (IMINT) guide source spine: inherited keys and local citation roles Primary guide citations: [253, 2026]; [269, 2026]; [270, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [302, 2026]; [297, 2026]; [309, 2026]; [310, 2026]; [300, 2026].

25.3.3.2 Imagery Intelligence (IMINT) verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [253, 2026]; [269, 2026].

Tier	What counts	How it is used
Source guide	[253, 2026]; [269, 2026]; [270, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [302, 2026]; [297, 2026]; [309, 2026]; [310, 2026]; [300, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 16's source-canon section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs** and [253, 2026]; [269, 2026], but only directly verified source URLs are encoded as citations.

25.3.3.3 Imagery Intelligence (IMINT) intelligence practice lens: evidence artifact and safety check Practice lens: **Requirements-to-Evidence Lens** for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**. [253, 2026]; [269, 2026].

Planning question: What accountable requirement justifies the evidence, and which source discipline is the least intrusive fit?

Evidence artifact: requirements matrix with source descriptors, caveats, and collection limits.

Validation rule: show priority, authority, minimization, corroboration, and source quality before any claim is reused. Applied to **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

Handoff contract: deliver metadata-rich evidence packets, not unscoped data piles or implicit targeting requests.

Safety check: exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure.

25.3.3.4 Imagery Intelligence (IMINT) runtime-to-reader map: generated sections and verifier surfaces **Evidence anchor.** Section 25; [253, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	16.99	16.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Imagery Intelligence (IMINT) to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	16.101	16.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Imagery Intelligence (IMINT)	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	16.102	16.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Imagery Intelligence (IMINT)	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Imagery modality literacy: resolution, scale, and sensor-fit	16.1	16.1 source title transformed into safe curriculum treatment; original: Types: Optical, SAR, Infrared, Hyperspectral, Multispectral	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Imagery collection-platform literacy: resolution and revisit tradeoffs	16.2	16.2 source title transformed into safe curriculum treatment; original: Collection Platforms: Satellites, UAVs, Aircraft, Ground-Based	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Photo-interpretation literacy: resolution, uncertainty, and scale	16.3	16.3 source title transformed into safe curriculum treatment; original: Photo Interpretation and All-Source Imagery Analysis	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Commercial imagery literacy: resolution tiers, licensing, and provenance	16.4	16.4 source title transformed into safe curriculum treatment; original: Commercial IMINT and the Democratization of Space-Based Reconnaissance	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Open-source geolocation literacy: resolution, corroboration, and uncertainty	16.5	16.5 source title transformed into safe curriculum treatment; original: Open-Source Geolocation Methods: Bellingcat Methodology	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

25.3.3.5 Imagery Intelligence (IMINT) reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 25; [253, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Imagery modality literacy: resolution, scale, and sensor-fit	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Imagery collection-platform literacy: resolution and revisit tradeoffs	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Photo-interpretation literacy: resolution, uncertainty, and scale	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Commercial imagery literacy: resolution tiers, licensing, and provenance	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Open-source geolocation literacy: resolution, corroboration, and uncertainty	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

25.3.3.6 Imagery Intelligence (IMINT) annotated source ledger: real titles and local contribution Each source cited by this **Open-Source and Geospatial Intelligence Integrity** module is paired below with its real title and a one-line note on what it contributes to **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

Source	Cited work	What it contributes	Status
[253, 2026]	Common European Data Spaces	This is an official European Commission webpage describing the Common European Data Spaces initiative, part of the EU strategy to create interconnected, trustworthy data-sharing environments across strategic sectors. It explains that data spaces let organizations and individuals share data while retaining control, guided by principles of open participation, privacy protection, and fair access rules.	verified source-guide

Source	Cited work	What it contributes	Status
[269, 2026]	Data on the Web Best Practices	A W3C Recommendation, "Data on the Web Best Practices," published January 31, 2017 by the Data on the Web Best Practices Working Group. It offers 35 best practices for publishing and consuming data on the Web, covering metadata, licensing and provenance, data quality, dataset versioning, persistent URIs, machine-readable formats, vocabulary reuse, access methods, preservation, and feedback.	verified source-guide
[270, 2026]	NIST Big Data Interoperability Framework	NIST Special Publication 1500-1 (revised edition by Chang and Grady) establishes foundational terminology and consensus definitions for Big Data through the NIST Big Data Public Working Group. The volume defines Big Data characteristics, taxonomy, and a reference architecture assigning roles to Application Providers, Data Consumers, Data Providers, and System Orchestrators.	verified source-guide
[275, 2026]	Fact Sheet: New Rule on the Accessibility of Web Content and Mobile Apps Provided by State and Local Governments	A US Department of Justice fact sheet explaining the 2024 ADA Title II rule requiring state and local governments to make their web content and mobile apps accessible. It establishes WCAG 2.1 Level AA as the technical standard, applies to entities such as schools, courts, libraries, and transit agencies, and sets compliance deadlines of April 2027 for larger jurisdictions and April 2028 for smaller ones.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[283, 2026]	Recommendation of the Council on Open Government	An OECD legal instrument document reproducing the Recommendation of the Council on Open Government (OECD/LEGAL/0438), adopted on 14 December 2017. It defines open government as a culture of governance promoting transparency, integrity, accountability, and stakeholder participation in support of democracy and inclusive growth.	verified source-guide
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide

Source	Cited work	What it contributes	Status
[293, 2026]	Inventory of NARA Artificial Intelligence (AI) Use Cases	The National Archives and Records Administration (NARA) official inventory of its artificial intelligence use cases, documenting 14 projects across deployed, pilot, and planned stages. Deployed efforts include workplace productivity tools, automated tagging for museum experiences, and historical record retrieval, while pilots cover PII detection and redaction, semantic search, and metadata generation, and planned work targets FOIA processing and public search.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[302, 2026]	National Geospatial-Intelligence Agency About Us	The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety.	verified source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[309, 2026]	STIX Version 2.1	An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection.	verified source-guide
[310, 2026]	TAXII Version 2.1	The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe).	verified source-guide
[300, 2026]	MITRE ATLAS	MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy.	original source-guide

Where this sits. This module's overview is Section 25; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

25.3.4 Imagery Intelligence (IMINT) governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 25; [253, 2026].

25.3.5 Imagery Intelligence (IMINT) analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 16's governance-boundary section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Open-Source and Geospatial Intelligence Integrity** for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**. [253, 2026]; [269, 2026].
Curriculum topic spine: Imagery modality literacy: resolution, scale, and sensor-fit, **Imagery collection-platform literacy: resolution and revisit tradeoffs**, **Photo-interpretation literacy: resolution, uncertainty, and scale**. **Verified anchor cluster:** [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]; [for Standardization, 2013]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015].
Conceptual depth: public-source discovery converted into accountable intelligence through provenance, corroboration, minimization, and relevance tests.
Method stack: source triage, provenance capture, corroboration matrix, recency audit, geospatial context review, and confidence calibration.
Composability contract: collection notes, source metadata, transformations, caveats, and analytic judgments remain separately exportable.
Known failure modes: privacy drift, stale data, context collapse, platform bias, over-collection, and mistaking availability for reliability.
Defensive boundary: OSINT work uses lawful public, owned-lab, or explicitly approved sources and avoids doxxing, harassment, live tracking, or operational targeting. Applied to **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

Anchor	Why it matters here
[of the Director of National Intelligence and Agency, 2024]	Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[of State, 2024]	Official strategy source for lawful OSINT governance, discovery, validation, and dissemination. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026c]	Official NGA strategy anchor for GEOINT readiness, warning, partnership resilience, resource stewardship, and AI integration. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026b]	Official NGA source on GEOINT AI, data quality, model performance, interoperability, analyst interaction, and standards leadership. Checked as of 2026-05-21; role: curriculum_anchor.
[for Standardization, 2013]	International geospatial data-quality standard for completeness, logical consistency, positional accuracy, temporal quality, and usability framing. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.

25.3.5.1 Imagery Intelligence (IMINT) evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Open-Source and Geospatial Intelligence Integrity** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [253, 2026]; [269, 2026].

25.3.6 Imagery Intelligence (IMINT) agentic boundary: assist, approve, block, and record

Evidence anchor. Section 25; [253, 2026].
AGEINT translation is bounded by the **Open-Source and Geospatial Intelligence Integrity** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

25.3.6.1 Imagery Intelligence (IMINT) permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 25; [253, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

25.3.6.2 Imagery Intelligence (IMINT) excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [253, 2026]; [269, 2026] and **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

25.3.7 Imagery Intelligence (IMINT) governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 25; [253, 2026].
Governance is practiced as a gate on the **Open-Source and Geospatial Intelligence Integrity** lane. Learners use the **Requirements-to-Evidence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

25.3.7.1 Imagery Intelligence (IMINT) governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [253, 2026]; [269, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Open-Source and Geospatial Intelligence Integrity** failure modes and the **Requirements-to-Evidence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

25.3.7.2 Imagery Intelligence (IMINT) evidence package handoff: appendices, records, and reuse Evidence anchor. Section 25; [253, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Requirements-to-Evidence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

25.3.7.3 Imagery Intelligence (IMINT) current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**. [253, 2026]; [269, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_ic_osint_strategy` for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**?	The INT of First Resort: The IC OSINT Strategy 2024-2026; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official IC OSINT strategy for professionalizing OSINT, integrated collection management, open-source sharing, innovation, and tradecraft.
What does the module inherit from `official_state_osint_strategy` for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**?	Open Source Intelligence Strategy; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official strategy source for lawful OSINT governance, discovery, validation, and dissemination.
What does the module inherit from `official_nga_strategy` for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**?	NGA Strategy; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official NGA strategy anchor for GEOINT readiness, warning, partnership resilience, resource stewardship, and AI integration.
What does the module inherit from `official_nga_geoint_ai` for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**?	GEOINT Artificial Intelligence; lane `osint_geoint`; checked 2026-05-21.	requirements matrix with source descriptors, caveats, and collection limits; Official NGA source on GEOINT AI, data quality, model performance, interoperability, analyst interaction, and standards leadership.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 25; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

25.3.8 Imagery Intelligence (IMINT) assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 25; [253, 2026].

25.3.9 Imagery Intelligence (IMINT) assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 25; [253, 2026].

25.3.9.1 Imagery Intelligence (IMINT) capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs** and [253, 2026]; [269, 2026].

25.3.9.2 Imagery Intelligence (IMINT) instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs** and [253, 2026]; [269, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

25.3.9.3 Imagery Intelligence (IMINT) assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Imagery modality literacy: resolution, scale, and sensor-fit	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Imagery collection-platform literacy: resolution and revisit tradeoffs	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Photo-interpretation literacy: resolution, uncertainty, and scale	Completed **requirements matrix with source descriptors, caveats, and collection limits** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

25.3.10 Imagery Intelligence (IMINT) refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [253, 2026]; [269, 2026] and **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**.

25.3.10.1 Imagery Intelligence (IMINT) refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**. The local signals begin with [253, 2026]; [269, 2026].

25.3.10.2 Imagery Intelligence (IMINT) claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**, and the source spine for these checks begins with [253, 2026]; [269, 2026].

25.3.11 Imagery Intelligence (IMINT) reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [253, 2026]; [269, 2026].

Triangulation anchors. In module 16's review-checklist section, directly verified anchors for the **Open-Source and Geospatial Intelligence Integrity** lane include [of the Director of National Intelligence and Agency, 2024]; [of State, 2024]; [Agency, 2026c]; [Agency, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs**. [253, 2026]; [269, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

25.3.12 Imagery Intelligence (IMINT) learning-path links: module map, overview, and curriculum atlas

These links keep **Imagery modality literacy: resolution, scale, and sensor-fit; Imagery collection-platform literacy: resolution and revisit tradeoffs** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [253, 2026]; [269, 2026].

Section 2, Section 24, Section 26

26 Financial Intelligence (FININT)

26.0.1 Financial Intelligence (FININT) figures and course links: visual evidence, source flow, and navigation

The module uses Figure 63 and Figure 58 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 24, Section 25, Section 27.
This module teaches the **Financial Intelligence and Economic-Security Due Diligence** lane through a bounded, source-backed coursebook chapter. [251, 2026]; [252, 2026].

26.1 Financial Intelligence and Economic-Security Due Diligence frame for Financial Intelligence (FININT): source context, topic focus, and reader task

Evidence anchor. Section 26; [251, 2026].

26.1.1 Financial Intelligence (FININT) orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 26; [251, 2026].

26.1.2 Financial Intelligence (FININT) conceptual primer: source context, core model, and reader task

This chapter teaches FININT and economic-security analysis as lawful due diligence: signals are interpreted through official lists, typology context, beneficial-ownership uncertainty, and compliance boundaries. The chapter uses **Economic-Security Due-Diligence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.
The central distinction is to separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting. Core topics include **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries; Non-state actor indicator review with attribution caution and governance boundaries**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Network, 2026a]; [Network, 2026b]; [of Foreign Assets Control, 2026]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [251, 2026]; [252, 2026].
Learners move from vocabulary and the **Economic-Security Due-Diligence Lens** distinction through topic lessons on **FININT Foundations: Collection, Analysis, Reporting** with evidence and misconception checks, then assemble an **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** with safety and rights gates.

26.1.3 Financial Intelligence (FININT) learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 26; [251, 2026].

- Connect **FININT Foundations: Collection, Analysis, Reporting and Financial due-diligence typology exercise using synthetic records and compliance boundaries** to **Financial Intelligence and Economic-Security Due Diligence** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build an **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as evasion playbooks, threshold gaming, overconfident attribution, stale sanctions data, unverified beneficial ownership, and confusing compliance screening with intelligence certainty, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: FININT and economic-security examples remain compliance, policy, and resilience oriented; they do not explain how to launder funds, evade sanctions, bypass export controls, or target real firms.

26.1.4 Financial Intelligence (FININT) core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 26; [251, 2026].

Term	Working definition
Typology	a recurring pattern used to recognize financial-crime or sanctions-risk signals
Sanctions program	the legal and policy structure behind a restricted-party or country measure
Beneficial ownership	the natural-person control or ownership question behind an entity
Red flag	an indicator that triggers review rather than a standalone conclusion
Compliance boundary	the line between lawful screening or resilience analysis and prohibited evasion advice
FININT Foundations: Collection, Analysis,…	Key terms: FININT, Foundations, Collection.
Financial due-diligence typology exercise using…	Key terms: Financial, due, diligence.

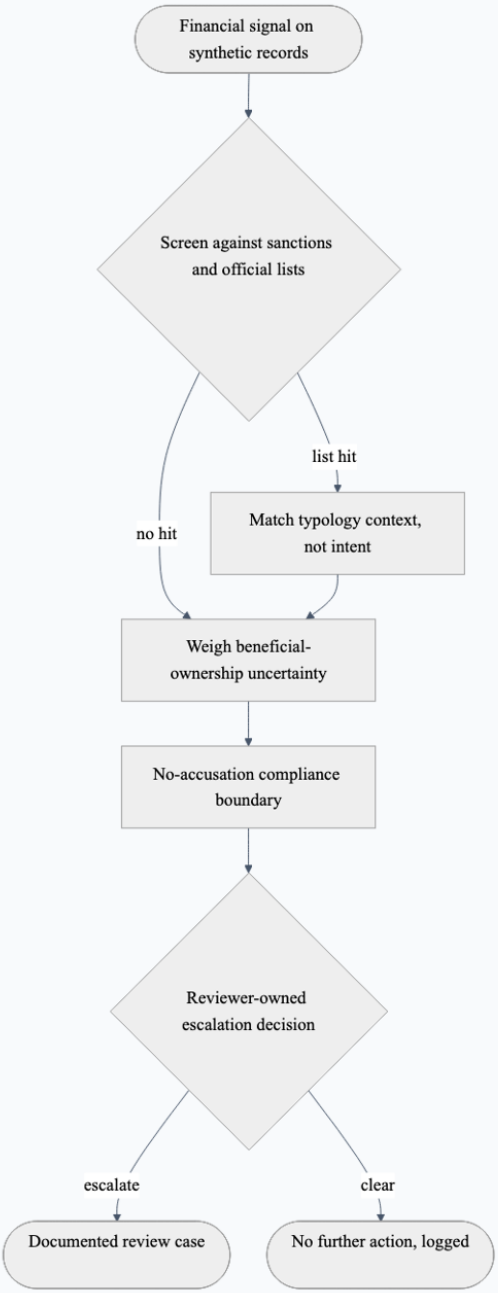

Figure 63: This diagram shows the lawful due-diligence workflow where a financial signal is screened against official lists and typology context, with uncertainty preserved so a typology match triggers review rather than an accusation of intent. It is anchored to the imagery and financial intelligence / financial intelligence finint section; use it to inspect Financial signal on synthetic records, Match typology context, not intent, Weigh beneficial-ownership uncertainty, and No-accusation compliance boundary while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

26.2 Economic-Security Due-Diligence Lens path for Financial Intelligence (FININT): lesson cluster, safe artifact, and review

Evidence anchor. Section 26; [251, 2026].

26.2.1 Financial Intelligence (FININT) practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 26; [251, 2026].

26.2.2 Financial Intelligence (FININT) topic lessons: source-backed concepts and transfer tasks

This module builds FININT and economic-security analysis as lawful due diligence: signals are interpreted through official lists, typology context, beneficial-ownership uncertainty, and compliance boundaries. The sequence opens with **FININT Foundations: Collection, Analysis, Reporting**, **Financial due-diligence typology exercise using synthetic records and compliance boundaries**, **Non-state actor indicator review with attribution caution and governance boundaries** and applies the **Economic-Security Due-Diligence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 58; module overview Section 26; curriculum atlas Section 2.

Triangulation anchors. In module 17's topic-lessons section, directly verified anchors for the **Financial Intelligence and Economic-Security Due Diligence** lane include [Network, 2026a]; [Network, 2026b]; [of Foreign Assets Control, 2026]; [of Foreign Assets Control, 2019]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

26.2.2.1 Lesson 1: FININT Foundations: Collection, Analysis, Reporting

Concept. **FININT Foundations: Collection, Analysis, Reporting** reads financial intelligence as due-diligence evidence that triggers review rather than proof of intent or guilt.

Why it matters. Analysts use **FININT Foundations** to separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting. A defensible treatment names the judgment it enables for defensive due diligence and uncertainty-preserving FININT review, the proof limit that evasion playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. FININT Foundations: Collection, Analysis, Reporting rests on [079, 2026] and [080, 2026]. The most specific cited work observes: The article describes the U.S. Use them for pinning down the scope of **FININT Foundations: Collection, Analysis, Reporting**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Network, 2026a]; [Network, 2026b].

Evidence to inspect. For **FININT Foundations**, work from the cited evidence behind this row. [079, 2026] The Wikipedia article on financial intelligence (FININT), defined as gathering information about the financial affairs of entities of interest to understand their nature, capabilities, and intentions. It outlines two core components: collection, in which Financial Intelligence Units gather transaction data and suspicious activity reports from banks, and analysis, in which specialists use data mining to detect tax evasion, money laundering, and terrorist financing. [080, 2026] A Wikipedia article on financial intelligence (FININT), the gathering and analysis of information about financial transactions to detect illicit activity such as money laundering, tax evasion, and terrorist financing. It distinguishes two core functions: collection of raw transaction data and suspicious activity reports by government financial intelligence units, and analysis using data-matching techniques to identify suspicious patterns. The article describes the U.S. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **FININT Foundations**, build a **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** for this defensive due diligence and uncertainty-preserving FININT topic. The artifact must name the source descriptor, the bounded claim about **FININT Foundations**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **FININT Foundations** work as a **location-and-entity evidence ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that FININT Foundations: Collection, Analysis, Reporting establishes intent without reviewing alternative explanations.

Transfer task. Transfer **FININT Foundations** to a second module by preserving defensive due diligence and uncertainty-preserving FININT, changing the source evidence, and naming a new reviewer.

26.2.2.2 Lesson 2: Financial due-diligence typology exercise using synthetic records and compliance boundaries

Concept. **Financial due-diligence typology exercise using synthetic records and compliance boundaries** reads financial intelligence as due-diligence evidence that triggers review rather than proof of intent or guilt.

Why it matters. Analysts use **Financial due-diligence typology exercise** to separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting. A defensible treatment names the judgment it enables for defensive due diligence and uncertainty-preserving FININT review, the proof limit that treating typology match as proof of intent would otherwise hide, and the reviewer accountable for challenge.

Source support. Financial due-diligence typology exercise using synthetic records and compliance boundaries rests on [079, 2026]. The closest source to this row notes: It outlines two core components: collection, in which Financial Intelligence Units gather transaction data and suspicious activity reports from banks, and analysis, in which specialists use data mining to detect tax evasion, money laundering, and terrorist financing. Use it for pinning down the scope of **Financial due-diligence typology exercise using synthetic records and compliance boundaries**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Network, 2026a]; [Network, 2026b].

Evidence to inspect. Ground **Financial due-diligence typology exercise** in the evidence the row cites. [079, 2026] The Wikipedia article on financial intelligence (FININT), defined as gathering information about the financial affairs of entities of interest to understand their nature, capabilities, and intentions. It outlines two core components: collection, in which Financial Intelligence Units gather transaction data and suspicious activity reports from banks, and analysis, in which specialists use data mining to detect tax evasion, money laundering, and terrorist financing. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Financial due-diligence typology exercise**, build a **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** for this defensive due diligence and uncertainty-preserving FININT topic. The artifact must note the typology descriptor, the bounded claim about **Financial due-diligence typology exercise using**, the intent caveat, the uncertainty threshold, the no-accusation boundary, and the reviewer who owns escalation. Shape **Financial due-diligence typology exercise** work as a **location-and-entity evidence ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Financial due-diligence typology exercise**: that a typology or pattern match is proof of intent rather than a flag requiring corroboration and alternative explanations.

Transfer task. Apply this module's safe boundary for **Financial due-diligence typology exercise** to another artifact while keeping defensive due diligence and uncertainty-preserving FININT and reviewer ownership explicit.

26.2.2.3 Lesson 3: Non-state actor indicator review with attribution caution and governance boundaries

Concept. **Non-state actor indicator review with attribution caution and governance boundaries** uses attribution indicators cautiously by separating technical similarity, context, confidence, and geopolitical inference.

Why it matters. Non-state actor indicator review matters in the **Financial Intelligence and Economic-Security Due Diligence** lane because defensive due diligence and uncertainty-preserving FININT evidence must stay separate from judgment; evasion playbooks is a common failure.

Source support. Non-state actor indicator review with attribution caution and governance boundaries rests on [079, 2026]. The lead source's own note reads: The Wikipedia article on financial intelligence (FININT), defined as gathering information about the financial affairs of entities of interest to understand their nature, capabilities, and intentions. Use it for the claim that **Non-state actor indicator review with attribution caution and governance boundaries** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Network, 2026a]; [Network, 2026b].

Evidence to inspect. For **Non-state actor indicator review**, work from the cited evidence behind this row. [079, 2026] The Wikipedia article on financial intelligence (FININT), defined as gathering information about the financial affairs of entities of interest to understand their nature, capabilities, and intentions. It outlines two core components: collection, in which Financial Intelligence Units gather transaction data and suspicious activity reports from banks, and analysis, in which specialists use data mining to detect tax evasion, money laundering, and terrorist financing. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Non-state actor indicator review**, build a **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** for this defensive due diligence and uncertainty-preserving FININT topic. The artifact must name the actor descriptor, the bounded claim about **state actor indicator review with**, the attribution caveat, the uncertainty note, the non-targeting boundary, and the reviewer who approves the assessment. Shape **Non-state actor indicator review** work as a **location-and-entity evidence ledger** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that lacking a state sponsor places an actor outside the reach of governance, accountability, and applicable rules.

Transfer task. Transfer **Non-state actor indicator review** from this module to a second motif by preserving defensive due diligence and uncertainty-preserving FININT, replacing action with audit, and naming the blocked use.

26.2.2.4 Lesson 4: The SWIFT System and Intelligence Collection

Concept. The SWIFT System and Intelligence Collection applies SWIFT, System, Collection within Financial Intelligence and Economic-Security Due Diligence: learners use separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting and defensive due diligence and uncertainty-preserving FININT evidence before any judgment moves forward.

Why it matters. The SWIFT System matters in the **Financial Intelligence and Economic-Security Due Diligence** lane because defensive due diligence and uncertainty-preserving FININT evidence must stay separate from judgment; evasion playbooks is a common failure.

Source support. The SWIFT System and Intelligence Collection rests on [079, 2026]. The closest source to this row notes: It outlines two core components: collection, in which Financial Intelligence Units gather transaction data and suspicious activity reports from banks, and analysis, in which specialists use data mining to detect tax evasion, money laundering, and terrorist financing. Use it for pinning down the scope of **The SWIFT System and Intelligence Collection**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Network, 2026a]; [Network, 2026b].

