Bounded autonomy, procurement, incident-response, and assurance studio	21.101	21.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Information Warfare and Cognitive Security	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Model-card, recoverability, retention, and learner-support evidence package	21.102	21.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Information Warfare and Cognitive Security	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Information Warfare Doctrine: Definitions, Theory, Air Force Policy	21.1	21.1 Information Warfare Doctrine: Definitions, Theory, Air Force Policy	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Military Deception: Six Principles and Historical Effectiveness	21.2	21.2 Military Deception: Six Principles and Historical Effectiveness	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Automated Influence and the Cognitive Security Challenge	21.3	21.3 Automated Influence and the Cognitive Security Challenge	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive Security in the Age of AI: NATO/EU Paradigm Shift	21.4	21.4 Cognitive Security in the Age of AI: NATO/EU Paradigm Shift	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Epistemic Chaos as an Adversarial Goal	21.5	21.5 Epistemic Chaos as an Adversarial Goal	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Active Inference and Predictive Processing as Models for Cognitive Attack/Defense	21.6	21.6 Active Inference and Predictive Processing as Models for Cognitive Attack/Defense	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Behavioral Outcomes of Human Cognitive Security (arXiv 2026)	21.7	21.7 Behavioral Outcomes of Human Cognitive Security (arXiv 2026)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

31.3.3.5 Information Warfare and Cognitive Security reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 31; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Information Warfare Doctrine: Definitions, Theory, Air Force Policy	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Military Deception: Six Principles and Historical Effectiveness	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Automated Influence and the Cognitive Security Challenge	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive Security in the Age of AI: NATO/EU Paradigm Shift	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Epistemic Chaos as an Adversarial Goal	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Active Inference and Predictive Processing as Models for Cognitive Attack/Defense	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Behavioral Outcomes of Human Cognitive Security (arXiv 2026)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

31.3.3.6 Information Warfare and Cognitive Security annotated source ledger: real titles and local contribution Each source cited by this **Cognitive Security and Influence Resilience** module is paired below with its real title and a one-line note on what it contributes to **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide
[239, 2026]	Digital Space and Human Rights	Official OHCHR digital rights portal.	original source-guide
[244, 2026]	AI and Education	Official UNESCO GEM AI and education source hub.	original source-guide
[273, 2026]	WCAG 2 Overview	The W3C Web Accessibility Initiative overview of the Web Content Accessibility Guidelines (WCAG), an international standard for making web content accessible to people with disabilities. It explains that WCAG is organized around four principles (perceivable, operable, understandable, robust) with testable success criteria at three conformance levels (A, AA, AAA), and covers versions 2.0, 2.1, and 2.2.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[285, 2026]	NIST AI Resource Center	The NIST AI Resource Center (AIRC), a government platform supporting implementation of the NIST AI Risk Management Framework, a voluntary framework for managing AI risk. It provides the core framework along with a playbook of practical actions, profiles tailored to specific sectors and technologies, use cases, and crosswalks linking the framework to other governance structures.	verified source-guide
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide

Source	Cited work	What it contributes	Status
[290, 2026]	NIST SP 800-218A: Secure Software Development Practices for Generative AI and Dual-Use Foundation Models	NIST Special Publication 800-218A (July 2024), which augments the Secure Software Development Framework with practices specific to AI model development across the software lifecycle. Produced in response to Executive Order 14110, it addresses AI model producers, developers building on those models, and acquirers of AI systems, and is designed to be used alongside NIST SP 800-218.	verified source-guide
[294, 2026]	M-25-21: Accelerating Federal Use of AI through Innovation, Governance, and Public Trust	An April 2025 Office of Management and Budget memorandum (M-25-21) directing executive branch agencies on federal use of artificial intelligence. Issued under Executive Order 14179, it instructs agencies to accelerate adoption of AI to improve public services and government efficiency while maintaining safeguards for civil rights, civil liberties, and privacy.	verified source-guide
[101, 2026]	Information Warfare: An Air Force Policy for the Role of Public Affairs	The military's use or misuse of information in psychological or deception operations, under.	original source-guide
[102, 2026]	Information Warfare and Deception	A 2006 paper by William Hutchinson published in the journal Informing Science. It examines the history of information warfare and the increasingly central role of deception within it, tracing the concept from its late-1980s origins as a technology-oriented military tactic for command-and-control dominance to a broader recognition of information itself as both weapon and target.	verified source-guide
[103, 2026]	Military Deception	A topic page from the Journal of Information Warfare collecting scholarly articles on military deception. Featured pieces argue that information operations officers should be conceptualized primarily as deception officers, and one quantitative reassessment reports that deception is employed in roughly 30 to 53 percent of military operations.	verified source-guide
[104, 2026]	The Utility of Military Deception and Information Operations	An essay published in Small Wars Journal (June 2025) by a U.S. Army Civil Affairs officer arguing that military deception and information operations have become central to modern conflict.	verified source-guide
[105, 2026]	Automated influence and the challenge of cognitive security	Sarah Rajtmajer and Daniel Susser, 'Automated Influence and the Challenge of Cognitive Security,' in Hot Topics in the Science of Security (HotSoS '20), April 2020, ACM. The paper argues that AI-powered computational propaganda poses national security threats that existing ethical frameworks do not address, and proposes 'cognitive security' as a productive conceptual lens for evaluating the ethics of automated influence operations and potential defensive responses.	verified source-guide
[095, 2026]	COGNITIVE SECURITY IN THE AGE OF AI	This policy paper examines the emergence of cognitive security.	original source-guide

Source	Cited work	What it contributes	Status
[096, 2026]	AI DEVELOPMENT SHOULD PRIORITIZE COGNITIVE SECURITY	A position paper (Stanford authors, ICLR 2026 workshop) arguing that AI research and development should prioritize cognitive security, defined as protecting human cognitive processes from hazardous influence. It notes that generative AI systems increasingly designed to influence beliefs and behavior raise acute governance concerns, while research on these effects remains fragmented.	verified source-guide
[106, 2026]	Applications of The Active Inference and The Free-Energy Principle	A 2024 bachelor's thesis by Lara Sakarya at Delft University of Technology presenting a systematic literature review of the active inference framework and the free-energy principle as applied to mimicking social human behavior in intelligent agents. It explains active inference as a theory describing behavior that minimizes surprise, and surveys model variants such as deep active inference, multimodal deep belief networks, predictive coding, and probabilistic programming.	verified source-guide
[003, 2026]	Active Inference: Applicability to Different Types of Social	A 2021 peer-reviewed article by Stephen Fox in the journal Entropy that relates the active inference framework to social organization. It maps concepts such as variational free energy, prediction error, generative models, and Markov blankets onto industrial engineering and quality management practices, treating organizational survival as the maintenance of process control limits.	verified source-guide
[107, 2026]	Behavioral Outcomes of Human Cognitive Security	An arXiv research paper (March 2026) proposing an integrative modeling framework for human cognitive security, defined as the degree to which people rely on truthful information to make truth-aligned judgments. It synthesizes Bayesian belief-updating with Prospect Theory to model how cognitive resources and emotional valuation shape behavior, and identifies three observable outcomes: veracity discernment, task-oriented actions, and information sharing.	verified source-guide

Where this sits. This module's overview is Section 31; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

31.3.4 Information Warfare and Cognitive Security governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 31; [238, 2026].

31.3.5 Information Warfare and Cognitive Security analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 21's governance-boundary section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Cognitive Security and Influence Resilience** for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**. [238, 2026]; [239, 2026].

Curriculum topic spine: Information Warfare Doctrine: Definitions, Theory, Air Force Policy, **Military Deception: Six Principles and Historical Effectiveness**, **Automated Influence and the Cognitive Security Challenge**. **Verified anchor cluster:** [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]; [OECD, 2026c]; [for Security Policy, 2025]; [Community, 2020a].

Conceptual depth: protecting attention, belief formation, and decision quality without turning resilience education into manipulation.

Method stack: claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning.

Composability contract: separate descriptive analysis, normative assessment, response options, and protected-audience considerations.

Known failure modes: counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty.

Defensive boundary: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans. Applied to **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

Anchor	Why it matters here
[Cybersecurity and Agency, 2024b]	Official CISA guidance on foreign influence operations targeting critical infrastructure. Checked as of 2026-05-21; role: source_quality_anchor.
[Organization, 2026b]	Official NATO counter-information-threat guidance. Checked as of 2026-05-21; role: source_quality_anchor.
[Cybersecurity and Agency, 2026b]	Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing. Checked as of 2026-05-21; role: curriculum_anchor.
[Organization, 2026c]	Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure. Checked as of 2026-05-21; role: curriculum_anchor.
[OECD, 2026c]	Official OECD policy source for information integrity, governance responses, public trust, and democratic resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[for Security Policy, 2025]	Policy-scholarship source for cognitive security, information literacy, critical thinking, and whole-of-society resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.

31.3.5.1 Information Warfare and Cognitive Security evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Cognitive Security and Influence Resilience** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [239, 2026].

31.3.6 Information Warfare and Cognitive Security agentic boundary: assist, approve, block, and record

Evidence anchor. Section 31; [238, 2026].

AGEINT translation is bounded by the **Cognitive Security and Influence Resilience** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

31.3.6.1 Information Warfare and Cognitive Security permitted defensive utility: curriculum uses and safe outputs Evidence anchor. Section 31; [238, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

31.3.6.2 Information Warfare and Cognitive Security excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [239, 2026] and **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

31.3.7 Information Warfare and Cognitive Security governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 31; [238, 2026].

Governance is practiced as a gate on the **Cognitive Security and Influence Resilience** lane. Learners use the **Cognitive-Resilience Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

31.3.7.1 Information Warfare and Cognitive Security governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [239, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Cognitive Security and Influence Resilience** failure modes and the **Cognitive-Resilience Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

31.3.7.2 Information Warfare and Cognitive Security evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 31; [238, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Cognitive-Resilience Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

31.3.7.3 Information Warfare and Cognitive Security current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**. [238, 2026]; [239, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cisa_foreign_influence` for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**?	Preparing for and Mitigating Foreign Influence Operations; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA guidance on foreign influence operations targeting critical infrastructure.
What does the module inherit from `official_nato_counter_information_threats` for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**?	Countering Information Threats; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO counter-information-threat guidance.
What does the module inherit from `official_cisa_election_security_influence` for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**?	Election Security; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing.
What does the module inherit from `official_nato_hybrid_threats` for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**?	Countering Hybrid Threats; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 31; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

31.3.8 Information Warfare and Cognitive Security assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 31; [238, 2026].

31.3.9 Information Warfare and Cognitive Security assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 31; [238, 2026].

31.3.9.1 Information Warfare and Cognitive Security capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.
Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness** and [238, 2026]; [239, 2026].

31.3.9.2 Information Warfare and Cognitive Security instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness** and [238, 2026]; [239, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

31.3.9.3 Information Warfare and Cognitive Security assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Information Warfare Doctrine: Definitions, Theory, Air Force Policy	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Military Deception: Six Principles and Historical Effectiveness	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Automated Influence and the Cognitive Security Challenge	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

31.3.10 Information Warfare and Cognitive Security refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [239, 2026] and **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**.

31.3.10.1 Information Warfare and Cognitive Security refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**. The local signals begin with [238, 2026]; [239, 2026].

31.3.10.2 Information Warfare and Cognitive Security claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**, and the source spine for these checks begins with [238, 2026]; [239, 2026].

31.3.11 Information Warfare and Cognitive Security reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [239, 2026].
Triangulation anchors. In module 21's review-checklist section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness**. [238, 2026]; [239, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

31.3.12 Information Warfare and Cognitive Security learning-path links: module map, overview, and curriculum atlas

These links keep **Information Warfare Doctrine: Definitions, Theory, Air Force Policy; Military Deception: Six Principles and Historical Effectiveness** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [238, 2026]; [239, 2026].

Section 2, Section 27, Section 30, Section 32

32 COUNTERINTELLIGENCE

32.1 COUNTERINTELLIGENCE learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 32; [238, 2026].

32.1.1 source-integrity defense discipline spine: domain question and learning focus

Evidence anchor. Section 32; [238, 2026].
This unit teaches **source-integrity defense**. CI lessons teach deception awareness, source integrity, insider-risk signals, corroboration, and protected escalation as defensive governance.

32.1.2 source-integrity defense source-use contract: citation roles and evidence limits

Evidence anchor. Section 32; [238, 2026].
Use guide citations and analytic-standards anchors to ground claims about deception, corroboration, uncertainty, and review.

32.1.3 source-integrity defense practice artifact: recurring packet and retained evidence

Evidence anchor. Section 32; [238, 2026].
The recurring practice artifact is a **source-integrity challenge memo** that draws on anomaly hypothesis table, corroboration note, protected-disclosure path, and uncertainty statement. The unit keeps its learning spine explicit. Learners list competing explanations for compromise signals and preserve uncertainty until evidence justifies escalation.

32.1.4 source-integrity defense safety boundary: accountable, synthetic, and evidence-bounded limits

No surveillance, cover construction, handling, elicitation, or operational security playbooks.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [238, 2026]; [240, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [238, 2026]; [240, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [238, 2026]; [240, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [238, 2026]; [240, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Counterintelligence and Source-Integrity Defense. Core anchors: [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]. Conceptual focus: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. Composability contract: identity, access, reporting, corroboration, caveats, and confidence are modeled independently so defensive review can happen without exposure. **Practice lens:** Structured-Judgment Lens; Which assumptions, alternatives, confidence statements, and source limits must stay visible for review? [238, 2026]; [240, 2026].

32.1.5 COUNTERINTELLIGENCE visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 70 and Figure 71 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 31, Section 33.

32.1.6 COUNTERINTELLIGENCE module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
Counterintelligence Fundamentals	Section 33	[238, 2026]; [240, 2026]; [241, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [012, 2026]; [108, 2026]; [029, 2026]; [297, 2026]; [298, 2026].
Counterintelligence Against Non-State Actors	Section 34	[239, 2026]; [240, 2026]; [241, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [012, 2026]; [033, 2026]; [109, 2026]; [307, 2026]; [305, 2026]; [304, 2026].

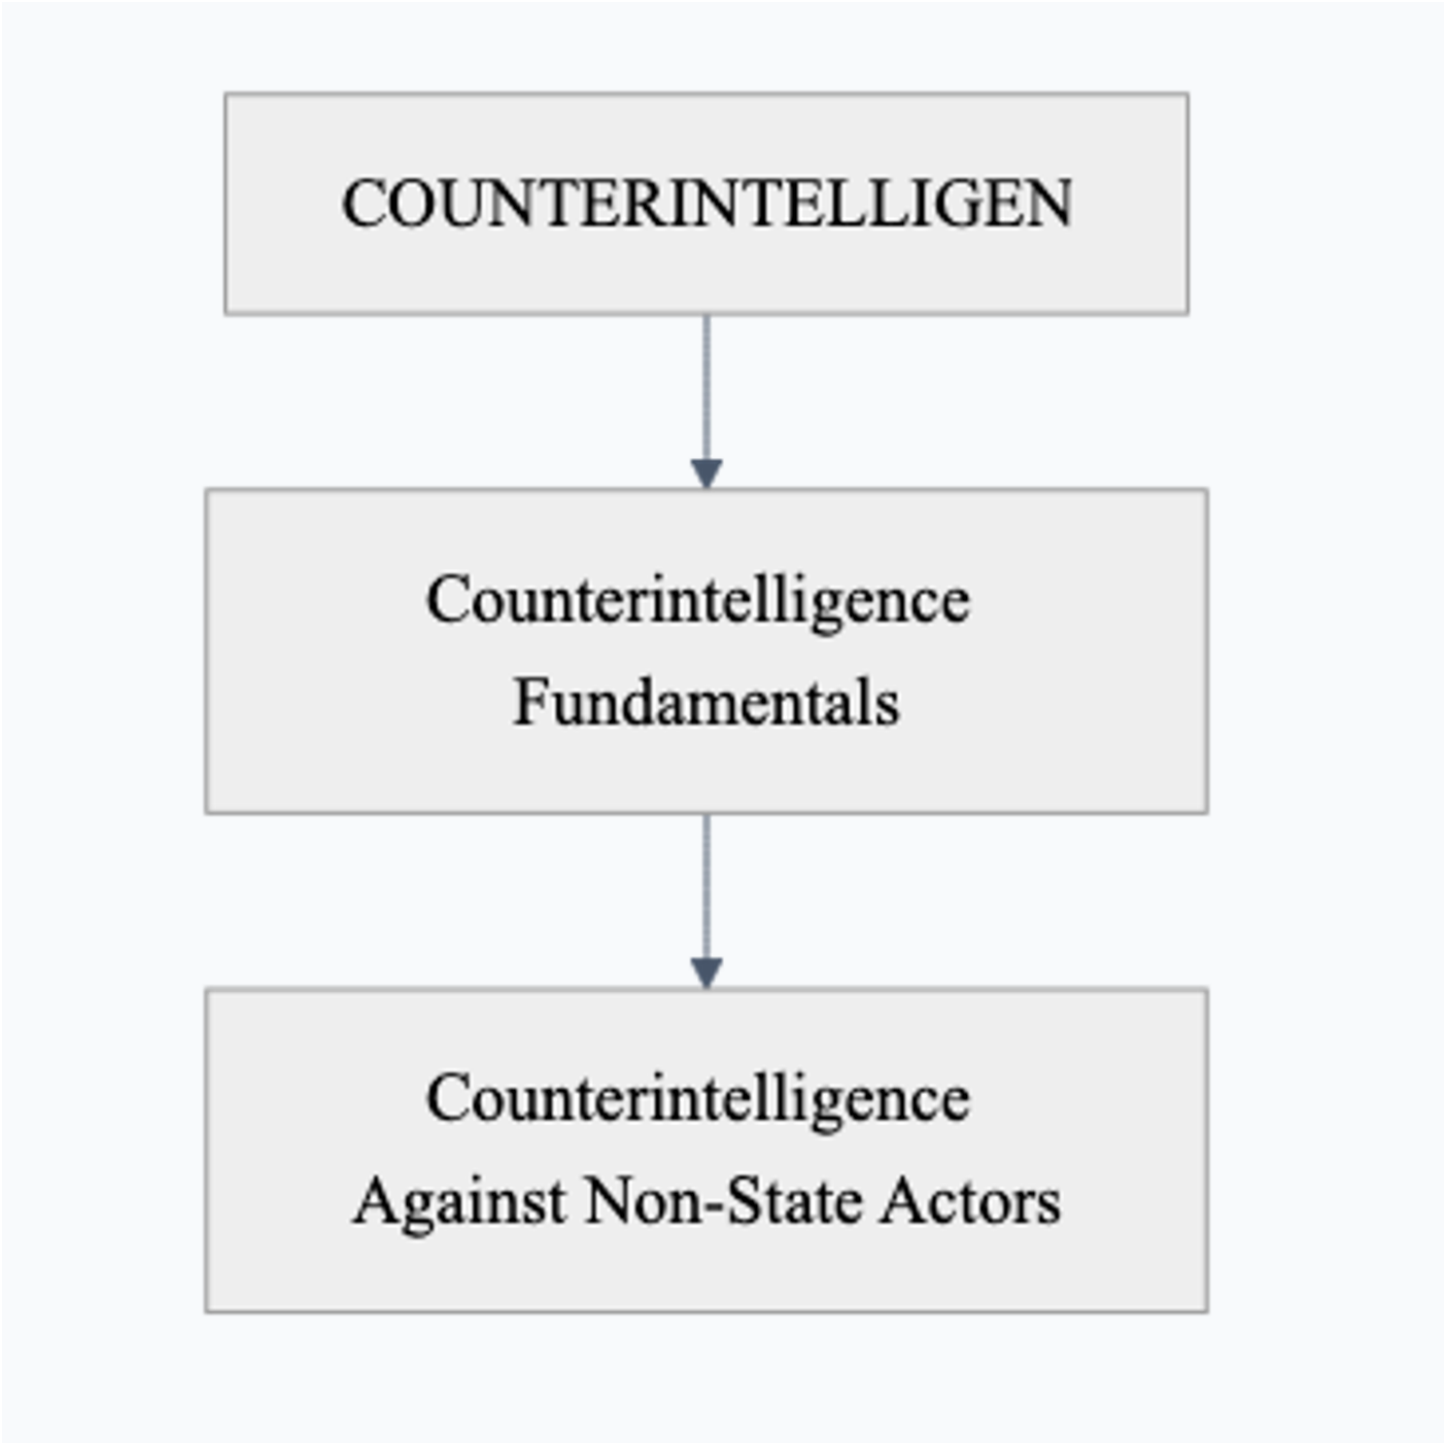

Figure 70: The unit module map traces the part's chapters as a linear reading sequence. In the counterintelligence section, it lets readers compare 2 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last so the visual functions as a traceable course aid rather than an unscoped assertion.