Evidence to inspect. Ground **The SWIFT System** in the evidence the row cites. [079, 2026] The Wikipedia article on financial intelligence (FININT), defined as gathering information about the financial affairs of entities of interest to understand their nature, capabilities, and intentions. It outlines two core components: collection, in which Financial Intelligence Units gather transaction data and suspicious activity reports from banks, and analysis, in which specialists use data mining to detect tax evasion, money laundering, and terrorist financing. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **The SWIFT System**, build a **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** for this defensive due diligence and uncertainty-preserving FININT topic. The artifact must name the source descriptor, the bounded claim about **SWIFT System and Intelligence Collection**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **The SWIFT System** work as a **location-and-entity evidence ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that The SWIFT System and Intelligence Collection is optional whenever separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting feels inconvenient.

Transfer task. Transfer **The SWIFT System** to a second module by preserving defensive due diligence and uncertainty-preserving FININT, changing the source evidence, and naming a new reviewer.

26.2.2.5 Lesson 5: Cryptocurrency as Covert Finance: Monero, Mixers, Bridges

Concept. Cryptocurrency as Covert Finance: Monero, Mixers, Bridges applies Cryptocurrency, Covert, Finance within Financial Intelligence and Economic-Security Due Diligence: learners use separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting and defensive due diligence and uncertainty-preserving FININT evidence before any judgment moves forward.

Why it matters. Cryptocurrency as Covert Finance connects classroom vocabulary to Financial Intelligence and Economic-Security Due Diligence practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Cryptocurrency as Covert Finance: Monero, Mixers, Bridges rests on [302, 2026] and [297, 2026]. Its anchor reference records: It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. Use them for fixing what **Cryptocurrency as Covert Finance: Monero, Mixers, Bridges** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Network, 2026a]; [Network, 2026b].

Evidence to inspect. For **Cryptocurrency as Covert Finance**, reason from the sources cited in this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Cryptocurrency as Covert Finance**, build a **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** for this defensive due diligence and uncertainty-preserving FININT topic. The artifact must name the source descriptor, the bounded claim about **Cryptocurrency as Covert Finance**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Cryptocurrency as Covert Finance** work as a **location-and-entity evidence ledger** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Cryptocurrency as Covert Finance: Monero, Mixers, Bridges establishes intent without reviewing alternative explanations.

Transfer task. Transfer **Cryptocurrency as Covert Finance** to a second module by preserving defensive due diligence and uncertainty-preserving FININT, changing the source evidence, and naming a new reviewer.

26.2.2.6 Lesson 6: Economic Warfare and FININT as a Strategic Tool

Concept. Economic Warfare and FININT as a Strategic Tool reads financial intelligence as due-diligence evidence that triggers review rather than proof of intent or guilt.

Why it matters. Without explicit treatment of **Economic Warfare**, evasion playbooks undermines defensive due diligence and uncertainty-preserving FININT review; the lesson builds the habit to separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting.

Source support. Economic Warfare and FININT as a Strategic Tool rests on [081, 2026]. The lead source's own note reads: The Citizendium 'Financial intelligence' article was never written; the page is empty. Use it for the working definition that **Economic Warfare and FININT as a Strategic Tool** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Network, 2026a]; [Network, 2026b].

Evidence to inspect. For **Economic Warfare**, reason from the sources cited in this row. [081, 2026] The Citizendium 'Financial intelligence' article was never written; the page is empty. Use an authoritative alternative source for financial intelligence definitions. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Economic Warfare**, build a **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** for this defensive due diligence and uncertainty-preserving FININT topic. The artifact must name the source descriptor, the bounded claim about **Economic Warfare and FININT as**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Economic Warfare** work as a **location-and-entity evidence ledger** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Economic Warfare and FININT as a Strategic Tool replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Economic Warfare** to a second module by preserving defensive due diligence and uncertainty-preserving FININT, changing the source evidence, and naming a new reviewer.

26.2.2.7 Lesson 7: Money Laundering Detection: Financial due-diligence typology exercise using synthetic records and compliance boundaries

Concept. Money Laundering Detection: Financial due-diligence typology exercise using synthetic records and compliance boundaries uses typologies to structure review of transactional patterns, source quality, and escalation thresholds—not investigative targeting.

Why it matters. Money Laundering Detection matters in the **Financial Intelligence and Economic-Security Due Diligence** lane because defensive due diligence and uncertainty-preserving FININT evidence must stay separate from judgment; treating typology match as proof of intent is a common failure.

Source support. Money Laundering Detection: Financial due-diligence typology exercise using synthetic records and compliance boundaries rests on [080, 2026]. The lead source's own note reads: A Wikipedia article on financial intelligence (FININT), the gathering and analysis of information about financial transactions to detect illicit activity such as money laundering, tax evasion, and terrorist financing. Use it for the working definition that **Money Laundering Detection: Financial due-diligence typology exercise using synthetic records and compliance boundaries** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Network, 2026a]; [Network, 2026b].

Evidence to inspect. Read **Money Laundering Detection** against the works cited for this row. [080, 2026] A Wikipedia article on financial intelligence (FININT), the gathering and analysis of information about financial transactions to detect illicit activity such as money laundering, tax evasion, and terrorist financing. It distinguishes two core functions: collection of raw transaction data and suspicious activity reports by government financial intelligence units, and analysis using data-matching techniques to identify suspicious patterns. The article describes the U.S. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Money Laundering Detection**, build a **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** for this defensive due diligence and uncertainty-preserving FININT topic. The artifact must note the typology descriptor, the bounded claim about **Money Laundering Detection**, the intent caveat, the uncertainty threshold, the no-accusation boundary, and the reviewer who owns escalation. Shape **Money Laundering Detection** work as a **location-and-entity evidence ledger** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Money Laundering Detection**: that a typology or pattern match is proof of intent rather than a flag requiring corroboration and alternative explanations.

Transfer task. Apply this module's safe boundary for **Money Laundering Detection** to another artifact while keeping defensive due diligence and uncertainty-preserving FININT and reviewer ownership explicit.

26.2.2.8 Lesson 8: FININT Supporting National Security: Pillars and Methods

Concept. FININT Supporting National Security: Pillars and Methods reads financial intelligence as due-diligence evidence that triggers review rather than proof of intent or guilt.

Why it matters. FININT Supporting National Security matters in the **Financial Intelligence and Economic-Security Due Diligence** lane because defensive due diligence and uncertainty-preserving FININT evidence must stay separate from judgment; evasion playbooks is a common failure.

Source support. FININT Supporting National Security: Pillars and Methods rests on [082, 2026]. Its anchor reference records: A 2025 article by Kevin Hk Chow in Modern Economy titled "Financial Intelligence: A Crucial Pillar of National Security." It argues that the module serves as a critical interface between economic systems and national security, used to detect and disrupt illicit financial networks tied to money laundering, terrorism financing, and transnational crime. Use it for the working definition that **FININT Supporting National Security: Pillars and Methods** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Network, 2026a]; [Network, 2026b].

Evidence to inspect. Ground **FININT Supporting National Security** in the evidence the row cites. [082, 2026] A 2025 article by Kevin Hk Chow in Modern Economy titled "Financial Intelligence: A Crucial Pillar of National Security." It argues that the module serves as a critical interface between economic systems and national security, used to detect and disrupt illicit financial networks tied to money laundering, terrorism financing, and transnational crime. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **FININT Supporting National Security**, build a **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** for this defensive due diligence and uncertainty-preserving FININT topic. The artifact must name the source descriptor, the bounded claim about **FININT Supporting National Security**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **FININT Supporting National Security** work as a **location-and-entity evidence ledger** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that FININT Supporting National Security: Pillars and Methods is optional whenever separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting feels inconvenient.

Transfer task. Transfer **FININT Supporting National Security** to a second module by preserving defensive due diligence and uncertainty-preserving FININT, changing the source evidence, and naming a new reviewer.

26.2.3 Financial Intelligence (FININT) worked safe example: synthetic inputs, evidence, and review

Worked example: a sample nonprofit screens a synthetic supplier record for classroom due-diligence practice. [251, 2026]; [252, 2026].

Triangulation anchors. In module 17's worked-example section, directly verified anchors for the **Financial Intelligence and Economic-Security Due Diligence** lane include [Network, 2026a]; [Network, 2026b]; [of Foreign Assets Control, 2026]; [of Foreign Assets Control, 2019]. Use them to test

source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **geospatial and financial intelligence uncertainty**. Learners use a **location-and-entity evidence ledger** and keep this boundary visible: No facility targeting, pattern-of-life inference, evasion advice, or attribution certainty beyond evidence.

Frame. The classroom question centers on **FININT Foundations: Collection, Analysis, Reporting**. Excluded actions stay explicit, and the **Economic-Security Due-Diligence Lens** planning question is: Which financial, sanctions, export-control, or supplier-risk signal is being interpreted for lawful compliance or resilience?

Inputs. For the **FININT Foundations: Collection, Analysis, Reporting** scenario, use toy entity records, public sanctions-program descriptions, synthetic transaction summaries, and supplier-context notes. The Economic-Security Due-Diligence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **FININT Foundations: Collection, Analysis, Reporting**, students check official list provenance, identify red flags, preserve beneficial-ownership uncertainty, and avoid evasion guidance. Pause whenever an inference about FININT Foundations: Collection, Analysis, Reporting appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **FININT Foundations: Collection, Analysis, Reporting** classroom scenario; unit artifact = location-and-entity evidence ledger; evidence = allowed inputs; method = defensive due diligence and uncertainty-preserving FININT; output = an economic-security packet with source links, uncertainty, red-flag rationale, and a compliance review owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **FININT Foundations: Collection, Analysis, Reporting** as "Economic-Security Due-Diligence Lens confirms it" is not enough. The revision ties the claim to defensive due diligence and uncertainty-preserving FININT, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **FININT Foundations: Collection, Analysis, Reporting** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

26.2.4 Financial Intelligence (FININT) practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Economic-Security Due-Diligence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

Triangulation anchors. In module 17's practice-sequence section, directly verified anchors for the **Financial Intelligence and Economic-Security Due Diligence** lane include [Network, 2026a]; [Network, 2026b]; [of Foreign Assets Control, 2026]; [of Foreign Assets Control, 2019]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare FININT Foundations: Collection, Analysis, Reporting, Financial due-diligence typology exercise using synthetic records and compliance boundaries, Non-state actor indicator review with attribution caution and governance boundaries; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Financial Intelligence and Economic-Security Due Diligence** lane.
2. Frame	Answer the lens question: Which financial, sanctions, export-control, or supplier-risk signal is being interpreted for lawful compliance or resilience?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for FININT Foundations: Collection, Analysis, Reporting: economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the location-and-entity evidence ledger fields for FININT Foundations: Collection, Analysis, Reporting.	Unit profile note.	Evidence artifacts include geospatial quality note, temporal caveat.
4. Challenge	Test the misconception that FININT Foundations: Collection, Analysis, Reporting establishes intent without reviewing alternative explanations.	Failure-mode note.	The artifact applies the key distinction: separate compliance-oriented risk analysis from evasion, attribution certainty, or targeting.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

26.2.4.1 Financial Intelligence (FININT) instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**. [251, 2026]; [252, 2026].

26.2.4.2 Financial Intelligence (FININT) extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 26; [251, 2026].

Have learners swap artifacts and apply the **Economic-Security Due-Diligence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

26.2.5 Financial Intelligence (FININT) knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 26; [251, 2026].

1. Explain how **FININT Foundations: Collection, Analysis, Reporting** is defined here; name the source descriptor that supports the definition.
2. Contrast **FININT Foundations: Collection, Analysis, Reporting** with **Financial due-diligence typology exercise using synthetic records and compliance boundaries** using the **Economic-Security Due-Diligence Lens** artifact fields.
3. Identify one failure mode from the **Financial Intelligence and Economic-Security Due Diligence** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which red flag requires escalation, and what evidence is still missing?
5. Correct this misconception: that FININT Foundations: Collection, Analysis, Reporting establishes intent without reviewing alternative explanations.

26.2.5.1 Financial Intelligence (FININT) answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **FININT Foundations: Collection, Analysis, Reporting** without source evidence, uncertainty, or a safe transfer task.

26.3 Financial Intelligence (FININT) assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 26; [251, 2026].

26.3.1 Financial Intelligence (FININT) evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 26; [251, 2026].

26.3.2 Financial Intelligence (FININT) transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 26; [251, 2026].

26.3.2.1 Financial Intelligence (FININT) lineage and source tradition: profile, concepts, and first anchors This sits in the **Financial Intelligence and Economic-Security Due Diligence** lineage: defensive economic intelligence that links financial-crime signals, sanctions programs, export controls, beneficial-ownership uncertainty, and supply-chain due diligence to lawful compliance and policy analysis. [251, 2026]; [252, 2026].

26.3.2.2 Financial Intelligence (FININT) working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 26; [251, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**, with provenance and reviewability throughout.

26.3.2.3 Financial Intelligence (FININT) knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [251, 2026]; [252, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

26.3.2.4 Financial Intelligence (FININT) transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 26; [251, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.
- **Evidence contract:** keep the **Financial Intelligence and Economic-Security Due Diligence** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

26.3.2.5 Financial Intelligence (FININT) profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 26; [251, 2026].

The matched profile emphasizes defensive economic intelligence that links financial-crime signals, sanctions programs, export controls, beneficial-ownership uncertainty, and supply-chain due diligence to lawful compliance and policy analysis. The method stack is typology-to-control mapping, sanctions-program review, beneficial ownership uncertainty notes, export-control red-flag triage, supplier risk registers, and compliance-oriented analytic memos; the local topic cluster is **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

26.3.3 Financial Intelligence (FININT) evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 26; [251, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Financial Intelligence and Economic-Security Due Diligence** profile tells reviewers what evidence is strong enough for the module artifact built around **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

26.3.3.1 Financial Intelligence (FININT) guide source spine: inherited keys and local citation roles Primary guide citations: [251, 2026]; [252, 2026]; [254, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [079, 2026]; [080, 2026]; [081, 2026]; [082, 2026]; [302, 2026]; [297, 2026].

26.3.3.2 Financial Intelligence (FININT) verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [251, 2026]; [252, 2026].

Tier	What counts	How it is used
Source guide	[251, 2026]; [252, 2026]; [254, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [079, 2026]; [080, 2026]; [081, 2026]; [082, 2026]; [302, 2026]; [297, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 17's source-canon section, directly verified anchors for the **Financial Intelligence and Economic-Security Due Diligence** lane include [Network, 2026a]; [Network, 2026b]; [of Foreign Assets Control, 2026]; [of Foreign Assets Control, 2019]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries** and [251, 2026]; [252, 2026], but only directly verified source URLs are encoded as citations.

26.3.3.3 Financial Intelligence (FININT) intelligence practice lens: evidence artifact and safety check Practice lens: **Economic-Security Due-Diligence Lens** for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**. [251, 2026]; [252, 2026].

Planning question: Which financial, sanctions, export-control, or supplier-risk signal is being interpreted for lawful compliance or resilience?

Evidence artifact: economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary.

Validation rule: verify official list source, typology provenance, beneficial-ownership uncertainty, export-control relevance, and non-evasion framing. Applied to **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

Handoff contract: handoff separates raw source, entity hypothesis, compliance control, analytic judgment, and recommended defensive next review.

Safety check: exclude sanctions evasion, laundering methods, threshold gaming, procurement bypasses, and tailored targeting of real firms.

26.3.3.4 Financial Intelligence (FININT) runtime-to-reader map: generated sections and verifier surfaces **Evidence anchor.** Section 26; [251, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	17.99	17.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Financial Intelligence (FININT) to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	17.101	17.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Financial Intelligence (FININT)	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Model-card, recoverability, retention, and learner-support evidence package	17.102	17.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Financial Intelligence (FININT)	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
FININT Foundations: Collection, Analysis, Reporting	17.1	17.1 FININT Foundations: Collection, Analysis, Reporting	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Financial due-diligence typology exercise using synthetic records and compliance boundaries	17.2	17.2 source title transformed into safe curriculum treatment; original: Suspicious Activity Reports (SARs) and Financial Intelligence Units	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Non-state actor indicator review with attribution caution and governance boundaries	17.3	17.3 source title transformed into safe curriculum treatment; original: Terrorist Financing: Identification, Typologies, Interdiction	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
The SWIFT System and Intelligence Collection	17.4	17.4 The SWIFT System and Intelligence Collection	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Cryptocurrency as Covert Finance: Monero, Mixers, Bridges	17.5	17.5 Cryptocurrency as Covert Finance: Monero, Mixers, Bridges	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Economic Warfare and FININT as a Strategic Tool	17.6	17.6 Economic Warfare and FININT as a Strategic Tool	Economic-Security Due-Diligence Lens	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary	exclude sanctions evasion, laundering methods, threshold gaming, procurement bypasses, and tailored targeting of real firms
Financial due-diligence typology exercise using synthetic records and compliance boundaries	17.7	17.7 source title transformed into safe curriculum treatment; original: Money Laundering Detection: Data Mining and Matching Techniques	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
FININT Supporting National Security: Pillars and Methods	17.8	17.8 FININT Supporting National Security: Pillars and Methods	Economic-Security Due-Diligence Lens	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary	exclude sanctions evasion, laundering methods, threshold gaming, procurement bypasses, and tailored targeting of real firms

26.3.3.5 Financial Intelligence (FININT) reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 26; [251, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
FININT Foundations: Collection, Analysis, Reporting	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Financial due-diligence typology exercise using synthetic records and compliance boundaries	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Non-state actor indicator review with attribution caution and governance boundaries	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
The SWIFT System and Intelligence Collection	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Cryptocurrency as Covert Finance: Monero, Mixers, Bridges	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Economic Warfare and FININT as a Strategic Tool	Economic-Security Due-Diligence Lens	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary	exclude sanctions evasion, laundering methods, threshold gaming, procurement bypasses, and tailored targeting of real firms

Lesson topic	Practice lens	Evidence artifact	Safety check
Money Laundering Detection: Financial due-diligence typology exercise using synthetic records and compliance boundaries	Economic-Security Due-Diligence Lens	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary	exclude sanctions evasion, laundering methods, threshold gaming, procurement bypasses, and tailored targeting of real firms
FININT Supporting National Security: Pillars and Methods	Economic-Security Due-Diligence Lens	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary	exclude sanctions evasion, laundering methods, threshold gaming, procurement bypasses, and tailored targeting of real firms

26.3.3.6 Financial Intelligence (FININT) annotated source ledger: real titles and local contribution Each source cited by this **Financial Intelligence and Economic-Security Due Diligence** module is paired below with its real title and a one-line note on what it contributes to **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

Source	Cited work	What it contributes	Status
[251, 2026]	European Data Governance Act	The European Commission page explaining the Data Governance Act, an EU regulation that became applicable in September 2023 to build trust in data sharing and ease reuse of data. It outlines four mechanisms: facilitating reuse of protected public-sector data, establishing trusted data intermediaries, enabling voluntary data sharing by citizens and businesses, and removing barriers to cross-sector and cross-border data use.	verified source-guide
[252, 2026]	Data Act Explained	An official European Commission explainer on the EU Data Act, which became applicable on 12 September 2025.	verified source-guide
[254, 2026]	A European Strategy for Data	An official European Commission page outlining the European Strategy for Data, which aims to create a single market for data to support competitiveness and data sovereignty. It describes initiatives such as Common European Data Spaces, opening high-value public datasets, and investment in cloud and data-processing capacity, supported by the Data Governance Act and the Data Act. The page frames data sharing as a driver of innovation balanced with privacy and European values.	verified source-guide
[273, 2026]	WCAG 2 Overview	The W3C Web Accessibility Initiative overview of the Web Content Accessibility Guidelines (WCAG), an international standard for making web content accessible to people with disabilities. It explains that WCAG is organized around four principles (perceivable, operable, understandable, robust) with testable success criteria at three conformance levels (A, AA, AAA), and covers versions 2.0, 2.1, and 2.2.	verified source-guide
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide

Source	Cited work	What it contributes	Status
[275, 2026]	Fact Sheet: New Rule on the Accessibility of Web Content and Mobile Apps Provided by State and Local Governments	A US Department of Justice fact sheet explaining the 2024 ADA Title II rule requiring state and local governments to make their web content and mobile apps accessible. It establishes WCAG 2.1 Level AA as the technical standard, applies to entities such as schools, courts, libraries, and transit agencies, and sets compliance deadlines of April 2027 for larger jurisdictions and April 2028 for smaller ones.	verified source-guide
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide
[079, 2026]	Financial intelligence	The Wikipedia article on financial intelligence (FININT), defined as gathering information about the financial affairs of entities of interest to understand their nature, capabilities, and intentions. It outlines two core components: collection, in which Financial Intelligence Units gather transaction data and suspicious activity reports from banks, and analysis, in which specialists use data mining to detect tax evasion, money laundering, and terrorist financing.	verified source-guide context; do not use as primary analytic support

Source	Cited work	What it contributes	Status
[080, 2026]	Financial intelligence	A Wikipedia article on financial intelligence (FININT), the gathering and analysis of information about financial transactions to detect illicit activity such as money laundering, tax evasion, and terrorist financing. It distinguishes two core functions: collection of raw transaction data and suspicious activity reports by government financial intelligence units, and analysis using data-matching techniques to identify suspicious patterns. The article describes the U.S.	verified source-guide context; do not use as primary analytic support
[081, 2026]	Financial intelligence	The Citizendium 'Financial intelligence' article was never written; the page is empty. Use an authoritative alternative source for financial intelligence definitions.	verified source-guide
[082, 2026]	Financial Intelligence: A Crucial Pillar of National Security	A 2025 article by Kevin Hk Chow in Modern Economy titled "Financial Intelligence: A Crucial Pillar of National Security." It argues that Financial Intelligence (FININT) serves as a critical interface between economic systems and national security, used to detect and disrupt illicit financial networks tied to money laundering, terrorism financing, and transnational crime.	verified source-guide
[302, 2026]	National Geospatial-Intelligence Agency About Us	The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety.	verified source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide

Where this sits. This module's overview is Section 26; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

26.3.4 Financial Intelligence (FININT) governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 26; [251, 2026].

26.3.5 Financial Intelligence (FININT) analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 17's governance-boundary section, directly verified anchors for the **Financial Intelligence and Economic-Security Due Diligence** lane include [Network, 2026a]; [Network, 2026b]; [of Foreign Assets Control, 2026]; [of Foreign Assets Control, 2019]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Financial Intelligence and Economic-Security Due Diligence** for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**. [251, 2026]; [252, 2026].
Curriculum topic spine: FININT Foundations: Collection, Analysis, Reporting, **Financial due-diligence typology exercise using synthetic records and compliance boundaries**, **Non-state actor indicator review with attribution caution and governance boundaries**.
Verified anchor cluster: [Network, 2026a]; [Network, 2026b]; [of Foreign Assets Control, 2026]; [of Foreign Assets Control, 2019]; [Force, 2025]; [Force, 2021]; [for International Settlements, 2021].
Conceptual depth: defensive economic intelligence that links financial-crime signals, sanctions programs, export controls, beneficial-ownership uncertainty, and supply-chain due diligence to lawful compliance and policy analysis.
Method stack: typology-to-control mapping, sanctions-program review, beneficial ownership uncertainty notes, export-control red-flag triage, supplier risk registers, and compliance-oriented analytic memos.
Composability contract: entities, transactions, sanctions programs, red flags, supplier evidence, legal constraints, and analytic judgments remain separately reviewable.
Known failure modes: evasion playbooks, threshold gaming, overconfident attribution, stale sanctions data, unverified beneficial ownership, and confusing compliance screening with intelligence certainty.
Defensive boundary: FININT and economic-security examples remain compliance, policy, and resilience oriented; they do not explain how to launder funds, evade sanctions, bypass export controls, or target real firms. Applied to **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

Anchor	Why it matters here
[Network, 2026a]	Official FININT source for AML/CFT advisories, typology awareness, sanctions-evasion warnings, red flags, and compliance-oriented monitoring. Checked as of 2026-05-21; role: curriculum_anchor.
[Network, 2026b]	Official FinCEN source for beneficial-ownership reporting, entity transparency, exemptions, and compliance-oriented analysis. Checked as of 2026-05-21; role: curriculum_anchor.
[of Foreign Assets Control, 2026]	Official OFAC sanctions-program library for understanding legal program structure, list maintenance, and compliance-oriented economic statecraft. Checked as of 2026-05-21; role: curriculum_anchor.
[of Foreign Assets Control, 2019]	Official OFAC compliance framework for management commitment, risk assessment, internal controls, testing, auditing, and training. Checked as of 2026-05-21; role: curriculum_anchor.
[Force, 2025]	Official international AML/CFT/CPF standard for risk-based controls, beneficial ownership, information sharing, supervision, and mutual evaluation. Checked as of 2026-05-21; role: curriculum_anchor.
[Force, 2021]	Official FATF guidance for virtual-asset risk, VASP supervision, travel-rule compliance, and non-evasion FININT education. Checked as of 2026-05-21; role: curriculum_anchor.
[for International Settlements, 2021]	Official BIS policy source for financial technology, market structure, data, network effects, regulation, privacy, and stability tradeoffs. Checked as of 2026-05-21; role: curriculum_anchor.