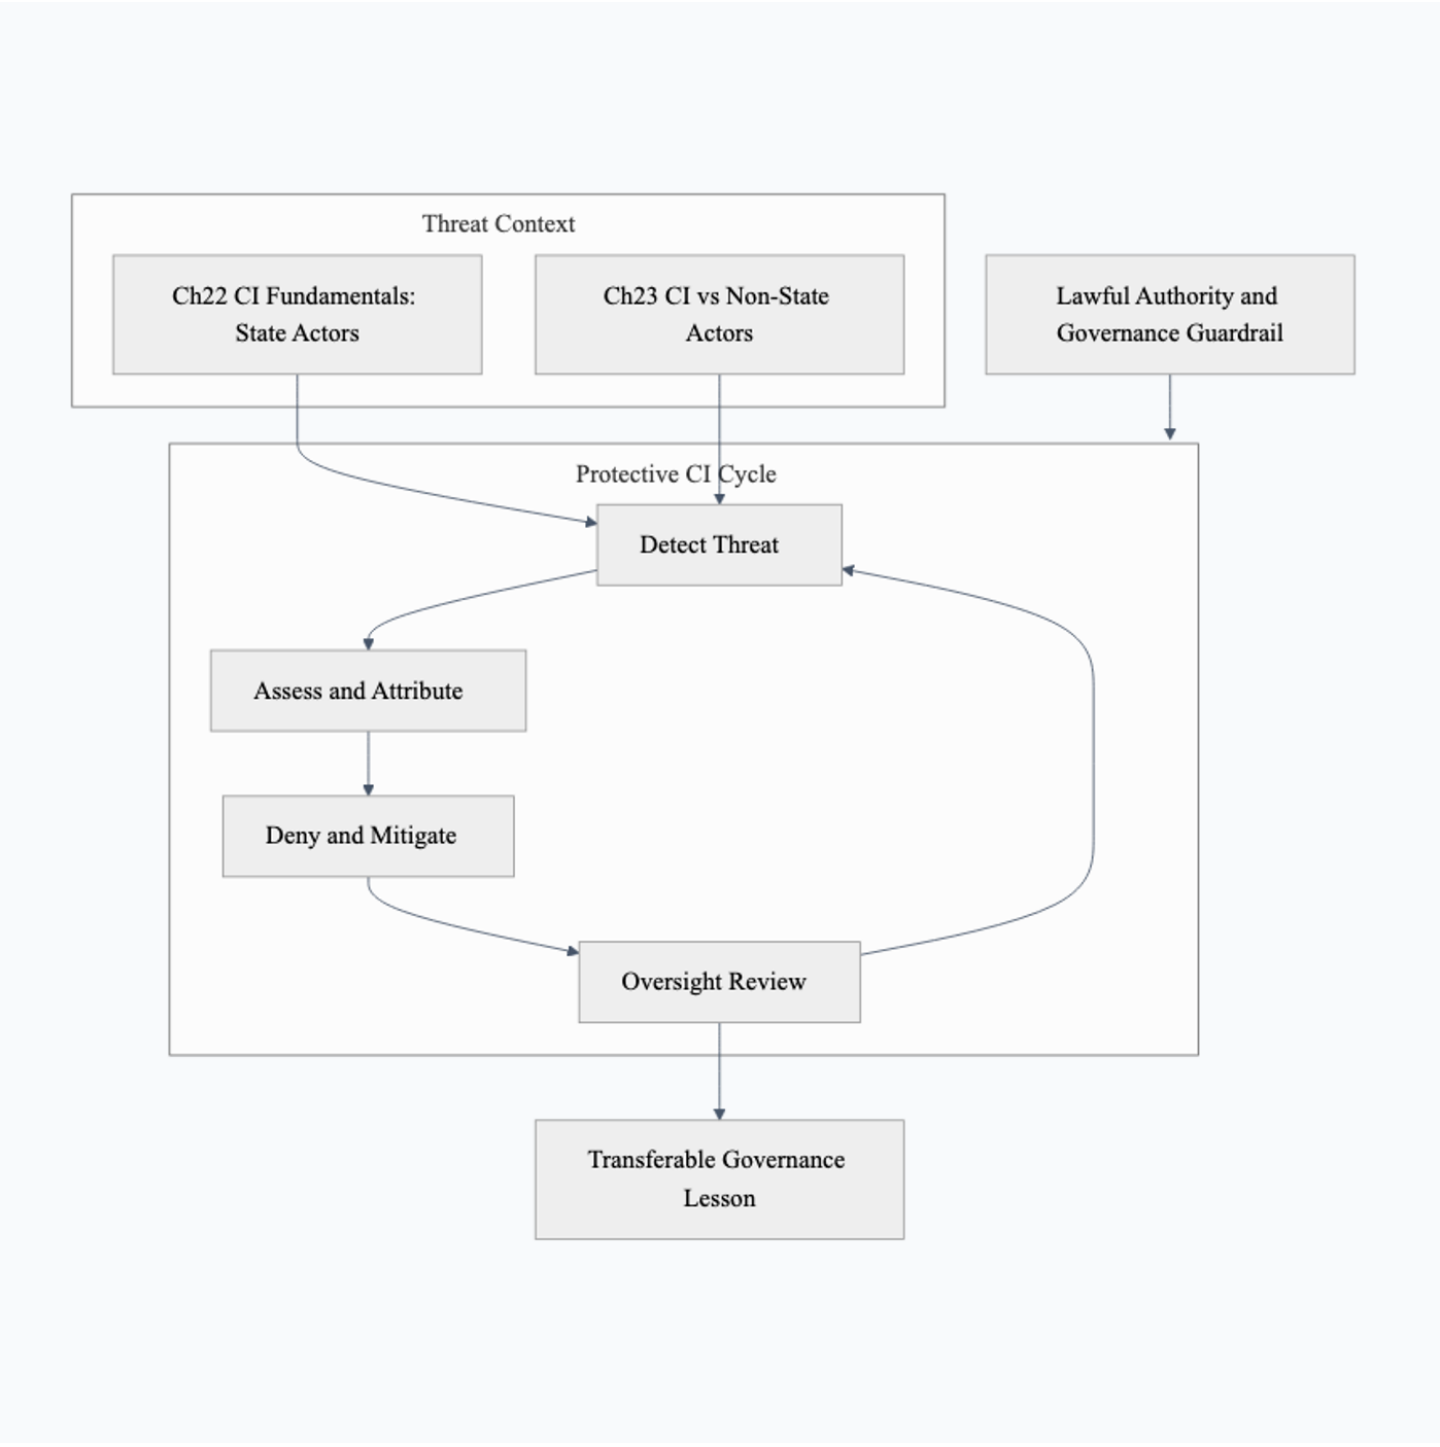

Figure 71: This Part presents counterintelligence as a continuous protective cycle whose detect-assess-deny-review loop is applied across both state and non-state adversaries. Its reader value is to make Threat Context, Ch22 CI Fundamentals: State Actors, Ch23 CI vs Non-State Actors, and Protective CI Cycle visible at a glance, with the counterintelligence section as the source section and defensive review as the boundary.

33 Counterintelligence Fundamentals

33.0.1 Counterintelligence Fundamentals figures and course links: visual evidence, source flow, and navigation

The module uses Figure 72 and Figure 70 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 32, Section 34.
This module teaches the **Counterintelligence and Source-Integrity Defense** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [240, 2026].

33.1 Counterintelligence and Source-Integrity Defense frame for Counterintelligence Fundamentals: source context, topic focus, and reader task

Evidence anchor. Section 33; [238, 2026].

33.1.1 Counterintelligence Fundamentals orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 33; [238, 2026].

33.1.2 Counterintelligence Fundamentals conceptual primer: source context, core model, and reader task

This chapter teaches counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The chapter uses **Structured-Judgment Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.
The central distinction is to separate defensive awareness from surveillance, handling, or operational security playbooks. Core topics include **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records; Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [240, 2026].
Learners move from vocabulary and the **Structured-Judgment Lens** distinction through topic lessons on **Source-vetting and insider-threat review using sample personnel records** with evidence and misconception checks, then assemble an **analytic note with hypotheses, evidence table, confidence, and dissent fields** with safety and rights gates.

33.1.3 Counterintelligence Fundamentals learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 33; [238, 2026].

- Connect **Source-vetting and insider-threat review using sample personnel records and Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records** to **Counterintelligence and Source-Integrity Defense** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build an **analytic note with hypotheses, evidence table, confidence, and dissent fields** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks.

33.1.4 Counterintelligence Fundamentals core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 33; [238, 2026].

Term	Working definition
Source integrity	confidence that evidence has not been distorted, laundered, or compromised
Compromise signal	a clue that access, identity, or source reliability needs review
Corroboration	independent support that reduces single-source vulnerability
Insider risk	risk created by trusted access combined with motive, pressure, or control failure
Protected disclosure	a safe channel for reporting concerns without exposing sensitive details
Source-vetting and insider-threat review using…	Key terms: vetting, insider, threat.
Offensive vs Defensive Counterintelligence:…	Key terms: Offensive, Defensive, Counterintelligence.

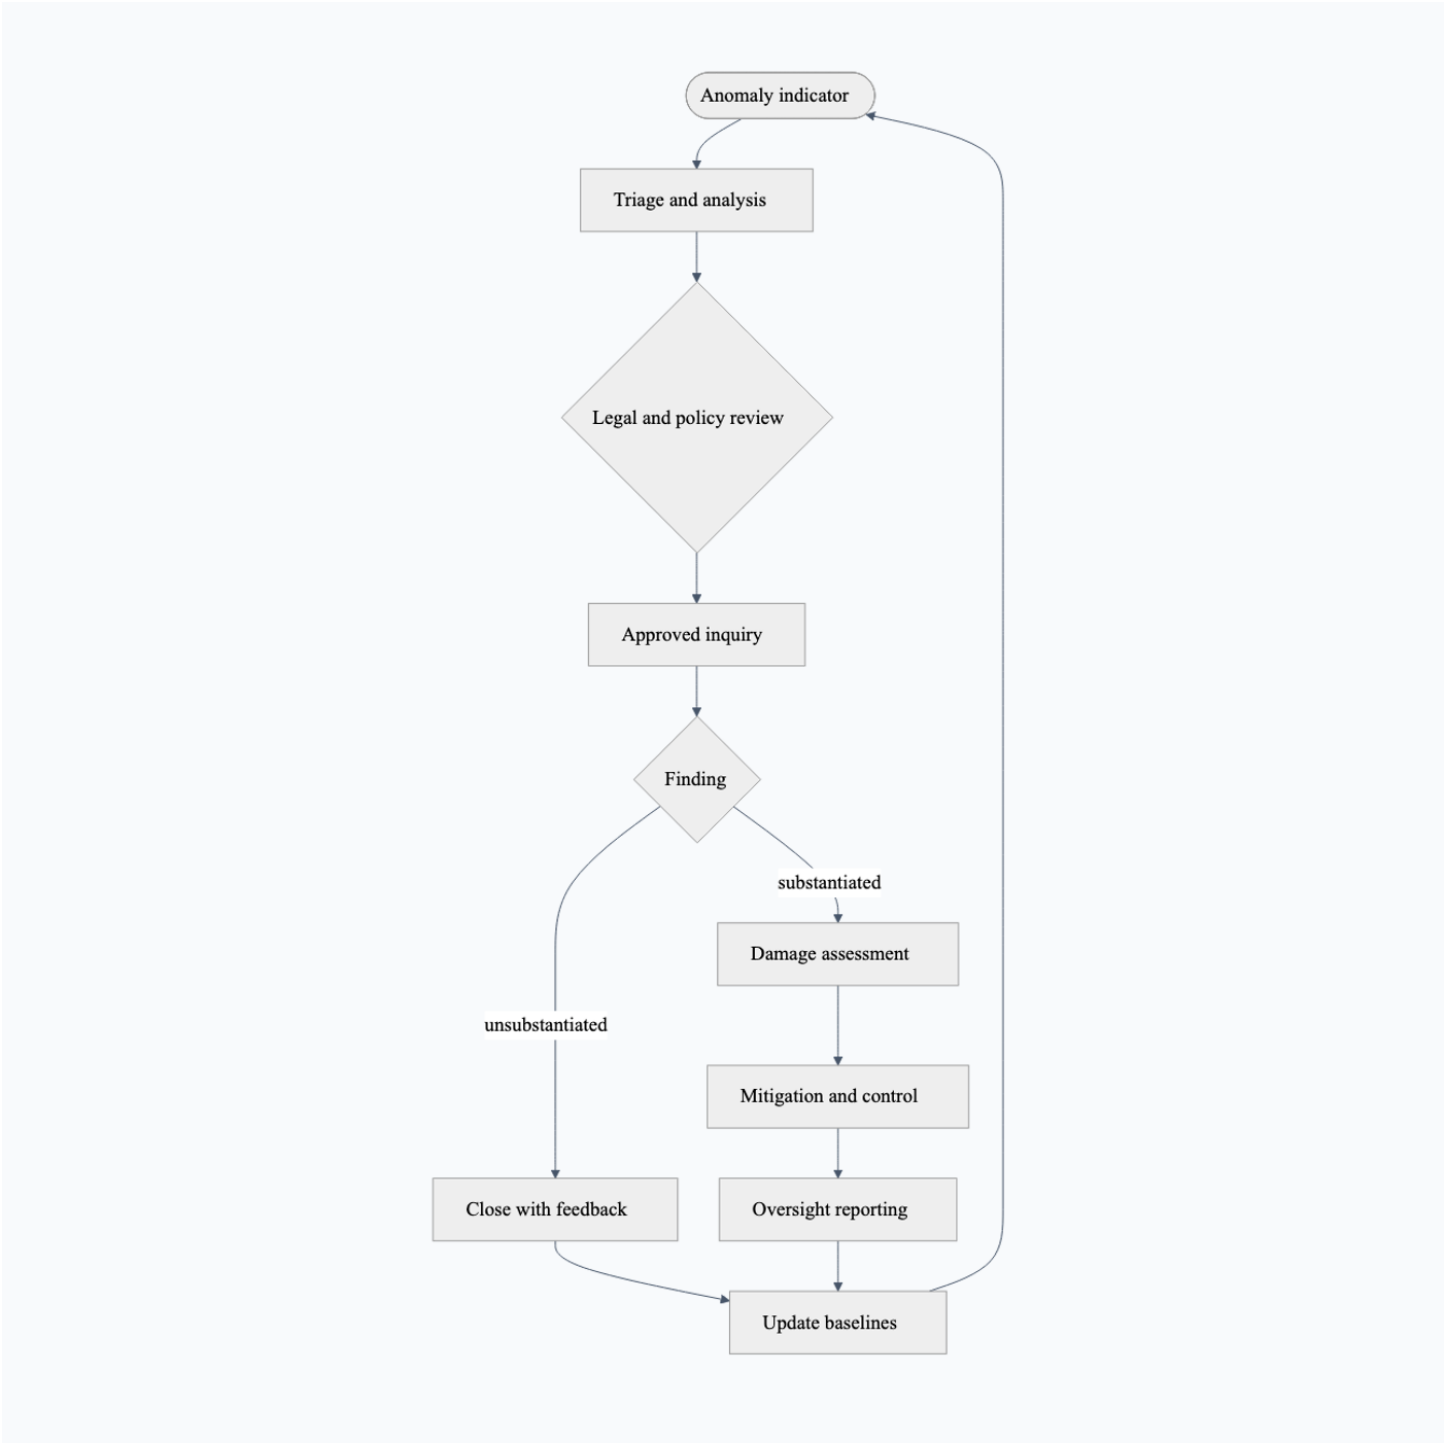

Figure 72: The oversight-bounded cycle by which an anomaly indicator becomes a governed counterintelligence investigation with damage assessment and legal review at every gate. The captioned view belongs to the counterintelligence / counterintelligence fundamentals section and should be read as a map of Anomaly indicator, Triage and analysis, Approved inquiry, and Close with feedback, not as a capability score or live-task instruction.

33.2 Structured-Judgment Lens path for Counterintelligence Fundamentals: lesson cluster, safe artifact, and review

Evidence anchor. Section 33; [238, 2026].

33.2.1 Counterintelligence Fundamentals practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 33; [238, 2026].

33.2.2 Counterintelligence Fundamentals topic lessons: source-backed concepts and transfer tasks

This module builds counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The sequence opens with **Source-vetting and insider-threat review using sample personnel records**, **Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**, **Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records** and applies the **Structured-Judgment Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 70; module overview Section 33; curriculum atlas Section 2.

Triangulation anchors. In module 22's topic-lessons section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

33.2.2.1 Lesson 1: Source-vetting and insider-threat review using sample personnel records Concept. Source-vetting and insider-threat review using sample personnel records connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. Analysts use **Source-vetting and insider-threat review using sample personnel records** to separate defensive awareness from surveillance, handling, or operational security playbooks. A defensible treatment names the judgment it enables for deception-aware source review and defensive escalation review, the proof limit that source compromise would otherwise hide, and the reviewer accountable for challenge.

Source support. Source-vetting and insider-threat review using sample personnel records rests on [012, 2026]. Its anchor reference records: A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. Use it for the claim that **Source-vetting and insider-threat review using sample personnel records** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Read **Source-vetting and insider-threat review using sample personnel records** against the works cited for this row. [012, 2026] A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Source-vetting and insider-threat review using sample personnel records**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Source-vetting and insider-threat review using**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape this subject work as a **source-integrity challenge memo** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Source-vetting and insider-threat review using sample personnel records**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Reuse the **Source-vetting and insider-threat review using sample personnel records** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

33.2.2.2 Lesson 2: Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records Concept. Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records frames counterintelligence as source-vetting, anomaly review, and institutional protection—not operational entrapment.

Why it matters. Offensive vs Defensive Counterintelligence connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records rests on [012, 2026]. The most specific cited work observes: It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion. Use it for the claim that **Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Offensive vs Defensive Counterintelligence**, work from the cited evidence behind this row. [012, 2026] A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Offensive vs Defensive Counterintelligence**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Offensive vs Defensive Counterintelligence**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **Offensive vs Defensive Counterintelligence** work as a **source-integrity challenge memo** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Offensive vs Defensive Counterintelligence**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Transfer **Offensive vs Defensive Counterintelligence** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

33.2.2.3 Lesson 3: Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records Concept. Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. Without explicit treatment of **Insider Threat Analysis**, source compromise undermines deception-aware source review and defensive escalation review; the lesson builds the habit to separate defensive awareness from surveillance, handling, or operational security playbooks.

Source support. Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records rests on [108, 2026]. The closest source to this row notes: Intelligence Analysis. Use it for pinning down the scope of **Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Insider Threat Analysis**, work from the cited evidence behind this row. [108, 2026] A Tradecraft Primer: Structured Analytic Techniques for Improving. Intelligence Analysis. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Insider Threat Analysis**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Insider Threat Analysis**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **Insider Threat Analysis** work as a **source-integrity challenge memo** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Insider Threat Analysis**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Reuse the **Insider Threat Analysis** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

33.2.2.4 Lesson 4: Double-Agent and Triple-Cross Operations: Source-vetting and insider-threat review using sample personnel records

Concept. Double-Agent and Triple-Cross Operations: Source-vetting and insider-threat review using sample personnel records connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. Double-Agent and Triple-Cross Operations matters in the **Counterintelligence and Source-Integrity Defense** lane because deception-aware source review and defensive escalation evidence must stay separate from judgment; source compromise is a common failure.

Source support. Double-Agent and Triple-Cross Operations: Source-vetting and insider-threat review using sample personnel records rests on [012, 2026] and [029, 2026]. The closest source to this row notes: It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. Use them for the claim that **Double-Agent and Triple-Cross Operations: Source-vetting and insider-threat review using sample personnel records** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Double-Agent and Triple-Cross Operations**, work from the cited evidence behind this row. [012, 2026] A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion. [029, 2026] A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Double-Agent and Triple-Cross Operations**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Double-Agent and Triple-Cross Operations**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **Double-Agent and Triple-Cross Operations** work as a **source-integrity challenge memo** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Double-Agent and Triple-Cross Operations**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Apply this module's safe boundary for **Double-Agent and Triple-Cross Operations** to another artifact while keeping deception-aware source review and defensive escalation and reviewer ownership explicit.

33.2.2.5 Lesson 5: Penetration of Hostile Services: Source-vetting and insider-threat review using sample personnel records

Concept. Penetration of Hostile Services: Source-vetting and insider-threat review using sample personnel records connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. Without explicit treatment of **Penetration of Hostile Services**, source compromise undermines deception-aware source review and defensive escalation review; the lesson builds the habit to separate defensive awareness from surveillance, handling, or operational security playbooks.

Source support. Penetration of Hostile Services: Source-vetting and insider-threat review using sample personnel records rests on [297, 2026] and [298, 2026]. The lead source's own note reads: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for fixing what **Penetration of Hostile Services: Source-vetting and insider-threat review using sample personnel records** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Penetration of Hostile Services**, work from the cited evidence behind this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Penetration of Hostile Services**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Penetration of Hostile Services**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **Penetration of Hostile Services** work as a **source-integrity challenge memo** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Penetration of Hostile Services**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Apply this module's safe boundary for **Penetration of Hostile Services** to another artifact while keeping deception-aware source review and defensive escalation and reviewer ownership explicit.

33.2.2.6 Lesson 6: Polygraph: Source-vetting and insider-threat review using sample personnel records

Concept. Polygraph: Source-vetting and insider-threat review using sample personnel records connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. Polygraph: Source-vetting and insider-threat review using sample personnel records connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Polygraph: Source-vetting and insider-threat review using sample personnel records rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence,

timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the claim that **Polygraph: Source-vetting and insider-threat review using sample personnel records** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Read **Polygraph: Source-vetting and insider-threat review using sample personnel records** against the works cited for this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Polygraph**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Polygraph**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **Polygraph: Source-vetting and insider-threat review using sample personnel records** work as a **source-integrity challenge memo** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Polygraph: Source-vetting and insider-threat review using sample personnel records**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Apply this module's safe boundary for **Polygraph: Source-vetting and insider-threat review using sample personnel records** to another artifact while keeping deception-aware source review and defensive escalation and reviewer ownership explicit.

33.2.2.7 Lesson 7: Damage Assessment and Control: Source-vetting and insider-threat review using sample personnel records

Concept. Damage Assessment and Control: Source-vetting and insider-threat review using sample personnel records connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. Without explicit treatment of **Damage Assessment and Control**, source compromise undermines deception-aware source review and defensive escalation review; the lesson builds the habit to separate defensive awareness from surveillance, handling, or operational security playbooks.

Source support. Damage Assessment and Control: Source-vetting and insider-threat review using sample personnel records rests on [297, 2026] and [298, 2026]. The lead source's own note reads: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for fixing what **Damage Assessment and Control: Source-vetting and insider-threat review using sample personnel records** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Damage Assessment and Control**, reason from the sources cited in this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Damage Assessment and Control**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Damage Assessment and Control**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **Damage Assessment and Control** work as a **source-integrity challenge memo** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Damage Assessment and Control**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Apply this module's safe boundary for **Damage Assessment and Control** to another artifact while keeping deception-aware source review and defensive escalation and reviewer ownership explicit.

33.2.2.8 Lesson 8: Case Studies: Source-vetting and insider-threat review using sample personnel records

Concept. Case Studies: Source-vetting and insider-threat review using sample personnel records connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. Analysts use **Case Studies** to separate defensive awareness from surveillance, handling, or operational security playbooks. A defensible treatment names the judgment it enables for deception-aware source review and defensive escalation review, the proof limit that source compromise would otherwise hide, and the reviewer accountable for challenge.

Source support. Case Studies: Source-vetting and insider-threat review using sample personnel records rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for fixing what **Case Studies: Source-vetting and insider-threat review using sample personnel records** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Ground **Case Studies** in the evidence the row cites. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Case Studies**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Case Studies**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **Case Studies** work as a **source-integrity challenge memo** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Case Studies**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Reuse the **Case Studies** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

33.2.3 Counterintelligence Fundamentals worked safe example: synthetic inputs, evidence, and review

Worked example: a sample research lab reviews a synthetic source-quality anomaly after a disputed report. [238, 2026]; [240, 2026].

Triangulation anchors. In module 22's worked-example section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **source-integrity defense**. Learners use a **source-integrity challenge memo** and keep this boundary visible: No surveillance, cover construction, handling, elicitation, or operational security playbooks.

Frame. The classroom question centers on **Source-vetting and insider-threat review using sample personnel records**. Excluded actions

stay explicit, and the **Structured-Judgment Lens** planning question is: Which assumptions, alternatives, confidence statements, and source limits must stay visible for review?

Inputs. For the **Source-vetting and insider-threat review using sample personnel records** scenario, use toy access logs, public policy excerpts, synthetic source notes, and a reviewer escalation path. The Structured-Judgment Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Source-vetting and insider-threat review using sample personnel records**, students separate identity from access, list anomaly hypotheses, seek corroboration, and route sensitive concerns to review. Pause whenever an inference about Source-vetting and insider-threat review using sample personnel records appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Source-vetting and insider-threat review using sample personnel records** classroom scenario; unit artifact = source-integrity challenge memo; evidence = allowed inputs; method = deception-aware source review and defensive escalation; output = a source-integrity memo with competing explanations, confidence, protected-disclosure note, and next-review owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Source-vetting and insider-threat review using sample personnel records** as "Structured-Judgment Lens confirms it" is not enough. The revision ties the claim to deception-aware source review and defensive escalation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Source-vetting and insider-threat review using sample personnel records** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

33.2.4 Counterintelligence Fundamentals practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Structured-Judgment Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

Triangulation anchors. In module 22's practice-sequence section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Source-vetting and insider-threat review using sample personnel records, Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records, Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Counterintelligence and Source-Integrity Defense** lane.
2. Frame	Answer the lens question: Which assumptions, alternatives, confidence statements, and source limits must stay visible for review?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Source-vetting and insider-threat review using sample personnel records: analytic note with hypotheses, evidence table, confidence, and dissent fields.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the source-integrity challenge memo fields for Source-vetting and insider-threat review using sample personnel records.	Unit profile note.	Evidence artifacts include anomaly hypothesis table, corroboration note.
4. Challenge	Test the misconception that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.	Failure-mode note.	The artifact applies the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

33.2.4.1 Counterintelligence Fundamentals instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**. [238, 2026]; [240, 2026].

33.2.4.2 Counterintelligence Fundamentals extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 33; [238, 2026].

Have learners swap artifacts and apply the **Structured-Judgment Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

33.2.5 Counterintelligence Fundamentals knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 33; [238, 2026].

1. Explain how **Source-vetting and insider-threat review using sample personnel records** is defined here; name the source descriptor that supports the definition.

2. Contrast **Source-vetting and insider-threat review using sample personnel records** with **Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records** using the **Structured-Judgment Lens** artifact fields.
3. Identify one failure mode from the **Counterintelligence and Source-Integrity Defense** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which explanation preserves uncertainty without ignoring a possible compromise signal?
5. Correct this misconception: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

33.2.5.1 Counterintelligence Fundamentals answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Source-vetting and insider-threat review using sample personnel records** without source evidence, uncertainty, or a safe transfer task.

33.3 Counterintelligence Fundamentals assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 33; [238, 2026].

33.3.1 Counterintelligence Fundamentals evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 33; [238, 2026].

33.3.2 Counterintelligence Fundamentals transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 33; [238, 2026].

33.3.2.1 Counterintelligence Fundamentals lineage and source tradition: profile, concepts, and first anchors This sits in the **Counterintelligence and Source-Integrity Defense** lineage: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. [238, 2026]; [240, 2026].

33.3.2.2 Counterintelligence Fundamentals working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 33; [238, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**, with provenance and reviewability throughout.

33.3.2.3 Counterintelligence Fundamentals knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [238, 2026]; [240, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

33.3.2.4 Counterintelligence Fundamentals transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 33; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.
- **Evidence contract:** keep the **Counterintelligence and Source-Integrity Defense** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

33.3.2.5 Counterintelligence Fundamentals profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 33; [238, 2026].

The matched profile emphasizes defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. The method stack is threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths; the local topic cluster is **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

33.3.3 Counterintelligence Fundamentals evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 33; [238, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Counterintelligence and Source-Integrity Defense** profile tells reviewers what evidence is strong enough for the module artifact built around **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

33.3.3.1 Counterintelligence Fundamentals guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [240, 2026]; [241, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [012, 2026]; [108, 2026]; [029, 2026]; [297, 2026]; [298, 2026].

33.3.3.2 Counterintelligence Fundamentals verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [240, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [240, 2026]; [241, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [012, 2026]; [108, 2026]; [029, 2026]; [297, 2026]; [298, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 22's source-canon section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records** and [238, 2026]; [240, 2026], but only directly verified source URLs are encoded as citations.

33.3.3.3 Counterintelligence Fundamentals intelligence practice lens: evidence artifact and safety check Practice lens: **Structured-Judgment Lens** for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**. [238, 2026]; [240, 2026].

Planning question: Which assumptions, alternatives, confidence statements, and source limits must stay visible for review?

Evidence artifact: analytic note with hypotheses, evidence table, confidence, and dissent fields.

Validation rule: separate raw reporting, inference, judgment, and recommendation before synthesis. Applied to **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

Handoff contract: handoff preserves alternatives, uncertainty, caveats, and revision history for downstream modules.

Safety check: avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence.

33.3.3.4 Counterintelligence Fundamentals runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 33; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	22.99	22.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Counterintelligence Fundamentals to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	22.101	22.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Counterintelligence Fundamentals	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Model-card, recoverability, retention, and learner-support evidence package	22.102	22.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Counterintelligence Fundamentals	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Source-vetting and insider-threat review using sample personnel records	22.1	22.1 source title transformed into safe curriculum treatment; original: CI Definition, Scope, Relationship to Intelligence	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-vetting and insider-threat review using sample personnel records	22.2	22.2 source title transformed into safe curriculum treatment; original: Offensive vs. Defensive Counterintelligence	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Source-vetting and insider-threat review using sample personnel records	22.3	22.3 source title transformed into safe curriculum treatment; original: Insider Threat Analysis: Critical Thinking Techniques (CDSE)	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Source-vetting and insider-threat review using sample personnel records	22.4	22.4 source title transformed into safe curriculum treatment; original: The Double-Agent and Triple-Cross Operations	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Source-vetting and insider-threat review using sample personnel records	22.5	22.5 source title transformed into safe curriculum treatment; original: Penetration of Hostile Services	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Source-vetting and insider-threat review using sample personnel records	22.6	22.6 source title transformed into safe curriculum treatment; original: Polygraph: Use and Limitations in CI	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Source-vetting and insider-threat review using sample personnel records	22.7	22.7 source title transformed into safe curriculum treatment; original: Damage Assessment and Control	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Source-vetting and insider-threat review using sample personnel records	22.8	22.8 source title transformed into safe curriculum treatment; original: Case Studies: Hanssen, Ames, Lee, Pollard	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

33.3.3.5 Counterintelligence Fundamentals reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 33; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Double-Agent and Triple-Cross Operations: Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Penetration of Hostile Services: Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Polygraph: Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Damage Assessment and Control: Source-vetting and insider-threat review using sample personnel records	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

Lesson topic	Practice lens	Evidence artifact	Safety check
Case Studies: Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

33.3.3.6 Counterintelligence Fundamentals annotated source ledger: real titles and local contribution Each source cited by this **Counterintelligence and Source-Integrity Defense** module is paired below with its real title and a one-line note on what it contributes to **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide
[240, 2026]	The Right to Privacy in the Digital Age	The Office of the High Commissioner for Human Rights (OHCHR) hub page on the right to privacy in the digital age. It addresses how data-intensive technologies, particularly artificial intelligence, create risks for privacy, autonomy, and human dignity, and curates international standards, reports, and expert consultations.	verified source-guide
[241, 2026]	Modernised Convention 108	Official Council of Europe Convention 108+ source.	original source-guide
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide

Source	Cited work	What it contributes	Status
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide
[288, 2026]	Algorithmic Transparency Recording Standard Hub	A GOV.UK collection page serving as the hub for the UK Algorithmic Transparency Recording Standard (ATRS), maintained by the Government Digital Service. It provides a standardized template for documenting public-sector use of algorithmic tools, completion guidance, policy on scope and compliance, and a searchable repository of published transparency records.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[012, 2026]	Counterintelligence Activities of Non-State Actors - Grey Dynamics	A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion.	verified source-guide
[108, 2026]	Critical Thinking techniques	A Tradecraft Primer: Structured Analytic Techniques for Improving. Intelligence Analysis.	original source-guide
[029, 2026]	Agent Handling in Counterintelligence / PDF	A roughly 28-page Scribd document titled "Agent Handling in Counterintelligence" providing an educational overview of intelligence operations. It surveys the roles of case officers in managing sources, recruitment and training of agents, protective measures such as fronts and cutouts, agent classifications including unwitting sources, and counterintelligence methods for identifying foreign operatives and reducing security breaches.	verified source-guide context; do not use as primary analytic support
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide

Where this sits. This module's overview is Section 33; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates

that govern this module.

33.3.4 Counterintelligence Fundamentals governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 33; [238, 2026].

33.3.5 Counterintelligence Fundamentals analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 22's governance-boundary section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Counterintelligence and Source-Integrity Defense** for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**. [238, 2026]; [240, 2026].

Curriculum topic spine: Source-vetting and insider-threat review using sample personnel records, **Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**, **Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records**. **Verified anchor cluster:** [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]; [Agency, 2009]; [Jr., 2007]; [Burkett, 2013].

Conceptual depth: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination.

Method stack: threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths.

Composability contract: identity, access, reporting, corroboration, caveats, and confidence are modeled independently so defensive review can happen without exposure.

Known failure modes: source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage.

Defensive boundary: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks. Applied to **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

Anchor	Why it matters here
[Counterintelligence and Center, 2024]	Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.
[Jr., 2007]	Foundational analytic cognition source for bias, mental models, and structured reasoning. Checked as of 2026-06-06; role: curriculum_anchor.
[Burkett, 2013]	A CIA Studies in Intelligence analyst essay arguing that the traditional MICE recruitment-motivation model (Money, Ideology, Compromise, Ego) is better understood through Cialdini's influence principles reframed as RASCLS (Reciprocation, Authority, Scarcity, Commitment/Consistency, Liking, Social Proof), grounding the historical and conceptual lineage of HUMINT recruitment frameworks. Checked as of 2026-06-08; role: curriculum_anchor.

33.3.5.1 Counterintelligence Fundamentals evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Counterintelligence and Source-Integrity Defense** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [240, 2026].

33.3.6 Counterintelligence Fundamentals agentic boundary: assist, approve, block, and record

Evidence anchor. Section 33; [238, 2026].

AGEINT translation is bounded by the **Counterintelligence and Source-Integrity Defense** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

33.3.6.1 Counterintelligence Fundamentals permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 33; [238, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

33.3.6.2 Counterintelligence Fundamentals excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [240, 2026] and **Source-vetting and**

insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

33.3.7 Counterintelligence Fundamentals governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 33; [238, 2026].
Governance is practiced as a gate on the **Counterintelligence and Source-Integrity Defense** lane. Learners use the **Structured-Judgment Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

33.3.7.1 Counterintelligence Fundamentals governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [240, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Counterintelligence and Source-Integrity Defense** failure modes and the **Structured-Judgment Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

33.3.7.2 Counterintelligence Fundamentals evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 33; [238, 2026].
Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Structured-Judgment Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

33.3.7.3 Counterintelligence Fundamentals current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**. [238, 2026]; [240, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_ncsc_counterintelligence_strategy` for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**?	The National Counterintelligence Strategy; lane `counterintelligence_source_integrity`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness.
What does the module inherit from `official_odni_eo_12333` for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**?	Executive Order 12333: United States Intelligence Activities; lane `legal_oversight`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection.
What does the module inherit from `official_odni_icd_206` for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**?	Intelligence Community Directive 206: Sourcing Requirements for Disseminated Analytic Products; lane `analytic_tradecraft`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official sourcing directive for traceability, citations, source descriptors, and source summaries.
What does the module inherit from `official_odni_icd_203` for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**?	Intelligence Community Directive 203: Analytic Standards; lane `source_quality_spine`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official ODNI analytic tradecraft standards directive.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 33; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

33.3.8 Counterintelligence Fundamentals assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 33; [238, 2026].

33.3.9 Counterintelligence Fundamentals assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 33; [238, 2026].

33.3.9.1 Counterintelligence Fundamentals capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records** and [238, 2026]; [240, 2026].

33.3.9.2 Counterintelligence Fundamentals instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records** and [238, 2026]; [240, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

33.3.9.3 Counterintelligence Fundamentals assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Source-vetting and insider-threat review using sample personnel records	Completed **analytic note with hypotheses, evidence table, confidence, and dissent fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records	Completed **analytic note with hypotheses, evidence table, confidence, and dissent fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Insider Threat Analysis: Source-vetting and insider-threat review using sample personnel records	Completed **analytic note with hypotheses, evidence table, confidence, and dissent fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

33.3.10 Counterintelligence Fundamentals refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [240, 2026] and **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**.

33.3.10.1 Counterintelligence Fundamentals refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**. The local signals begin with [238, 2026]; [240, 2026].

33.3.10.2 Counterintelligence Fundamentals claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**, and the source spine for these checks begins with [238, 2026]; [240, 2026].

33.3.11 Counterintelligence Fundamentals reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [240, 2026].

Triangulation anchors. In module 22's review-checklist section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records**. [238, 2026]; [240, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.

- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

33.3.12 Counterintelligence Fundamentals learning-path links: module map, overview, and curriculum atlas

Read this module in sequence with the curriculum orientation, its parent unit, and the adjacent modules so the evidence behind **Source-vetting and insider-threat review using sample personnel records; Offensive vs Defensive Counterintelligence: Source-vetting and insider-threat review using sample personnel records** carries forward intact. Source anchors for this module begin at [238, 2026]; [240, 2026].
Section 2, Section 32, Section 34

34 Counterintelligence Against Non-State Actors

34.0.1 Counterintelligence Against Non-State Actors figures and course links: visual evidence, source flow, and navigation

The module uses Figure 73 and Figure 70 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.

Navigation links: Section 2, Section 32, Section 33, Section 35.

This module teaches the **Counterintelligence and Source-Integrity Defense** lane through a bounded, source-backed coursebook chapter. [239, 2026]; [240, 2026].

34.1 Counterintelligence and Source-Integrity Defense frame for Counterintelligence Against Non-State Actors: source context, topic focus, and reader task

Evidence anchor. Section 34; [239, 2026].

34.1.1 Counterintelligence Against Non-State Actors orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 34; [239, 2026].

34.1.2 Counterintelligence Against Non-State Actors conceptual primer: source context, core model, and reader task

This chapter teaches counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The chapter uses **Structured-Judgment Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

The central distinction is to separate defensive awareness from surveillance, handling, or operational security playbooks. Core topics include **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries; CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.

Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [239, 2026]; [240, 2026].

Learners move from vocabulary and the **Structured-Judgment Lens** distinction through topic lessons on **Source-vetting and insider-threat review using sample personnel records** with evidence and misconception checks, then assemble an **analytic note with hypotheses, evidence table, confidence, and dissent fields** with safety and rights gates.

34.1.3 Counterintelligence Against Non-State Actors learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 34; [239, 2026].

- Connect **Source-vetting and insider-threat review using sample personnel records and Non-state actor indicator review with attribution caution and governance boundaries** to **Counterintelligence and Source-Integrity Defense** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build an **analytic note with hypotheses, evidence table, confidence, and dissent fields** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks.

34.1.4 Counterintelligence Against Non-State Actors core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 34; [239, 2026].

Term	Working definition
Source integrity	confidence that evidence has not been distorted, laundered, or compromised
Compromise signal	a clue that access, identity, or source reliability needs review
Corroboration	independent support that reduces single-source vulnerability
Insider risk	risk created by trusted access combined with motive, pressure, or control failure
Protected disclosure	a safe channel for reporting concerns without exposing sensitive details
Source-vetting and insider-threat review using…	Key terms: vetting, insider, threat.
Non-state actor indicator review with…	Key terms: Non, state, actor.

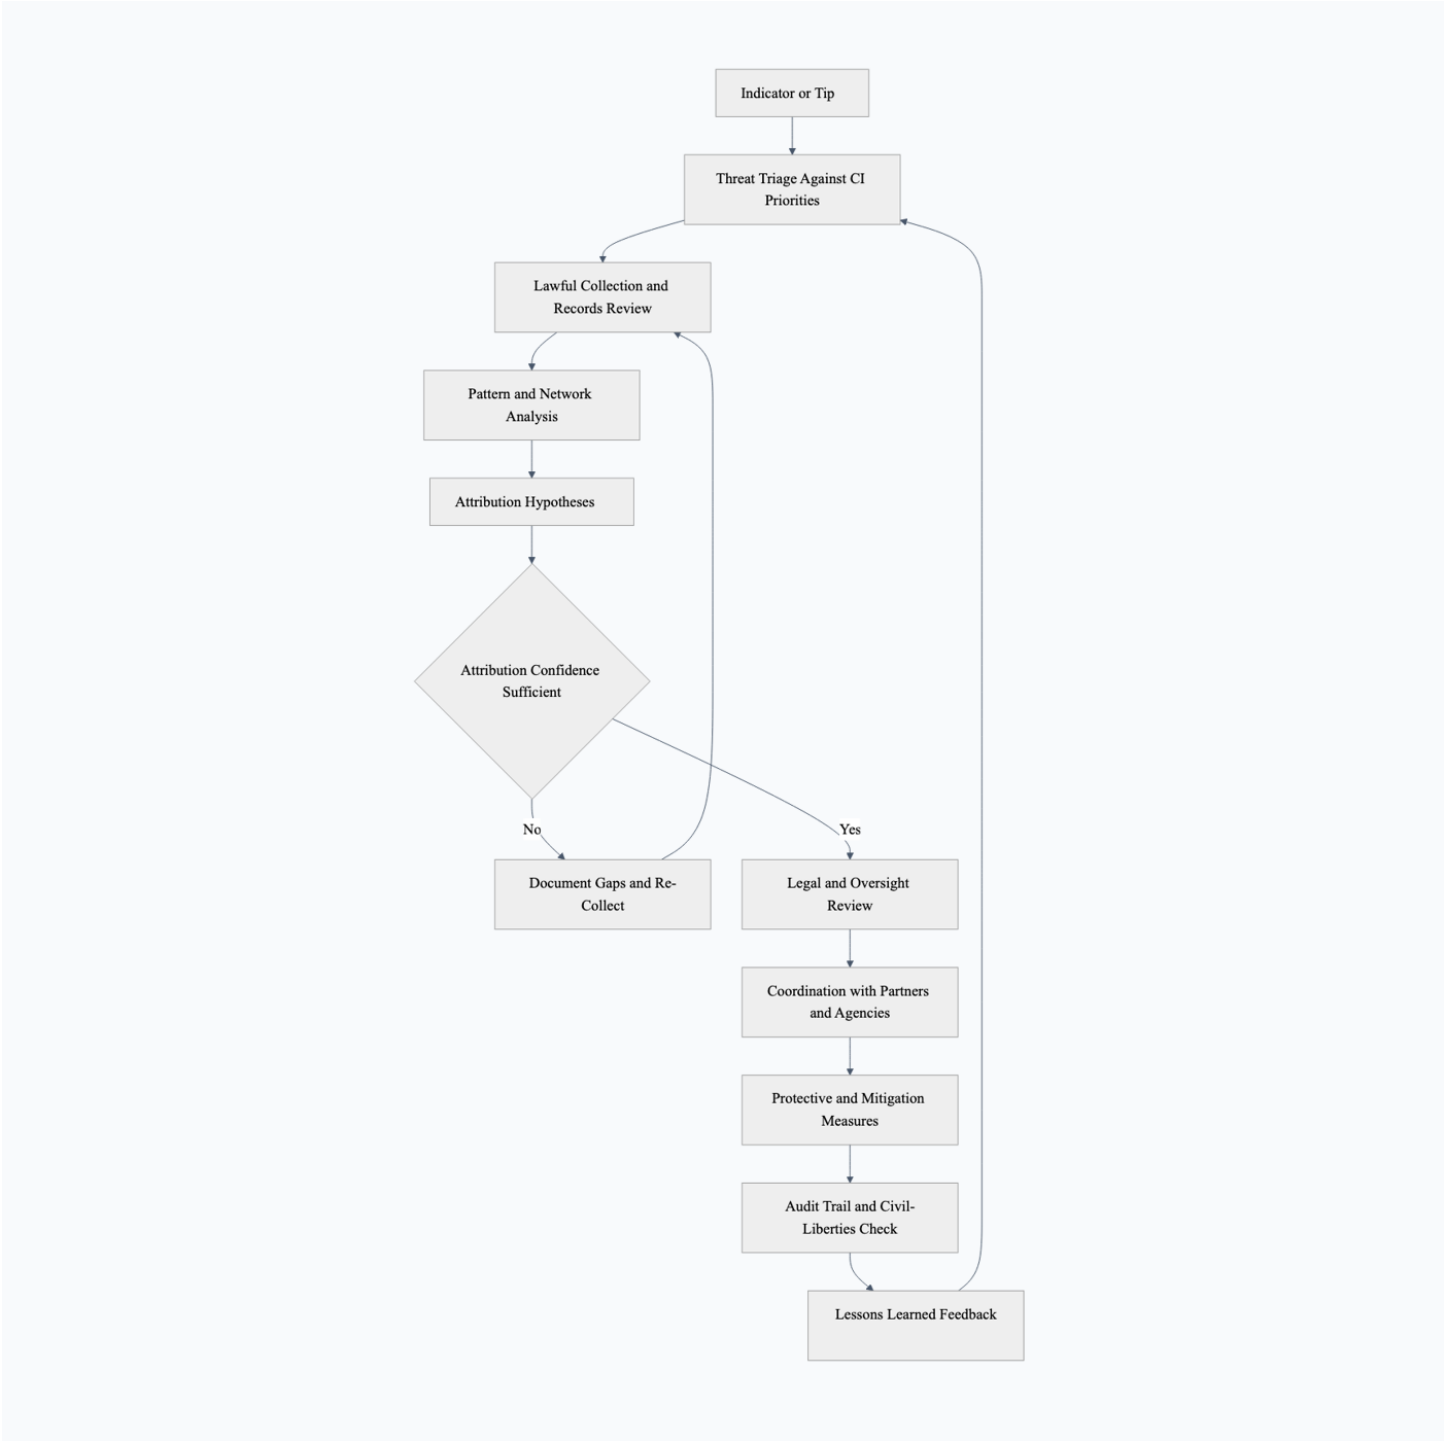

Figure 73: A governed counterintelligence loop showing how indicators against non-state actors move through lawful collection, attribution confidence checks, oversight review, and civil-liberties audit. The captioned view belongs to the counterintelligence / counterintelligence against non state actors section and should be read as a map of Indicator or Tip, Threat Triage Against CI Priorities, Lawful Collection and Records Review, and Pattern and Network Analysis, not as a capability score or live-task instruction.

34.2 Structured-Judgment Lens path for Counterintelligence Against Non-State Actors: lesson cluster, safe artifact, and review

Evidence anchor. Section 34; [239, 2026].

34.2.1 Counterintelligence Against Non-State Actors practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 34; [239, 2026].

34.2.2 Counterintelligence Against Non-State Actors topic lessons: source-backed concepts and transfer tasks

This module builds counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The sequence opens with **Source-vetting and insider-threat review using sample personnel records**, **Non-state actor indicator review with attribution caution and governance boundaries**, **CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records** and applies the **Structured-Judgment Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 70; module overview Section 34; curriculum atlas Section 2.

Triangulation anchors. In module 23's topic-lessons section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

34.2.2.1 Lesson 1: Source-vetting and insider-threat review using sample personnel records

Concept. Source-vetting and insider-threat review using sample personnel records connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. Source-vetting and insider-threat review using sample personnel records connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Source-vetting and insider-threat review using sample personnel records rests on [012, 2026]. Its anchor reference records: A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. Use it for the claim that **Source-vetting and insider-threat review using sample personnel records** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Read **Source-vetting and insider-threat review using sample personnel records** against the works cited for this row. [012, 2026] A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Source-vetting and insider-threat review using sample personnel records**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Source-vetting and insider-threat review using**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape this subject work as a **source-integrity challenge memo** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Source-vetting and insider-threat review using sample personnel records**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Reuse the **Source-vetting and insider-threat review using sample personnel records** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

34.2.2.2 Lesson 2: Non-state actor indicator review with attribution caution and governance boundaries

Concept. Non-state actor indicator review with attribution caution and governance boundaries uses attribution indicators cautiously by separating technical similarity, context, confidence, and geopolitical inference.

Why it matters. Non-state actor indicator review matters in the **Counterintelligence and Source-Integrity Defense** lane because deception-aware source review and defensive escalation evidence must stay separate from judgment; source compromise is a common failure.

Source support. Non-state actor indicator review with attribution caution and governance boundaries rests on [033, 2026]. The lead source's own note reads: How seriously is the U.S. Use it for the claim that **Non-state actor indicator review with attribution caution and governance boundaries** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Non-state actor indicator review**, work from the cited evidence behind this row. [033, 2026] How seriously is the U.S. Intelligence Community (IC) considering this challenge to U.S. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Non-state actor indicator review**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must name the actor descriptor, the bounded claim about **state actor indicator review with**, the attribution caveat, the uncertainty note, the non-targeting boundary, and the reviewer who approves the assessment. Shape **Non-state actor indicator review** work as a **source-integrity challenge memo** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that lacking a state sponsor places an actor outside the reach of governance, accountability, and applicable rules.

Transfer task. Transfer **Non-state actor indicator review** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

34.2.2.3 Lesson 3: CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records

Concept. CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records connects insider-threat review to access control, behavior indicators, and accountable escalation paths.

Why it matters. CI in Hybrid Threat Environments matters in the **Counterintelligence and Source-Integrity Defense** lane because deception-aware source review and defensive escalation evidence must stay separate from judgment; source compromise is a common failure.