26.3.5.1 Financial Intelligence (FININT) evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Financial Intelligence and Economic-Security Due Diligence** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [251, 2026]; [252, 2026].

26.3.6 Financial Intelligence (FININT) agentic boundary: assist, approve, block, and record

Evidence anchor. Section 26; [251, 2026].
AGEINT translation is bounded by the **Financial Intelligence and Economic-Security Due Diligence** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

26.3.6.1 Financial Intelligence (FININT) permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 26; [251, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

26.3.6.2 Financial Intelligence (FININT) excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [251, 2026]; [252, 2026] and **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

26.3.7 Financial Intelligence (FININT) governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 26; [251, 2026].
Governance is practiced as a gate on the **Financial Intelligence and Economic-Security Due Diligence** lane. Learners use the **Economic-Security Due-Diligence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and

when an agent-assisted artifact must stop for human review while using **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

26.3.7.1 Financial Intelligence (FININT) governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [251, 2026]; [252, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Financial Intelligence and Economic-Security Due Diligence** failure modes and the **Economic-Security Due-Diligence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

26.3.7.2 Financial Intelligence (FININT) evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 26; [251, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Economic-Security Due-Diligence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

26.3.7.3 Financial Intelligence (FININT) current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**. [251, 2026]; [252, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_fincen_advisories` for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**?	FinCEN Alerts, Advisories, Notices, Bulletins, and Fact Sheets; lane `financial_economic_security`; checked 2026-05-21.	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary; Official FININT source for AML/CFT advisories, typology awareness, sanctions-evasion warnings, red flags, and compliance-oriented monitoring.
What does the module inherit from `official_fincen_boi` for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**?	Beneficial Ownership Information Reporting; lane `financial_economic_security`; checked 2026-05-21.	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary; Official FinCEN source for beneficial-ownership reporting, entity transparency, exemptions, and compliance-oriented analysis.
What does the module inherit from `official_ofac_sanctions_programs` for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**?	Sanctions Programs and Country Information; lane `financial_economic_security`; checked 2026-05-21.	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary; Official OFAC sanctions-program library for understanding legal program structure, list maintenance, and compliance-oriented economic statecraft.
What does the module inherit from `official_ofac_compliance_commitments` for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**?	A Framework for OFAC Compliance Commitments; lane `financial_economic_security`; checked 2026-05-21.	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary; Official OFAC compliance framework for management commitment, risk assessment, internal controls, testing, auditing, and training.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 26; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

26.3.8 Financial Intelligence (FININT) assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 26; [251, 2026].

26.3.9 Financial Intelligence (FININT) assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 26; [251, 2026].

26.3.9.1 Financial Intelligence (FININT) capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries** and [251, 2026]; [252, 2026].

26.3.9.2 Financial Intelligence (FININT) instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries** and [251, 2026]; [252, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

26.3.9.3 Financial Intelligence (FININT) assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
FININT Foundations: Collection, Analysis, Reporting	Completed **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Financial due-diligence typology exercise using synthetic records and compliance boundaries	Completed **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Non-state actor indicator review with attribution caution and governance boundaries	Completed **economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

26.3.10 Financial Intelligence (FININT) refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [251, 2026]; [252, 2026] and **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**.

26.3.10.1 Financial Intelligence (FININT) refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**. The local signals begin with [251, 2026]; [252, 2026].

26.3.10.2 Financial Intelligence (FININT) claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**, and the source spine for these checks begins with [251, 2026]; [252, 2026].

26.3.11 Financial Intelligence (FININT) reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [251, 2026]; [252, 2026].

Triangulation anchors. In module 17's review-checklist section, directly verified anchors for the **Financial Intelligence and Economic-Security Due Diligence** lane include [Network, 2026a]; [Network, 2026b]; [of Foreign Assets Control, 2026]; [of Foreign Assets Control, 2019]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries**. [251, 2026]; [252, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.

- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

26.3.12 Financial Intelligence (FININT) learning-path links: module map, overview, and curriculum atlas

These links keep **FININT Foundations: Collection, Analysis, Reporting; Financial due-diligence typology exercise using synthetic records and compliance boundaries** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [251, 2026]; [252, 2026].
Section 2, Section 24, Section 25, Section 27

27 PSYCHOLOGICAL OPERATIONS AND INFLUENCE

27.1 PSYCHOLOGICAL OPERATIONS AND INFLUENCE learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 27; [238, 2026].

27.1.1 information-integrity and influence analysis discipline spine: domain question and learning focus

Evidence anchor. Section 27; [238, 2026].
This unit teaches **information-integrity and influence analysis**. Influence lessons analyze narratives, provenance, audience harm, attribution caution, and transparent resilience education without persuasion design.

27.1.2 information-integrity and influence analysis source-use contract: citation roles and evidence limits

Evidence anchor. Section 27; [238, 2026].
Use CISA and NATO anchors for foreign influence, information threats, public resilience, and transparent mitigation claims.

27.1.3 information-integrity and influence analysis practice artifact: recurring packet and retained evidence

Evidence anchor. Section 27; [238, 2026].
The recurring practice artifact is a **narrative-risk and resilience map** that draws on narrative provenance chain, audience-harm note, attribution caveat, and transparent response option. The unit keeps its learning spine explicit. Learners separate message observation from attribution, identify harm, and choose transparent education or correction options.

27.1.4 information-integrity and influence analysis safety boundary: accountable, synthetic, and evidence-bounded limits

No covert persuasion, microtargeting, manipulation, or campaign design.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [238, 2026]; [239, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [238, 2026]; [239, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [238, 2026]; [239, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [238, 2026]; [239, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Cognitive Security and Influence Resilience. Core anchors: [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]. Conceptual focus: protecting attention, belief formation, and decision quality without turning resilience education into manipulation. Composability contract: separate descriptive analysis, normative assessment, response options, and protected-audience considerations. **Practice lens:** Cognitive-Resilience Lens; How does the module protect autonomy, attention, trust, and decision quality without designing persuasion? [238, 2026]; [239, 2026].

27.1.5 PSYCHOLOGICAL OPERATIONS AND INFLUENCE visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 64 and Figure 65 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 26, Section 28.

27.1.6 PSYCHOLOGICAL OPERATIONS AND INFLUENCE module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
PSYOP and MISO Doctrine	Section 28	[238, 2026]; [239, 2026]; [242, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [083, 2026]; [084, 2026]; [085, 2026]; [086, 2026]; [087, 2026]; [302, 2026]; [297, 2026]; [308, 2026]; [311, 2026].
Active Measures and Disinformation	Section 29	[238, 2026]; [239, 2026]; [240, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [088, 2026]; [089, 2026]; [090, 2026]; [091, 2026]; [092, 2026]; [093, 2026]; [094, 2026]; [095, 2026]; [096, 2026]; [308, 2026]; [311, 2026].

Module	Section reference	Source spine
Social Engineering	Section 30	[238, 2026]; [240, 2026]; [242, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [097, 2026]; [098, 2026]; [099, 2026]; [100, 2026]; [300, 2026]; [304, 2026]; [306, 2026]; [308, 2026]; [311, 2026].
Information Warfare and Cognitive Security	Section 31	[238, 2026]; [239, 2026]; [244, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [101, 2026]; [102, 2026]; [103, 2026]; [104, 2026]; [105, 2026]; [095, 2026]; [096, 2026]; [106, 2026]; [003, 2026]; [107, 2026].

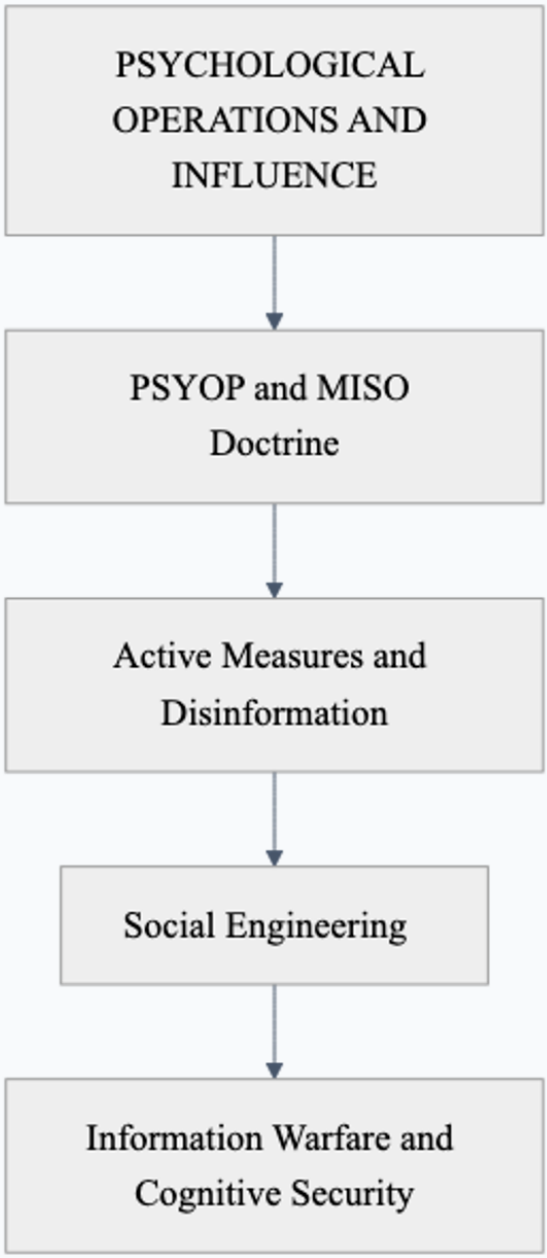

Figure 64: The unit module map traces the part's chapters as a linear reading sequence. Its reader value is to make 4 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last visible at a glance, with the psychological operations and influence section as the source section and defensive review as the boundary.

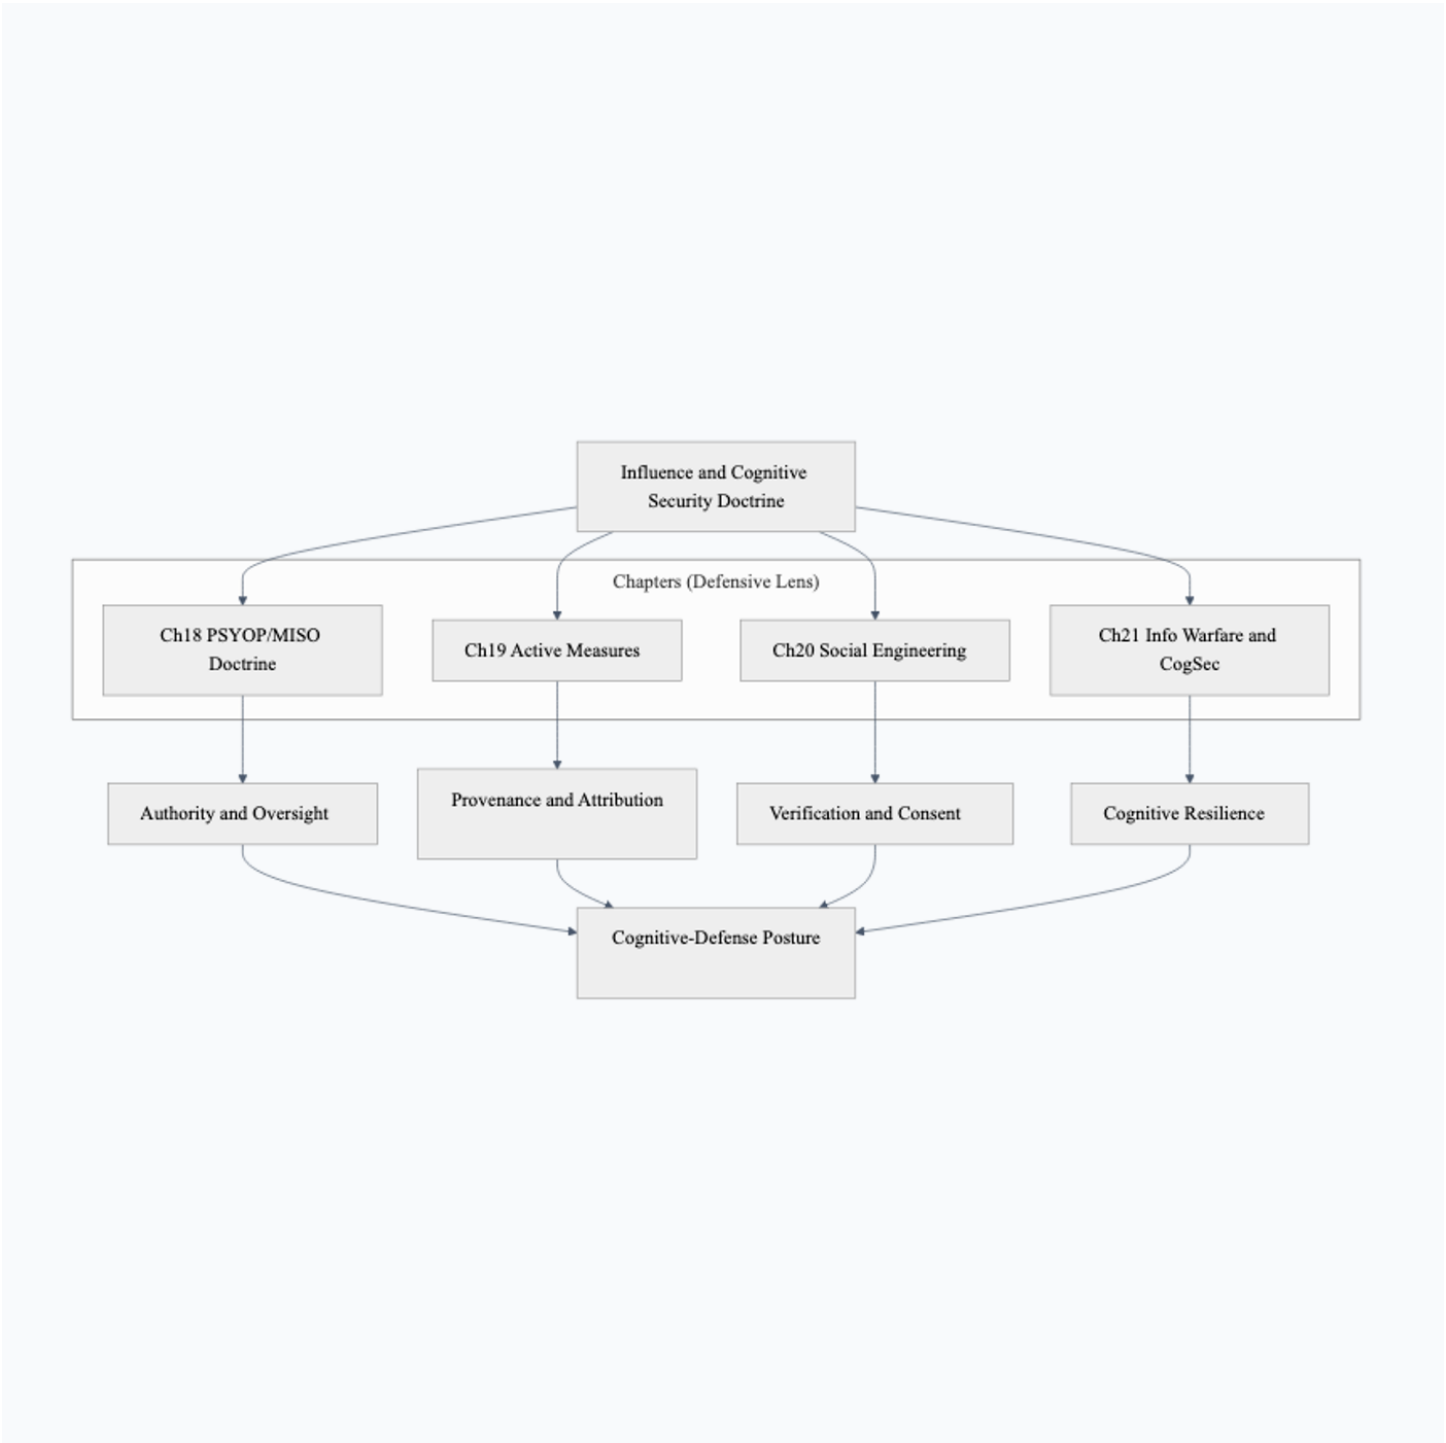

Figure 65: Studied defensively, this Part is a doctrine-and-countermeasure spine: each influence chapter is matched to the detection signals and cognitive-resilience controls that defend against it. In the psychological operations and influence section, it lets readers compare Influence and Cognitive Security Doctrine, Chapters (Defensive Lens), Ch18 PSYOP/MISO Doctrine, and Ch19 Active Measures so the visual functions as a traceable course aid rather than an unscoped assertion.

28 PSYOP and MISO Doctrine

28.0.1 PSYOP and MISO Doctrine figures and course links: visual evidence, source flow, and navigation

The module uses Figure 66 and Figure 64 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 27, Section 29.
This module teaches the **Cognitive Security and Influence Resilience** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [239, 2026].

28.1 Cognitive Security and Influence Resilience frame for PSYOP and MISO Doctrine: source context, topic focus, and reader task

Evidence anchor. Section 28; [238, 2026].

28.1.1 PSYOP and MISO Doctrine orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 28; [238, 2026].

28.1.2 PSYOP and MISO Doctrine conceptual primer: source context, core model, and reader task

This chapter teaches cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The chapter uses **Cognitive-Resilience Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.
The central distinction is to separate analysis of influence from persuasion design. Core topics include **Cognitive influence-analysis case review using sample materials; Military Information Support Operations (MISO): JP 3-13.2; Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [239, 2026].
Learners move from vocabulary and the **Cognitive-Resilience Lens** distinction through topic lessons on **Cognitive influence-analysis case review using sample materials** with evidence and misconception checks, then assemble a **narrative-risk map with provenance, uncertainty, audience harms, and response options** with safety and rights gates.

28.1.3 PSYOP and MISO Doctrine learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 28; [238, 2026].

- Connect **Cognitive influence-analysis case review using sample materials and Military Information Support Operations (MISO): JP 3-13.2** to **Cognitive Security and Influence Resilience** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate analysis of influence from persuasion design; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans.

28.1.4 PSYOP and MISO Doctrine core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 28; [238, 2026].

Term	Working definition
Narrative provenance	where a claim, frame, or story came from and how it spread
Prebunking	transparent education that helps people recognize misleading patterns before exposure
Audience harm	a privacy, dignity, autonomy, or trust risk for people receiving information
Attribution caution	the rule that intent and origin claims need strong evidence
Resilience response	a transparent education, correction, or process improvement that avoids manipulation
MISO boundary	the line between accountable public messaging analysis and covert influence design
Inoculation	building recognition of manipulation tactics without deploying persuasion against a population
Cognitive influence-analysis case review using…	Key terms: Cognitive, influence, analysis.
Military Information Support Operations (MISO):…	Key terms: Military, Information, Support.

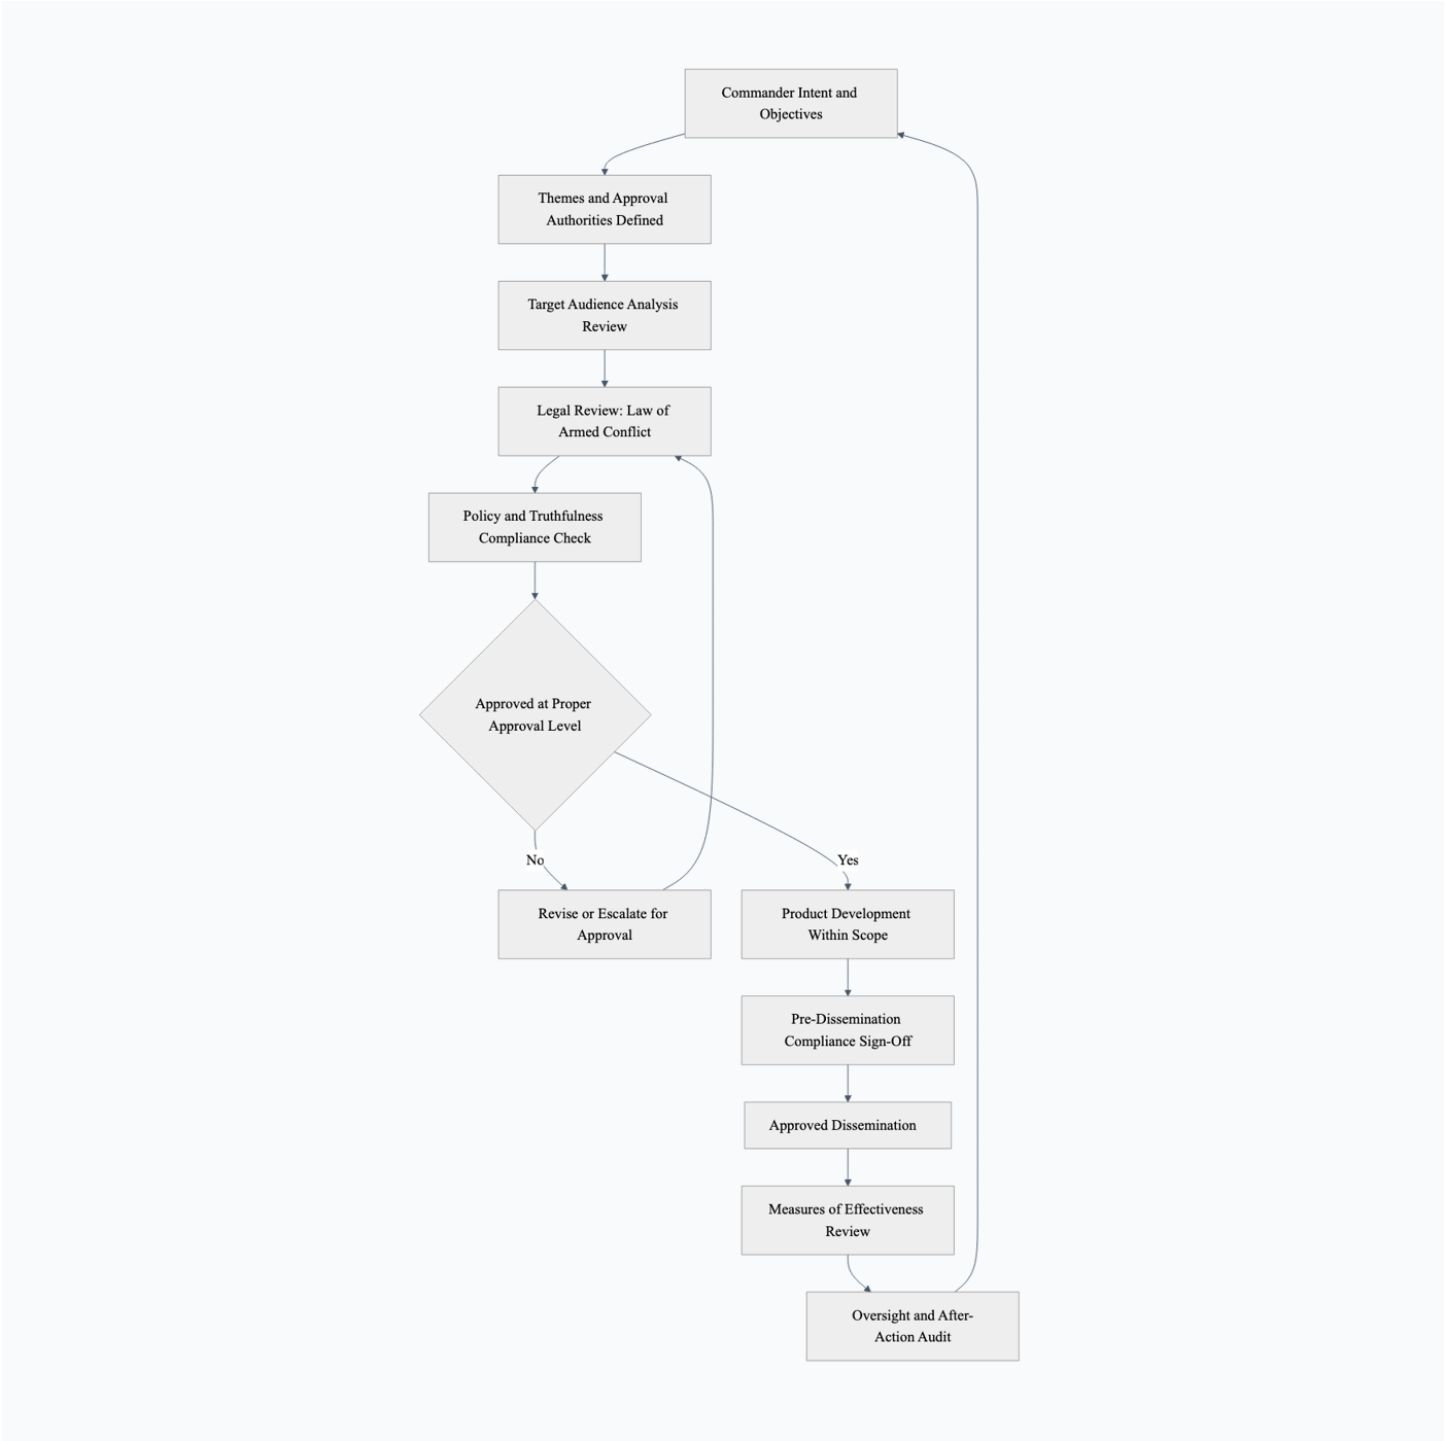

Figure 66: A doctrinal governance view showing how influence products must pass through legal, policy, and approval-authority gates before approved dissemination and after-action audit. The captioned view belongs to the psychological operations and influence / psyop and miso doctrine section and should be read as a map of Commander Intent and Objectives, Themes and Approval Authorities Defined, Target Audience Analysis Review, and Legal Review: Law of Armed Conflict, not as a capability score or live-task instruction.