Source support. CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records rests on [109, 2026]. The most specific cited work observes: It analyzes how Russia, China, and Iran operate in the space between peace and war, describing Russia's emphasis on information measures, China's maritime and force approaches, and Iran's anti-access and proxy strategies. Use it for pinning down the scope of **CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **CI in Hybrid Threat Environments**, reason from the sources cited in this row. [109, 2026] This is a peer-reviewed article in Connections: The Quarterly Journal (Vol. 21, No. 2, Spring 2022) by Peter Dobias and Kyle Christensen examining military competition below the threshold of armed conflict. It analyzes how Russia, China, and Iran operate in the space between peace and war, describing Russia's emphasis on information measures, China's maritime and force approaches, and Iran's anti-access and proxy strategies. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **CI in Hybrid Threat Environments**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **CI in Hybrid Threat Environments**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **CI in Hybrid Threat Environments** work as a **source-integrity challenge memo** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **CI in Hybrid Threat Environments**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Reuse the **CI in Hybrid Threat Environments** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

34.2.2.4 Lesson 4: Attribution Problems in State CI: Source-vetting and insider-threat review using sample personnel records

Concept. Attribution Problems in State CI: Source-vetting and insider-threat review using sample personnel records uses attribution indicators cautiously by separating technical similarity, context, confidence, and geopolitical inference.

Why it matters. Attribution Problems in State CI connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Attribution Problems in State CI: Source-vetting and insider-threat review using sample personnel records rests on [033, 2026]. The lead source's own note reads: How seriously is the U.S. Use it for the claim that **Attribution Problems in State CI: Source-vetting and insider-threat review using sample personnel records** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Attribution Problems in State CI**, reason from the sources cited in this row. [033, 2026] How seriously is the U.S. Intelligence Community (IC) considering this challenge to U.S. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Attribution Problems in State CI**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Attribution Problems in State CI**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **Attribution Problems in State CI** work as a **source-integrity challenge memo** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Attribution Problems in State CI**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Transfer **Attribution Problems in State CI** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

34.2.2.5 Lesson 5: Corporate Counterintelligence and Trade Secret: Source-vetting and insider-threat review using sample personnel records

Concept. Corporate Counterintelligence and Trade Secret: Source-vetting and insider-threat review using sample personnel records frames counterintelligence as source-vetting, anomaly review, and institutional protection—not operational entrapment.

Why it matters. Corporate Counterintelligence and Trade Secret connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Corporate Counterintelligence and Trade Secret: Source-vetting and insider-threat review using sample personnel records rests on [307, 2026], [305, 2026], and [304, 2026]. The lead source's own note reads: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for pinning down the scope of **Corporate Counterintelligence and Trade Secret: Source-vetting and insider-threat review using sample personnel records**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Corporate Counterintelligence and Trade Secret**, reason from the sources cited in this row. [307, 2026] Official CISA Industrial Control Systems recommended practices page for defensive ICS/OT safety, resilience, and incident-preparation guidance. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Corporate Counterintelligence and Trade Secret**, build a **analytic note with hypotheses, evidence table, confidence, and dissent fields** for this deception-aware source review and defensive escalation topic. The artifact must record the vetting descriptor, the bounded claim about **Corporate Counterintelligence and Trade Secret**, the bias caveat, the uncertainty note, the unproven-allegation boundary, and the reviewer who adjudicates. Shape **Corporate Counterintelligence and Trade Secret** work as a **source-integrity challenge memo** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Corporate Counterintelligence and Trade Secret**: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

Transfer task. Apply this module's safe boundary for **Corporate Counterintelligence and Trade Secret** to another artifact while keeping deception-aware source review and defensive escalation and reviewer ownership explicit.

34.2.3 Counterintelligence Against Non-State Actors worked safe example: synthetic inputs, evidence, and review

Worked example: a sample research lab reviews a synthetic source-quality anomaly after a disputed report. [239, 2026]; [240, 2026].

Triangulation anchors. In module 23's worked-example section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **source-integrity defense**. Learners use a **source-integrity challenge memo** and keep this boundary visible: No surveillance, cover construction, handling, elicitation, or operational security playbooks.

Frame. The classroom question centers on **Source-vetting and insider-threat review using sample personnel records**. Excluded actions stay explicit, and the **Structured-Judgment Lens** planning question is: Which assumptions, alternatives, confidence statements, and source limits must stay visible for review?

Inputs. For the **Source-vetting and insider-threat review using sample personnel records** scenario, use toy access logs, public policy excerpts, synthetic source notes, and a reviewer escalation path. The Structured-Judgment Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Source-vetting and insider-threat review using sample personnel records**, students separate identity from access, list anomaly hypotheses, seek corroboration, and route sensitive concerns to review. Pause whenever an inference about Source-vetting and insider-threat review using sample personnel records appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Source-vetting and insider-threat review using sample personnel records** classroom scenario; unit artifact = source-integrity challenge memo; evidence = allowed inputs; method = deception-aware source review and defensive escalation; output = a source-integrity memo with competing explanations, confidence, protected-disclosure note, and next-review owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Source-vetting and insider-threat review using sample personnel records** as "Structured-Judgment Lens confirms it" is not enough. The revision ties the claim to deception-aware source review and defensive escalation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Source-vetting and insider-threat review using sample personnel records** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

34.2.4 Counterintelligence Against Non-State Actors practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Structured-Judgment Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

Triangulation anchors. In module 23's practice-sequence section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Source-vetting and insider-threat review using sample personnel records, Non-state actor indicator review with attribution caution and governance boundaries, CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Counterintelligence and Source-Integrity Defense** lane.
2. Frame	Answer the lens question: Which assumptions, alternatives, confidence statements, and source limits must stay visible for review?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Source-vetting and insider-threat review using sample personnel records: analytic note with hypotheses, evidence table, confidence, and dissent fields.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the source-integrity challenge memo fields for Source-vetting and insider-threat review using sample personnel records.	Unit profile note.	Evidence artifacts include anomaly hypothesis table, corroboration note.
4. Challenge	Test the misconception that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.	Failure-mode note.	The artifact applies the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

34.2.4.1 Counterintelligence Against Non-State Actors instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**. [239, 2026]; [240, 2026].

34.2.4.2 Counterintelligence Against Non-State Actors extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 34; [239, 2026].

Have learners swap artifacts and apply the **Structured-Judgment Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

34.2.5 Counterintelligence Against Non-State Actors knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 34; [239, 2026].

1. Explain how **Source-vetting and insider-threat review using sample personnel records** is defined here; name the source descriptor that supports the definition.
2. Contrast **Source-vetting and insider-threat review using sample personnel records** with **Non-state actor indicator review with attribution caution and governance boundaries** using the **Structured-Judgment Lens** artifact fields.

3. Identify one failure mode from the **Counterintelligence and Source-Integrity Defense** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which explanation preserves uncertainty without ignoring a possible compromise signal?
5. Correct this misconception: that a clean vetting result certifies present trustworthiness rather than a point-in-time judgment that must be continuously re-examined.

34.2.5.1 Counterintelligence Against Non-State Actors answer quality rubric: source evidence, uncertainty, and safe transfer
Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Source-vetting and insider-threat review using sample personnel records** without source evidence, uncertainty, or a safe transfer task.

34.3 Counterintelligence Against Non-State Actors assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 34; [239, 2026].

34.3.1 Counterintelligence Against Non-State Actors evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 34; [239, 2026].

34.3.2 Counterintelligence Against Non-State Actors transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 34; [239, 2026].

34.3.2.1 Counterintelligence Against Non-State Actors lineage and source tradition: profile, concepts, and first anchors This sits in the **Counterintelligence and Source-Integrity Defense** lineage: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. [239, 2026]; [240, 2026].

34.3.2.2 Counterintelligence Against Non-State Actors working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 34; [239, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**, with provenance and reviewability throughout.

34.3.2.3 Counterintelligence Against Non-State Actors knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [239, 2026]; [240, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

34.3.2.4 Counterintelligence Against Non-State Actors transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 34; [239, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.
- **Evidence contract:** keep the **Counterintelligence and Source-Integrity Defense** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

34.3.2.5 Counterintelligence Against Non-State Actors profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 34; [239, 2026].

The matched profile emphasizes defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. The method stack is threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths; the local topic cluster is **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

34.3.3 Counterintelligence Against Non-State Actors evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 34; [239, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Counterintelligence and Source-Integrity Defense** profile tells reviewers what evidence is strong enough for the module artifact built around **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

34.3.3.1 Counterintelligence Against Non-State Actors guide source spine: inherited keys and local citation roles Primary guide citations: [239, 2026]; [240, 2026]; [241, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [012, 2026]; [033, 2026]; [109, 2026]; [307, 2026]; [305, 2026]; [304, 2026].

34.3.3.2 Counterintelligence Against Non-State Actors verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [239, 2026]; [240, 2026].

Tier	What counts	How it is used
Source guide	[239, 2026]; [240, 2026]; [241, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [012, 2026]; [033, 2026]; [109, 2026]; [307, 2026]; [305, 2026]; [304, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 23's source-canon section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries** and [239, 2026]; [240, 2026], but only directly verified source URLs are encoded as citations.

34.3.3.3 Counterintelligence Against Non-State Actors intelligence practice lens: evidence artifact and safety check Practice lens: **Structured-Judgment Lens** for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**. [239, 2026]; [240, 2026].

Planning question: Which assumptions, alternatives, confidence statements, and source limits must stay visible for review?

Evidence artifact: analytic note with hypotheses, evidence table, confidence, and dissent fields.

Validation rule: separate raw reporting, inference, judgment, and recommendation before synthesis. Applied to **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

Handoff contract: handoff preserves alternatives, uncertainty, caveats, and revision history for downstream modules.

Safety check: avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence.

34.3.3.4 Counterintelligence Against Non-State Actors runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 34; [239, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	23.99	23.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Counterintelligence Against Non-State Actors to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	23.101	23.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Counterintelligence Against Non-State Actors	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Model-card, recoverability, retention, and learner-support evidence package	23.102	23.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Counterintelligence Against Non-State Actors	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-vetting and insider-threat review using sample personnel records	23.1	23.1 source title transformed into safe curriculum treatment; original: CI Against Terrorist and Criminal Intelligence Networks	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Non-state actor indicator review with attribution caution and governance boundaries	23.2	23.2 source title transformed into safe curriculum treatment; original: The Counterintelligence Threat from Non-State Actors	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Source-vetting and insider-threat review using sample personnel records	23.3	23.3 source title transformed into safe curriculum treatment; original: CI in Hybrid Threat Environments	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Source-vetting and insider-threat review using sample personnel records	23.4	23.4 source title transformed into safe curriculum treatment; original: Attribution Problems in Non-State CI Operations	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Source-vetting and insider-threat review using sample personnel records	23.5	23.5 source title transformed into safe curriculum treatment; original: Corporate Counterintelligence and Trade Secret Protection	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

34.3.3.5 Counterintelligence Against Non-State Actors reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 34; [239, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Non-state actor indicator review with attribution caution and governance boundaries	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Attribution Problems in State CI: Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Corporate Counterintelligence and Trade Secret: Source-vetting and insider-threat review using sample personnel records	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

34.3.3.6 Counterintelligence Against Non-State Actors annotated source ledger: real titles and local contribution Each source cited by this **Counterintelligence and Source-Integrity Defense** module is paired below with its real title and a one-line note on what it contributes to **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

Source	Cited work	What it contributes	Status
[239, 2026]	Digital Space and Human Rights	Official OHCHR digital rights portal.	original source-guide

Source	Cited work	What it contributes	Status
[240, 2026]	The Right to Privacy in the Digital Age	The Office of the High Commissioner for Human Rights (OHCHR) hub page on the right to privacy in the digital age. It addresses how data-intensive technologies, particularly artificial intelligence, create risks for privacy, autonomy, and human dignity, and curates international standards, reports, and expert consultations.	verified source-guide
[241, 2026]	Modernised Convention 108	Official Council of Europe Convention 108+ source.	original source-guide
[279, 2026]	Open Contracting Data Standard	The documentation homepage for the Open Contracting Data Standard, version 1.1.5, maintained by the Open Contracting Partnership to support disclosure of government contracting data across the procurement lifecycle. It provides a common data model spanning planning, tender, award, contract, and implementation stages, along with a primer, implementation guidance, technical schemas, and validation tooling.	verified source-guide
[282, 2026]	AI Research: Security and Resilience	A NIST page on AI research focused on security and resilience, framing these as core characteristics of trustworthy AI under the NIST AI Risk Management Framework.	verified source-guide
[284, 2026]	Verifiable Credential Data Integrity 1.0	The W3C Recommendation for Verifiable Credential Data Integrity 1.0, published May 2025, defining mechanisms for ensuring the authenticity and integrity of verifiable credentials using cryptographic proofs. It specifies a process of data transformation, hashing, and proof generation, and a corresponding verification procedure, along with a proof data model containing properties such as type, verification method, purpose, and proof value.	verified source-guide
[289, 2026]	Guidance for Organisations Using the Algorithmic Transparency Recording Standard	This is a GOV.UK guidance page published by the Government Digital Service that instructs public sector organizations on completing the Algorithmic Transparency Recording Standard (ATRS) template and publishing their records to the GOV.UK repository. It applies both to central government bodies required to publish under mandatory policy and to other public sector bodies doing so voluntarily.	verified source-guide
[291, 2026]	Revised 508 Standards and 255 Guidelines	Official documentation from the U.S. Access Board on the Revised 508 Standards and 255 Guidelines for information and communication technology accessibility. It establishes mandatory accessibility requirements for federal agencies and voluntary guidelines for telecommunications manufacturers, covering hardware, software, websites, electronic documents, and support services.	verified source-guide

Source	Cited work	What it contributes	Status
[296, 2026]	Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile	NIST AI 600-1, the Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile, a cross-sectoral companion resource to the NIST AI RMF 1.0 issued pursuant to Executive Order 14110. It identifies risks that are unique to or amplified by generative AI and organizes suggested actions for managing those risks, mapped to the AI RMF functions.	verified source-guide
[012, 2026]	Counterintelligence Activities of Non-State Actors - Grey Dynamics	A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion.	verified source-guide
[033, 2026]	The Counterintelligence Threat from Non-State Actors	How seriously is the U.S. Intelligence Community (IC) considering this challenge to U.S.	original source-guide context; do not use as primary analytic support
[109, 2026]	The 'Grey Zone' and Hybrid Activities	This is a peer-reviewed article in Connections: The Quarterly Journal (Vol. 21, No. 2, Spring 2022) by Peter Dobias and Kyle Christensen examining military competition below the threshold of armed conflict. It analyzes how Russia, China, and Iran operate in the space between peace and war, describing Russia's emphasis on information measures, China's maritime and force approaches, and Iran's anti-access and proxy strategies.	verified source-guide
[307, 2026]	ICS Recommended Practices	Official CISA Industrial Control Systems recommended practices page for defensive ICS/OT safety, resilience, and incident-preparation guidance.	original source-guide
[305, 2026]	DevSecOps	Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support.	original source-guide
[304, 2026]	Secure Software Development Framework (SSDF) Version 1.1: Recommendations for Mitigating the Risk of Software Vulnerabilities	NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences.	verified source-guide

Where this sits. This module's overview is Section 34; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

34.3.4 Counterintelligence Against Non-State Actors governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 34; [239, 2026].

34.3.5 Counterintelligence Against Non-State Actors analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 23's governance-boundary section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Counterintelligence and Source-Integrity Defense** for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**. [239, 2026]; [240, 2026].

Curriculum topic spine: Source-vetting and insider-threat review using sample personnel records, **Non-state actor indicator review with attribution caution and governance boundaries**, **CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records**. **Verified anchor cluster:** [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]; [Agency, 2009]; [Jr., 2007]; [Burkett, 2013].

Conceptual depth: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination.

Method stack: threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths.

Composability contract: identity, access, reporting, corroboration, caveats, and confidence are modeled independently so defensive review can happen without exposure.

Known failure modes: source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage.

Defensive boundary: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks. Applied to **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

Anchor	Why it matters here
[Counterintelligence and Center, 2024]	Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.
[Jr., 2007]	Foundational analytic cognition source for bias, mental models, and structured reasoning. Checked as of 2026-06-06; role: curriculum_anchor.
[Burkett, 2013]	A CIA Studies in Intelligence analyst essay arguing that the traditional MICE recruitment-motivation model (Money, Ideology, Compromise, Ego) is better understood through Cialdini's influence principles reframed as RASCLS (Reciprocation, Authority, Scarcity, Commitment/Consistency, Liking, Social Proof), grounding the historical and conceptual lineage of HUMINT recruitment frameworks. Checked as of 2026-06-08; role: curriculum_anchor.

34.3.5.1 Counterintelligence Against Non-State Actors evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Counterintelligence and Source-Integrity Defense** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [239, 2026]; [240, 2026].

34.3.6 Counterintelligence Against Non-State Actors agentic boundary: assist, approve, block, and record

Evidence anchor. Section 34; [239, 2026].

AGEINT translation is bounded by the **Counterintelligence and Source-Integrity Defense** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

34.3.6.1 Counterintelligence Against Non-State Actors permitted defensive utility: curriculum uses and safe outputs Evidence anchor. Section 34; [239, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

34.3.6.2 Counterintelligence Against Non-State Actors excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [239, 2026]; [240, 2026] and **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

34.3.7 Counterintelligence Against Non-State Actors governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 34; [239, 2026].
Governance is practiced as a gate on the **Counterintelligence and Source-Integrity Defense** lane. Learners use the **Structured-Judgment Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

34.3.7.1 Counterintelligence Against Non-State Actors governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [239, 2026]; [240, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Counterintelligence and Source-Integrity Defense** failure modes and the **Structured-Judgment Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

34.3.7.2 Counterintelligence Against Non-State Actors evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 34; [239, 2026].
Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Structured-Judgment Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

34.3.7.3 Counterintelligence Against Non-State Actors current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**. [239, 2026]; [240, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_ncsc_counterintelligence_strategy` for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**?	The National Counterintelligence Strategy; lane `counterintelligence_source_integrity`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness.
What does the module inherit from `official_odni_eo_12333` for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**?	Executive Order 12333: United States Intelligence Activities; lane `legal_oversight`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection.
What does the module inherit from `official_odni_icd_206` for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**?	Intelligence Community Directive 206: Sourcing Requirements for Disseminated Analytic Products; lane `analytic_tradecraft`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official sourcing directive for traceability, citations, source descriptors, and source summaries.
What does the module inherit from `official_odni_icd_203` for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**?	Intelligence Community Directive 203: Analytic Standards; lane `source_quality_spine`; checked 2026-05-21.	analytic note with hypotheses, evidence table, confidence, and dissent fields; Official ODNI analytic tradecraft standards directive.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 34; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

34.3.8 Counterintelligence Against Non-State Actors assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 34; [239, 2026].

34.3.9 Counterintelligence Against Non-State Actors assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 34; [239, 2026].

34.3.9.1 Counterintelligence Against Non-State Actors capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.
Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries** and [239, 2026]; [240, 2026].

34.3.9.2 Counterintelligence Against Non-State Actors instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries** and [239, 2026]; [240, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

34.3.9.3 Counterintelligence Against Non-State Actors assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Source-vetting and insider-threat review using sample personnel records	Completed **analytic note with hypotheses, evidence table, confidence, and dissent fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Non-state actor indicator review with attribution caution and governance boundaries	Completed **analytic note with hypotheses, evidence table, confidence, and dissent fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
CI in Hybrid Threat Environments: Source-vetting and insider-threat review using sample personnel records	Completed **analytic note with hypotheses, evidence table, confidence, and dissent fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

34.3.10 Counterintelligence Against Non-State Actors refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [239, 2026]; [240, 2026] and **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**.

34.3.10.1 Counterintelligence Against Non-State Actors refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**. The local signals begin with [239, 2026]; [240, 2026].

34.3.10.2 Counterintelligence Against Non-State Actors claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**, and the source spine for these checks begins with [239, 2026]; [240, 2026].

34.3.11 Counterintelligence Against Non-State Actors reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [239, 2026]; [240, 2026].
Triangulation anchors. In module 23's review-checklist section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries**. [239, 2026]; [240, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.

- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

34.3.12 Counterintelligence Against Non-State Actors learning-path links: module map, overview, and curriculum atlas

Read this module in sequence with the curriculum orientation, its parent unit, and the adjacent modules so the evidence behind **Source-vetting and insider-threat review using sample personnel records; Non-state actor indicator review with attribution caution and governance boundaries** carries forward intact. Source anchors for this module begin at [239, 2026]; [240, 2026].

Section 2, Section 32, Section 33, Section 35

35 GRAY ZONE, HYBRID WARFARE, AND NON-STATE ACTORS

35.1 GRAY ZONE, HYBRID WARFARE, AND NON-STATE ACTORS learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 35; [239, 2026].

35.1.1 hybrid-threat governance discipline spine: domain question and learning focus

Evidence anchor. Section 35; [239, 2026].
This unit teaches **hybrid-threat governance**. Gray-zone lessons analyze ambiguous coercion, proxy relationships, resilience choices, and policy thresholds without operationalizing response.

35.1.2 hybrid-threat governance source-use contract: citation roles and evidence limits

Evidence anchor. Section 35; [239, 2026].
Use official and alliance anchors for threshold language, information threats, and resilience governance.

35.1.3 hybrid-threat governance practice artifact: recurring packet and retained evidence

Evidence anchor. Section 35; [239, 2026].
The recurring practice artifact is a **ambiguous-threshold indicator matrix** that draws on threshold indicator, attribution caveat, proxy-pattern note, and policy review field. The unit keeps its learning spine explicit. Learners distinguish observable indicators from sponsorship claims and state the review needed before action.

35.1.4 hybrid-threat governance safety boundary: accountable, synthetic, and evidence-bounded limits

No live targeting, covert action, retaliation planning, or attribution certainty beyond evidence.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [239, 2026]; [247, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [239, 2026]; [247, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [239, 2026]; [247, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [239, 2026]; [247, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Counterintelligence and Source-Integrity Defense. Core anchors: [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]. Conceptual focus: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. Composability contract: identity, access, reporting, corroboration, caveats, and confidence are modeled independently so defensive review can happen without exposure. **Practice lens:** Dissemination-and-Marking Control Lens; Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact? [239, 2026]; [247, 2026].

35.1.5 GRAY ZONE, HYBRID WARFARE, AND NON-STATE ACTORS visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 74 and Figure 75 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 34, Section 36.

35.1.6 GRAY ZONE, HYBRID WARFARE, AND NON-STATE ACTORS module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
Gray Zone Warfare	Section 36	[239, 2026]; [247, 2026]; [249, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [109, 2026]; [110, 2026]; [111, 2026]; [308, 2026]; [311, 2026].
Non-State Actor Intelligence	Section 37	[238, 2026]; [247, 2026]; [249, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [012, 2026]; [033, 2026]; [308, 2026]; [311, 2026]; [309, 2026]; [310, 2026]; [300, 2026].

Module	Section reference	Source spine
Irregular Warfare and Special Operations	Section 38	[239, 2026]; [249, 2026]; [266, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [112, 2026]; [113, 2026]; [114, 2026]; [115, 2026]; [116, 2026]; [117, 2026]; [118, 2026]; [119, 2026]; [120, 2026]; [308, 2026]; [311, 2026].

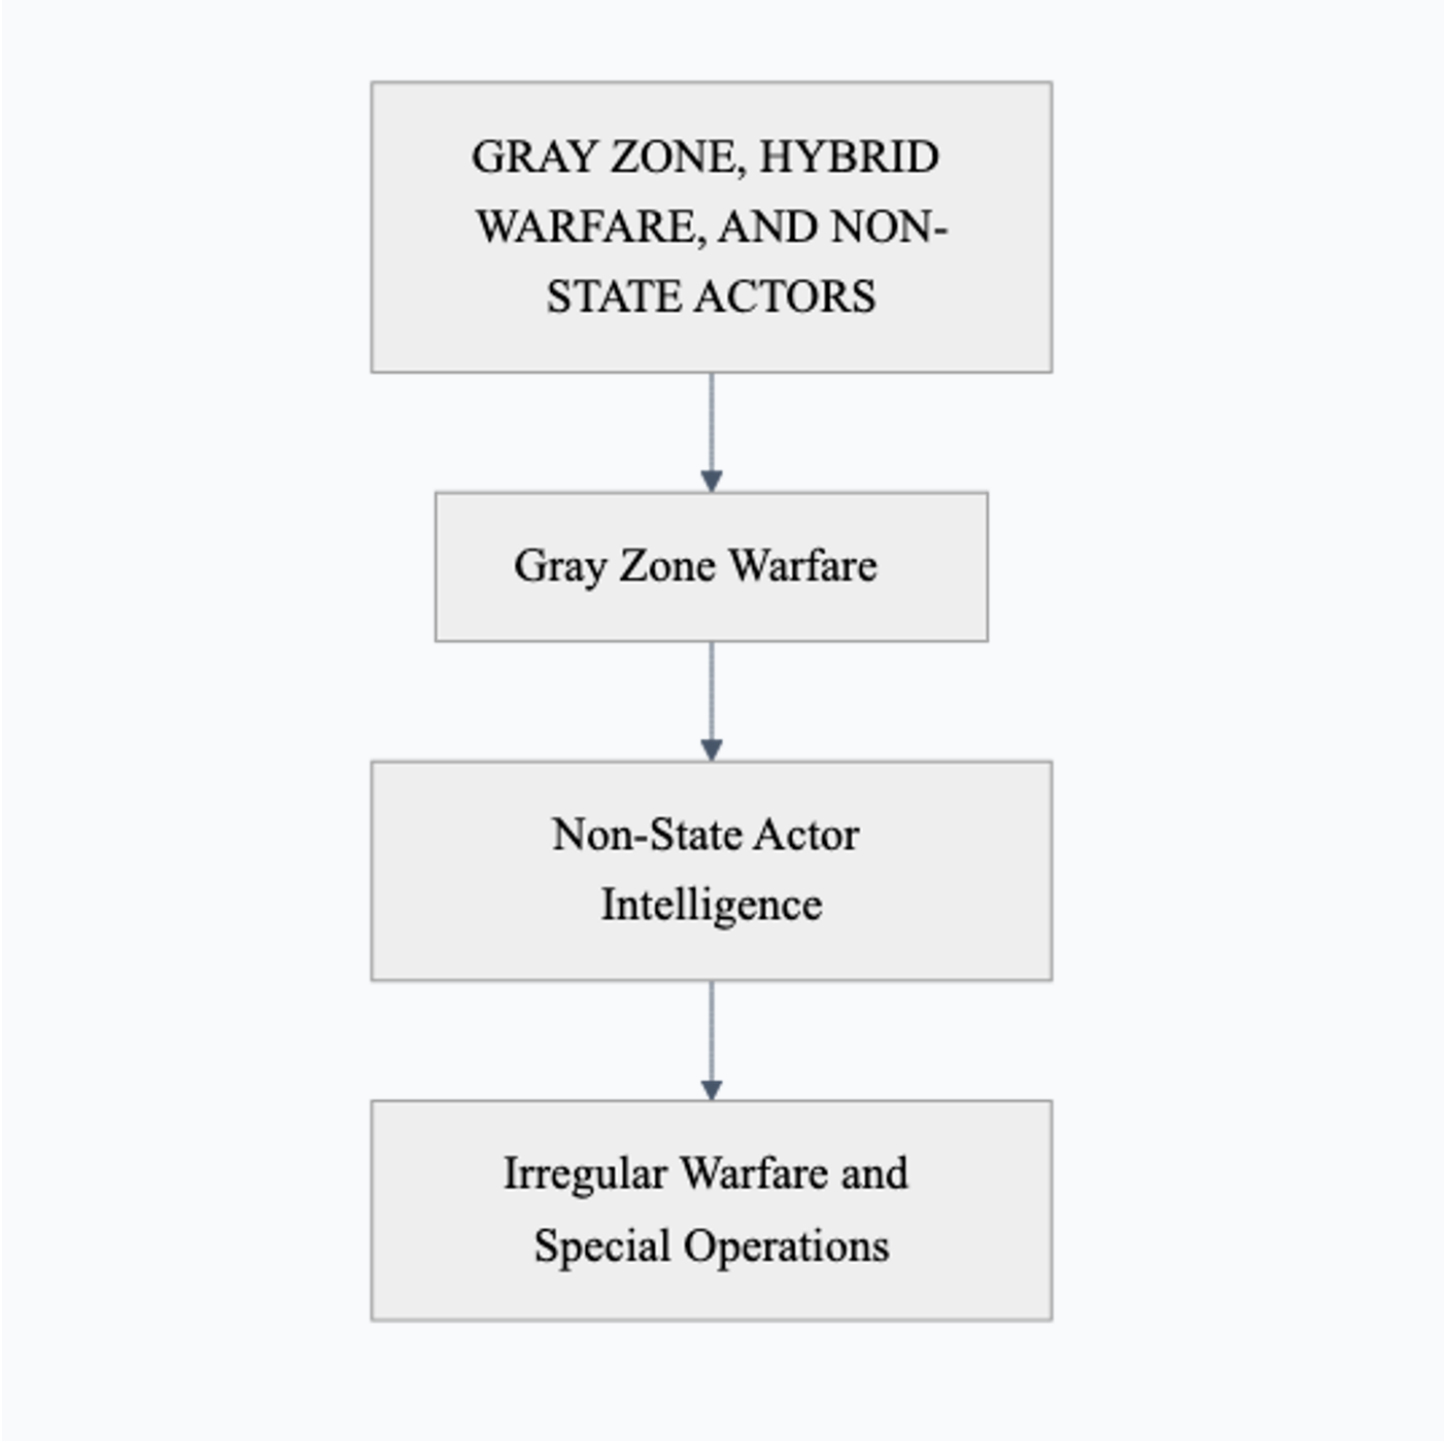

Figure 74: The unit module map traces the part's chapters as a linear reading sequence. In the gray zone hybrid warfare and non state actors section, it lets readers compare 3 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last so the visual functions as a traceable course aid rather than an unscoped assertion.

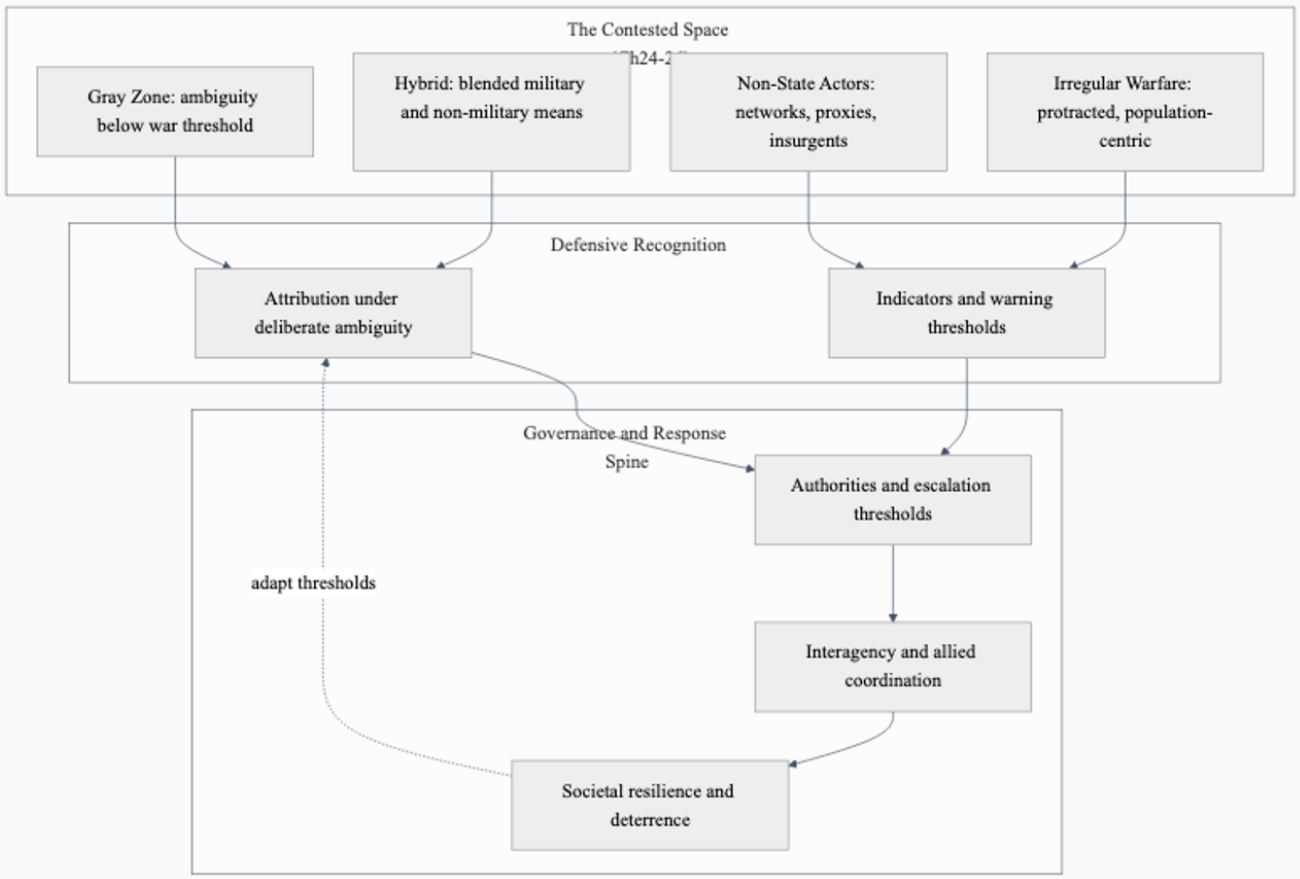

Figure 75: This part traces how the contested space below the threshold of war is recognized, attributed, and met through a defensive governance spine that ties authorities, coordination, and societal resilience back into sharper detection. The captioned view belongs to the gray zone hybrid warfare and non state actors section and should be read as a map of The Contested Space (Ch24-26), Gray Zone: ambiguity below war threshold, Hybrid: blended military and non-military means, and Non-State Actors: networks, proxies, insurgents, not as a capability score or live-task instruction.

36 Gray Zone Warfare

36.0.1 Gray Zone Warfare figures and course links: visual evidence, source flow, and navigation

The module uses Figure 76 and Figure 74 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 35, Section 37.
This module teaches the **Counterintelligence and Source-Integrity Defense** lane through a bounded, source-backed coursebook chapter. [239, 2026]; [247, 2026].

36.1 Counterintelligence and Source-Integrity Defense frame for Gray Zone Warfare: source context, topic focus, and reader task

Evidence anchor. Section 36; [239, 2026].

36.1.1 Gray Zone Warfare orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 36; [239, 2026].

36.1.2 Gray Zone Warfare conceptual primer: source context, core model, and reader task

This chapter teaches counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The chapter uses **Dissemination-and-Marking Control Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.
The central distinction is to separate defensive awareness from surveillance, handling, or operational security playbooks. Core topics include **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds; Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [239, 2026]; [247, 2026].
Learners move from vocabulary and the **Dissemination-and-Marking Control Lens** distinction through topic lessons on **Hybrid-threat indicator review using sample scenarios and policy thresholds** with evidence and misconception checks, then assemble a **dissemination map with audience, caveat, marking, records, and feedback fields** with safety and rights gates.

36.1.3 Gray Zone Warfare learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 36; [239, 2026].

- Connect **Hybrid-threat indicator review using sample scenarios and policy thresholds and Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds** to **Counterintelligence and Source-Integrity Defense** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **dissemination map with audience, caveat, marking, records, and feedback fields** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks.

36.1.4 Gray Zone Warfare core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 36; [239, 2026].

Term	Working definition
Source integrity	confidence that evidence has not been distorted, laundered, or compromised
Compromise signal	a clue that access, identity, or source reliability needs review
Corroboration	independent support that reduces single-source vulnerability
Insider risk	risk created by trusted access combined with motive, pressure, or control failure
Protected disclosure	a safe channel for reporting concerns without exposing sensitive details
Hybrid-threat indicator review using sample…	Key terms: Hybrid, threat, indicator.
Gray Zone Tactics: Hybrid-threat indicator…	Key terms: Gray, Zone, Tactics.

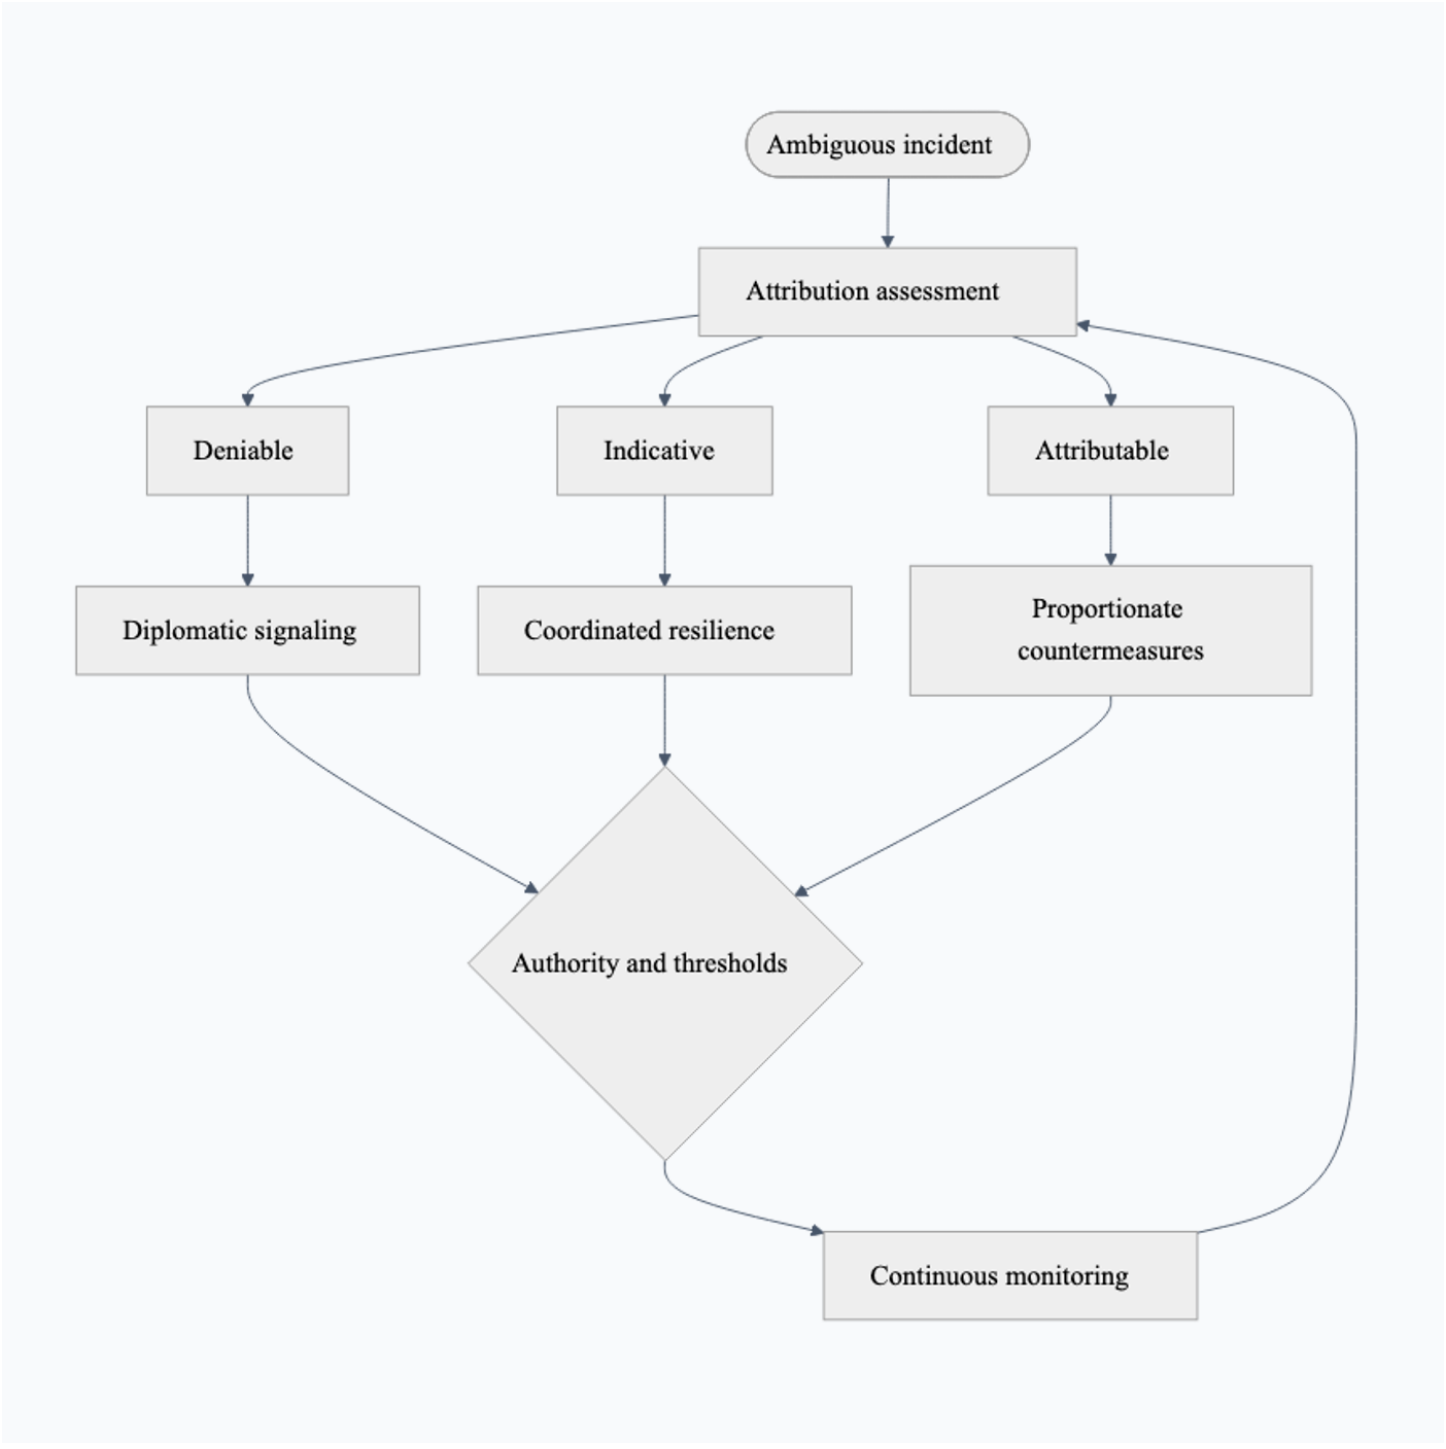

Figure 76: How ambiguous gray-zone activity is mapped onto rising attribution-confidence and response thresholds so that defensive options stay proportionate and governed. The captioned view belongs to the gray zone hybrid warfare and non state actors / gray zone warfare section and should be read as a map of Ambiguous incident, Attribution assessment, Deniable, and Indicative, not as a capability score or live-task instruction.

36.2 Dissemination-and-Marking Control Lens path for Gray Zone Warfare: lesson cluster, safe artifact, and review

Evidence anchor. Section 36; [239, 2026].

36.2.1 Gray Zone Warfare practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 36; [239, 2026].

36.2.2 Gray Zone Warfare topic lessons: source-backed concepts and transfer tasks

This module builds counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The sequence opens with **Hybrid-threat indicator review using sample scenarios and policy thresholds**, **Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**, **Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds** and applies the **Dissemination-and-Marking Control Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 74; module overview Section 36; curriculum atlas Section 2.

Triangulation anchors. In module 24's topic-lessons section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

36.2.2.1 Lesson 1: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Hybrid-threat indicator review using sample scenarios and policy thresholds identifies hybrid indicators—proxy activity, ambiguous attribution, sub-threshold pressure—without prescribing response actions.

Why it matters. Hybrid-threat indicator review matters in the **Counterintelligence and Source-Integrity Defense** lane because deception-aware source review and defensive escalation evidence must stay separate from judgment; source compromise is a common failure.

Source support. Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [109, 2026] and [110, 2026]. The lead source's own note reads: This is a peer-reviewed article in Connections: The Quarterly Journal (Vol. Use them for pinning down the scope of **Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Read **Hybrid-threat indicator review** against the works cited for this row. [109, 2026] This is a peer-reviewed article in Connections: The Quarterly Journal (Vol. 21, No. 2, Spring 2022) by Peter Dobias and Kyle Christensen examining military competition below the threshold of armed conflict. It analyzes how Russia, China, and Iran operate in the space between peace and war, describing Russia's emphasis on information measures, China's maritime and force approaches, and Iran's anti-access and proxy strategies. [110, 2026] An article by Dr. Robert S. Burrell on the Irregular Warfare Initiative arguing that U.S. military doctrine inadequately addresses gray zone and hybrid warfare. It proposes a two-dimensional framework spanning peace-to-war and direct-to-indirect means, yielding four approaches: traditional warfare, deterrence, irregular warfare, and competition. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Hybrid-threat indicator review**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Hybrid-threat indicator review using sample**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Hybrid-threat indicator review** work as an **ambiguous-threshold indicator matrix** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Hybrid-threat indicator review**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Transfer **Hybrid-threat indicator review** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

36.2.2.2 Lesson 2: Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds identifies hybrid indicators—proxy activity, ambiguous attribution, sub-threshold pressure—without prescribing response actions.

Why it matters. Analysts use **Gray Zone Tactics** to separate defensive awareness from surveillance, handling, or operational security playbooks. A defensible treatment names the judgment it enables for deception-aware source review and defensive escalation review, the proof limit that source compromise would otherwise hide, and the reviewer accountable for challenge.

Source support. Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [111, 2026]. The most specific cited work observes: The piece is framed around adapting intelligence practice to contemporary competition short of war. Use it for pinning down the scope of **Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Ground **Gray Zone Tactics** in the evidence the row cites. [111, 2026] An article in the U.S. Army's Military Intelligence Professional Bulletin on countering gray zone threats. It discusses how adversaries operate below the threshold of open conflict using hybrid activities across tactical, operational, and strategic levels, and considers how military intelligence can identify and attribute actors who attempt to remain anonymous. The piece is framed around adapting intelligence practice to contemporary competition short of war. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Gray Zone Tactics**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Gray Zone Tactics**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Gray Zone Tactics** work as an **ambiguous-threshold indicator matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Gray Zone Tactics**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Reuse the **Gray Zone Tactics** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

36.2.2.3 Lesson 3: Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds identifies hybrid indicators—proxy activity, ambiguous attribution, sub-threshold pressure—without prescribing response actions.

Why it matters. Analysts use **Chinese Gray Zone** to separate defensive awareness from surveillance, handling, or operational security playbooks. A defensible treatment names the judgment it enables for deception-aware source review and defensive escalation review, the proof limit that source compromise would otherwise hide, and the reviewer accountable for challenge.

Source support. Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [308, 2026] and [311, 2026]. The closest source to this row notes: An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. Use them for pinning down the scope of **Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Ground **Chinese Gray Zone** in the evidence the row cites. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Chinese Gray Zone**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Chinese Gray Zone**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Chinese Gray Zone** work as an **ambiguous-threshold indicator matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Chinese Gray Zone**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Reuse the **Chinese Gray Zone** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

36.2.2.4 Lesson 4: Russian Hybrid Warfare: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Russian Hybrid Warfare: Hybrid-threat indicator review using sample scenarios and policy thresholds identifies hybrid indicators—proxy activity, ambiguous attribution, sub-threshold pressure—without prescribing response actions.