28.2 Cognitive-Resilience Lens path for PSYOP and MISO Doctrine: lesson cluster, safe artifact, and review

Evidence anchor. Section 28; [238, 2026].

28.2.1 PSYOP and MISO Doctrine practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 28; [238, 2026].

28.2.2 PSYOP and MISO Doctrine topic lessons: source-backed concepts and transfer tasks

This module builds cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The sequence opens with **Cognitive influence-analysis case review using sample materials**, **Military Information Support Operations (MISO): JP 3-13.2**, **Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials** and applies the **Cognitive-Resilience Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 64; module overview Section 28; curriculum atlas Section 2.

Triangulation anchors. In module 18's topic-lessons section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

28.2.2.1 Lesson 1: Cognitive influence-analysis case review using sample materials

Concept. Cognitive influence-analysis case review using sample materials studies influence doctrine as audience analysis, message integrity, and ethics—not as manipulation technique.

Why it matters. Cognitive influence-analysis case review matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. Cognitive influence-analysis case review using sample materials rests on [083, 2026] and [084, 2026]. The closest source to this row notes: It establishes organizational structure, command relationships, planning processes, and approval authorities for integrating psychological operations into joint military campaigns and peacetime activities. Use them for the claim that **Cognitive influence-analysis case review using sample materials** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Cognitive influence-analysis case review**, work from the cited evidence behind this row. [083, 2026] Joint Publication 3-53, the US Department of Defense joint doctrine for psychological operations. It establishes organizational structure, command relationships, planning processes, and approval authorities for integrating psychological operations into joint military campaigns and peacetime activities. [084, 2026] Joint Publication 3-53, Doctrine for Joint Psychological Operations (Joint Chiefs of Staff, 10 July 1996). This US military doctrine document establishes the doctrinal basis for planning and conducting psychological operations in support of joint military operations. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Cognitive influence-analysis case review**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Cognitive influence-analysis case review using**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Cognitive influence-analysis case review** work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Cognitive influence-analysis case review**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Cognitive influence-analysis case review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

28.2.2.2 Lesson 2: Military Information Support Operations (MISO): JP 3-13.2

Concept. Military Information Support Operations (MISO): JP 3-13.2 studies influence doctrine as audience analysis, message integrity, and ethics—not as manipulation technique.

Why it matters. Analysts use **Military Information Support Operations (MISO)** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that counter-messaging as manipulation would otherwise hide, and the reviewer accountable for challenge.

Source support. Military Information Support Operations (MISO): JP 3-13.2 rests on [085, 2026]. Its anchor reference records: It sets forth joint doctrine to govern the activities and performance of the Armed Forces. Use it for pinning down the scope of **Military Information Support Operations (MISO): JP 3-13.2**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Military Information Support Operations (MISO)**, reason from the sources cited in this row. [085, 2026] It sets forth joint doctrine to govern the activities and performance of the Armed Forces. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Military Information Support Operations (MISO)**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must name the source descriptor, the bounded claim about **Military Information Support Operations**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Military Information Support Operations (MISO)** work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Military Information Support Operations (MISO): JP 3-13.2 can be used while ignoring the rule to separate analysis of influence from persuasion design.

Transfer task. Transfer **Military Information Support Operations (MISO)** to a second module by preserving information-integrity analysis and resilience education, changing the source evidence, and naming a new reviewer.

28.2.2.3 Lesson 3: Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials

Concept. Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials studies influence doctrine as audience analysis, message integrity, and ethics—not as manipulation technique.

Why it matters. Tactical PSYOP TTP matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials rests on [086, 2026]. The most specific cited work observes: A U.S. Use it for the working definition that **Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Tactical PSYOP TTP** in the evidence the row cites. [086, 2026] A U.S. military field manual, FM 3-05.302, providing doctrine for tactical psychological operations at the unit level. The roughly 255-page document covers the organization of these units,

command relationships when supporting joint forces, a multi-phase product development and assessment process, and how intelligence supports such operations. It serves as a comprehensive training and reference document for personnel involved in tactical influence operations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Tactical PSYOP TTP**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Tactical PSYOP TTP**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Tactical PSYOP TTP** work as a **narrative-risk and resilience map** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Tactical PSYOP TTP**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Tactical PSYOP TTP** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

28.2.2.4 Lesson 4: FM 3-05 301: Cognitive influence-analysis case review using sample materials

Concept. FM 3-05 301: Cognitive influence-analysis case review using sample materials studies influence doctrine as audience analysis, message integrity, and ethics—not as manipulation technique.

Why it matters. FM 3-05 301: Cognitive influence-analysis case review using sample materials connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. FM 3-05 301: Cognitive influence-analysis case review using sample materials rests on [087, 2026]. Its anchor reference records: … Use it for fixing what **FM 3-05 301: Cognitive influence-analysis case review using sample materials** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **FM 3-05 301: Cognitive influence-analysis case review using sample materials**, work from the cited evidence behind this row. [087, 2026] … Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **FM 3-05 301**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **FM 3-05 301**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **FM 3-05 301: Cognitive influence-analysis case review using sample materials** work as a **narrative-risk and resilience map** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **FM 3-05 301: Cognitive influence-analysis case review using sample materials**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **FM 3-05 301: Cognitive influence-analysis case review using sample materials** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

28.2.2.5 Lesson 5: Target Audience Analysis (TAA) and Susceptibility Mapping

Concept. Target Audience Analysis (TAA) and Susceptibility Mapping applies Target, Audience, Analysis within Cognitive Security and Influence Resilience: learners use separate analysis of influence from persuasion design and information-integrity analysis and resilience education evidence before any judgment moves forward.

Why it matters. Target Audience Analysis (TAA) matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; counter-messaging as manipulation is a common failure.

Source support. Target Audience Analysis (TAA) and Susceptibility Mapping rests on [302, 2026] and [297, 2026]. The closest source to this row notes: The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Use them for pinning down the scope of **Target Audience Analysis (TAA) and Susceptibility Mapping**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Target Audience Analysis (TAA)**, work from the cited evidence behind this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Target Audience Analysis (TAA)**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must name the source descriptor, the bounded claim about **Target Audience Analysis and Susceptibility**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Target Audience Analysis (TAA)** work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Target Audience Analysis (TAA) and Susceptibility Mapping replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Target Audience Analysis (TAA)** to a second module by preserving information-integrity analysis and resilience education, changing the source evidence, and naming a new reviewer.

28.2.2.6 Lesson 6: PSYOP in Full-Spectrum Operations: Cognitive influence-analysis case review using sample materials

Concept. PSYOP in Full-Spectrum Operations: Cognitive influence-analysis case review using sample materials studies influence doctrine as audience analysis, message integrity, and ethics—not as manipulation technique.

Why it matters. PSYOP in Full-Spectrum Operations connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. PSYOP in Full-Spectrum Operations: Cognitive influence-analysis case review using sample materials rests on [086, 2026]. Its anchor reference records: The roughly 255-page document covers the organization of these units, command relationships when supporting joint forces, a multi-phase product development and assessment process, and how intelligence supports such operations. Use it for the working definition that **PSYOP in Full-Spectrum Operations: Cognitive influence-analysis case review using sample materials** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **PSYOP in Full-Spectrum Operations**, work from the cited evidence behind this row. [086, 2026] A U.S. military field manual, FM 3-05.302, providing doctrine for tactical psychological operations at the unit level. The roughly 255-page document covers the organization of these units, command relationships when supporting joint forces, a multi-phase product development and assessment process, and how intelligence supports such operations. It serves as a comprehensive training and reference document for personnel involved in tactical influence operations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **PSYOP in Full-Spectrum Operations**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **PSYOP in Full-Spectrum Operations**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and

the reviewer accountable for correction. Shape **PSYOP in Full-Spectrum Operations** work as a **narrative-risk and resilience map** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **PSYOP in Full-Spectrum Operations**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **PSYOP in Full-Spectrum Operations** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

28.2.2.7 Lesson 7: Leaflets, Loudspeakers, and Digital Media: Product Development and Dissemination Concept. Leaflets, Loudspeakers, and Digital Media: Product Development and Dissemination applies Leaflets, Loudspeakers, Digital within Cognitive Security and Influence Resilience: learners use separate analysis of influence from persuasion design and information-integrity analysis and resilience education evidence before any judgment moves forward.

Why it matters. Leaflets, Loudspeakers, and Digital Media matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; counter-messaging as manipulation is a common failure.

Source support. Leaflets, Loudspeakers, and Digital Media: Product Development and Dissemination rests on [308, 2026] and [311, 2026]. The most specific cited work observes: An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. Use them for fixing what **Leaflets, Loudspeakers, and Digital Media: Product Development and Dissemination** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Leaflets, Loudspeakers, and Digital Media** in the evidence the row cites. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Leaflets, Loudspeakers, and Digital Media**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must name the source descriptor, the bounded claim about **Leaflets Loudspeakers and Digital Media**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Leaflets, Loudspeakers, and Digital Media** work as a **narrative-risk and resilience map** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Leaflets, Loudspeakers, and Digital Media: Product Development and Dissemination is optional whenever separate analysis of influence from persuasion design feels inconvenient.

Transfer task. Transfer **Leaflets, Loudspeakers, and Digital Media** to a second module by preserving information-integrity analysis and resilience education, changing the source evidence, and naming a new reviewer.

28.2.3 PSYOP and MISO Doctrine worked safe example: synthetic inputs, evidence, and review

Worked example: a sample public-library class evaluates a synthetic rumor about a community service and compares transparent correction options. [238, 2026]; [239, 2026].

Triangulation anchors. In module 18's worked-example section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **information-integrity and influence analysis**. Learners use a **narrative-risk and resilience map** and keep this boundary visible: No covert persuasion, microtargeting, manipulation, or campaign design.

Frame. The classroom question centers on **Cognitive influence-analysis case review using sample materials**. Excluded actions stay explicit, and the **Cognitive-Resilience Lens** planning question is: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Inputs. For the **Cognitive influence-analysis case review using sample materials** scenario, use sample posts, source timestamps, public-service facts, and a media-literacy rubric. The Cognitive-Resilience Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Cognitive influence-analysis case review using sample materials**, students trace narrative provenance, separate observation from attribution, name audience harms, and design a transparent lesson. Pause whenever an inference about Cognitive influence-analysis case review using sample materials appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Cognitive influence-analysis case review using sample materials** classroom scenario; unit artifact = narrative-risk and resilience map; evidence = allowed inputs; method = information-integrity analysis and resilience education; output = a narrative-risk map with caveats, response options, and no microtargeted persuasion; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Cognitive influence-analysis case review using sample materials** as "Cognitive-Resilience Lens confirms it" is not enough. The revision ties the claim to information-integrity analysis and resilience education, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Cognitive influence-analysis case review using sample materials** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

28.2.4 PSYOP and MISO Doctrine practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Cognitive-Resilience Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

Triangulation anchors. In module 18's practice-sequence section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Cognitive influence-analysis case review using sample materials, Military Information Support Operations: JP 3-13.2, Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Cognitive Security and Influence Resilience** lane.
2. Frame	Answer the lens question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Cognitive influence-analysis case review using sample materials: narrative-risk map with provenance, uncertainty, audience harms, and response options.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the narrative-risk and resilience map fields for Cognitive influence-analysis case review using sample materials.	Unit profile note.	Evidence artifacts include narrative provenance chain, audience-harm note.
4. Challenge	Test the misconception that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.	Failure-mode note.	The artifact applies the key distinction: separate analysis of influence from persuasion design.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

28.2.4.1 PSYOP and MISO Doctrine instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**. [238, 2026]; [239, 2026].

28.2.4.2 PSYOP and MISO Doctrine extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 28; [238, 2026].

Have learners swap artifacts and apply the **Cognitive-Resilience Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

28.2.5 PSYOP and MISO Doctrine knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 28; [238, 2026].

1. Explain how **Cognitive influence-analysis case review using sample materials** is defined here; name the source descriptor that supports the definition.
2. Contrast **Cognitive influence-analysis case review using sample materials** with **Military Information Support Operations: JP 3-13.2** using the **Cognitive-Resilience Lens** artifact fields.
3. Identify one failure mode from the **Cognitive Security and Influence Resilience** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which response informs people without crossing into MISO-style manipulation or unverified attribution?
5. Correct this misconception: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

28.2.5.1 PSYOP and MISO Doctrine answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Cognitive influence-analysis case review using sample materials** without source evidence, uncertainty, or a safe transfer task.

28.3 PSYOP and MISO Doctrine assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 28; [238, 2026].

28.3.1 PSYOP and MISO Doctrine evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 28; [238, 2026].

28.3.2 PSYOP and MISO Doctrine transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 28; [238, 2026].

28.3.2.1 PSYOP and MISO Doctrine lineage and source tradition: profile, concepts, and first anchors This sits in the **Cognitive Security and Influence Resilience** lineage: protecting attention, belief formation, and decision quality without turning resilience education into manipulation. [238, 2026]; [239, 2026].

28.3.2.2 PSYOP and MISO Doctrine working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 28; [238, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**, with provenance and reviewability throughout.

28.3.2.3 PSYOP and MISO Doctrine knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [238, 2026]; [239, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

28.3.2.4 PSYOP and MISO Doctrine transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 28; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.
- **Evidence contract:** keep the **Cognitive Security and Influence Resilience** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

28.3.2.5 PSYOP and MISO Doctrine profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 28; [238, 2026].

The matched profile emphasizes protecting attention, belief formation, and decision quality without turning resilience education into manipulation. The method stack is claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning; the local topic cluster is **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

28.3.3 PSYOP and MISO Doctrine evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 28; [238, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Cognitive Security and Influence Resilience** profile tells reviewers what evidence is strong enough for the module artifact built around **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

28.3.3.1 PSYOP and MISO Doctrine guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [239, 2026]; [242, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [083, 2026]; [084, 2026]; [085, 2026]; [086, 2026]; [087, 2026]; [302, 2026]; [297, 2026]; [308, 2026]; [311, 2026].

28.3.3.2 PSYOP and MISO Doctrine verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [239, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [239, 2026]; [242, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [083, 2026]; [084, 2026]; [085, 2026]; [086, 2026]; [087, 2026]; [302, 2026]; [297, 2026]; [308, 2026]; [311, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 18's source-canon section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2** and [238, 2026]; [239, 2026], but only directly verified source URLs are encoded as citations.

28.3.3.3 PSYOP and MISO Doctrine intelligence practice lens: evidence artifact and safety check Practice lens: **Cognitive-Resilience Lens** for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**. [238, 2026]; [239, 2026].

Planning question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Evidence artifact: narrative-risk map with provenance, uncertainty, audience harms, and response options.

Validation rule: distinguish observation, attribution, impact assessment, and resilience response. Applied to **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

Handoff contract: handoff supports transparency, education, and resilience, not microtargeted influence or deception.

Safety check: exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning.

28.3.3.4 PSYOP and MISO Doctrine runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 28; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	18.99	18.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind PSYOP and MISO Doctrine to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Bounded autonomy, procurement, incident-response, and assurance studio	18.101	18.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for PSYOP and MISO Doctrine	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Model-card, recoverability, retention, and learner-support evidence package	18.102	18.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for PSYOP and MISO Doctrine	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive influence-analysis case review using sample materials	18.1	18.1 source title transformed into safe curriculum treatment; original: Joint PSYOP Doctrine: JP 3-53 (1996 and 2003)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Military Information Support Operations (MISO): JP 3-13.2	18.2	18.2 Military Information Support Operations (MISO): JP 3-13.2	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Cognitive influence-analysis case review using sample materials	18.3	18.3 source title transformed into safe curriculum treatment; original: Tactical PSYOP TTP: FM 3-05.302	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive influence-analysis case review using sample materials	18.4	18.4 source title transformed into safe curriculum treatment; original: FM 3-05.301: PSYOP Process Tactics and Techniques	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Target Audience Analysis (TAA) and Susceptibility Mapping	18.5	18.5 Target Audience Analysis (TAA) and Susceptibility Mapping	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive influence-analysis case review using sample materials	18.6	18.6 source title transformed into safe curriculum treatment; original: PSYOP in Full-Spectrum Operations: Themes and Objectives	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Leaflets, Loudspeakers, and Digital Media: Product Development and Dissemination	18.7	18.7 Leaflets, Loudspeakers, and Digital Media: Product Development and Dissemination	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

28.3.3.5 PSYOP and MISO Doctrine reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 28; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Cognitive influence-analysis case review using sample materials	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Military Information Support Operations (MISO): JP 3-13.2	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
FM 3-05 301: Cognitive influence-analysis case review using sample materials	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Target Audience Analysis (TAA) and Susceptibility Mapping	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
PSYOP in Full-Spectrum Operations: Cognitive influence-analysis case review using sample materials	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Leaflets, Loudspeakers, and Digital Media: Product Development and Dissemination	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

28.3.3.6 PSYOP and MISO Doctrine annotated source ledger: real titles and local contribution Each source cited by this **Cognitive Security and Influence Resilience** module is paired below with its real title and a one-line note on what it contributes to **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide

[311, 2026]	Countering Information Threats	An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering.	verified source-guide

Where this sits. This module's overview is Section 28; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

28.3.4 PSYOP and MISO Doctrine governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 28; [238, 2026].

28.3.5 PSYOP and MISO Doctrine analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 18's governance-boundary section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Cognitive Security and Influence Resilience** for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations (MISO): JP 3-13.2**. [238, 2026]; [239, 2026].
Curriculum topic spine: Cognitive influence-analysis case review using sample materials, **Military Information Support Operations (MISO): JP 3-13.2**, **Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials**. **Verified anchor cluster:** [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]; [OECD, 2026c]; [for Security Policy, 2025]; [Community, 2020a].
Conceptual depth: protecting attention, belief formation, and decision quality without turning resilience education into manipulation.
Method stack: claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning.
Composability contract: separate descriptive analysis, normative assessment, response options, and protected-audience considerations.
Known failure modes: counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty.
Defensive boundary: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans. Applied to **Cognitive influence-analysis case review using sample materials; Military Information Support Operations (MISO): JP 3-13.2**.

Anchor	Why it matters here
[Cybersecurity and Agency, 2024b]	Official CISA guidance on foreign influence operations targeting critical infrastructure. Checked as of 2026-05-21; role: source_quality_anchor.
[Organization, 2026b]	Official NATO counter-information-threat guidance. Checked as of 2026-05-21; role: source_quality_anchor.
[Cybersecurity and Agency, 2026b]	Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing. Checked as of 2026-05-21; role: curriculum_anchor.
[Organization, 2026c]	Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure. Checked as of 2026-05-21; role: curriculum_anchor.
[OECD, 2026c]	Official OECD policy source for information integrity, governance responses, public trust, and democratic resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[for Security Policy, 2025]	Policy-scholarship source for cognitive security, information literacy, critical thinking, and whole-of-society resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.

28.3.5.1 PSYOP and MISO Doctrine evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Cognitive Security and Influence Resilience** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [239, 2026].

28.3.6 PSYOP and MISO Doctrine agentic boundary: assist, approve, block, and record

Evidence anchor. Section 28; [238, 2026].
AGEINT translation is bounded by the **Cognitive Security and Influence Resilience** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

28.3.6.1 PSYOP and MISO Doctrine permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 28; [238, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

28.3.6.2 PSYOP and MISO Doctrine excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [239, 2026] and **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

28.3.7 PSYOP and MISO Doctrine governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 28; [238, 2026].
Governance is practiced as a gate on the **Cognitive Security and Influence Resilience** lane. Learners use the **Cognitive-Resilience Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

28.3.7.1 PSYOP and MISO Doctrine governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [239, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Cognitive Security and Influence Resilience** failure modes and the **Cognitive-Resilience Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

28.3.7.2 PSYOP and MISO Doctrine evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 28; [238, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Cognitive-Resilience Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

28.3.7.3 PSYOP and MISO Doctrine current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**. [238, 2026]; [239, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cisa_foreign_influence` for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**?	Preparing for and Mitigating Foreign Influence Operations; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA guidance on foreign influence operations targeting critical infrastructure.
What does the module inherit from `official_nato_counter_information_threats` for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**?	Countering Information Threats; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO counter-information-threat guidance.
What does the module inherit from `official_cisa_election_security_influence` for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**?	Election Security; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing.
What does the module inherit from `official_nato_hybrid_threats` for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**?	Countering Hybrid Threats; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 28; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

28.3.8 PSYOP and MISO Doctrine assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 28; [238, 2026].

28.3.9 PSYOP and MISO Doctrine assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 28; [238, 2026].

28.3.9.1 PSYOP and MISO Doctrine capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2** and [238, 2026]; [239, 2026].

28.3.9.2 PSYOP and MISO Doctrine instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2** and [238, 2026]; [239, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

28.3.9.3 PSYOP and MISO Doctrine assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Cognitive influence-analysis case review using sample materials	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Military Information Support Operations (MISO): JP 3-13.2	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Tactical PSYOP TTP: Cognitive influence-analysis case review using sample materials	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

28.3.10 PSYOP and MISO Doctrine refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [239, 2026] and **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**.

28.3.10.1 PSYOP and MISO Doctrine refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**. The local signals begin with [238, 2026]; [239, 2026].

28.3.10.2 PSYOP and MISO Doctrine claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**, and the source spine for these checks begins with [238, 2026]; [239, 2026].

28.3.11 PSYOP and MISO Doctrine reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [239, 2026].

Triangulation anchors. In module 18's review-checklist section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2**. [238, 2026]; [239, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

28.3.12 PSYOP and MISO Doctrine learning-path links: module map, overview, and curriculum atlas

These links keep **Cognitive influence-analysis case review using sample materials; Military Information Support Operations: JP 3-13.2** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [238, 2026]; [239, 2026].

Section 2, Section 27, Section 29

29 Active Measures and Disinformation

29.0.1 Active Measures and Disinformation figures and course links: visual evidence, source flow, and navigation

The module uses Figure 67 and Figure 64 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 27, Section 28, Section 30.
This module teaches the **Cognitive Security and Influence Resilience** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [239, 2026].

29.1 Cognitive Security and Influence Resilience frame for Active Measures and Disinformation: source context, topic focus, and reader task

Evidence anchor. Section 29; [238, 2026].

29.1.1 Active Measures and Disinformation orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 29; [238, 2026].

29.1.2 Active Measures and Disinformation conceptual primer: source context, core model, and reader task

This chapter teaches cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The chapter uses **Cognitive-Resilience Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.
The central distinction is to separate analysis of influence from persuasion design. Core topics include **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation; Declassified source-protection and institutional-control case study**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [239, 2026].
Learners move from vocabulary and the **Cognitive-Resilience Lens** distinction through topic lessons on **Cognitive influence-analysis case review using sample materials** with evidence and misconception checks, then assemble a **narrative-risk map with provenance, uncertainty, audience harms, and response options** with safety and rights gates.

29.1.3 Active Measures and Disinformation learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 29; [238, 2026].

- Connect **Cognitive influence-analysis case review using sample materials and Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** to **Cognitive Security and Influence Resilience** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate analysis of influence from persuasion design; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans.

29.1.4 Active Measures and Disinformation core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 29; [238, 2026].

Term	Working definition
Narrative provenance	where a claim, frame, or story came from and how it spread
Prebunking	transparent education that helps people recognize misleading patterns before exposure
Audience harm	a privacy, dignity, autonomy, or trust risk for people receiving information
Attribution caution	the rule that intent and origin claims need strong evidence
Resilience response	a transparent education, correction, or process improvement that avoids manipulation
MISO boundary	the line between accountable public messaging analysis and covert influence design
Inoculation	building recognition of manipulation tactics without deploying persuasion against a population
Cognitive influence-analysis case review using…	Key terms: Cognitive, influence, analysis.
Dezinformatsiya: Forgery, Front Organizations,…	Key terms: Dezinformatsiya, Forgery, Front.

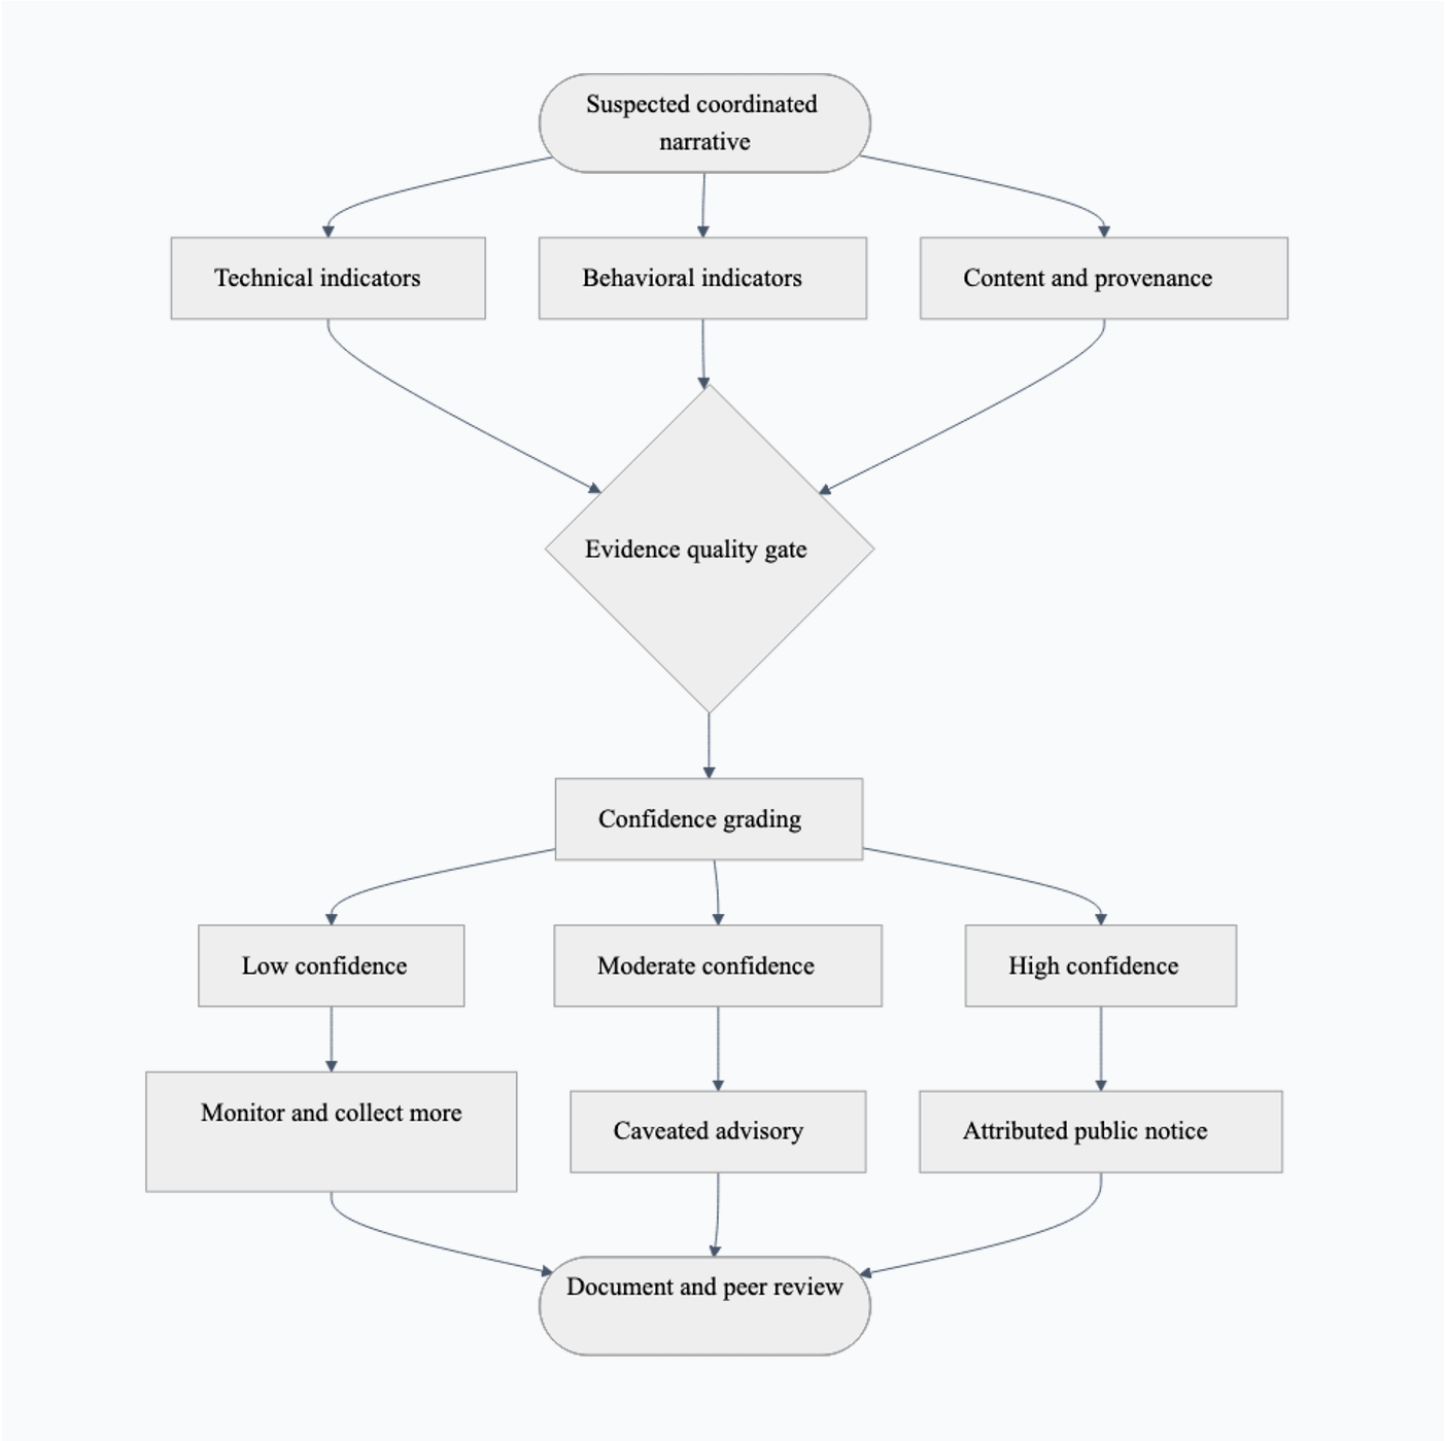

Figure 67: How analysts move a suspected influence narrative from raw signals through evidence gating to a graded, defensible attribution-confidence judgment. The captioned view belongs to the psychological operations and influence / active measures and disinformation section and should be read as a map of Suspected coordinated narrative, Technical indicators, Behavioral indicators, and Content and provenance, not as a capability score or live-task instruction.

29.2 Cognitive-Resilience Lens path for Active Measures and Disinformation: lesson cluster, safe artifact, and review

Evidence anchor. Section 29; [238, 2026].

29.2.1 Active Measures and Disinformation practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 29; [238, 2026].

29.2.2 Active Measures and Disinformation topic lessons: source-backed concepts and transfer tasks

This module builds cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The sequence opens with **Cognitive influence-analysis case review using sample materials**, **Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**, **Declassified source-protection and institutional-control case study** and applies the **Cognitive-Resilience Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 64; module overview Section 29; curriculum atlas Section 2.

Triangulation anchors. In module 19's topic-lessons section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

29.2.2.1 Lesson 1: Cognitive influence-analysis case review using sample materials Concept. Cognitive influence-analysis case review using sample materials analyzes influence campaigns through provenance, audience harm, attribution caution, and transparent response options.

Why it matters. Analysts use **Cognitive influence-analysis case review** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Cognitive influence-analysis case review using sample materials rests on [088, 2026] and [089, 2026]. The closest source to this row notes: Department of State Bureau of Public Affairs report from October 1981, released under FOIA. Use them for the claim that **Cognitive influence-analysis case review using sample materials** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Cognitive influence-analysis case review**, work from the cited evidence behind this row. [088, 2026] A U.S. Department of State Bureau of Public Affairs report from October 1981, released under FOIA. It catalogs Soviet 'active measures' — the Soviet term for covert influence operations — including written disinformation, control of foreign media, use of front organizations, clandestine broadcasting, blackmail, and political influence operations. Specific cases include Soviet forgeries related to the 1979 Grand Mosque seizure and NATO theater nuclear force debates. [089, 2026] An article by Dennis Kux published in Parameters: Journal of the US Army War College (1985) and preserved in the CIA CREST archive. It defines and distinguishes Soviet 'disinformation' and 'active measures,' situating them within a spectrum of white, gray, and black foreign influence operations. Kux examines KGB front groups, agents of influence, forgeries, and the broader strategic goal of tarnishing Western governments while advancing Soviet foreign policy. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Cognitive influence-analysis case review**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Cognitive influence-analysis case review using**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Cognitive influence-analysis case review** work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Cognitive influence-analysis case review**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Cognitive influence-analysis case review** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

29.2.2.2 Lesson 2: Dezinformatsiya: Forgery, Front Organizations, Media Manipulation Concept. Dezinformatsiya: Forgery, Front Organizations, Media Manipulation applies Dezinformatsiya, Forgery, Front within Cognitive Security and Influence Resilience: learners use separate analysis of influence from persuasion design and information-integrity analysis and resilience education evidence before any judgment moves forward.

Why it matters. Analysts use **Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that counter-messaging as manipulation would otherwise hide, and the reviewer accountable for challenge.

Source support. Dezinformatsiya: Forgery, Front Organizations, Media Manipulation rests on [090, 2026] and [091, 2026]. The closest source to this row notes: It explains the KGB's use of forgeries, disinformation, and front organizations to covertly influence foreign governments and publics, illustrating with the forged 1984 Olympic KKK leaflet operation designed to discourage participation in the Los Angeles Games. Use them for pinning down the scope of **Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** in the evidence the row cites. [090, 2026] A CIA CREST record (October 1981, released March 2007) comprising a routing and record sheet from the PCS/PGLO office dated February 8, 1982, attached to the same Department of State Special Report No. 88 on Soviet active measures. The document is catalogued as an open-source CREST entry and captures the internal CIA circulation of the State Department's public report on Soviet forgery and disinformation operations. [091, 2026] A declassified-in-part 1986 CIA speech text on Soviet active measures, prepared by the Foreign Activities Branch, Third World Activities Division, Office of Soviet Analysis. It explains the KGB's use of forgeries, disinformation, and front organizations to covertly influence foreign governments and publics, illustrating with the forged 1984 Olympic KKK leaflet operation designed to discourage participation in the Los Angeles Games. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Dezinformatsiya**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must name the source descriptor, the bounded claim about **Dezinformatsiya**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** work as a **narrative-risk and resilience map** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Dezinformatsiya: Forgery, Front Organizations, Media Manipulation can be used while ignoring the rule to separate analysis of influence from persuasion design.

Transfer task. Transfer **Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** to a second module by preserving information-integrity analysis and resilience education, changing the source evidence, and naming a new reviewer.

29.2.2.3 Lesson 3: Declassified source-protection and institutional-control case study **Concept. Declassified source-protection and institutional-control case study** studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Analysts use **Declassified source-protection** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that counter-messaging as manipulation would otherwise hide, and the reviewer accountable for challenge.

Source support. Declassified source-protection and institutional-control case study rests on [089, 2026]. The lead source's own note reads: An article by Dennis Kux published in Parameters: Journal of the US Army War College (1985) and preserved in the CIA CREST archive. Use it for the working definition that **Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Declassified source-protection**, reason from the sources cited in this row. [089, 2026] An article by Dennis Kux published in Parameters: Journal of the US Army War College (1985) and preserved in the CIA CREST archive. It defines and distinguishes Soviet 'disinformation' and 'active measures,' situating them within a spectrum of white, gray, and black foreign influence operations. Kux examines KGB front groups, agents of influence, forgeries, and the broader strategic goal of tarnishing Western governments while advancing Soviet foreign policy. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Declassified source-protection**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection and institutional-control case**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Declassified source-protection** work as a **narrative-risk and resilience map** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Declassified source-protection** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

29.2.2.4 Lesson 4: Historical Active Measures Campaigns: Cognitive influence-analysis case review using sample materials **Concept. Historical Active Measures Campaigns: Cognitive influence-analysis case review using sample materials** analyzes influence campaigns through provenance, audience harm, attribution caution, and transparent response options.

Why it matters. Analysts use **Historical Active Measures Campaigns** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Historical Active Measures Campaigns: Cognitive influence-analysis case review using sample materials rests on [091, 2026]. The lead source's own note reads: It explains the KGB's use of forgeries, disinformation, and front organizations to covertly influence foreign governments and publics, illustrating with the forged 1984 Olympic KKK leaflet operation designed to discourage participation in the Los Angeles Games. Use it for the working definition that **Historical Active Measures Campaigns: Cognitive influence-analysis case review using sample materials** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **Historical Active Measures Campaigns** against the works cited for this row. [091, 2026] A declassified-in-part 1986 CIA speech text on Soviet active measures, prepared by the Foreign Activities Branch, Third World Activities Division, Office of Soviet Analysis. It explains the KGB's use of forgeries, disinformation, and front organizations to covertly influence foreign governments and publics, illustrating with the forged 1984 Olympic KKK leaflet operation designed to discourage participation in the Los Angeles Games. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Historical Active Measures Campaigns**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Historical Active Measures Campaigns**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Historical Active Measures Campaigns** work as a **narrative-risk and resilience map** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Historical Active Measures Campaigns**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Historical Active Measures Campaigns** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

29.2.2.5 Lesson 5: Russian Active Measures in the: Cognitive influence-analysis case review using sample materials **Concept. Russian Active Measures in the: Cognitive influence-analysis case review using sample materials** analyzes influence campaigns through provenance, audience harm, attribution caution, and transparent response options.

Why it matters. Russian Active Measures in the matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. Russian Active Measures in the: Cognitive influence-analysis case review using sample materials rests on [092, 2026]. The most specific cited work observes: It examines the historical background of Soviet and Russian disinformation, including the concept of active measures, and how disinformation is woven into strategic narratives and diplomacy. Use it for the working definition that **Russian Active Measures in the: Cognitive influence-analysis case review using sample materials** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Russian Active Measures in the**, work from the cited evidence behind this row. [092, 2026] A March 2019 CREST (Centre for Research and Evidence on Security Threats) report titled "Russia and Disinformation: Maskirovka," prepared by scholars of Russian foreign and security policy using open-source and Russian-language primary material. It examines the historical background of Soviet and Russian disinformation, including the concept of active measures, and how disinformation is woven into strategic narratives and diplomacy. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Russian Active Measures in the**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Russian Active Measures**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Russian Active Measures in the** work as a **narrative-risk and resilience map** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Russian Active Measures in the**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Russian Active Measures in the** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

29.2.2.6 Lesson 6: Chinese Information Operations: United Front Work Department Concept. Chinese Information Operations: United Front Work Department applies Chinese, Information, Operations within Cognitive Security and Influence Resilience: learners use separate analysis of influence from persuasion design and information-integrity analysis and resilience education evidence before any judgment moves forward.

Why it matters. Chinese Information Operations connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Chinese Information Operations: United Front Work Department rests on [308, 2026] and [311, 2026]. Its anchor reference records: It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Use them for pinning down the scope of **Chinese Information Operations: United Front Work Department**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Chinese Information Operations** in the evidence the row cites. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Chinese Information Operations**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must name the source descriptor, the bounded claim about **Chinese Information Operations**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Chinese Information Operations** work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Chinese Information Operations: United Front Work Department can be used while ignoring the rule to separate analysis of influence from persuasion design.

Transfer task. Transfer **Chinese Information Operations** to a second module by preserving information-integrity analysis and resilience education, changing the source evidence, and naming a new reviewer.

29.2.2.7 Lesson 7: Deception, Disinformation, and Strategic Communications (NDU/Brown) Concept. Deception, Disinformation, and Strategic Communications (NDU/Brown) analyzes influence campaigns through provenance, audience harm, attribution caution, and transparent response options.

Why it matters. Without explicit treatment of **Deception, Disinformation, and Strategic Communications (NDU/Brown)**, counter-messaging as manipulation undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Deception, Disinformation, and Strategic Communications (NDU/Brown) rests on [093, 2026] and [094, 2026]. The closest source to this row notes: Lamb, 'Deception, Disinformation, and Strategic Communications: How One Interagency Group Made a Major Difference,' INSS Strategic Perspectives No. Use them for the claim that **Deception, Disinformation, and Strategic Communications (NDU/Brown)** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Deception, Disinformation, and Strategic Communications (NDU/Brown)** in the evidence the row cites. [093, 2026] Fletcher Schoen and Christopher J. Lamb, 'Deception, Disinformation, and Strategic Communications: How One Interagency Group Made a Major Difference,' INSS Strategic Perspectives No. 11 (NDU Press, June 2012). The study examines the U.S. Active Measures Working Group, a small interagency committee formed in the 1980s to expose and counter Soviet disinformation, and analyzes why it succeeded where most such groups fail. [094, 2026] Fletcher Schoen and Christopher J. Lamb, 'Deception, Disinformation, and Strategic Communications: How One Interagency Group Made a Major Difference,' INSS Strategic Perspectives No. 11 (NDU Press, June 2012). Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Deception, Disinformation, and Strategic Communications (NDU/Brown)**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must name the source descriptor, the bounded claim about **Deception Disinformation and Strategic Communications**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **narrative-risk and resilience map** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Deception, Disinformation, and Strategic Communications (NDU/Brown) is optional whenever separate analysis of influence from persuasion design feels inconvenient.

Transfer task. Transfer **Deception, Disinformation, and Strategic Communications (NDU/Brown)** to a second module by preserving information-integrity analysis and resilience education, changing the source evidence, and naming a new reviewer.

29.2.2.8 Lesson 8: AI-Driven Active Measures: Cognitive influence-analysis case review using sample materials Concept. AI-Driven Active Measures: Cognitive influence-analysis case review using sample materials compares resolution, accuracy, and temporal fitness before drawing a geospatial conclusion from imagery or map products.

Why it matters. Analysts use **AI-Driven Active Measures** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. AI-Driven Active Measures: Cognitive influence-analysis case review using sample materials rests on [095, 2026] and [096, 2026]. The lead source's own note reads: A position paper (Stanford authors, ICLR 2026 workshop) arguing that AI research and development should prioritize cognitive security, defined as protecting human cognitive processes from hazardous influence. Use them for the claim that **AI-Driven Active Measures: Cognitive influence-analysis case review using sample materials** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **AI-Driven Active Measures**, work from the cited evidence behind this row. [095, 2026] This policy paper examines the emergence of cognitive security. [096, 2026] A position paper (Stanford authors, ICLR 2026 workshop) arguing that AI research and development should prioritize cognitive security, defined as protecting human cognitive processes from hazardous influence. It notes that generative AI systems increasingly designed to influence beliefs and behavior raise acute governance concerns, while research on these effects remains fragmented. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **AI-Driven Active Measures**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **AI-Driven Active Measures**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **AI-Driven Active Measures** work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **AI-Driven Active Measures**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **AI-Driven Active Measures** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

29.2.2.9 Lesson 9: Countermeasures: Disinformation Detection and Response

Concept. Countermeasures: Disinformation Detection and Response analyzes influence campaigns through provenance, audience harm, attribution caution, and transparent response options.

Why it matters. Countermeasures: Disinformation Detection and Response matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; counter-messaging as manipulation is a common failure.

Source support. Countermeasures: Disinformation Detection and Response rests on [092, 2026]. The most specific cited work observes: A March 2019 CREST (Centre for Research and Evidence on Security Threats) report titled "Russia and Disinformation: Maskirovka," prepared by scholars of Russian foreign and security policy using open-source and Russian-language primary material. Use it for the working definition that **Countermeasures: Disinformation Detection and Response** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Countermeasures: Disinformation Detection and Response**, work from the cited evidence behind this row. [092, 2026] A March 2019 CREST (Centre for Research and Evidence on Security Threats) report titled "Russia and Disinformation: Maskirovka," prepared by scholars of Russian foreign and security policy using open-source and Russian-language primary material. It examines the historical background of Soviet and Russian disinformation, including the concept of active measures, and how disinformation is woven into strategic narratives and diplomacy. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Countermeasures**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must name the source descriptor, the bounded claim about **Countermeasures**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Countermeasures: Disinformation Detection and Response** work as a **narrative-risk and resilience map** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Countermeasures: Disinformation Detection and Response replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Countermeasures: Disinformation Detection and Response** to a second module by preserving information-integrity analysis and resilience education, changing the source evidence, and naming a new reviewer.

29.2.3 Active Measures and Disinformation worked safe example: synthetic inputs, evidence, and review

Worked example: a sample public-library class evaluates a synthetic rumor about a community service and compares transparent correction options. [238, 2026]; [239, 2026].

Triangulation anchors. In module 19's worked-example section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **information-integrity and influence analysis**. Learners use a **narrative-risk and resilience map** and keep this boundary visible: No covert persuasion, microtargeting, manipulation, or campaign design.

Frame. The classroom question centers on **Cognitive influence-analysis case review using sample materials**. Excluded actions stay explicit, and the **Cognitive-Resilience Lens** planning question is: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Inputs. For the **Cognitive influence-analysis case review using sample materials** scenario, use sample posts, source timestamps, public-service facts, and a media-literacy rubric. The Cognitive-Resilience Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Cognitive influence-analysis case review using sample materials**, students trace narrative provenance, separate observation from attribution, name audience harms, and design a transparent lesson. Pause whenever an inference about Cognitive influence-analysis case review using sample materials appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Cognitive influence-analysis case review using sample materials** classroom scenario; unit artifact = narrative-risk and resilience map; evidence = allowed inputs; method = information-integrity analysis and resilience education; output = a narrative-risk map with caveats, response options, and no microtargeted persuasion; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Cognitive influence-analysis case review using sample materials** as "Cognitive-Resilience Lens confirms it" is not enough. The revision ties the claim to information-integrity analysis and resilience education, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Cognitive influence-analysis case review using sample materials** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

29.2.4 Active Measures and Disinformation practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Cognitive-Resilience Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

Triangulation anchors. In module 19's practice-sequence section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Cognitive influence-analysis case review using sample materials, Dezinformatsiya: Forgery, Front Organizations, Media Manipulation, Declassified source-protection and institutional-control case study; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Cognitive Security and Influence Resilience** lane.

Move	Learner action	Output	Check
2. Frame	Answer the lens question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Cognitive influence-analysis case review using sample materials: narrative-risk map with provenance, uncertainty, audience harms, and response options.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the narrative-risk and resilience map fields for Cognitive influence-analysis case review using sample materials.	Unit profile note.	Evidence artifacts include narrative provenance chain, audience-harm note.
4. Challenge	Test the misconception that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.	Failure-mode note.	The artifact applies the key distinction: separate analysis of influence from persuasion design.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

29.2.4.1 Active Measures and Disinformation instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**. [238, 2026]; [239, 2026].