Why it matters. Without explicit treatment of **Russian Hybrid Warfare**, source compromise undermines deception-aware source review and defensive escalation review; the lesson builds the habit to separate defensive awareness from surveillance, handling, or operational security playbooks.

Source support. Russian Hybrid Warfare: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [111, 2026]. Its anchor reference records: The piece is framed around adapting intelligence practice to contemporary competition short of war. Use it for the working definition that **Russian Hybrid Warfare: Hybrid-threat indicator review using sample scenarios and policy thresholds** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Ground **Russian Hybrid Warfare** in the evidence the row cites. [111, 2026] An article in the U.S. Army's Military Intelligence Professional Bulletin on countering gray zone threats. It discusses how adversaries operate below the threshold of open conflict using hybrid activities across tactical, operational, and strategic levels, and considers how military intelligence can identify and attribute actors who attempt to remain anonymous. The piece is framed around adapting intelligence practice to contemporary competition short of war. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Russian Hybrid Warfare**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Russian Hybrid Warfare**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Russian Hybrid Warfare** work as an **ambiguous-threshold indicator matrix** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Russian Hybrid Warfare**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Transfer **Russian Hybrid Warfare** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

36.2.2.5 Lesson 5: Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds identifies hybrid indicators—proxy activity, ambiguous attribution, sub-threshold pressure—without prescribing response actions.

Why it matters. Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [111, 2026]. The lead source's own note reads: Army's Military Intelligence Professional Bulletin on countering gray zone threats. Use it for the working definition that **Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds**, reason from the sources cited in this row. [111, 2026] An article in the U.S. Army's Military Intelligence Professional Bulletin on countering gray zone threats. It discusses how adversaries operate below the threshold of open conflict using hybrid activities across tactical, operational, and strategic levels, and considers how military intelligence can identify and attribute actors who attempt to remain anonymous. The piece is framed around adapting intelligence practice to contemporary competition short of war. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Anonymous**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Anonymous**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds** work as an **ambiguous-threshold indicator matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Reuse the **Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

36.2.2.6 Lesson 6: Full Spectrum Conflict Design: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Full Spectrum Conflict Design: Hybrid-threat indicator review using sample scenarios and policy thresholds identifies ambiguous-threshold activity through indicators, attribution caution, and policy review—not through prescribed response actions.

Why it matters. Analysts use **Full Spectrum Conflict Design** to separate defensive awareness from surveillance, handling, or operational security playbooks. A defensible treatment names the judgment it enables for deception-aware source review and defensive escalation review, the proof limit that source compromise would otherwise hide, and the reviewer accountable for challenge.

Source support. Full Spectrum Conflict Design: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [110, 2026]. The most specific cited work observes: Burrell on the Irregular Warfare Initiative arguing that U.S. Use it for fixing what **Full Spectrum Conflict Design: Hybrid-threat indicator review using sample scenarios and policy thresholds** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Read **Full Spectrum Conflict Design** against the works cited for this row. [110, 2026] An article by Dr. Robert S. Burrell on the Irregular Warfare Initiative arguing that U.S. military doctrine inadequately addresses gray zone and hybrid warfare. It proposes a two-dimensional framework spanning peace-to-war and direct-to-indirect means, yielding four approaches: traditional warfare, deterrence, irregular warfare, and competition. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Full Spectrum Conflict Design**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Full Spectrum Conflict Design**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Full Spectrum Conflict Design** work as an **ambiguous-threshold indicator matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Full Spectrum Conflict Design**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Transfer **Full Spectrum Conflict Design** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

36.2.3 Gray Zone Warfare worked safe example: synthetic inputs, evidence, and review

Worked example: a sample research lab reviews a synthetic source-quality anomaly after a disputed report. [239, 2026]; [247, 2026].

Triangulation anchors. In module 24's worked-example section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **hybrid-threat governance**. Learners use a **ambiguous-threshold indicator matrix** and keep this boundary visible: No live targeting, covert action, retaliation planning, or attribution certainty beyond evidence.

Frame. The classroom question centers on **Hybrid-threat indicator review using sample scenarios and policy thresholds**. Excluded actions stay explicit, and the **Dissemination-and-Marking Control Lens** planning question is: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Inputs. For the **Hybrid-threat indicator review using sample scenarios and policy thresholds** scenario, use toy access logs, public policy excerpts, synthetic source notes, and a reviewer escalation path. The Dissemination-and-Marking Control Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Hybrid-threat indicator review using sample scenarios and policy thresholds**, students separate identity from access, list anomaly hypotheses, seek corroboration, and route sensitive concerns to review. Pause whenever an inference about Hybrid-threat indicator review using sample scenarios and policy thresholds appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Hybrid-threat indicator review using sample scenarios and policy thresholds** classroom scenario; unit artifact = ambiguous-threshold indicator matrix; evidence = allowed inputs; method = deception-aware source review and defensive escalation; output = a source-integrity memo with competing explanations, confidence, protected-disclosure note, and next-review owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Hybrid-threat indicator review using sample scenarios and policy thresholds** as "Dissemination-and-Marking Control Lens confirms it" is not enough. The revision ties the claim to deception-aware source review and defensive escalation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Hybrid-threat indicator review using sample scenarios and policy thresholds** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

36.2.4 Gray Zone Warfare practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Dissemination-and-Marking Control Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Triangulation anchors. In module 24's practice-sequence section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Hybrid-threat indicator review using sample scenarios and policy thresholds, Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds, Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Counterintelligence and Source-Integrity Defense** lane.
2. Frame	Answer the lens question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.

Move	Learner action	Output	Check
3. Evidence	Fill the artifact fields for Hybrid-threat indicator review using sample scenarios and policy thresholds: dissemination map with audience, caveat, marking, records, and feedback fields.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the ambiguous-threshold indicator matrix fields for Hybrid-threat indicator review using sample scenarios and policy thresholds.	Unit profile note.	Evidence artifacts include threshold indicator, attribution caveat.
4. Challenge	Test the misconception that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.	Failure-mode note.	The artifact applies the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

36.2.4.1 Gray Zone Warfare instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [247, 2026].

36.2.4.2 Gray Zone Warfare extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 36; [239, 2026]. Have learners swap artifacts and apply the **Dissemination-and-Marking Control Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

36.2.5 Gray Zone Warfare knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 36; [239, 2026].

1. Explain how **Hybrid-threat indicator review using sample scenarios and policy thresholds** is defined here; name the source descriptor that supports the definition.
2. Contrast **Hybrid-threat indicator review using sample scenarios and policy thresholds** with **Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds** using the **Dissemination-and-Marking Control Lens** artifact fields.
3. Identify one failure mode from the **Counterintelligence and Source-Integrity Defense** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which explanation preserves uncertainty without ignoring a possible compromise signal?
5. Correct this misconception: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

36.2.5.1 Gray Zone Warfare answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Hybrid-threat indicator review using sample scenarios and policy thresholds** without source evidence, uncertainty, or a safe transfer task.

36.3 Gray Zone Warfare assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 36; [239, 2026].

36.3.1 Gray Zone Warfare evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 36; [239, 2026].

36.3.2 Gray Zone Warfare transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 36; [239, 2026].

36.3.2.1 Gray Zone Warfare lineage and source tradition: profile, concepts, and first anchors This sits in the **Counterintelligence and Source-Integrity Defense** lineage: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. [239, 2026]; [247, 2026].

36.3.2.2 Gray Zone Warfare working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 36; [239, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**, with provenance and reviewability throughout.

36.3.2.3 Gray Zone Warfare knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [239, 2026]; [247, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

36.3.2.4 Gray Zone Warfare transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 36; [239, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.
- **Evidence contract:** keep the **Counterintelligence and Source-Integrity Defense** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

36.3.2.5 Gray Zone Warfare profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 36; [239, 2026].

The matched profile emphasizes defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. The method stack is threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths; the local topic cluster is **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

36.3.3 Gray Zone Warfare evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 36; [239, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Counterintelligence and Source-Integrity Defense** profile tells reviewers what evidence is strong enough for the module artifact built around **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

36.3.3.1 Gray Zone Warfare guide source spine: inherited keys and local citation roles Primary guide citations: [239, 2026]; [247, 2026]; [249, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [109, 2026]; [110, 2026]; [111, 2026]; [308, 2026]; [311, 2026].

36.3.3.2 Gray Zone Warfare verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [239, 2026]; [247, 2026].

Tier	What counts	How it is used
Source guide	[239, 2026]; [247, 2026]; [249, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [109, 2026]; [110, 2026]; [111, 2026]; [308, 2026]; [311, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 24's source-canon section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds** and [239, 2026]; [247, 2026], but only directly verified source URLs are encoded as citations.

36.3.3.3 Gray Zone Warfare intelligence practice lens: evidence artifact and safety check Practice lens: **Dissemination-and-Marking Control Lens** for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [247, 2026].

Planning question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Evidence artifact: dissemination map with audience, caveat, marking, records, and feedback fields.

Validation rule: verify source authority, public/classification status, CAPCO-safe vocabulary, audience need, and records disposition before reuse. Applied to **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Handoff contract: deliver release-neutral summaries, source metadata, marking rationale, and review ownership as separate fields.

Safety check: exclude classified content, live release decisions, source-method exposure, and improvised control markings.

36.3.3.4 Gray Zone Warfare runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 36; [239, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	24.99	24.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Gray Zone Warfare to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	24.101	24.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Gray Zone Warfare	Cyber-Physical Readiness Lens	tabletop packet with OT asset inventory, architecture record, consequences, injects, and debrief rubric	keep exercises lab-only or tabletop; exclude exploitation, process manipulation, unsafe actuation, and live-control actions
Model-card, recoverability, retention, and learner-support evidence package	24.102	24.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Gray Zone Warfare	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	24.1	24.1 source title transformed into safe curriculum treatment; original: Defining the Gray Zone: Between Peace and War	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Hybrid-threat indicator review using sample scenarios and policy thresholds	24.2	24.2 source title transformed into safe curriculum treatment; original: Gray Zone Tactics: Competition, Crisis, and Conflict	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	24.3	24.3 source title transformed into safe curriculum treatment; original: Chinese Gray Zone: South China Sea and Taiwan Straits	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	24.4	24.4 source title transformed into safe curriculum treatment; original: Russian Hybrid Warfare: Ukraine, Baltic States, Information Domain	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	24.5	24.5 source title transformed into safe curriculum treatment; original: Anonymous No More: Countering Gray Zone Threats (MIPB 2025)	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	24.6	24.6 source title transformed into safe curriculum treatment; original: Full Spectrum Conflict Design (IWI 2025)	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

36.3.3.5 Gray Zone Warfare reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 36; [239, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Russian Hybrid Warfare: Hybrid-threat indicator review using sample scenarios and policy thresholds	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Anonymous: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Full Spectrum Conflict Design: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

36.3.3.6 Gray Zone Warfare annotated source ledger: real titles and local contribution Each source cited by this **Counterintelligence and Source-Integrity Defense** module is paired below with its real title and a one-line note on what it contributes to **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Source	Cited work	What it contributes	Status
[239, 2026]	Digital Space and Human Rights	Official OHCHR digital rights portal.	original source-guide
[247, 2026]	AI in the Public Sector	Official OECD.AI public-sector AI theme page.	original source-guide

Source	Cited work	What it contributes	Status
[249, 2026]	GovTech: Putting People First	The official page for the World Bank's Global Program on GovTech and Public Sector Innovation, which helps governments use technology and data to improve public services and governance. It describes support for digital transformation in public administration across areas such as tax administration, public financial management, human resource systems, and citizen engagement, with cross-cutting themes including responsible AI and green digital transformation.	verified source-guide
[275, 2026]	Fact Sheet: New Rule on the Accessibility of Web Content and Mobile Apps Provided by State and Local Governments	A US Department of Justice fact sheet explaining the 2024 ADA Title II rule requiring state and local governments to make their web content and mobile apps accessible. It establishes WCAG 2.1 Level AA as the technical standard, applies to entities such as schools, courts, libraries, and transit agencies, and sets compliance deadlines of April 2027 for larger jurisdictions and April 2028 for smaller ones.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[283, 2026]	Recommendation of the Council on Open Government	An OECD legal instrument document reproducing the Recommendation of the Council on Open Government (OECD/LEGAL/0438), adopted on 14 December 2017. It defines open government as a culture of governance promoting transparency, integrity, accountability, and stakeholder participation in support of democracy and inclusive growth.	verified source-guide
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide

Source	Cited work	What it contributes	Status
[293, 2026]	Inventory of NARA Artificial Intelligence (AI) Use Cases	The National Archives and Records Administration (NARA) official inventory of its artificial intelligence use cases, documenting 14 projects across deployed, pilot, and planned stages. Deployed efforts include workplace productivity tools, automated tagging for museum experiences, and historical record retrieval, while pilots cover PII detection and redaction, semantic search, and metadata generation, and planned work targets FOIA processing and public search.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[109, 2026]	The 'Grey Zone' and Hybrid Activities	This is a peer-reviewed article in Connections: The Quarterly Journal (Vol. 21, No. 2, Spring 2022) by Peter Dobias and Kyle Christensen examining military competition below the threshold of armed conflict. It analyzes how Russia, China, and Iran operate in the space between peace and war, describing Russia's emphasis on information measures, China's maritime and force approaches, and Iran's anti-access and proxy strategies.	verified source-guide
[110, 2026]	A Full Spectrum of Conflict Design: How Doctrine Should Embrace	An article by Dr. Robert S. Burrell on the Irregular Warfare Initiative arguing that U.S. military doctrine inadequately addresses gray zone and hybrid warfare. It proposes a two-dimensional framework spanning peace-to-war and direct-to-indirect means, yielding four approaches: traditional warfare, deterrence, irregular warfare, and competition.	verified source-guide
[111, 2026]	Anonymous No More: Countering the Gray Zone Threat - from MIPB	An article in the U.S. Army's Military Intelligence Professional Bulletin on countering gray zone threats. It discusses how adversaries operate below the threshold of open conflict using hybrid activities across tactical, operational, and strategic levels, and considers how military intelligence can identify and attribute actors who attempt to remain anonymous. The piece is framed around adapting intelligence practice to contemporary competition short of war.	verified source-guide
[308, 2026]	Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure	An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure.	verified source-guide

Source	Cited work	What it contributes	Status
[311, 2026]	Countering Information Threats	An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering.	verified source-guide

Where this sits. This module's overview is Section 36; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

36.3.4 Gray Zone Warfare governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 36; [239, 2026].

36.3.5 Gray Zone Warfare analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 24's governance-boundary section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Counterintelligence and Source-Integrity Defense** for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [247, 2026].

Curriculum topic spine: Hybrid-threat indicator review using sample scenarios and policy thresholds, **Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**, **Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds**. **Verified anchor cluster:** [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]; [Agency, 2009]; [Jr., 2007]; [Burkett, 2013].

Conceptual depth: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination.

Method stack: threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths.

Composability contract: identity, access, reporting, corroboration, caveats, and confidence are modeled independently so defensive review can happen without exposure.

Known failure modes: source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage.

Defensive boundary: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks. Applied to **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Anchor	Why it matters here
[Counterintelligence and Center, 2024]	Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.
[Jr., 2007]	Foundational analytic cognition source for bias, mental models, and structured reasoning. Checked as of 2026-06-06; role: curriculum_anchor.
[Burkett, 2013]	A CIA Studies in Intelligence analyst essay arguing that the traditional MICE recruitment-motivation model (Money, Ideology, Compromise, Ego) is better understood through Cialdini's influence principles reframed as RASCLS (Reciprocation, Authority, Scarcity, Commitment/Consistency, Liking, Social Proof), grounding the historical and conceptual lineage of HUMINT recruitment frameworks. Checked as of 2026-06-08; role: curriculum_anchor.

36.3.5.1 Gray Zone Warfare evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Counterintelligence and Source-Integrity Defense** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [239, 2026]; [247, 2026].

36.3.6 Gray Zone Warfare agentic boundary: assist, approve, block, and record

Evidence anchor. Section 36; [239, 2026].

AGEINT translation is bounded by the **Counterintelligence and Source-Integrity Defense** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

36.3.6.1 Gray Zone Warfare permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 36; [239, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

36.3.6.2 Gray Zone Warfare excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [239, 2026]; [247, 2026] and **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

36.3.7 Gray Zone Warfare governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 36; [239, 2026].
Governance is practiced as a gate on the **Counterintelligence and Source-Integrity Defense** lane. Learners use the **Dissemination-and-Marking Control Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

36.3.7.1 Gray Zone Warfare governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [239, 2026]; [247, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Counterintelligence and Source-Integrity Defense** failure modes and the **Dissemination-and-Marking Control Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

36.3.7.2 Gray Zone Warfare evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 36; [239, 2026].
Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Dissemination-and-Marking Control Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

36.3.7.3 Gray Zone Warfare current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [247, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_ncsc_counterintelligence_strategy` for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**?	The National Counterintelligence Strategy; lane `counterintelligence_source_integrity`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness.
What does the module inherit from `official_odni_eo_12333` for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Executive Order 12333: United States Intelligence Activities; lane `legal_oversight`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection.
What does the module inherit from `official_odni_icd_206` for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Intelligence Community Directive 206: Sourcing Requirements for Disseminated Analytic Products; lane `analytic_tradecraft`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official sourcing directive for traceability, citations, source descriptors, and source summaries.
What does the module inherit from `official_odni_icd_203` for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Intelligence Community Directive 203: Analytic Standards; lane `source_quality_spine`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official ODNI analytic tradecraft standards directive.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 36; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

36.3.8 Gray Zone Warfare assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 36; [239, 2026].

36.3.9 Gray Zone Warfare assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 36; [239, 2026].

36.3.9.1 Gray Zone Warfare capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds** and [239, 2026]; [247, 2026].

36.3.9.2 Gray Zone Warfare instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds** and [239, 2026]; [247, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

36.3.9.3 Gray Zone Warfare assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Hybrid-threat indicator review using sample scenarios and policy thresholds	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Chinese Gray Zone: Hybrid-threat indicator review using sample scenarios and policy thresholds	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

36.3.10 Gray Zone Warfare refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [239, 2026]; [247, 2026] and **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

36.3.10.1 Gray Zone Warfare refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**. The local signals begin with [239, 2026]; [247, 2026].

36.3.10.2 Gray Zone Warfare claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**, and the source spine for these checks begins with [239, 2026]; [247, 2026].

36.3.11 Gray Zone Warfare reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [239, 2026]; [247, 2026].

Triangulation anchors. In module 24's review-checklist section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [247, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.

- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

36.3.12 Gray Zone Warfare learning-path links: module map, overview, and curriculum atlas

These links keep **Hybrid-threat indicator review using sample scenarios and policy thresholds; Gray Zone Tactics: Hybrid-threat indicator review using sample scenarios and policy thresholds** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [239, 2026]; [247, 2026].
Section 2, Section 35, Section 37

37 Non-State Actor Intelligence

37.0.1 Non-State Actor Intelligence figures and course links: visual evidence, source flow, and navigation

The module uses Figure 77 and Figure 74 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 35, Section 36, Section 38.
This module teaches the **Counterintelligence and Source-Integrity Defense** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [247, 2026].

37.1 Counterintelligence and Source-Integrity Defense frame for Non-State Actor Intelligence: source context, topic focus, and reader task

Evidence anchor. Section 37; [238, 2026].

37.1.1 Non-State Actor Intelligence orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 37; [238, 2026].

37.1.2 Non-State Actor Intelligence conceptual primer: source context, core model, and reader task

This chapter teaches counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The chapter uses **Dissemination-and-Marking Control Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.
The central distinction is to separate defensive awareness from surveillance, handling, or operational security playbooks. Core topics include **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds; Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [247, 2026].
Learners move from vocabulary and the **Dissemination-and-Marking Control Lens** distinction through topic lessons on **Financial due-diligence typology exercise using synthetic records and compliance boundaries** with evidence and misconception checks, then assemble a **dissemination map with audience, caveat, marking, records, and feedback fields** with safety and rights gates.

37.1.3 Non-State Actor Intelligence learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 37; [238, 2026].

- Connect **Financial due-diligence typology exercise using synthetic records and compliance boundaries and Hybrid-threat indicator review using sample scenarios and policy thresholds** to **Counterintelligence and Source-Integrity Defense** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **dissemination map with audience, caveat, marking, records, and feedback fields** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks.

37.1.4 Non-State Actor Intelligence core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 37; [238, 2026].

Term	Working definition
Source integrity	confidence that evidence has not been distorted, laundered, or compromised
Compromise signal	a clue that access, identity, or source reliability needs review
Corroboration	independent support that reduces single-source vulnerability
Insider risk	risk created by trusted access combined with motive, pressure, or control failure
Protected disclosure	a safe channel for reporting concerns without exposing sensitive details
Financial due-diligence typology exercise using…	Key terms: Financial, due, diligence.
Hybrid-threat indicator review using sample…	Key terms: Hybrid, threat, indicator.