29.2.4.2 Active Measures and Disinformation extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 29; [238, 2026].

Have learners swap artifacts and apply the **Cognitive-Resilience Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

29.2.5 Active Measures and Disinformation knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 29; [238, 2026].

1. Explain how **Cognitive influence-analysis case review using sample materials** is defined here; name the source descriptor that supports the definition.
2. Contrast **Cognitive influence-analysis case review using sample materials** with **Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** using the **Cognitive-Resilience Lens** artifact fields.
3. Identify one failure mode from the **Cognitive Security and Influence Resilience** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which response informs people without crossing into MISO-style manipulation or unverified attribution?
5. Correct this misconception: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

29.2.5.1 Active Measures and Disinformation answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Cognitive influence-analysis case review using sample materials** without source evidence, uncertainty, or a safe transfer task.

29.3 Active Measures and Disinformation assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 29; [238, 2026].

29.3.1 Active Measures and Disinformation evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 29; [238, 2026].

29.3.2 Active Measures and Disinformation transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 29; [238, 2026].

29.3.2.1 Active Measures and Disinformation lineage and source tradition: profile, concepts, and first anchors This sits in the **Cognitive Security and Influence Resilience** lineage: protecting attention, belief formation, and decision quality without turning resilience education into manipulation. [238, 2026]; [239, 2026].

29.3.2.2 Active Measures and Disinformation working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 29; [238, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**, with provenance and reviewability throughout.

29.3.2.3 Active Measures and Disinformation knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [238, 2026]; [239, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

29.3.2.4 Active Measures and Disinformation transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 29; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.
- **Evidence contract:** keep the **Cognitive Security and Influence Resilience** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

29.3.2.5 Active Measures and Disinformation profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 29; [238, 2026].

The matched profile emphasizes protecting attention, belief formation, and decision quality without turning resilience education into manipulation. The method stack is claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning; the local topic cluster is **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

29.3.3 Active Measures and Disinformation evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 29; [238, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Cognitive Security and Influence Resilience** profile tells reviewers what evidence is strong enough for the module artifact built around **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

29.3.3.1 Active Measures and Disinformation guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [239, 2026]; [240, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [088, 2026]; [089, 2026]; [090, 2026]; [091, 2026]; [092, 2026]; [093, 2026]; [094, 2026]; [095, 2026]; [096, 2026]; [308, 2026]; [311, 2026].

29.3.3.2 Active Measures and Disinformation verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [239, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [239, 2026]; [240, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [088, 2026]; [089, 2026]; [090, 2026]; [091, 2026]; [092, 2026]; [093, 2026]; [094, 2026]; [095, 2026]; [096, 2026]; [308, 2026]; [311, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 19's source-canon section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** and [238, 2026]; [239, 2026], but only directly verified source URLs are encoded as citations.

29.3.3.3 Active Measures and Disinformation intelligence practice lens: evidence artifact and safety check Practice lens: **Cognitive-Resilience Lens** for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**. [238, 2026]; [239, 2026].

Planning question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Evidence artifact: narrative-risk map with provenance, uncertainty, audience harms, and response options.

Validation rule: distinguish observation, attribution, impact assessment, and resilience response. Applied to **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

Handoff contract: handoff supports transparency, education, and resilience, not microtargeted influence or deception.

Safety check: exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning.

29.3.3.4 Active Measures and Disinformation runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 29; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	19.99	19.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Active Measures and Disinformation to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Bounded autonomy, procurement, incident-response, and assurance studio	19.101	19.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Active Measures and Disinformation	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Model-card, recoverability, retention, and learner-support evidence package	19.102	19.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Active Measures and Disinformation	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive influence-analysis case review using sample materials	19.1	19.1 source title transformed into safe curriculum treatment; original: Soviet Active Measures: Definitions and Doctrine	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Dezinformatsiya: Forgery, Front Organizations, Media Manipulation	19.2	19.2 Dezinformatsiya: Forgery, Front Organizations, Media Manipulation	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Declassified source-protection and institutional-control case study	19.3	19.3 source title transformed into safe curriculum treatment; original: KGB Aktivnyye Meropriyatiya: Historical Organization	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive influence-analysis case review using sample materials	19.4	19.4 source title transformed into safe curriculum treatment; original: Historical Active Measures Campaigns: INFEKTION, RYAN, DENVER	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive influence-analysis case review using sample materials	19.5	19.5 source title transformed into safe curriculum treatment; original: Russian Active Measures in the Contemporary Era	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Chinese Information Operations: United Front Work Department	19.6	19.6 Chinese Information Operations: United Front Work Department	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Deception, Disinformation, and Strategic Communications (NDU/Brown)	19.7	19.7 Deception, Disinformation, and Strategic Communications (NDU/Brown)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive influence-analysis case review using sample materials	19.8	19.8 source title transformed into safe curriculum treatment; original: AI-Driven Active Measures: Synthetic Influence at Scale	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Countermeasures: Disinformation Detection and Response	19.9	19.9 Countermeasures: Disinformation Detection and Response	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

29.3.3.5 Active Measures and Disinformation reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 29; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Cognitive influence-analysis case review using sample materials	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Dezinformatsiya: Forgery, Front Organizations, Media Manipulation	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Declassified source-protection and institutional-control case study	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Historical Active Measures Campaigns: Cognitive influence-analysis case review using sample materials	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Russian Active Measures in the: Cognitive influence-analysis case review using sample materials	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

Lesson topic	Practice lens	Evidence artifact	Safety check
Chinese Information Operations: United Front Work Department	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Deception, Disinformation, and Strategic Communications (NDU/Brown)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
AI-Driven Active Measures: Cognitive influence-analysis case review using sample materials	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Countermeasures: Disinformation Detection and Response	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

29.3.3.6 Active Measures and Disinformation annotated source ledger: real titles and local contribution Each source cited by this **Cognitive Security and Influence Resilience** module is paired below with its real title and a one-line note on what it contributes to **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide
[239, 2026]	Digital Space and Human Rights	Official OHCHR digital rights portal.	original source-guide
[240, 2026]	The Right to Privacy in the Digital Age	The Office of the High Commissioner for Human Rights (OHCHR) hub page on the right to privacy in the digital age. It addresses how data-intensive technologies, particularly artificial intelligence, create risks for privacy, autonomy, and human dignity, and curates international standards, reports, and expert consultations.	verified source-guide
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide
[279, 2026]	Open Contracting Data Standard	The documentation homepage for the Open Contracting Data Standard, version 1.1.5, maintained by the Open Contracting Partnership to support disclosure of government contracting data across the procurement lifecycle. It provides a common data model spanning planning, tender, award, contract, and implementation stages, along with a primer, implementation guidance, technical schemas, and validation tooling.	verified source-guide

Source	Cited work	What it contributes	Status
[283, 2026]	Recommendation of the Council on Open Government	An OECD legal instrument document reproducing the Recommendation of the Council on Open Government (OECD/LEGAL/0438), adopted on 14 December 2017. It defines open government as a culture of governance promoting transparency, integrity, accountability, and stakeholder participation in support of democracy and inclusive growth.	verified source-guide
[290, 2026]	NIST SP 800-218A: Secure Software Development Practices for Generative AI and Dual-Use Foundation Models	NIST Special Publication 800-218A (July 2024), which augments the Secure Software Development Framework with practices specific to AI model development across the software lifecycle. Produced in response to Executive Order 14110, it addresses AI model producers, developers building on those models, and acquirers of AI systems, and is designed to be used alongside NIST SP 800-218.	verified source-guide
[291, 2026]	Revised 508 Standards and 255 Guidelines	Official documentation from the U.S. Access Board on the Revised 508 Standards and 255 Guidelines for information and communication technology accessibility. It establishes mandatory accessibility requirements for federal agencies and voluntary guidelines for telecommunications manufacturers, covering hardware, software, websites, electronic documents, and support services.	verified source-guide
[294, 2026]	M-25-21: Accelerating Federal Use of AI through Innovation, Governance, and Public Trust	An April 2025 Office of Management and Budget memorandum (M-25-21) directing executive branch agencies on federal use of artificial intelligence. Issued under Executive Order 14179, it instructs agencies to accelerate adoption of AI to improve public services and government efficiency while maintaining safeguards for civil rights, civil liberties, and privacy.	verified source-guide
[088, 2026]	SOVIET 'ACTIVE MEASURES' FORGERY, DISINFORMATION, POLITICAL OPERATIONS	A U.S. Department of State Bureau of Public Affairs report from October 1981, released under FOIA. It catalogs Soviet 'active measures' — the Soviet term for covert influence operations — including written disinformation, control of foreign media, use of front organizations, clandestine broadcasting, blackmail, and political influence operations. Specific cases include Soviet forgeries related to the 1979 Grand Mosque seizure and NATO theater nuclear force debates.	verified source-guide

Source	Cited work	What it contributes	Status
[089, 2026]	SOVIET ACTIVE MEASURES AND DISINFORMATION: OVERVIEW AND ASSESSMENT	An article by Dennis Kux published in Parameters: Journal of the US Army War College (1985) and preserved in the CIA CREST archive. It defines and distinguishes Soviet 'disinformation' and 'active measures,' situating them within a spectrum of white, gray, and black foreign influence operations. Kux examines KGB front groups, agents of influence, forgeries, and the broader strategic goal of tarnishing Western governments while advancing Soviet foreign policy.	verified source-guide
[090, 2026]	"SOVIET ACTIVE MEASURES: FORGERY, DISINFORMATION, POLITICAL OPERATIONS"	A CIA CREST record (October 1981, released March 2007) comprising a routing and record sheet from the PCS/PGLO office dated February 8, 1982, attached to the same Department of State Special Report No. 88 on Soviet active measures. The document is catalogued as an open-source CREST entry and captures the internal CIA circulation of the State Department's public report on Soviet forgery and disinformation operations.	verified source-guide
[091, 2026]	SOVIET ACTIVE MEASURES AND DISINFORMATION	A declassified-in-part 1986 CIA speech text on Soviet active measures, prepared by the Foreign Activities Branch, Third World Activities Division, Office of Soviet Analysis. It explains the KGB's use of forgeries, disinformation, and front organizations to covertly influence foreign governments and publics, illustrating with the forged 1984 Olympic KKK leaflet operation designed to discourage participation in the Los Angeles Games.	verified source-guide
[092, 2026]	INTRODUCTION	A March 2019 CREST (Centre for Research and Evidence on Security Threats) report titled "Russia and Disinformation: Maskirovka," prepared by scholars of Russian foreign and security policy using open-source and Russian-language primary material. It examines the historical background of Soviet and Russian disinformation, including the concept of active measures, and how disinformation is woven into strategic narratives and diplomacy.	verified source-guide
[093, 2026]	Deception, Disinformation, and Strategic Communications	Fletcher Schoen and Christopher J. Lamb, 'Deception, Disinformation, and Strategic Communications: How One Interagency Group Made a Major Difference,' INSS Strategic Perspectives No. 11 (NDU Press, June 2012). The study examines the U.S. Active Measures Working Group, a small interagency committee formed in the 1980s to expose and counter Soviet disinformation, and analyzes why it succeeded where most such groups fail.	verified source-guide

Source	Cited work	What it contributes	Status
[094, 2026]	Deception, Disinformation, and Strategic Communications: How One Interagency Group Made a Major Difference	Fletcher Schoen and Christopher J. Lamb, 'Deception, Disinformation, and Strategic Communications: How One Interagency Group Made a Major Difference,' INSS Strategic Perspectives No. 11 (NDU Press, June 2012).	verified source-guide
[095, 2026]	COGNITIVE SECURITY IN THE AGE OF AI	This policy paper examines the emergence of cognitive security.	original source-guide
[096, 2026]	AI DEVELOPMENT SHOULD PRIORITIZE COGNITIVE SECURITY	A position paper (Stanford authors, ICLR 2026 workshop) arguing that AI research and development should prioritize cognitive security, defined as protecting human cognitive processes from hazardous influence. It notes that generative AI systems increasingly designed to influence beliefs and behavior raise acute governance concerns, while research on these effects remains fragmented.	verified source-guide
[308, 2026]	Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure	An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure.	verified source-guide
[311, 2026]	Countering Information Threats	An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering.	verified source-guide

Where this sits. This module's overview is Section 29; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

29.3.4 Active Measures and Disinformation governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 29; [238, 2026].

29.3.5 Active Measures and Disinformation analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 19's governance-boundary section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Cognitive Security and Influence Resilience** for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**. [238, 2026]; [239, 2026].
Curriculum topic spine: Cognitive influence-analysis case review using sample materials, **Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**, **Declassified source-protection and institutional-control case study**. **Verified anchor cluster:** [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]; [OECD, 2026c]; [for Security Policy, 2025]; [Community, 2020a].
Conceptual depth: protecting attention, belief formation, and decision quality without turning resilience education into manipulation.
Method stack: claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning.
Composability contract: separate descriptive analysis, normative assessment, response options, and protected-audience considerations.
Known failure modes: counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty.
Defensive boundary: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans. Applied to **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

Anchor	Why it matters here
[Cybersecurity and Agency, 2024b]	Official CISA guidance on foreign influence operations targeting critical infrastructure. Checked as of 2026-05-21; role: source_quality_anchor.
[Organization, 2026b]	Official NATO counter-information-threat guidance. Checked as of 2026-05-21; role: source_quality_anchor.
[Cybersecurity and Agency, 2026b]	Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing. Checked as of 2026-05-21; role: curriculum_anchor.
[Organization, 2026c]	Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure. Checked as of 2026-05-21; role: curriculum_anchor.
[OECD, 2026c]	Official OECD policy source for information integrity, governance responses, public trust, and democratic resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[for Security Policy, 2025]	Policy-scholarship source for cognitive security, information literacy, critical thinking, and whole-of-society resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.

29.3.5.1 Active Measures and Disinformation evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Cognitive Security and Influence Resilience** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [239, 2026].

29.3.6 Active Measures and Disinformation agentic boundary: assist, approve, block, and record

Evidence anchor. Section 29; [238, 2026].
AGEINT translation is bounded by the **Cognitive Security and Influence Resilience** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

29.3.6.1 Active Measures and Disinformation permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 29; [238, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

29.3.6.2 Active Measures and Disinformation excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [239, 2026] and **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

29.3.7 Active Measures and Disinformation governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 29; [238, 2026].
Governance is practiced as a gate on the **Cognitive Security and Influence Resilience** lane. Learners use the **Cognitive-Resilience Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

29.3.7.1 Active Measures and Disinformation governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [239, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Cognitive Security and Influence Resilience** failure modes and the **Cognitive-Resilience Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

29.3.7.2 Active Measures and Disinformation evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 29; [238, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Cognitive-Resilience Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

29.3.7.3 Active Measures and Disinformation current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**. [238, 2026]; [239, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cisa_foreign_influence` for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**?	Preparing for and Mitigating Foreign Influence Operations; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA guidance on foreign influence operations targeting critical infrastructure.
What does the module inherit from `official_nato_counter_information_threats` for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**?	Countering Information Threats; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO counter-information-threat guidance.
What does the module inherit from `official_cisa_election_security_influence` for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**?	Election Security; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing.
What does the module inherit from `official_nato_hybrid_threats` for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**?	Countering Hybrid Threats; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 29; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

29.3.8 Active Measures and Disinformation assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 29; [238, 2026].

29.3.9 Active Measures and Disinformation assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 29; [238, 2026].

29.3.9.1 Active Measures and Disinformation capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** and [238, 2026]; [239, 2026].

29.3.9.2 Active Measures and Disinformation instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** and [238, 2026]; [239, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

29.3.9.3 Active Measures and Disinformation assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Cognitive influence-analysis case review using sample materials	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Dezinformatsiya: Forgery, Front Organizations, Media Manipulation	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Declassified source-protection and institutional-control case study	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

29.3.10 Active Measures and Disinformation refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [239, 2026] and **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**.

29.3.10.1 Active Measures and Disinformation refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**. The local signals begin with [238, 2026]; [239, 2026].

29.3.10.2 Active Measures and Disinformation claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**, and the source spine for these checks begins with [238, 2026]; [239, 2026].

29.3.11 Active Measures and Disinformation reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [239, 2026].

Triangulation anchors. In module 19's review-checklist section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation**. [238, 2026]; [239, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

29.3.12 Active Measures and Disinformation learning-path links: module map, overview, and curriculum atlas

These links keep **Cognitive influence-analysis case review using sample materials; Dezinformatsiya: Forgery, Front Organizations, Media Manipulation** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [238, 2026]; [239, 2026].

Section 2, Section 27, Section 28, Section 30

30 Social Engineering

30.0.1 Social Engineering figures and course links: visual evidence, source flow, and navigation

The module uses Figure 68 and Figure 64 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 27, Section 29, Section 31.
This module teaches the **Cognitive Security and Influence Resilience** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [240, 2026].

30.1 Cognitive Security and Influence Resilience frame for Social Engineering: source context, topic focus, and reader task

Evidence anchor. Section 30; [238, 2026].

30.1.1 Social Engineering orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 30; [238, 2026].

30.1.2 Social Engineering conceptual primer: source context, core model, and reader task

This chapter teaches cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The chapter uses **Cognitive-Resilience Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.
The central distinction is to separate analysis of influence from persuasion design. Core topics include **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering; Social Engineering: The Science of Human Hacking (Hadnagy, 2018)**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [240, 2026].
Learners move from vocabulary and the **Cognitive-Resilience Lens** distinction through topic lessons on **The Psychology of Influence: Cialdini's Seven Principles** with evidence and misconception checks, then assemble a **narrative-risk map with provenance, uncertainty, audience harms, and response options** with safety and rights gates.

30.1.3 Social Engineering learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 30; [238, 2026].

- Connect **The Psychology of Influence: Cialdini's Seven Principles and History of Social Engineering** to **Cognitive Security and Influence Resilience** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate analysis of influence from persuasion design; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans.

30.1.4 Social Engineering core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 30; [238, 2026].

Term	Working definition
Narrative provenance	where a claim, frame, or story came from and how it spread
Prebunking	transparent education that helps people recognize misleading patterns before exposure
Audience harm	a privacy, dignity, autonomy, or trust risk for people receiving information
Attribution caution	the rule that intent and origin claims need strong evidence
Resilience response	a transparent education, correction, or process improvement that avoids manipulation
MISO boundary	the line between accountable public messaging analysis and covert influence design
Inoculation	building recognition of manipulation tactics without deploying persuasion against a population
The Psychology of Influence: Cialdini's Seven…	Key terms: Psychology, Influence, Cialdini.
History of Social Engineering	Key terms: History, Social, Engineering.

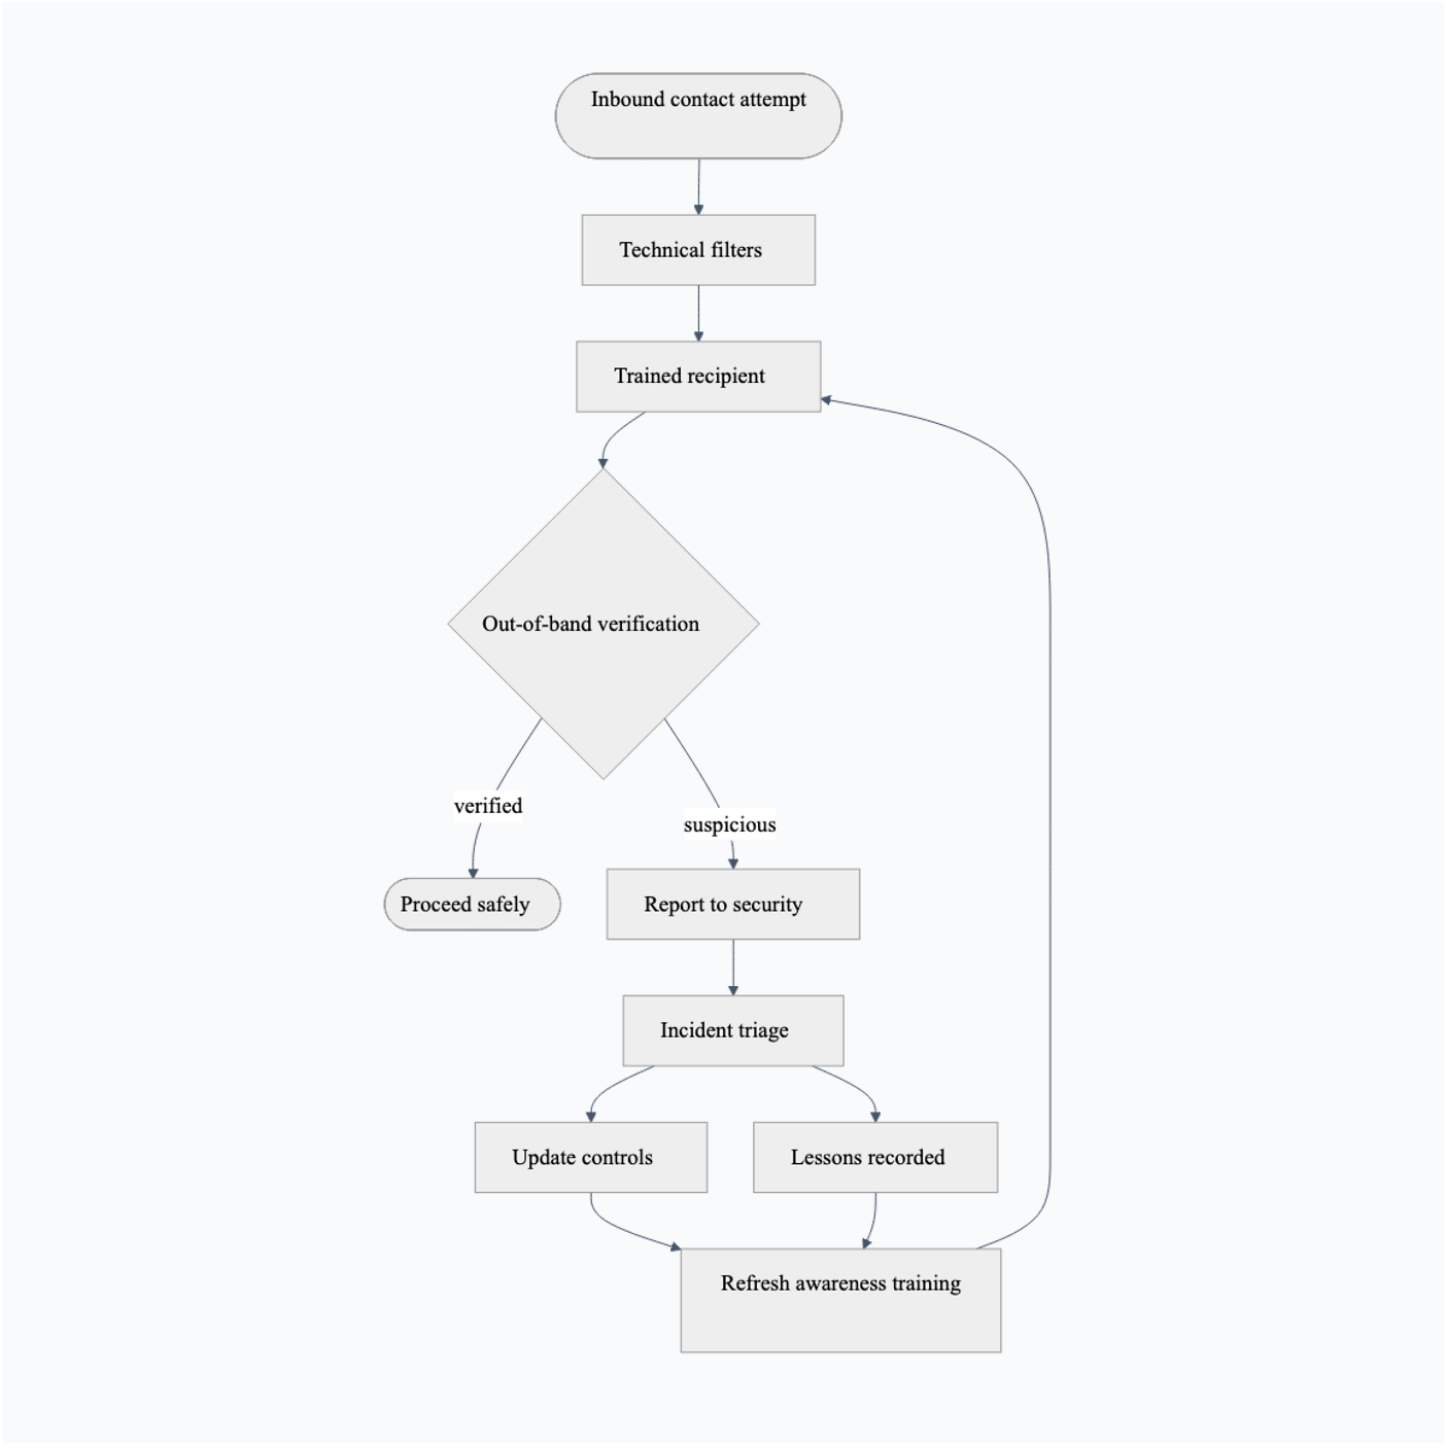

Figure 68: The layered human and technical control loop that lets an organization absorb a social-engineering attempt and convert it into a reported, learned-from event. The captioned view belongs to the psychological operations and influence / social engineering section and should be read as a map of Inbound contact attempt, Technical filters, Trained recipient, and Proceed safely, not as a capability score or live-task instruction.

30.2 Cognitive-Resilience Lens path for Social Engineering: lesson cluster, safe artifact, and review

Evidence anchor. Section 30; [238, 2026].

30.2.1 Social Engineering practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 30; [238, 2026].

30.2.2 Social Engineering topic lessons: source-backed concepts and transfer tasks

This module builds cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The sequence opens with **The Psychology of Influence: Cialdini's Seven Principles**, **History of Social Engineering**, **Social Engineering: The Science of Human Hacking (Hadnagy, 2018)** and applies the **Cognitive-Resilience Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 64; module overview Section 30; curriculum atlas Section 2.

Triangulation anchors. In module 20's topic-lessons section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

30.2.2.1 Lesson 1: The Psychology of Influence: Cialdini's Seven Principles

Concept. The Psychology of Influence: Cialdini's Seven Principles focuses on transparent resilience education: provenance, audience harm, attribution caution, and non-manipulative response options.

Why it matters. Analysts use **The Psychology of Influence** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. The Psychology of Influence: Cialdini's Seven Principles rests on [097, 2026]. The most specific cited work observes: It surveys major attack categories including phishing and its variants, pretexting, baiting, tailgating, and quid pro quo schemes, and explains the psychological influence principles such as reciprocity, scarcity, authority, and consensus that attackers exploit. Use it for fixing what **The Psychology of Influence: Cialdini's Seven Principles** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **The Psychology of Influence**, reason from the sources cited in this row. [097, 2026] This Mitnick Security guide traces the history and evolution of social engineering from antiquity through modern cyberattacks. It surveys major attack categories including phishing and its variants, pretexting, baiting, tailgating, and quid pro quo schemes, and explains the psychological influence principles such as reciprocity, scarcity, authority, and consensus that attackers exploit. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **The Psychology of Influence**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Psychology of Influence**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **The Psychology of Influence** work as a **narrative-risk and resilience map** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **The Psychology of Influence**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **The Psychology of Influence** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

30.2.2.2 Lesson 2: History of Social Engineering

Concept. History of Social Engineering teaches defensive recognition of manipulation attempts using sample messages, consent boundaries, and reporting duties.

Why it matters. History of Social Engineering matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. History of Social Engineering rests on [097, 2026]. The most specific cited work observes: It surveys major attack categories including phishing and its variants, pretexting, baiting, tailgating, and quid pro quo schemes, and explains the psychological influence principles such as reciprocity, scarcity, authority, and consensus that attackers exploit. Use it for fixing what **History of Social Engineering** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **History of Social Engineering** against the works cited for this row. [097, 2026] This Mitnick Security guide traces the history and evolution of social engineering from antiquity through modern cyberattacks. It surveys major attack categories including phishing and its variants, pretexting, baiting, tailgating, and quid pro quo schemes, and explains the psychological influence principles such as reciprocity, scarcity, authority, and consensus that attackers exploit. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **History of Social Engineering**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **History of Social Engineering**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **History of Social Engineering** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

30.2.2.3 Lesson 3: Social Engineering: The Science of Human Hacking (Hadnagy, 2018)

Concept. Social Engineering: The Science of Human Hacking (Hadnagy, 2018) teaches defensive recognition of manipulation attempts using sample messages, consent boundaries, and reporting duties.

Why it matters. Analysts use **Social Engineering: The Science of Human Hacking (Hadnagy, 2018)** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Social Engineering: The Science of Human Hacking (Hadnagy, 2018) rests on [098, 2026]. The closest source to this row notes: It is written as a professional reference on understanding and countering human-targeted security threats. Use it for the working definition that **Social Engineering: The Science of Human Hacking (Hadnagy, 2018)** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Social Engineering: The Science of Human Hacking (Hadnagy, 2018)** in the evidence the row cites. [098, 2026] The full text of "the module: The Science of Human Hacking" (2nd edition, 2018) by Christopher Hadnagy, published by John Wiley & Sons.

The book examines the human element of security, analyzing how manipulation and persuasion techniques can be used to influence people, and how individuals and organizations can recognize and defend against such tactics. It is written as a professional reference on understanding and countering human-targeted security threats. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For the module, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about the module, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Social Engineering: The Science of Human Hacking (Hadnagy, 2018)** work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Social Engineering: The Science of Human Hacking (Hadnagy, 2018)**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Social Engineering: The Science of Human Hacking (Hadnagy, 2018)** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

30.2.2.4 Lesson 4: The Art of Human Hacking (Hadnagy, 2010)

Concept. The Art of Human Hacking (Hadnagy, 2010) focuses on transparent resilience education: provenance, audience harm, attribution caution, and non-manipulative response options.

Why it matters. Without explicit treatment of **The Art of Human Hacking (Hadnagy, 2010)**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. The Art of Human Hacking (Hadnagy, 2010) rests on [099, 2026]. Its anchor reference records: A PDF of the book the module: The Art of Human Hacking by Christopher Hadnagy, a foundational security text on how attackers exploit human psychology rather than technical flaws to obtain information or access. Use it for fixing what **The Art of Human Hacking (Hadnagy, 2010)** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **The Art of Human Hacking (Hadnagy, 2010)** against the works cited for this row. [099, 2026] A PDF of the book the module: The Art of Human Hacking by Christopher Hadnagy, a foundational security text on how attackers exploit human psychology rather than technical flaws to obtain information or access. The work surveys manipulation tactics and the human factors that make organizations vulnerable, and frames this knowledge defensively to help security professionals recognize and resist such attacks. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **The Art of Human Hacking (Hadnagy, 2010)**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Art of Human Hacking**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as a **narrative-risk and resilience map** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **The Art of Human Hacking (Hadnagy, 2010)**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **The Art of Human Hacking (Hadnagy, 2010)** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

30.2.2.5 Lesson 5: Phishing, Vishing, Smishing, Deepfake Voice Attacks

Concept. Phishing, Vishing, Smishing, Deepfake Voice Attacks teaches defensive recognition of manipulation attempts using sample messages, consent boundaries, and reporting duties.

Why it matters. Phishing, Vishing, Smishing, Deepfake Voice Attacks connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Phishing, Vishing, Smishing, Deepfake Voice Attacks rests on [300, 2026], [304, 2026], and [306, 2026]. Its anchor reference records: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for fixing what **Phishing, Vishing, Smishing, Deepfake Voice Attacks** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Phishing, Vishing, Smishing, Deepfake Voice Attacks** in the evidence the row cites. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Phishing, Vishing, Smishing, Deepfake Voice Attacks**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Phishing Vishing Smishing Deepfake Voice**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as a **narrative-risk and resilience map** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Phishing, Vishing, Smishing, Deepfake Voice Attacks**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Phishing, Vishing, Smishing, Deepfake Voice Attacks** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

30.2.2.6 Lesson 6: Physical Social Engineering: Access, Elicitation, Impersonation

Concept. Physical Social Engineering: Access, Elicitation, Impersonation teaches defensive recognition of manipulation attempts using sample messages, consent boundaries, and reporting duties.

Why it matters. Without explicit treatment of **Physical Social Engineering**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Physical Social Engineering: Access, Elicitation, Impersonation rests on [308, 2026] and [311, 2026]. The closest source to this row notes: An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. Use them for the working definition that **Physical Social Engineering: Access, Elicitation, Impersonation** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Physical Social Engineering**, work from the cited evidence behind this row. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering

information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Physical Social Engineering**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Physical Social Engineering**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Physical Social Engineering** work as a **narrative-risk and resilience map** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Physical Social Engineering**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Physical Social Engineering** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

30.2.2.7 Lesson 7: AI Automation of Social Engineering at Scale

Concept. AI Automation of Social Engineering at Scale compares resolution, accuracy, and temporal fitness before drawing a geospatial conclusion from imagery or map products.

Why it matters. AI Automation of Social Engineering at Scale connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. AI Automation of Social Engineering at Scale rests on [100, 2026]. Its anchor reference records: The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. Use it for the claim that **AI Automation of Social Engineering at Scale** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **AI Automation of Social Engineering at Scale** against the works cited for this row. [100, 2026] This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **AI Automation**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **AI Automation of Social Engineering**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **AI Automation of Social Engineering at Scale** work as a **narrative-risk and resilience map** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **AI Automation of Social Engineering at Scale**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **AI Automation of Social Engineering at Scale** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

30.2.2.8 Lesson 8: Defense: Training, Simulation, Technical Controls

Concept. Defense: Training, Simulation, Technical Controls focuses on transparent resilience education: provenance, audience harm, attribution caution, and non-manipulative response options.

Why it matters. Defense: Training, Simulation, Technical Controls matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. Defense: Training, Simulation, Technical Controls rests on [308, 2026] and [311, 2026]. The most specific cited work observes: It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Use them for fixing what **Defense: Training, Simulation, Technical Controls** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Defense: Training, Simulation, Technical Controls** in the evidence the row cites. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Defense**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Defense**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Defense: Training, Simulation, Technical Controls** work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Defense: Training, Simulation, Technical Controls**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Defense: Training, Simulation, Technical Controls** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

30.2.3 Social Engineering worked safe example: synthetic inputs, evidence, and review

Worked example: a sample public-library class evaluates a synthetic rumor about a community service and compares transparent correction options. [238, 2026]; [240, 2026].

Triangulation anchors. In module 20's worked-example section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **information-integrity and influence analysis**. Learners use a **narrative-risk and resilience map** and keep this boundary visible: No covert persuasion, microtargeting, manipulation, or campaign design.

Frame. The classroom question centers on **The Psychology of Influence: Cialdini's Seven Principles**. Excluded actions stay explicit, and the **Cognitive-Resilience Lens** planning question is: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Inputs. For the **The Psychology of Influence: Cialdini's Seven Principles** scenario, use sample posts, source timestamps, public-service facts, and a media-literacy rubric. The Cognitive-Resilience Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **The Psychology of Influence: Cialdini's Seven Principles**, students trace narrative provenance, separate observation from attribution, name audience harms, and design a transparent lesson. Pause whenever an inference about The Psychology of Influence: Cialdini's Seven Principles appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **The Psychology of Influence: Cialdini's Seven Principles** classroom scenario; unit artifact = narrative-risk and resilience map; evidence = allowed inputs; method = information-integrity analysis and resilience education; output = a narrative-risk map with caveats, response options, and no microtargeted persuasion; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **The Psychology of Influence: Cialdini's Seven Principles** as "Cognitive-Resilience Lens confirms it" is not enough. The revision ties the claim to information-integrity analysis and resilience education, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **The Psychology of Influence: Cialdini's Seven Principles** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

30.2.4 Social Engineering practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Cognitive-Resilience Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

Triangulation anchors. In module 20's practice-sequence section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare The Psychology of Influence: Cialdini's Seven Principles, History of Social Engineering, Social Engineering: The Science of Human Hacking; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Cognitive Security and Influence Resilience** lane.
2. Frame	Answer the lens question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for The Psychology of Influence: Cialdini's Seven Principles: narrative-risk map with provenance, uncertainty, audience harms, and response options.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the narrative-risk and resilience map fields for The Psychology of Influence: Cialdini's Seven Principles.	Unit profile note.	Evidence artifacts include narrative provenance chain, audience-harm note.
4. Challenge	Test the misconception that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.	Failure-mode note.	The artifact applies the key distinction: separate analysis of influence from persuasion design.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

30.2.4.1 Social Engineering instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**. [238, 2026]; [240, 2026].

30.2.4.2 Social Engineering extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 30; [238, 2026]. Have learners swap artifacts and apply the **Cognitive-Resilience Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

30.2.5 Social Engineering knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 30; [238, 2026].

1. Explain how **The Psychology of Influence: Cialdini's Seven Principles** is defined here; name the source descriptor that supports the definition.
2. Contrast **The Psychology of Influence: Cialdini's Seven Principles** with **History of Social Engineering** using the **Cognitive-Resilience Lens** artifact fields.
3. Identify one failure mode from the **Cognitive Security and Influence Resilience** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which response informs people without crossing into MISO-style manipulation or unverified attribution?
5. Correct this misconception: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

30.2.5.1 Social Engineering answer quality rubric: source evidence, uncertainty, and safe transfer

Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **The Psychology of Influence: Cialdini's Seven Principles** without source evidence, uncertainty, or a safe transfer task.

30.3 Social Engineering assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 30; [238, 2026].

30.3.1 Social Engineering evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 30; [238, 2026].

30.3.2 Social Engineering transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 30; [238, 2026].

30.3.2.1 Social Engineering lineage and source tradition: profile, concepts, and first anchors This sits in the **Cognitive Security and Influence Resilience** lineage: protecting attention, belief formation, and decision quality without turning resilience education into manipulation. [238, 2026]; [240, 2026].

30.3.2.2 Social Engineering working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 30; [238, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**, with provenance and reviewability throughout.

30.3.2.3 Social Engineering knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [238, 2026]; [240, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

30.3.2.4 Social Engineering transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 30; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.
- **Evidence contract:** keep the **Cognitive Security and Influence Resilience** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

30.3.2.5 Social Engineering profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 30; [238, 2026].

The matched profile emphasizes protecting attention, belief formation, and decision quality without turning resilience education into manipulation. The method stack is claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning; the local topic cluster is **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

30.3.3 Social Engineering evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 30; [238, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Cognitive Security and Influence Resilience** profile tells reviewers what evidence is strong enough for the module artifact built around **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

30.3.3.1 Social Engineering guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [240, 2026]; [242, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [097, 2026]; [098, 2026]; [099, 2026]; [100, 2026]; [300, 2026]; [304, 2026]; [306, 2026]; [308, 2026]; [311, 2026].

30.3.3.2 Social Engineering verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [240, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [240, 2026]; [242, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [097, 2026]; [098, 2026]; [099, 2026]; [100, 2026]; [300, 2026]; [304, 2026]; [306, 2026]; [308, 2026]; [311, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 20's source-canon section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering** and [238, 2026]; [240, 2026], but only directly verified source URLs are encoded as citations.

30.3.3.3 Social Engineering intelligence practice lens: evidence artifact and safety check Practice lens: **Cognitive-Resilience Lens** for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**. [238, 2026]; [240, 2026].

Planning question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Evidence artifact: narrative-risk map with provenance, uncertainty, audience harms, and response options.

Validation rule: distinguish observation, attribution, impact assessment, and resilience response. Applied to **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

Handoff contract: handoff supports transparency, education, and resilience, not microtargeted influence or deception.

Safety check: exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning.

30.3.3.4 Social Engineering runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 30; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	20.99	20.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Social Engineering to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Bounded autonomy, procurement, incident-response, and assurance studio	20.101	20.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Social Engineering	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Model-card, recoverability, retention, and learner-support evidence package	20.102	20.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Social Engineering	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
The Psychology of Influence: Cialdini's Seven Principles	20.1	20.1 The Psychology of Influence: Cialdini's Seven Principles	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
History of Social Engineering	20.2	20.2 History of Social Engineering	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Social Engineering: The Science of Human Hacking (Hadnagy, 2018)	20.3	20.3 Social Engineering: The Science of Human Hacking (Hadnagy, 2018)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
The Art of Human Hacking (Hadnagy, 2010)	20.4	20.4 The Art of Human Hacking (Hadnagy, 2010)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Phishing, Vishing, Smishing, Deepfake Voice Attacks	20.5	20.5 Phishing, Vishing, Smishing, Deepfake Voice Attacks	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Physical Social Engineering: Access, Elicitation, Impersonation	20.6	20.6 Physical Social Engineering: Access, Elicitation, Impersonation	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
AI Automation of Social Engineering at Scale	20.7	20.7 AI Automation of Social Engineering at Scale	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Defense: Training, Simulation, Technical Controls	20.8	20.8 Defense: Training, Simulation, Technical Controls	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

30.3.3.5 Social Engineering reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 30; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
The Psychology of Influence: Cialdini's Seven Principles	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
History of Social Engineering	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Social Engineering: The Science of Human Hacking (Hadnagy, 2018)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
The Art of Human Hacking (Hadnagy, 2010)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Phishing, Vishing, Smishing, Deepfake Voice Attacks	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Physical Social Engineering: Access, Elicitation, Impersonation	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
AI Automation of Social Engineering at Scale	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Defense: Training, Simulation, Technical Controls	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

30.3.3.6 Social Engineering annotated source ledger: real titles and local contribution Each source cited by this **Cognitive Security and Influence Resilience** module is paired below with its real title and a one-line note on what it contributes to **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide
[240, 2026]	The Right to Privacy in the Digital Age	The Office of the High Commissioner for Human Rights (OHCHR) hub page on the right to privacy in the digital age. It addresses how data-intensive technologies, particularly artificial intelligence, create risks for privacy, autonomy, and human dignity, and curates international standards, reports, and expert consultations.	verified source-guide
[242, 2026]	Guidance for Generative AI in Education and Research	Official UNESCO generative AI education guidance.	original source-guide
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide
[281, 2026]	Artificial Intelligence Cybersecurity Challenges	An ENISA (European Union Agency for Cybersecurity) report published December 15, 2020 mapping the cybersecurity challenges of artificial intelligence. It defines AI scope through a lifecycle approach, identifies the assets requiring protection within AI ecosystems, and develops a threat taxonomy classified across lifecycle stages and asset categories.	verified source-guide
[282, 2026]	AI Research: Security and Resilience	A NIST page on AI research focused on security and resilience, framing these as core characteristics of trustworthy AI under the NIST AI Risk Management Framework.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide

Source	Cited work	What it contributes	Status
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[296, 2026]	Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile	NIST AI 600-1, the Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile, a cross-sectoral companion resource to the NIST AI RMF 1.0 issued pursuant to Executive Order 14110. It identifies risks that are unique to or amplified by generative AI and organizes suggested actions for managing those risks, mapped to the AI RMF functions.	verified source-guide
[097, 2026]	The History of Social Engineering	This Mitnick Security guide traces the history and evolution of social engineering from antiquity through modern cyberattacks. It surveys major attack categories including phishing and its variants, pretexting, baiting, tailgating, and quid pro quo schemes, and explains the psychological influence principles such as reciprocity, scarcity, authority, and consensus that attackers exploit.	verified source-guide
[098, 2026]	Social Engineering: T he Science of Human Hacking	The full text of "Social Engineering: The Science of Human Hacking" (2nd edition, 2018) by Christopher Hadnagy, published by John Wiley & Sons. The book examines the human element of security, analyzing how manipulation and persuasion techniques can be used to influence people, and how individuals and organizations can recognize and defend against such tactics. It is written as a professional reference on understanding and countering human-targeted security threats.	verified source-guide
[099, 2026]	Social Engineering: The Art of Human Hacking	A PDF of the book Social Engineering: The Art of Human Hacking by Christopher Hadnagy, a foundational security text on how attackers exploit human psychology rather than technical flaws to obtain information or access. The work surveys manipulation tactics and the human factors that make organizations vulnerable, and frames this knowledge defensively to help security professionals recognize and resist such attacks.	verified source-guide
[100, 2026]	A Survey on Large Language Model-based Agents in Autonomous	This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse.	verified source-guide

Source	Cited work	What it contributes	Status
[300, 2026]	MITRE ATLAS	MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy.	original source-guide
[304, 2026]	Secure Software Development Framework (SSDF) Version 1.1: Recommendations for Mitigating the Risk of Software Vulnerabilities	NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences.	verified source-guide
[306, 2026]	Artificial Intelligence	Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support.	original source-guide
[308, 2026]	Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure	An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure.	verified source-guide
[311, 2026]	Countering Information Threats	An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering.	verified source-guide

Where this sits. This module's overview is Section 30; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

30.3.4 Social Engineering governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 30; [238, 2026].

30.3.5 Social Engineering analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 20's governance-boundary section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Cognitive Security and Influence Resilience** for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**. [238, 2026]; [240, 2026].
Curriculum topic spine: The Psychology of Influence: Cialdini's Seven Principles, **History of Social Engineering**, **Social Engineering: The Science of Human Hacking (Hadnagy, 2018)**. **Verified anchor cluster:** [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]; [OECD, 2026c]; [for Security Policy, 2025]; [Community, 2020a].
Conceptual depth: protecting attention, belief formation, and decision quality without turning resilience education into manipulation.
Method stack: claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning.
Composability contract: separate descriptive analysis, normative assessment, response options, and protected-audience considerations.
Known failure modes: counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty.
Defensive boundary: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans. Applied to **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

Anchor	Why it matters here
[Cybersecurity and Agency, 2024b]	Official CISA guidance on foreign influence operations targeting critical infrastructure. Checked as of 2026-05-21; role: source_quality_anchor.
[Organization, 2026b]	Official NATO counter-information-threat guidance. Checked as of 2026-05-21; role: source_quality_anchor.
[Cybersecurity and Agency, 2026b]	Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing. Checked as of 2026-05-21; role: curriculum_anchor.
[Organization, 2026c]	Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure. Checked as of 2026-05-21; role: curriculum_anchor.
[OECD, 2026c]	Official OECD policy source for information integrity, governance responses, public trust, and democratic resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[for Security Policy, 2025]	Policy-scholarship source for cognitive security, information literacy, critical thinking, and whole-of-society resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.

30.3.5.1 Social Engineering evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Cognitive Security and Influence Resilience** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [240, 2026].

30.3.6 Social Engineering agentic boundary: assist, approve, block, and record

Evidence anchor. Section 30; [238, 2026].
AGEINT translation is bounded by the **Cognitive Security and Influence Resilience** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

30.3.6.1 Social Engineering permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 30; [238, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

30.3.6.2 Social Engineering excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [240, 2026] and **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

30.3.7 Social Engineering governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 30; [238, 2026].
Governance is practiced as a gate on the **Cognitive Security and Influence Resilience** lane. Learners use the **Cognitive-Resilience Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

30.3.7.1 Social Engineering governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials

Gate	Coursebook check	Evidence retained
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [240, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Cognitive Security and Influence Resilience** failure modes and the **Cognitive-Resilience Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

30.3.7.2 Social Engineering evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 30; [238, 2026]. Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Cognitive-Resilience Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

30.3.7.3 Social Engineering current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**. [238, 2026]; [240, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cisa_foreign_influence` for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**?	Preparing for and Mitigating Foreign Influence Operations; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA guidance on foreign influence operations targeting critical infrastructure.
What does the module inherit from `official_nato_counter_information_threats` for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**?	Countering Information Threats; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO counter-information-threat guidance.
What does the module inherit from `official_cisa_election_security_influence` for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**?	Election Security; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing.
What does the module inherit from `official_nato_hybrid_threats` for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**?	Countering Hybrid Threats; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 30; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

30.3.8 Social Engineering assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 30; [238, 2026].

30.3.9 Social Engineering assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 30; [238, 2026].

30.3.9.1 Social Engineering capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.
Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering** and [238, 2026]; [240, 2026].

30.3.9.2 Social Engineering instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering** and [238, 2026]; [240, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

30.3.9.3 Social Engineering assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
The Psychology of Influence: Cialdini's Seven Principles	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
History of Social Engineering	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Social Engineering: The Science of Human Hacking (Hadnagy, 2018)	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

30.3.10 Social Engineering refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [240, 2026] and **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**.

30.3.10.1 Social Engineering refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**. The local signals begin with [238, 2026]; [240, 2026].

30.3.10.2 Social Engineering claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**, and the source spine for these checks begins with [238, 2026]; [240, 2026].

30.3.11 Social Engineering reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [240, 2026].
Triangulation anchors. In module 20's review-checklist section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering**. [238, 2026]; [240, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

30.3.12 Social Engineering learning-path links: module map, overview, and curriculum atlas

These links keep **The Psychology of Influence: Cialdini's Seven Principles; History of Social Engineering** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [238, 2026]; [240, 2026].
Section 2, Section 27, Section 29, Section 31

31 Information Warfare and Cognitive Security

31.0.1 Information Warfare and Cognitive Security figures and course links: visual evidence, source flow, and navigation

The module uses Figure 69 and Figure 64 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 27, Section 30, Section 32.
This module teaches the **Cognitive Security and Influence Resilience** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [239, 2026].