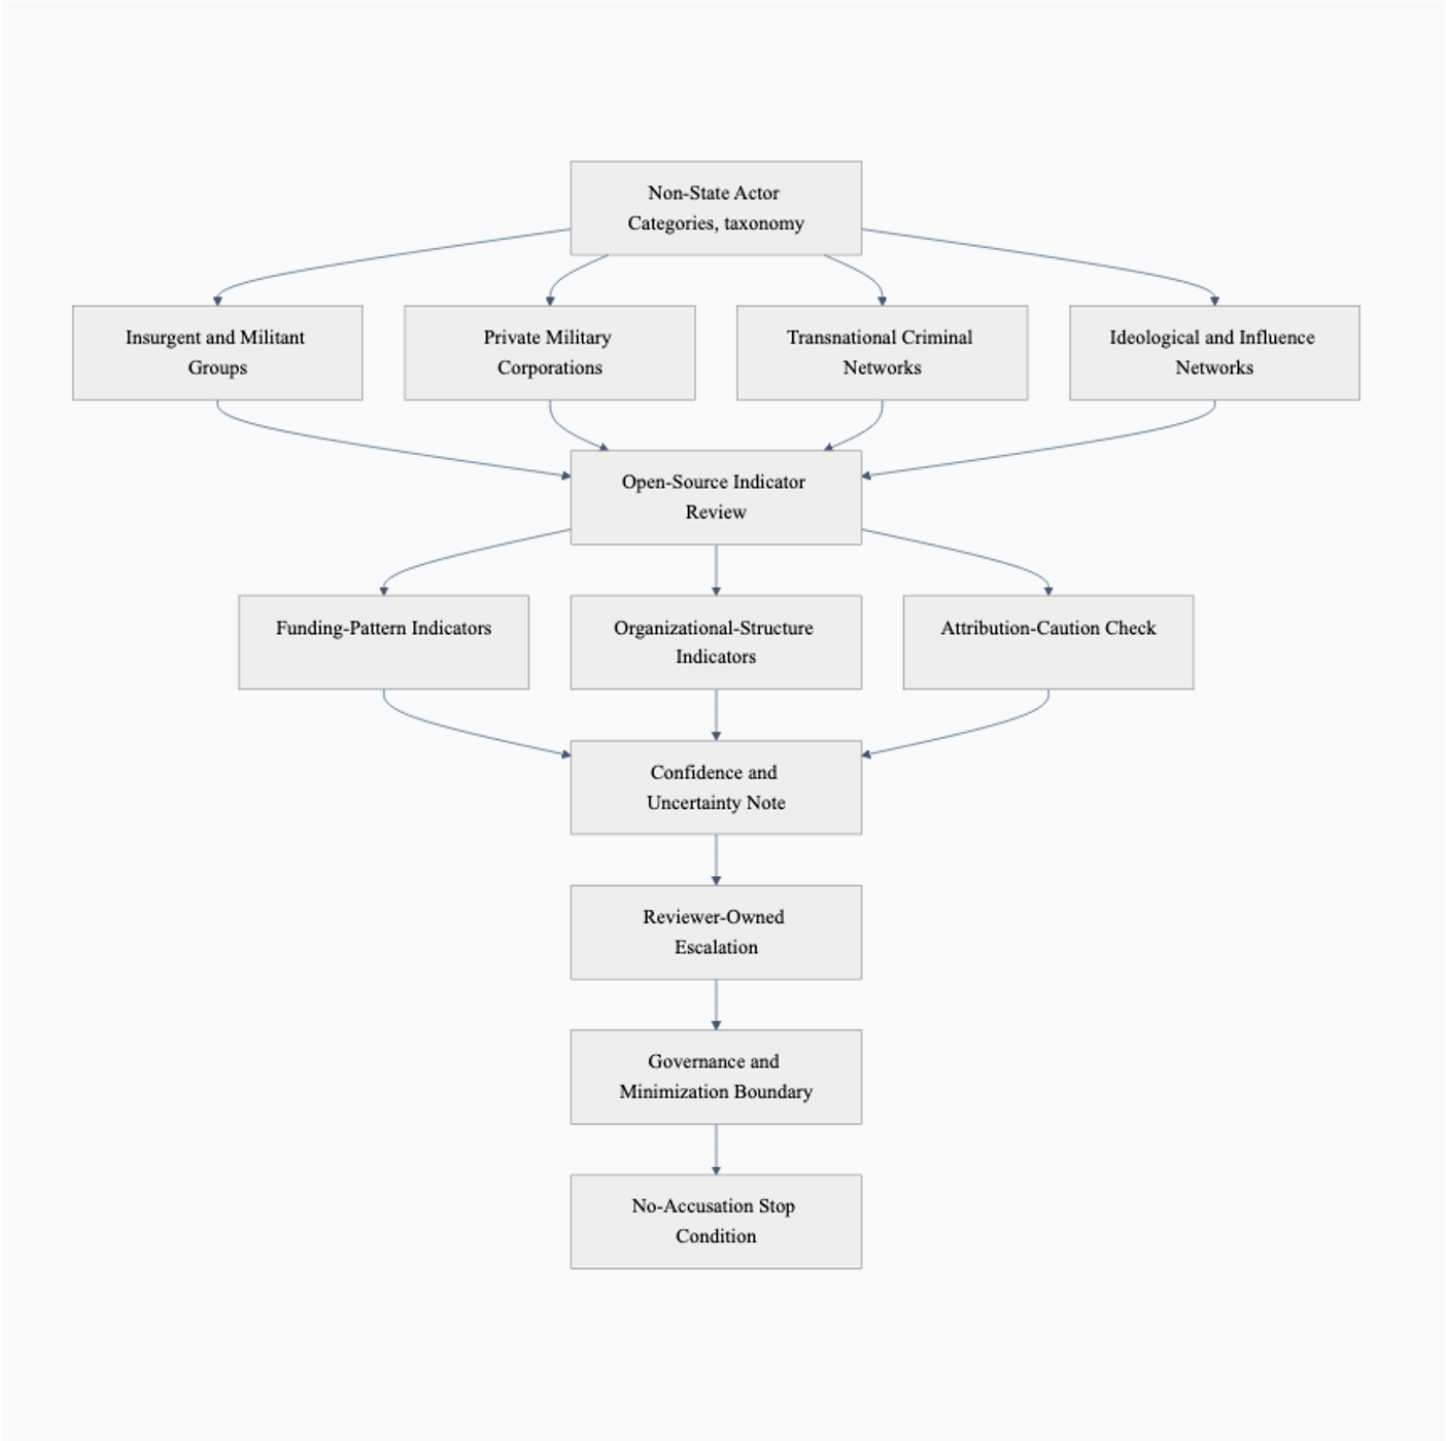

Figure 77: A defensive classification of non-state actor categories feeding an attribution-cautious indicator review with reviewer-owned escalation and governance boundaries. It is anchored to the gray zone hybrid warfare and non state actors / non state actor intelligence section; use it to inspect Non-State Actor Categories, taxonomy, Insurgent and Militant Groups, Private Military Corporations, and Transnational Criminal Networks while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

37.2 Dissemination-and-Marking Control Lens path for Non-State Actor Intelligence: lesson cluster, safe artifact, and review

Evidence anchor. Section 37; [238, 2026].

37.2.1 Non-State Actor Intelligence practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 37; [238, 2026].

37.2.2 Non-State Actor Intelligence topic lessons: source-backed concepts and transfer tasks

This module builds counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The sequence opens with **Financial due-diligence typology exercise using synthetic records and compliance boundaries**, **Hybrid-threat indicator review using sample scenarios and policy thresholds**, **Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds** and applies the **Dissemination-and-Marking Control Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 74; module overview Section 37; curriculum atlas Section 2.

Triangulation anchors. In module 25's topic-lessons section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

37.2.2.1 Lesson 1: Financial due-diligence typology exercise using synthetic records and compliance boundaries **Concept. Financial due-diligence typology exercise using synthetic records and compliance boundaries** studies non-state actors through organizational indicators, funding patterns, and open-source evidence with strict minimization.

Why it matters. Financial due-diligence typology exercise connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Financial due-diligence typology exercise using synthetic records and compliance boundaries rests on [012, 2026]. The closest source to this row notes: It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion. Use it for pinning down the scope of **Financial due-diligence typology exercise using synthetic records and compliance boundaries**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Ground **Financial due-diligence typology exercise** in the evidence the row cites. [012, 2026] A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Financial due-diligence typology exercise**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must note the typology descriptor, the bounded claim about **Financial due-diligence typology exercise using**, the intent caveat, the uncertainty threshold, the no-accusation boundary, and the reviewer who owns escalation. Shape **Financial due-diligence typology exercise** work as an **ambiguous-threshold indicator matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Financial due-diligence typology exercise**: that a typology or pattern match is proof of intent rather than a flag requiring corroboration and alternative explanations.

Transfer task. Apply this module's safe boundary for **Financial due-diligence typology exercise** to another artifact while keeping deception-aware source review and defensive escalation and reviewer ownership explicit.

37.2.2.2 Lesson 2: Hybrid-threat indicator review using sample scenarios and policy thresholds **Concept. Hybrid-threat indicator review using sample scenarios and policy thresholds** identifies ambiguous-threshold activity through indicators, attribution caution, and policy review—not through prescribed response actions.

Why it matters. Hybrid-threat indicator review matters in the **Counterintelligence and Source-Integrity Defense** lane because deception-aware source review and defensive escalation evidence must stay separate from judgment; source compromise is a common failure.

Source support. Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [308, 2026] and [311, 2026]. The lead source's own note reads: An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. Use them for pinning down the scope of **Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Read **Hybrid-threat indicator review** against the works cited for this row. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Hybrid-threat indicator review**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Hybrid-threat indicator review using sample**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Hybrid-threat indicator review** work as an **ambiguous-threshold indicator matrix** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Hybrid-threat indicator review**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Transfer **Hybrid-threat indicator review** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

37.2.2.3 Lesson 3: Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds **Concept. Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds** identifies ambiguous-threshold activity through indicators, attribution caution, and policy review—not through prescribed response actions.

Why it matters. Analysts use **Private Military Corporations as Intelligence** to separate defensive awareness from surveillance, handling, or operational security playbooks. A defensible treatment names the judgment it enables for deception-aware source review and defensive escalation review, the proof limit that source compromise would otherwise hide, and the reviewer accountable for challenge.

Source support. Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [308, 2026] and [311, 2026]. The lead source's own note reads: An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. Use them for the claim that **Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Ground **Private Military Corporations as Intelligence** in the evidence the row cites. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Private Military Corporations as Intelligence**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Private Military Corporations as Intelligence**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Private Military Corporations as Intelligence** work as an **ambiguous-threshold indicator matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Private Military Corporations as Intelligence**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Reuse the **Private Military Corporations as Intelligence** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

37.2.2.4 Lesson 4: Non-state actor indicator review with attribution caution and governance boundaries

Concept. Non-state actor indicator review with attribution caution and governance boundaries uses attribution indicators cautiously by separating technical similarity, context, confidence, and geopolitical inference.

Why it matters. Analysts use **Non-state actor indicator review** to separate defensive awareness from surveillance, handling, or operational security playbooks. A defensible treatment names the judgment it enables for deception-aware source review and defensive escalation review, the proof limit that source compromise would otherwise hide, and the reviewer accountable for challenge.

Source support. Non-state actor indicator review with attribution caution and governance boundaries rests on [033, 2026]. The lead source's own note reads: How seriously is the U.S. Use it for the claim that **Non-state actor indicator review with attribution caution and governance boundaries** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Non-state actor indicator review**, work from the cited evidence behind this row. [033, 2026] How seriously is the U.S. Intelligence Community (IC) considering this challenge to U.S. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Non-state actor indicator review**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the actor descriptor, the bounded claim about **state actor indicator review with**, the attribution caveat, the uncertainty note, the non-targeting boundary, and the reviewer who approves the assessment. Shape **Non-state actor indicator review** work as an **ambiguous-threshold indicator matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that lacking a state sponsor places an actor outside the reach of governance, accountability, and applicable rules.

Transfer task. Reuse the **Non-state actor indicator review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

37.2.2.5 Lesson 5: State Actor Use of Commercial: Non-state actor indicator review with attribution caution and governance boundaries

Concept. State Actor Use of Commercial: Non-state actor indicator review with attribution caution and governance boundaries uses attribution indicators cautiously by separating technical similarity, context, confidence, and geopolitical inference.

Why it matters. Without explicit treatment of **State Actor Use of Commercial**, source compromise undermines deception-aware source review and defensive escalation review; the lesson builds the habit to separate defensive awareness from surveillance, handling, or operational security playbooks.

Source support. State Actor Use of Commercial: Non-state actor indicator review with attribution caution and governance boundaries rests on [309, 2026], [310, 2026], and [300, 2026]. The most specific cited work observes: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for the claim that **State Actor Use of Commercial: Non-state actor indicator review with attribution caution and governance boundaries** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Ground **State Actor Use of Commercial** in the evidence the row cites. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **State Actor Use of Commercial**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the actor descriptor, the bounded claim about **State Actor Use of Commercial**, the attribution caveat, the uncertainty note, the non-targeting boundary, and the reviewer who approves the assessment. Shape **State Actor Use of Commercial** work as an **ambiguous-threshold indicator matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that lacking a state sponsor places an actor outside the reach of governance, accountability, and applicable rules.

Transfer task. Reuse the **State Actor Use of Commercial** audit pattern from this module on a different sample record set with a new reviewer

and blocked-use note.

37.2.3 Non-State Actor Intelligence worked safe example: synthetic inputs, evidence, and review

Worked example: a sample research lab reviews a synthetic source-quality anomaly after a disputed report. [238, 2026]; [247, 2026].

Triangulation anchors. In module 25's worked-example section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **hybrid-threat governance**. Learners use a **ambiguous-threshold indicator matrix** and keep this boundary visible: No live targeting, covert action, retaliation planning, or attribution certainty beyond evidence.

Frame. The classroom question centers on **Financial due-diligence typology exercise using synthetic records and compliance boundaries**. Excluded actions stay explicit, and the **Dissemination-and-Marking Control Lens** planning question is: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Inputs. For the **Financial due-diligence typology exercise using synthetic records and compliance boundaries** scenario, use toy access logs, public policy excerpts, synthetic source notes, and a reviewer escalation path. The Dissemination-and-Marking Control Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Financial due-diligence typology exercise using synthetic records and compliance boundaries**, students separate identity from access, list anomaly hypotheses, seek corroboration, and route sensitive concerns to review. Pause whenever an inference about Financial due-diligence typology exercise using synthetic records and compliance boundaries appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Financial due-diligence typology exercise using synthetic records and compliance boundaries** classroom scenario; unit artifact = ambiguous-threshold indicator matrix; evidence = allowed inputs; method = deception-aware source review and defensive escalation; output = a source-integrity memo with competing explanations, confidence, protected-disclosure note, and next-review owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Financial due-diligence typology exercise using synthetic records and compliance boundaries** as "Dissemination-and-Marking Control Lens confirms it" is not enough. The revision ties the claim to deception-aware source review and defensive escalation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Financial due-diligence typology exercise using synthetic records and compliance boundaries** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

37.2.4 Non-State Actor Intelligence practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Dissemination-and-Marking Control Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Triangulation anchors. In module 25's practice-sequence section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Financial due-diligence typology exercise using synthetic records and compliance boundaries, Hybrid-threat indicator review using sample scenarios and policy thresholds, Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Counterintelligence and Source-Integrity Defense** lane.
2. Frame	Answer the lens question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Financial due-diligence typology exercise using synthetic records and compliance boundaries: dissemination map with audience, caveat, marking, records, and feedback fields.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the ambiguous-threshold indicator matrix fields for Financial due-diligence typology exercise using synthetic records and compliance boundaries.	Unit profile note.	Evidence artifacts include threshold indicator, attribution caveat.
4. Challenge	Test the misconception that a typology or pattern match is proof of intent rather than a flag requiring corroboration and alternative explanations.	Failure-mode note.	The artifact applies the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

37.2.4.1 Non-State Actor Intelligence instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [238, 2026]; [247, 2026].

37.2.4.2 Non-State Actor Intelligence extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 37; [238, 2026].

Have learners swap artifacts and apply the **Dissemination-and-Marking Control Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

37.2.5 Non-State Actor Intelligence knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 37; [238, 2026].

1. Explain how **Financial due-diligence typology exercise using synthetic records and compliance boundaries** is defined here; name the source descriptor that supports the definition.
2. Contrast **Financial due-diligence typology exercise using synthetic records and compliance boundaries** with **Hybrid-threat indicator review using sample scenarios and policy thresholds** using the **Dissemination-and-Marking Control Lens** artifact fields.
3. Identify one failure mode from the **Counterintelligence and Source-Integrity Defense** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which explanation preserves uncertainty without ignoring a possible compromise signal?
5. Correct this misconception: that a typology or pattern match is proof of intent rather than a flag requiring corroboration and alternative explanations.

37.2.5.1 Non-State Actor Intelligence answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Financial due-diligence typology exercise using synthetic records and compliance boundaries** without source evidence, uncertainty, or a safe transfer task.

37.3 Non-State Actor Intelligence assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 37; [238, 2026].

37.3.1 Non-State Actor Intelligence evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 37; [238, 2026].

37.3.2 Non-State Actor Intelligence transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 37; [238, 2026].

37.3.2.1 Non-State Actor Intelligence lineage and source tradition: profile, concepts, and first anchors This sits in the **Counterintelligence and Source-Integrity Defense** lineage: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. [238, 2026]; [247, 2026].

37.3.2.2 Non-State Actor Intelligence working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 37; [238, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**, with provenance and reviewability throughout.

37.3.2.3 Non-State Actor Intelligence knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [238, 2026]; [247, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

37.3.2.4 Non-State Actor Intelligence transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 37; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.
- **Evidence contract:** keep the **Counterintelligence and Source-Integrity Defense** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

37.3.2.5 Non-State Actor Intelligence profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 37; [238, 2026].

The matched profile emphasizes defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. The method stack is threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths; the local topic cluster is **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

37.3.3 Non-State Actor Intelligence evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 37; [238, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Counterintelligence and Source-Integrity Defense** profile tells reviewers what evidence is strong enough for the module artifact built around **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

37.3.3.1 Non-State Actor Intelligence guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [247, 2026]; [249, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [012, 2026]; [033, 2026]; [308, 2026]; [311, 2026]; [309, 2026]; [310, 2026]; [300, 2026].

37.3.3.2 Non-State Actor Intelligence verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [247, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [247, 2026]; [249, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [012, 2026]; [033, 2026]; [308, 2026]; [311, 2026]; [309, 2026]; [310, 2026]; [300, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 25's source-canon section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds** and [238, 2026]; [247, 2026], but only directly verified source URLs are encoded as citations.

37.3.3.3 Non-State Actor Intelligence intelligence practice lens: evidence artifact and safety check Practice lens: **Dissemination-and-Marking Control Lens** for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [238, 2026]; [247, 2026].

Planning question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Evidence artifact: dissemination map with audience, caveat, marking, records, and feedback fields.

Validation rule: verify source authority, public/classification status, CAPCO-safe vocabulary, audience need, and records disposition before reuse. Applied to **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Handoff contract: deliver release-neutral summaries, source metadata, marking rationale, and review ownership as separate fields.

Safety check: exclude classified content, live release decisions, source-method exposure, and improvised control markings.

37.3.3.4 Non-State Actor Intelligence runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 37; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	25.99	25.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Non-State Actor Intelligence to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	25.101	25.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Non-State Actor Intelligence	Cyber-Physical Readiness Lens	tabletop packet with OT asset inventory, architecture record, consequences, injects, and debrief rubric	keep exercises lab-only or tabletop; exclude exploitation, process manipulation, unsafe actuation, and live-control actions
Model-card, recoverability, retention, and learner-support evidence package	25.102	25.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Non-State Actor Intelligence	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Financial due-diligence typology exercise using synthetic records and compliance boundaries	25.1	25.1 source title transformed into safe curriculum treatment; original: Typology: Terrorist, Criminal, Commercial, Hacktivist, Proxy	Economic-Security Due-Diligence Lens	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary	exclude sanctions evasion, laundering methods, threshold gaming, procurement bypasses, and tailored targeting of real firms

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Hybrid-threat indicator review using sample scenarios and policy thresholds	25.2	25.2 source title transformed into safe curriculum treatment; original: Hezbollah, ISIS, MS-13: Intelligence Structures and Capabilities	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	25.3	25.3 source title transformed into safe curriculum treatment; original: Private Military Corporations as Intelligence Actors	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Non-state actor indicator review with attribution caution and governance boundaries	25.4	25.4 source title transformed into safe curriculum treatment; original: Counterintelligence Threat from Non-State Actors	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
Non-state actor indicator review with attribution caution and governance boundaries	25.5	25.5 source title transformed into safe curriculum treatment; original: Non-State Actor Use of Commercial AI for Intelligence Collection	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse

37.3.3.5 Non-State Actor Intelligence reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 37; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Financial due-diligence typology exercise using synthetic records and compliance boundaries	Economic-Security Due-Diligence Lens	economic-security packet with entity evidence, sanctions program, red flags, supplier context, uncertainty, and compliance boundary	exclude sanctions evasion, laundering methods, threshold gaming, procurement bypasses, and tailored targeting of real firms
Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Non-state actor indicator review with attribution caution and governance boundaries	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse
State Actor Use of Commercial: Non-state actor indicator review with attribution caution and governance boundaries	AI/Data Accountability Lens	AI/data impact card with authority, provenance, model version, impact score, register status, human owner, and review cadence	reject automated adverse action, hidden surveillance expansion, unowned outputs, unreviewed model drift, and opaque downstream reuse

37.3.3.6 Non-State Actor Intelligence annotated source ledger: real titles and local contribution Each source cited by this **Counterintelligence and Source-Integrity Defense** module is paired below with its real title and a one-line note on what it contributes to **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide

Source	Cited work	What it contributes	Status
[247, 2026]	AI in the Public Sector	Official OECD.AI public-sector AI theme page.	original source-guide
[249, 2026]	GovTech: Putting People First	The official page for the World Bank's Global Program on GovTech and Public Sector Innovation, which helps governments use technology and data to improve public services and governance. It describes support for digital transformation in public administration across areas such as tax administration, public financial management, human resource systems, and citizen engagement, with cross-cutting themes including responsible AI and green digital transformation.	verified source-guide
[273, 2026]	WCAG 2 Overview	The W3C Web Accessibility Initiative overview of the Web Content Accessibility Guidelines (WCAG), an international standard for making web content accessible to people with disabilities. It explains that WCAG is organized around four principles (perceivable, operable, understandable, robust) with testable success criteria at three conformance levels (A, AA, AAA), and covers versions 2.0, 2.1, and 2.2.	verified source-guide
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide
[275, 2026]	Fact Sheet: New Rule on the Accessibility of Web Content and Mobile Apps Provided by State and Local Governments	A US Department of Justice fact sheet explaining the 2024 ADA Title II rule requiring state and local governments to make their web content and mobile apps accessible. It establishes WCAG 2.1 Level AA as the technical standard, applies to entities such as schools, courts, libraries, and transit agencies, and sets compliance deadlines of April 2027 for larger jurisdictions and April 2028 for smaller ones.	verified source-guide
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide

Source	Cited work	What it contributes	Status
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide
[012, 2026]	Counterintelligence Activities of Non-State Actors - Grey Dynamics	A Grey Dynamics analysis article (Rachel Brown, 2021) on how non-state actors conduct counterintelligence. It argues that although such groups lack the technical collection capabilities of states, they compensate through open-source and human-source methods and benefit defensively from compartmentalized, cell-based structures and ideological cohesion.	verified source-guide

[308, 2026]	Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure	An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure.	verified source-guide
[311, 2026]	Countering Information Threats	An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering.	verified source-guide
[309, 2026]	STIX Version 2.1	An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection.	verified source-guide

Source	Cited work	What it contributes	Status
[310, 2026]	TAXII Version 2.1	The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe).	verified source-guide
[300, 2026]	MITRE ATLAS	MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy.	original source-guide

Where this sits. This module's overview is Section 37; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

37.3.4 Non-State Actor Intelligence governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 37; [238, 2026].

37.3.5 Non-State Actor Intelligence analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 25's governance-boundary section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Counterintelligence and Source-Integrity Defense** for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [238, 2026]; [247, 2026].

Curriculum topic spine: Financial due-diligence typology exercise using synthetic records and compliance boundaries, **Hybrid-threat indicator review using sample scenarios and policy thresholds**, **Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds**. **Verified anchor cluster:** [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]; [Agency, 2009]; [Jr., 2007]; [Burkett, 2013].

Conceptual depth: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination.

Method stack: threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths.

Composability contract: identity, access, reporting, corroboration, caveats, and confidence are modeled independently so defensive review can happen without exposure.

Known failure modes: source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage.

Defensive boundary: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks. Applied to **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Anchor	Why it matters here
[Counterintelligence and Center, 2024]	Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.
[Jr., 2007]	Foundational analytic cognition source for bias, mental models, and structured reasoning. Checked as of 2026-06-06; role: curriculum_anchor.
[Burkett, 2013]	A CIA Studies in Intelligence analyst essay arguing that the traditional MICE recruitment-motivation model (Money, Ideology, Compromise, Ego) is better understood through Cialdini's influence principles reframed as RASCLS (Reciprocation, Authority, Scarcity, Commitment/Consistency, Liking, Social Proof), grounding the historical and conceptual lineage of HUMINT recruitment frameworks. Checked as of 2026-06-08; role: curriculum_anchor.

37.3.5.1 Non-State Actor Intelligence evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Counterintelligence and Source-Integrity Defense** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [247, 2026].

37.3.6 Non-State Actor Intelligence agentic boundary: assist, approve, block, and record

Evidence anchor. Section 37; [238, 2026].