31.1 Cognitive Security and Influence Resilience frame for Information Warfare and Cognitive Security: source context, topic focus, and reader task

Evidence anchor. Section 31; [238, 2026].

31.1.1 Information Warfare and Cognitive Security orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 31; [238, 2026].

31.1.2 Information Warfare and Cognitive Security conceptual primer: source context, core model, and reader task

This chapter teaches cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The chapter uses **Cognitive-Resilience Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.
The central distinction is to separate analysis of influence from persuasion design. Core topics include **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness; Automated Influence and the Cognitive Security Challenge**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [239, 2026].
Learners move from vocabulary and the **Cognitive-Resilience Lens** distinction through topic lessons on **Information Warfare Doctrine: Definitions, Theory, Air Force Policy** with evidence and misconception checks, then assemble a **narrative-risk map with provenance, uncertainty, audience harms, and response options** with safety and rights gates.

31.1.3 Information Warfare and Cognitive Security learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 31; [238, 2026].

- Connect **Information Warfare Doctrine: Definitions, Theory, Air Force Policy and Military Deception: Six Principles and Historical Effectiveness** to **Cognitive Security and Influence Resilience** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate analysis of influence from persuasion design; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans.

31.1.4 Information Warfare and Cognitive Security core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 31; [238, 2026].

Term	Working definition
Narrative provenance	where a claim, frame, or story came from and how it spread
Prebunking	transparent education that helps people recognize misleading patterns before exposure
Audience harm	a privacy, dignity, autonomy, or trust risk for people receiving information
Attribution caution	the rule that intent and origin claims need strong evidence
Resilience response	a transparent education, correction, or process improvement that avoids manipulation
MISO boundary	the line between accountable public messaging analysis and covert influence design
Inoculation	building recognition of manipulation tactics without deploying persuasion against a population
Information Warfare Doctrine: Definitions,…	Key terms: Information, Warfare, Doctrine.
Military Deception: Six Principles and…	Key terms: Military, Deception, Six.

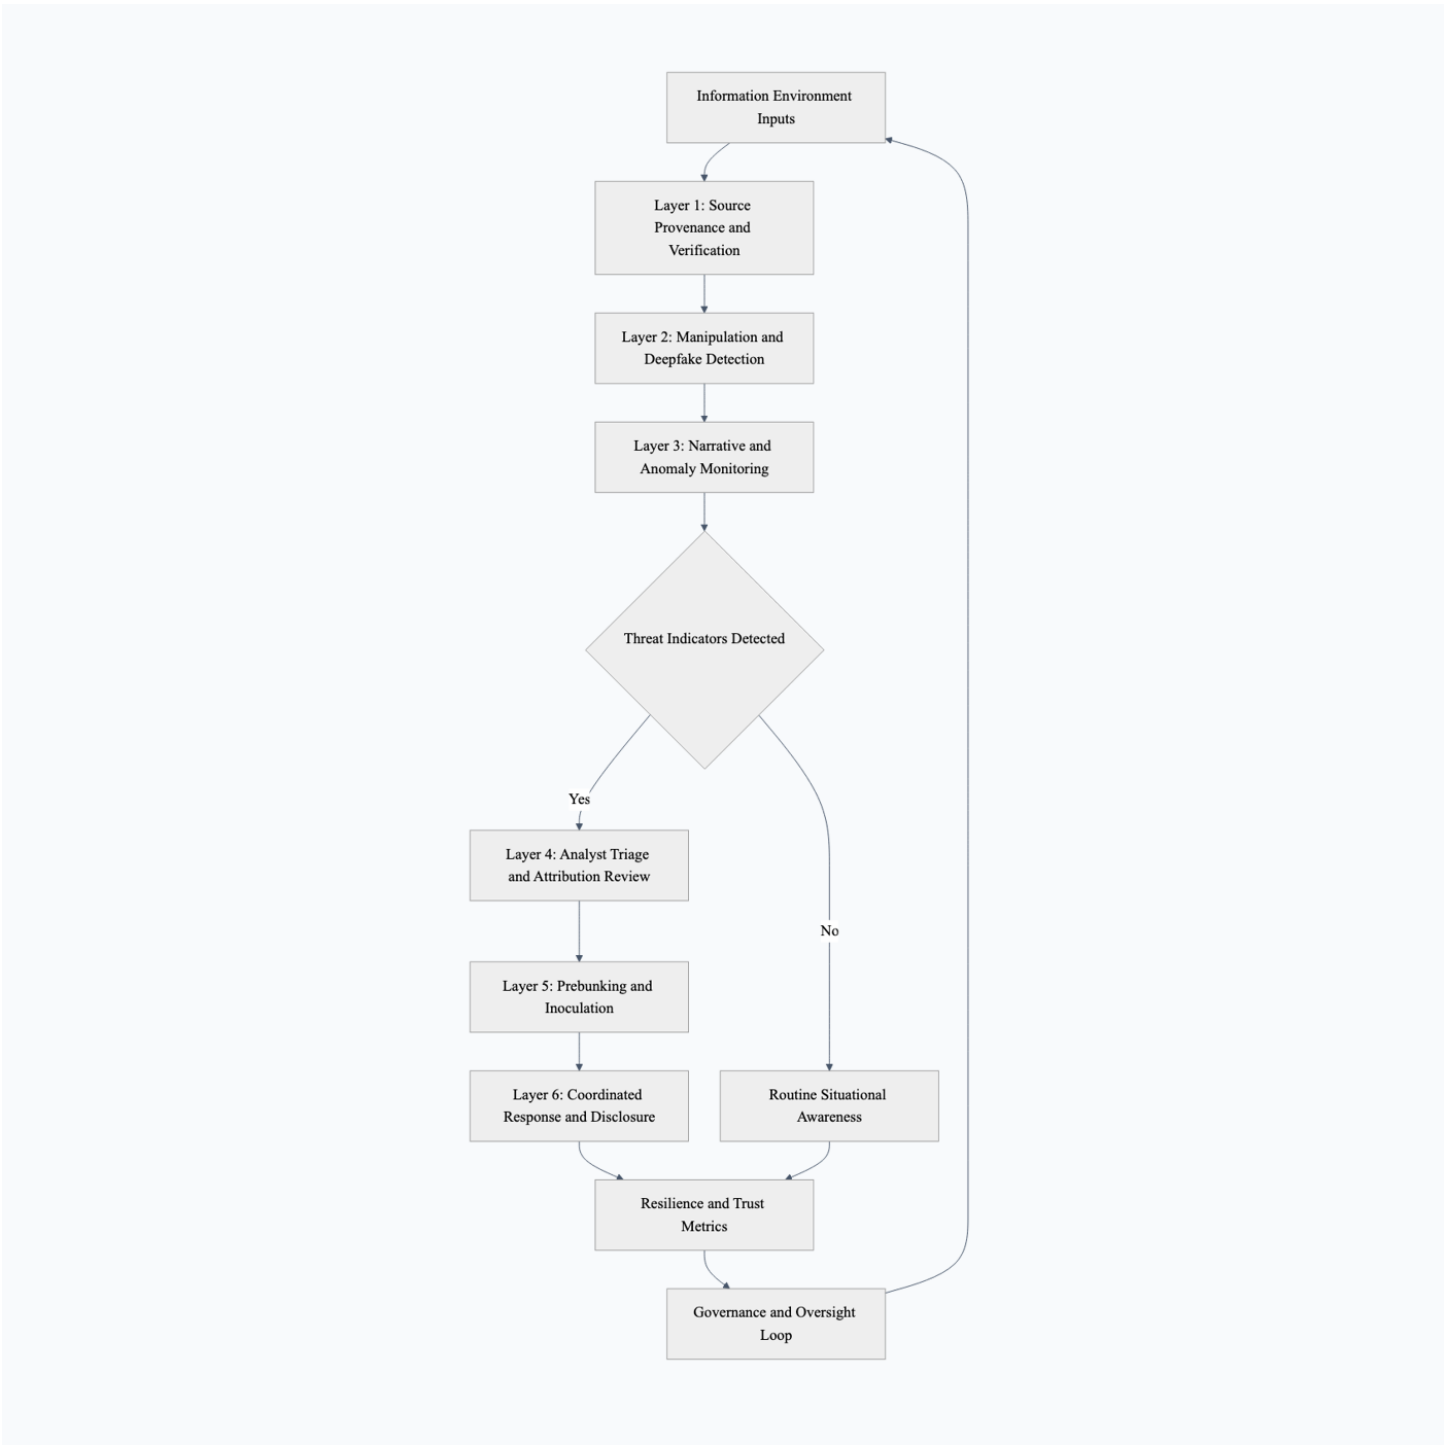

Figure 69: A layered defensive control stack for cognitive security, moving from source verification and manipulation detection through analyst triage, inoculation, and a governed response loop. It is anchored to the psychological operations and influence / information warfare and cognitive security section; use it to inspect Information Environment Inputs, Layer 1: Source Provenance and Verification, Layer 2: Manipulation and Deepfake Detection, and Layer 3: Narrative and Anomaly Monitoring while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

31.2 Cognitive-Resilience Lens path for Information Warfare and Cognitive Security: lesson cluster, safe artifact, and review

Evidence anchor. Section 31; [238, 2026].

31.2.1 Information Warfare and Cognitive Security practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 31; [238, 2026].

31.2.2 Information Warfare and Cognitive Security topic lessons: source-backed concepts and transfer tasks

This module builds cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The sequence opens with **Information Warfare Doctrine: Definitions, Theory, Air Force Policy**, **Military Deception: Six Principles and Historical Effectiveness**, **Automated Influence and the Cognitive Security Challenge** and applies the **Cognitive-Resilience Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 64; module overview Section 31; curriculum atlas Section 2.

Triangulation anchors. In module 21's topic-lessons section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

31.2.2.1 Lesson 1: Information Warfare Doctrine: Definitions, Theory, Air Force Policy **Concept. Information Warfare Doctrine: Definitions, Theory, Air Force Policy** analyzes information warfare through narrative provenance, audience harm, and transparent resilience—not influence operations design.

Why it matters. Information Warfare Doctrine matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. Information Warfare Doctrine: Definitions, Theory, Air Force Policy rests on [101, 2026] and [102, 2026]. Its anchor reference records: A 2006 paper by William Hutchinson published in the journal Informing Science. Use them for pinning down the scope of **Information Warfare Doctrine: Definitions, Theory, Air Force Policy**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **Information Warfare Doctrine** against the works cited for this row. [101, 2026] The military's use or misuse of information in psychological or deception operations, under. [102, 2026] A 2006 paper by William Hutchinson published in the journal Informing Science. It examines the history of information warfare and the increasingly central role of deception within it, tracing the concept from its late-1980s origins as a technology-oriented military tactic for command-and-control dominance to a broader recognition of information itself as both weapon and target. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Information Warfare Doctrine**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Information Warfare Doctrine**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Information Warfare Doctrine** work as a **narrative-risk and resilience map** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Information Warfare Doctrine**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Information Warfare Doctrine** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

31.2.2.2 Lesson 2: Military Deception: Six Principles and Historical Effectiveness **Concept. Military Deception: Six Principles and Historical Effectiveness** compares deception indicators with alternative explanations and uncertainty before any operational inference.

Why it matters. Military Deception connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Military Deception: Six Principles and Historical Effectiveness rests on [103, 2026] and [104, 2026]. The lead source's own note reads: Featured pieces argue that information operations officers should be conceptualized primarily as deception officers, and one quantitative reassessment reports that deception is employed in roughly 30 to 53 percent of military operations. Use them for fixing what **Military Deception: Six Principles and Historical Effectiveness** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Military Deception** in the evidence the row cites. [103, 2026] A topic page from the Journal of Information Warfare collecting scholarly articles on military deception. Featured pieces argue that information operations officers should be conceptualized primarily as deception officers, and one quantitative reassessment reports that deception is employed in roughly 30 to 53 percent of military operations. [104, 2026] An essay published in Small Wars Journal (June 2025) by a U.S. Army Civil Affairs officer arguing that military deception and information operations have become central to modern conflict. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Military Deception**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Military Deception**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Military Deception** work as a **narrative-risk and resilience map** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Military Deception**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Military Deception** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

31.2.2.3 Lesson 3: Automated Influence and the Cognitive Security Challenge **Concept. Automated Influence and the Cognitive Security Challenge** maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Without explicit treatment of **Automated Influence**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Automated Influence and the Cognitive Security Challenge rests on [105, 2026]. Its anchor reference records: Sarah Rajtmajer and Daniel Susser, 'Automated Influence and the Challenge of Cognitive Security,' in Hot Topics in the Science of Security (HotSoS '20), April 2020, ACM. Use it for fixing what **Automated Influence and the Cognitive Security Challenge** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Automated Influence**, reason from the sources cited in this row. [105, 2026] Sarah Rajtmajer and Daniel Susser, 'Automated Influence and the Challenge of Cognitive Security,' in Hot Topics in the Science of Security (HotSoS '20), April 2020, ACM. The paper argues that AI-powered computational propaganda poses national security threats that existing ethical frameworks do not address, and proposes 'cognitive security' as a productive conceptual lens for evaluating the ethics of automated influence operations and potential defensive responses. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Automated Influence**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Automated Influence and the Cognitive**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Automated Influence** work as a **narrative-risk and resilience map** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Automated Influence**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Automated Influence** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

31.2.2.4 Lesson 4: Cognitive Security in the Age of AI: NATO/EU Paradigm Shift

Concept. Cognitive Security in the Age of AI: NATO/EU Paradigm Shift maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Analysts use **Cognitive Security in the Age of AI** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Cognitive Security in the Age of AI: NATO/EU Paradigm Shift rests on [095, 2026]. The closest source to this row notes: This policy paper examines the emergence of cognitive security. Use it for fixing what **Cognitive Security in the Age of AI: NATO/EU Paradigm Shift** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Cognitive Security in the Age of AI**, reason from the sources cited in this row. [095, 2026] This policy paper examines the emergence of cognitive security. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Cognitive Security in the Age of AI**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Cognitive Security in the Age**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Cognitive Security in the Age of AI** work as a **narrative-risk and resilience map** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Cognitive Security in the Age of AI**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Cognitive Security in the Age of AI** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

31.2.2.5 Lesson 5: Epistemic Chaos as an Adversarial Goal

Concept. Epistemic Chaos as an Adversarial Goal protects knowledge production with provenance, dissent channels, and transparent correction—not narrative control.

Why it matters. Without explicit treatment of **Epistemic Chaos**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Epistemic Chaos as an Adversarial Goal rests on [095, 2026] and [096, 2026]. The closest source to this row notes: It notes that generative AI systems increasingly designed to influence beliefs and behavior raise acute governance concerns, while research on these effects remains fragmented. Use them for pinning down the scope of **Epistemic Chaos as an Adversarial Goal**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Epistemic Chaos**, work from the cited evidence behind this row. [095, 2026] This policy paper examines the emergence of cognitive security. [096, 2026] A position paper (Stanford authors, ICLR 2026 workshop) arguing that AI research and development should prioritize cognitive security, defined as protecting human cognitive processes from hazardous influence. It notes that generative AI systems increasingly designed to influence beliefs and behavior raise acute governance concerns, while research on these effects remains fragmented. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Epistemic Chaos**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Epistemic Chaos as an Adversarial**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Epistemic Chaos** work as a **narrative-risk and resilience map** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Epistemic Chaos**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Epistemic Chaos** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

31.2.2.6 Lesson 6: Active Inference and Predictive Processing as Models for Cognitive Attack/Defense

Concept. Active Inference and Predictive Processing as Models for Cognitive Attack/Defense treats the free-energy principle as computational-neuroscience theory, define prediction error, generative model, and uncertainty in plain language, then show how the theory helps an analyst notice when a model is explaining too much from too little evidence.

Why it matters. Active Inference connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Active Inference and Predictive Processing as Models for Cognitive Attack/Defense rests on [106, 2026] and [003, 2026]. Its anchor reference records: A 2024 bachelor's thesis by Lara Sakarya at Delft University of Technology presenting a systematic literature review of the active inference framework and the free-energy principle as applied to mimicking social human behavior in intelligent agents. Use them for pinning down the scope of **Active Inference and Predictive Processing as Models for Cognitive Attack/Defense**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Active Inference**, reason from the sources cited in this row. [106, 2026] A 2024 bachelor's thesis by Lara Sakarya at Delft University of Technology presenting a systematic literature review of the active inference framework and the free-energy principle as applied to mimicking social human behavior in intelligent agents. It explains active inference as a theory describing behavior that minimizes surprise, and surveys model variants such as deep active inference, multimodal deep belief networks, predictive coding, and probabilistic programming. [003, 2026] A 2021 peer-reviewed article by Stephen Fox in the journal Entropy that relates the active inference framework to social organization. It maps concepts such as variational free energy, prediction error, generative models, and Markov blankets onto industrial engineering and quality management practices,

treating organizational survival as the maintenance of process control limits. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Active Inference**, build a prediction-error concept card linking formal source, surprise, model assumption, analogy limit, and reviewer checkpoint. Shape **Active Inference** work as a **narrative-risk and resilience map** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Active Inference**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. For **Active Inference**, transfer the idea to a non-AI chapter by naming the assumed model, the surprising observation, and the review point before any decision follows.

31.2.2.7 Lesson 7: Behavioral Outcomes of Human Cognitive Security (arXiv 2026)

Concept. Behavioral Outcomes of Human Cognitive Security (arXiv 2026) maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Behavioral Outcomes matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. Behavioral Outcomes of Human Cognitive Security (arXiv 2026) rests on [107, 2026]. The lead source's own note reads: An arXiv research paper (March 2026) proposing an integrative modeling framework for human cognitive security, defined as the degree to which people rely on truthful information to make truth-aligned judgments. Use it for pinning down the scope of **Behavioral Outcomes of Human Cognitive Security (arXiv 2026)**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Behavioral Outcomes**, reason from the sources cited in this row. [107, 2026] An arXiv research paper (March 2026) proposing an integrative modeling framework for human cognitive security, defined as the degree to which people rely on truthful information to make truth-aligned judgments. It synthesizes Bayesian belief-updating with Prospect Theory to model how cognitive resources and emotional valuation shape behavior, and identifies three observable outcomes: veracity discernment, task-oriented actions, and information sharing. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Behavioral Outcomes**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Behavioral Outcomes of Human Cognitive**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Behavioral Outcomes** work as a **narrative-risk and resilience map** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Behavioral Outcomes**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Behavioral Outcomes** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

31.2.3 Information Warfare and Cognitive Security worked safe example: synthetic inputs, evidence, and review

Worked example: a sample public-library class evaluates a synthetic rumor about a community service and compares transparent correction options. [238, 2026]; [239, 2026].

Triangulation anchors. In module 21's worked-example section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **information-integrity and influence analysis**. Learners use a **narrative-risk and resilience map** and keep this boundary visible: No covert persuasion, microtargeting, manipulation, or campaign design.

Frame. The classroom question centers on **Information Warfare Doctrine: Definitions, Theory, Air Force Policy**. Excluded actions stay explicit, and the **Cognitive-Resilience Lens** planning question is: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Inputs. For the **Information Warfare Doctrine: Definitions, Theory, Air Force Policy** scenario, use sample posts, source timestamps, public-service facts, and a media-literacy rubric. The Cognitive-Resilience Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Information Warfare Doctrine: Definitions, Theory, Air Force Policy**, students trace narrative provenance, separate observation from attribution, name audience harms, and design a transparent lesson. Pause whenever an inference about Information Warfare Doctrine: Definitions, Theory, Air Force Policy appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Information Warfare Doctrine: Definitions, Theory, Air Force Policy** classroom scenario; unit artifact = narrative-risk and resilience map; evidence = allowed inputs; method = information-integrity analysis and resilience education; output = a narrative-risk map with caveats, response options, and no microtargeted persuasion; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Information Warfare Doctrine: Definitions, Theory, Air Force Policy** as "Cognitive-Resilience Lens confirms it" is not enough. The revision ties the claim to information-integrity analysis and resilience education, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

31.2.4 Information Warfare and Cognitive Security practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Cognitive-Resilience Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

Triangulation anchors. In module 21's practice-sequence section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Information Warfare Doctrine: Definitions, Theory, Air Force Policy, Military Deception: Six Principles and Historical Effectiveness, Automated Influence and the Cognitive Security Challenge; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Cognitive Security and Influence Resilience** lane.
2. Frame	Answer the lens question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Information Warfare Doctrine: Definitions, Theory, Air Force Policy: narrative-risk map with provenance, uncertainty, audience harms, and response options.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the narrative-risk and resilience map fields for Information Warfare Doctrine: Definitions, Theory, Air Force Policy.	Unit profile note.	Evidence artifacts include narrative provenance chain, audience-harm note.
4. Challenge	Test the misconception that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.	Failure-mode note.	The artifact applies the key distinction: separate analysis of influence from persuasion design.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

31.2.4.1 Information Warfare and Cognitive Security instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**. [238, 2026]; [239, 2026].

31.2.4.2 Information Warfare and Cognitive Security extension exercise: peer validation and refresh trigger review Evidence anchor. Section 31; [238, 2026].

Have learners swap artifacts and apply the **Cognitive-Resilience Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

31.2.5 Information Warfare and Cognitive Security knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 31; [238, 2026].

1. Explain how **Information Warfare Doctrine: Definitions, Theory, Air Force Policy** is defined here; name the source descriptor that supports the definition.
2. Contrast **Information Warfare Doctrine: Definitions, Theory, Air Force Policy** with **Military Deception: Six Principles and Historical Effectiveness** using the **Cognitive-Resilience Lens** artifact fields.
3. Identify one failure mode from the **Cognitive Security and Influence Resilience** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which response informs people without crossing into MISO-style manipulation or unverified attribution?
5. Correct this misconception: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

31.2.5.1 Information Warfare and Cognitive Security answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Information Warfare Doctrine: Definitions, Theory, Air Force Policy** without source evidence, uncertainty, or a safe transfer task.

31.3 Information Warfare and Cognitive Security assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 31; [238, 2026].

31.3.1 Information Warfare and Cognitive Security evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 31; [238, 2026].

31.3.2 Information Warfare and Cognitive Security transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 31; [238, 2026].

31.3.2.1 Information Warfare and Cognitive Security lineage and source tradition: profile, concepts, and first anchors This sits in the **Cognitive Security and Influence Resilience** lineage: protecting attention, belief formation, and decision quality without turning resilience education into manipulation. [238, 2026]; [239, 2026].

31.3.2.2 Information Warfare and Cognitive Security working model: inputs, constraints, transforms, outputs, and oversight Evidence anchor. Section 31; [238, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**, with provenance and reviewability throughout.

31.3.2.3 Information Warfare and Cognitive Security knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [238, 2026]; [239, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

31.3.2.4 Information Warfare and Cognitive Security transfer contracts: authority, evidence, tools, and auditable output Evidence anchor. Section 31; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.
- **Evidence contract:** keep the **Cognitive Security and Influence Resilience** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

31.3.2.5 Information Warfare and Cognitive Security profile emphasis and local focus: method stack and topic cluster Evidence anchor. Section 31; [238, 2026].

The matched profile emphasizes protecting attention, belief formation, and decision quality without turning resilience education into manipulation. The method stack is claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning; the local topic cluster is **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

31.3.3 Information Warfare and Cognitive Security evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 31; [238, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Cognitive Security and Influence Resilience** profile tells reviewers what evidence is strong enough for the module artifact built around **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

31.3.3.1 Information Warfare and Cognitive Security guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [239, 2026]; [244, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [101, 2026]; [102, 2026]; [103, 2026]; [104, 2026]; [105, 2026]; [095, 2026]; [096, 2026]; [106, 2026]; [003, 2026]; [107, 2026].

31.3.3.2 Information Warfare and Cognitive Security verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [239, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [239, 2026]; [244, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [101, 2026]; [102, 2026]; [103, 2026]; [104, 2026]; [105, 2026]; [095, 2026]; [096, 2026]; [106, 2026]; [003, 2026]; [107, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 21's source-canon section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness** and [238, 2026]; [239, 2026], but only directly verified source URLs are encoded as citations.

31.3.3.3 Information Warfare and Cognitive Security intelligence practice lens: evidence artifact and safety check Practice lens: **Cognitive-Resilience Lens** for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**. [238, 2026]; [239, 2026].

Planning question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Evidence artifact: narrative-risk map with provenance, uncertainty, audience harms, and response options.

Validation rule: distinguish observation, attribution, impact assessment, and resilience response. Applied to **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

Handoff contract: handoff supports transparency, education, and resilience, not microtargeted influence or deception.

Safety check: exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning.

31.3.3.4 Information Warfare and Cognitive Security runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 31; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	21.99	21.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Information Warfare and Cognitive Security to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