AGEINT translation is bounded by the **Counterintelligence and Source-Integrity Defense** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

37.3.6.1 Non-State Actor Intelligence permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 37; [238, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

37.3.6.2 Non-State Actor Intelligence excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [247, 2026] and **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

37.3.7 Non-State Actor Intelligence governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 37; [238, 2026].
Governance is practiced as a gate on the **Counterintelligence and Source-Integrity Defense** lane. Learners use the **Dissemination-and-Marking Control Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

37.3.7.1 Non-State Actor Intelligence governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [247, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Counterintelligence and Source-Integrity Defense** failure modes and the **Dissemination-and-Marking Control Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

37.3.7.2 Non-State Actor Intelligence evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 37; [238, 2026].
Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Dissemination-and-Marking Control Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

37.3.7.3 Non-State Actor Intelligence current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [238, 2026]; [247, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_ncsc_counterintelligence_strategy` for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**?	The National Counterintelligence Strategy; lane `counterintelligence_source_integrity`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness.
What does the module inherit from `official_odni_eo_12333` for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Executive Order 12333: United States Intelligence Activities; lane `legal_oversight`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection.
What does the module inherit from `official_odni_icd_206` for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Intelligence Community Directive 206: Sourcing Requirements for Disseminated Analytic Products; lane `analytic_tradecraft`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official sourcing directive for traceability, citations, source descriptors, and source summaries.
What does the module inherit from `official_odni_icd_203` for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Intelligence Community Directive 203: Analytic Standards; lane `source_quality_spine`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official ODNI analytic tradecraft standards directive.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 37; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

37.3.8 Non-State Actor Intelligence assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 37; [238, 2026].

37.3.9 Non-State Actor Intelligence assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 37; [238, 2026].

37.3.9.1 Non-State Actor Intelligence capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds** and [238, 2026]; [247, 2026].

37.3.9.2 Non-State Actor Intelligence instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds** and [238, 2026]; [247, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

37.3.9.3 Non-State Actor Intelligence assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Financial due-diligence typology exercise using synthetic records and compliance boundaries	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Hybrid-threat indicator review using sample scenarios and policy thresholds	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Private Military Corporations as Intelligence: Hybrid-threat indicator review using sample scenarios and policy thresholds	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

37.3.10 Non-State Actor Intelligence refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [247, 2026] and **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

37.3.10.1 Non-State Actor Intelligence refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**. The local signals begin with [238, 2026]; [247, 2026].

37.3.10.2 Non-State Actor Intelligence claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**, and the source spine for these checks begins with [238, 2026]; [247, 2026].

37.3.11 Non-State Actor Intelligence reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [247, 2026].

Triangulation anchors. In module 25's review-checklist section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [238, 2026]; [247, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.

- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

37.3.12 Non-State Actor Intelligence learning-path links: module map, overview, and curriculum atlas

These links keep **Financial due-diligence typology exercise using synthetic records and compliance boundaries; Hybrid-threat indicator review using sample scenarios and policy thresholds** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [238, 2026]; [247, 2026].
Section 2, Section 35, Section 36, Section 38

38 Irregular Warfare and Special Operations

38.0.1 Irregular Warfare and Special Operations figures and course links: visual evidence, source flow, and navigation

The module uses Figure 78 and Figure 74 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.

Navigation links: Section 2, Section 35, Section 37, Section 39.

This module teaches the **Counterintelligence and Source-Integrity Defense** lane through a bounded, source-backed coursebook chapter. [239, 2026]; [249, 2026].

38.1 Counterintelligence and Source-Integrity Defense frame for Irregular Warfare and Special Operations: source context, topic focus, and reader task

Evidence anchor. Section 38; [239, 2026].

38.1.1 Irregular Warfare and Special Operations orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 38; [239, 2026].

38.1.2 Irregular Warfare and Special Operations conceptual primer: source context, core model, and reader task

This chapter teaches counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The chapter uses **Dissemination-and-Marking Control Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

The central distinction is to separate defensive awareness from surveillance, handling, or operational security playbooks. Core topics include **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.

Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [239, 2026]; [249, 2026].

Learners move from vocabulary and the **Dissemination-and-Marking Control Lens** distinction through topic lessons on **Hybrid-threat indicator review using sample scenarios and policy thresholds** with evidence and misconception checks, then assemble a **dissemination map with audience, caveat, marking, records, and feedback fields** with safety and rights gates.

38.1.3 Irregular Warfare and Special Operations learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 38; [239, 2026].

- Connect **Hybrid-threat indicator review using sample scenarios and policy thresholds and FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** to **Counterintelligence and Source-Integrity Defense** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **dissemination map with audience, caveat, marking, records, and feedback fields** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks.

38.1.4 Irregular Warfare and Special Operations core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 38; [239, 2026].

Term	Working definition
Source integrity	confidence that evidence has not been distorted, laundered, or compromised
Compromise signal	a clue that access, identity, or source reliability needs review
Corroboration	independent support that reduces single-source vulnerability
Insider risk	risk created by trusted access combined with motive, pressure, or control failure
Protected disclosure	a safe channel for reporting concerns without exposing sensitive details
Hybrid-threat indicator review using sample…	Key terms: Hybrid, threat, indicator.
FM 3-05 130: Hybrid-threat indicator review…	Key terms: FM, Hybrid, threat.

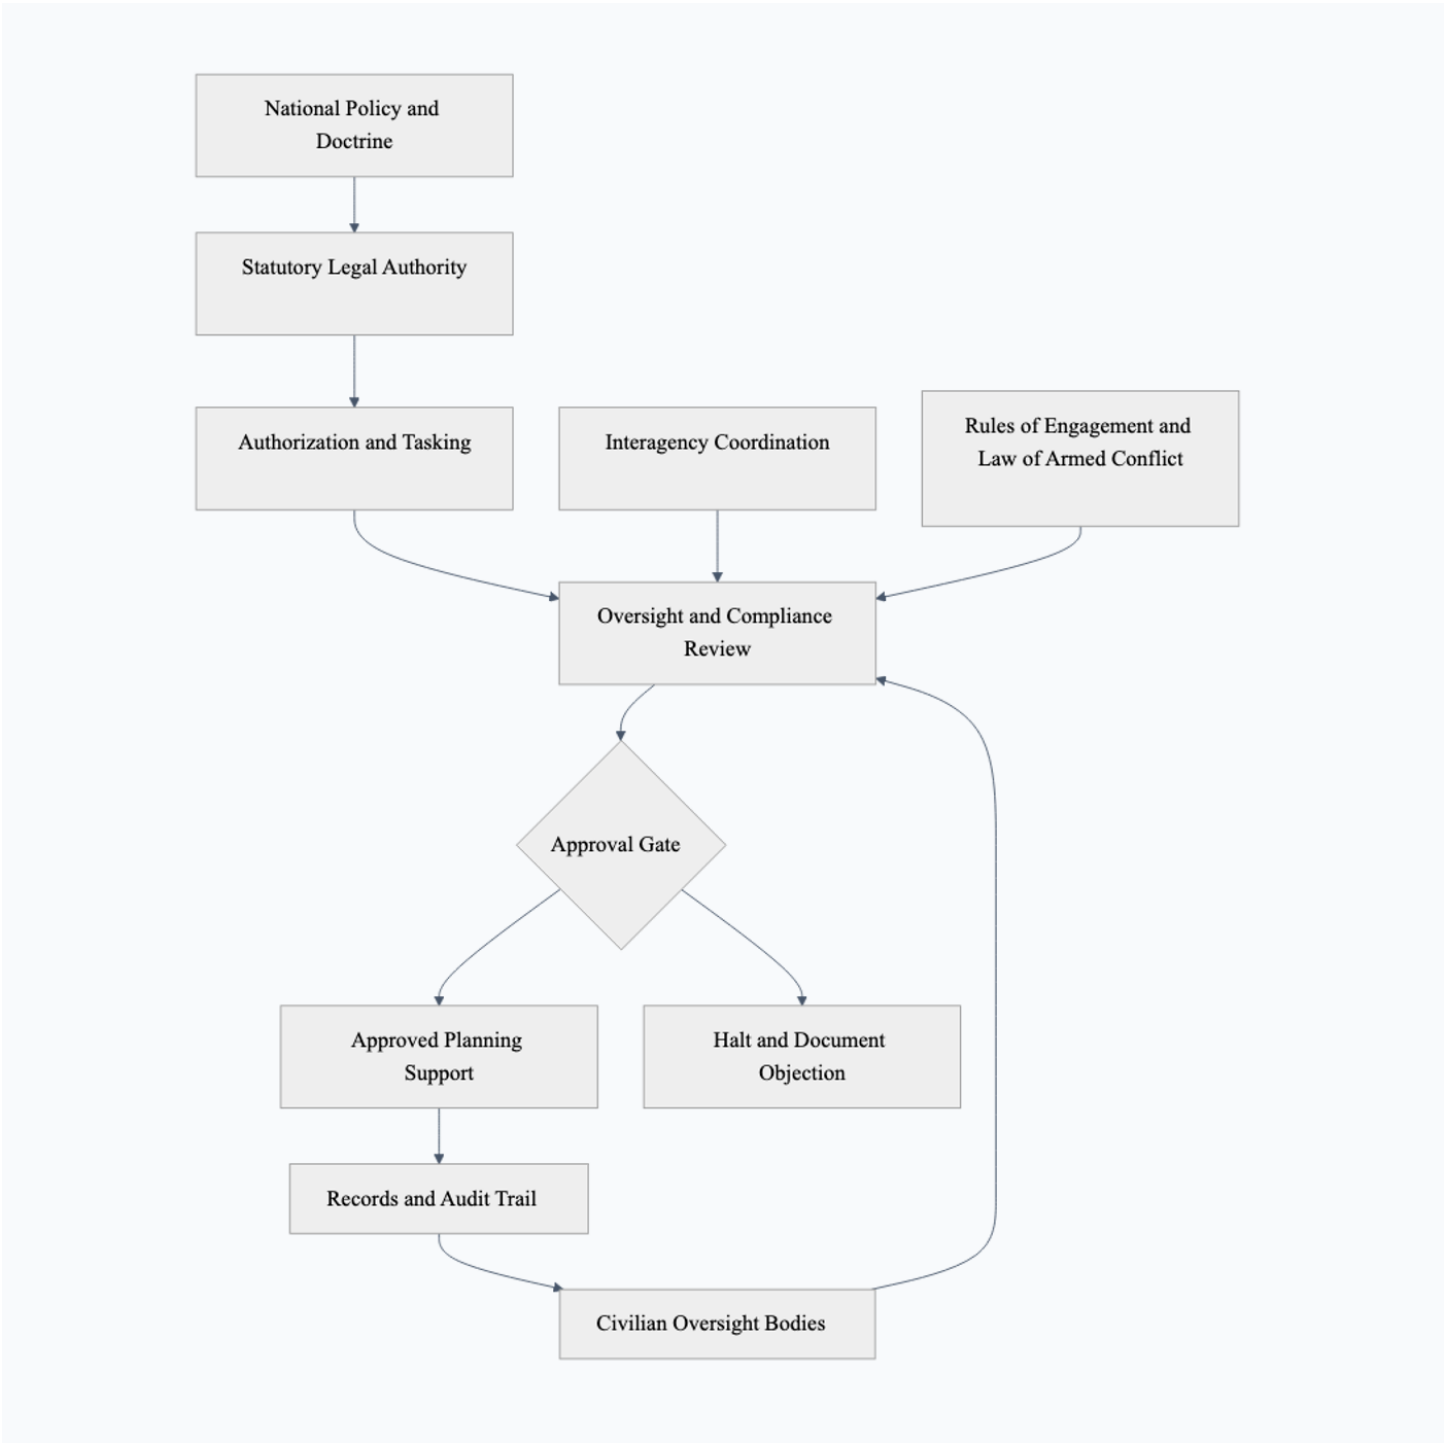

Figure 78: How intelligence support to special operations flows only through documented legal authority, oversight review, and approval gates before any approved planning proceeds. The captioned view belongs to the gray zone hybrid warfare and non state actors / irregular warfare and special operations section and should be read as a map of National Policy and Doctrine, Statutory Legal Authority, Authorization and Tasking, and Oversight and Compliance Review, not as a capability score or live-task instruction.

38.2 Dissemination-and-Marking Control Lens path for Irregular Warfare and Special Operations: lesson cluster, safe artifact, and review

Evidence anchor. Section 38; [239, 2026].

38.2.1 Irregular Warfare and Special Operations practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 38; [239, 2026].

38.2.2 Irregular Warfare and Special Operations topic lessons: source-backed concepts and transfer tasks

This module builds counterintelligence as source-integrity defense: the class studies how institutions protect evidence, people, access, and judgment from deception and compromise. The sequence opens with **Hybrid-threat indicator review using sample scenarios and policy thresholds**, **FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**, **FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds** and applies the **Dissemination-and-Marking Control Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 74; module overview Section 38; curriculum atlas Section 2.

Triangulation anchors. In module 26's topic-lessons section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

38.2.2.1 Lesson 1: Hybrid-threat indicator review using sample scenarios and policy thresholds **Concept. Hybrid-threat indicator review using sample scenarios and policy thresholds** reads special-operations intelligence as support to accountable planning with explicit authority and oversight fields.

Why it matters. Analysts use **Hybrid-threat indicator review** to separate defensive awareness from surveillance, handling, or operational security playbooks. A defensible treatment names the judgment it enables for deception-aware source review and defensive escalation review, the proof limit that source compromise would otherwise hide, and the reviewer accountable for challenge.

Source support. Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [112, 2026]. The closest source to this row notes: It presents a seven-phase operational framework encompassing psychological preparation, infiltration, organization of underground and guerrilla forces, employment, and transition. Use it for pinning down the scope of **Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Hybrid-threat indicator review**, work from the cited evidence behind this row. [112, 2026] This U.S. Army Training Circular (TC 18-01) defines the Special Forces concept for planning and conducting unconventional warfare operations, covering how units enable and support resistance movements in denied or hostile territory. It presents a seven-phase operational framework encompassing psychological preparation, infiltration, organization of underground and guerrilla forces, employment, and transition. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Hybrid-threat indicator review**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Hybrid-threat indicator review using sample**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Hybrid-threat indicator review** work as an **ambiguous-threshold indicator matrix** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Hybrid-threat indicator review**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Transfer **Hybrid-threat indicator review** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

38.2.2.2 Lesson 2: FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds **Concept. FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** reads special-operations intelligence as support to accountable planning with explicit authority and oversight fields.

Why it matters. FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds matters in the **Counter-intelligence and Source-Integrity Defense** lane because deception-aware source review and defensive escalation evidence must stay separate from judgment; source compromise is a common failure.

Source support. FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [113, 2026] and [114, 2026]. The most specific cited work observes: Distribution was restricted to U.S. Use them for the claim that **FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Read **FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** against the works cited for this row. [113, 2026] U.S. Army Field Manual FM 3-05.130, "Army Special Operations Forces Unconventional Warfare," published by Headquarters, Department of the Army in September 2008. The manual is organized into chapters covering an introduction to warfare types, the instruments of United States national power, national policy and doctrine, and planning considerations including the seven phases of unconventional warfare and the role of Army Special Operations Forces. [114, 2026] FM 3-05.130, Army Special Operations Forces Unconventional Warfare (Headquarters, Department of the Army, 30 September 2008). The manual defines unconventional warfare and situates it within U.S. national power, covering the seven phases of UW operations, Special Forces missions, psychological operations, civil affairs operations in the UW context, and the roles of supporting elements including interagency partners. Distribution was restricted to U.S. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **FM 3-05 130**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **FM 3-05 130**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** work as an **ambiguous-threshold indicator matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Apply this module's safe boundary for **FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** to another artifact while keeping deception-aware source review and defensive escalation and reviewer ownership explicit.

38.2.2.3 Lesson 3: FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds Concept. FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds identifies ambiguous-threshold activity through indicators, attribution caution, and policy review—not through prescribed response actions.

Why it matters. Analysts use **FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds** to separate defensive awareness from surveillance, handling, or operational security playbooks. A defensible treatment names the judgment it enables for deception-aware source review and defensive escalation review, the proof limit that source compromise would otherwise hide, and the reviewer accountable for challenge.

Source support. FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [115, 2026] and [116, 2026]. The lead source's own note reads: A U.S. Use them for the working definition that **FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Ground **FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds** in the evidence the row cites. [115, 2026] FM 3-05.102, Army Special Operations Forces Intelligence (Headquarters, Department of the Army). The manual addresses intelligence and electronic warfare (IEW) support across Army Special Operations Force components, covering Special Forces, Rangers, ARSOA, PSYOP, and Civil Affairs operations. [116, 2026] A U.S. Army field manual, FM 3-05.102 (Army Special Operations Forces Intelligence), dated 2001 and superseding FM 34-36, distributed with restrictions to U.S. government agencies. The manual gives special operations forces commanders and staff a doctrinal overview of intelligence support to their missions, covering force structure, training, and operational requirements consistent with joint doctrine. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **FM 3-05 102**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **FM 3-05 102**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds** work as an **ambiguous-threshold indicator matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Apply this module's safe boundary for **FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds** to another artifact while keeping deception-aware source review and defensive escalation and reviewer ownership explicit.

38.2.2.4 Lesson 4: Declassified training-manual archive Concept. Declassified training-manual archive studies OSS declassified manuals for oversight, ethics, and limits on translating history into practice.

Why it matters. Declassified training-manual archive connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Declassified training-manual archive rests on [117, 2026], [118, 2026], and [119, 2026]. The closest source to this row notes: A digitized World War II field manual from the Internet Archive, the Special Operations Field Manual, Strategic Services (provisional), issued July 18, 1944 by the U.S. Use them for pinning down the scope of **Declassified training-manual archive**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Declassified training-manual archive**, reason from the sources cited in this row. [117, 2026] An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. [118, 2026] A digitized World War II field manual from the Internet Archive, the Special Operations Field Manual, Strategic Services (provisional), issued July 18, 1944 by the U.S. Office of Strategic Services (OSS). The 32-page manual sets out the authorized functions, operational plans, methods, and organization of OSS Maritime Units and the broader Special Operations Branch. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified training-manual archive**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as an **ambiguous-threshold indicator matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Declassified training-manual archive**: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **Declassified training-manual archive** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

38.2.2.5 Lesson 5: Principles of Tradecraft for Resistance: Hybrid-threat indicator review using sample scenarios and policy thresholds Concept. Principles of Tradecraft for Resistance: Hybrid-threat indicator review using sample scenarios and policy thresholds identifies ambiguous-threshold activity through indicators, attribution caution, and policy review—not through prescribed response actions.

Why it matters. Principles of Tradecraft for Resistance connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Principles of Tradecraft for Resistance: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [120, 2026]. The closest source to this row notes: The document presents an overview of intelligence and espionage concepts, with chapters covering an introduction to espionage, agents (typology, identification, recruitment, and handling), and agent organization and management including personnel and structures. Use it for pinning down the scope of **Principles of Tradecraft for Resistance: Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. Ground **Principles of Tradecraft for Resistance** in the evidence the row cites. [120, 2026] Principles of Tradecraft, a 1995 publication by Militia Free Press (a subsidiary of The Resister). The document presents an overview of intelligence and espionage concepts, with chapters covering an introduction to espionage, agents (typology, identification, recruitment, and handling), and agent organization and management including personnel and structures. It is framed as an introductory treatment rather than a comprehensive reference on intelligence requirements. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Principles of Tradecraft for Resistance**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Principles of Tradecraft for Resistance**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Principles of Tradecraft for Resistance** work as an **ambiguous-threshold indicator matrix** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Principles of Tradecraft for Resistance**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Reuse the **Principles of Tradecraft for Resistance** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

38.2.2.6 Lesson 6: Underground Intelligence Networks: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Underground Intelligence Networks: Hybrid-threat indicator review using sample scenarios and policy thresholds identifies ambiguous-threshold activity through indicators, attribution caution, and policy review—not through prescribed response actions.

Why it matters. Underground Intelligence Networks connects classroom vocabulary to Counterintelligence and Source-Integrity Defense practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Underground Intelligence Networks: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [308, 2026] and [311, 2026]. The most specific cited work observes: An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. Use them for the working definition that **Underground Intelligence Networks: Hybrid-threat indicator review using sample scenarios and policy thresholds** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Underground Intelligence Networks**, work from the cited evidence behind this row. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Underground Intelligence Networks**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Underground Intelligence Networks**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Underground Intelligence Networks** work as an **ambiguous-threshold indicator matrix** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Underground Intelligence Networks**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Transfer **Underground Intelligence Networks** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

38.2.2.7 Lesson 7: OSS Simple Sabotage Field Manual: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. OSS Simple Sabotage Field Manual: Hybrid-threat indicator review using sample scenarios and policy thresholds studies OSS declassified manuals for oversight, ethics, and limits on translating history into practice.

Why it matters. OSS Simple Sabotage Field Manual matters in the **Counterintelligence and Source-Integrity Defense** lane because deception-aware source review and defensive escalation evidence must stay separate from judgment; source compromise is a common failure.

Source support. OSS Simple Sabotage Field Manual: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [117, 2026]. Its anchor reference records: An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. Use it for pinning down the scope of **OSS Simple Sabotage Field Manual: Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **OSS Simple Sabotage Field Manual**, reason from the sources cited in this row. [117, 2026] An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **OSS Simple Sabotage Field Manual**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **OSS Simple Sabotage Field Manual**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **OSS Simple Sabotage Field Manual** work as an **ambiguous-threshold indicator matrix** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **OSS Simple Sabotage Field Manual**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Transfer **OSS Simple Sabotage Field Manual** from this module to a second motif by preserving deception-aware source review and defensive escalation, replacing action with audit, and naming the blocked use.

38.2.2.8 Lesson 8: Morale Operations: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Morale Operations: Hybrid-threat indicator review using sample scenarios and policy thresholds studies OSS declassified manuals for oversight, ethics, and limits on translating history into practice.

Why it matters. Morale Operations matters in the **Counterintelligence and Source-Integrity Defense** lane because deception-aware source review and defensive escalation evidence must stay separate from judgment; source compromise is a common failure.

Source support. Morale Operations: Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [117, 2026]. Its anchor reference records: An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. Use it for pinning down the scope of **Morale Operations: Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Counterintelligence and Center, 2024]; [Archives and Administration, 1981].

Evidence to inspect. For **Morale Operations**, work from the cited evidence behind this row. [117, 2026] An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Morale Operations**, build a **dissemination map with audience, caveat, marking, records, and feedback fields** for this deception-aware source review and defensive escalation topic. The artifact must name the indicator descriptor, the bounded claim about **Morale Operations**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Morale Operations** work as an **ambiguous-threshold indicator matrix** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Morale Operations**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Reuse the **Morale Operations** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

38.2.3 Irregular Warfare and Special Operations worked safe example: synthetic inputs, evidence, and review

Worked example: a sample research lab reviews a synthetic source-quality anomaly after a disputed report. [239, 2026]; [249, 2026].

Triangulation anchors. In module 26's worked-example section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **hybrid-threat governance**. Learners use a **ambiguous-threshold indicator matrix** and keep this boundary visible: No live targeting, covert action, retaliation planning, or attribution certainty beyond evidence.

Frame. The classroom question centers on **Hybrid-threat indicator review using sample scenarios and policy thresholds**. Excluded actions stay explicit, and the **Dissemination-and-Marking Control Lens** planning question is: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Inputs. For the **Hybrid-threat indicator review using sample scenarios and policy thresholds** scenario, use toy access logs, public policy excerpts, synthetic source notes, and a reviewer escalation path. The Dissemination-and-Marking Control Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Hybrid-threat indicator review using sample scenarios and policy thresholds**, students separate identity from access, list anomaly hypotheses, seek corroboration, and route sensitive concerns to review. Pause whenever an inference about Hybrid-threat indicator review using sample scenarios and policy thresholds appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Hybrid-threat indicator review using sample scenarios and policy thresholds** classroom scenario; unit artifact = ambiguous-threshold indicator matrix; evidence = allowed inputs; method = deception-aware source review and defensive escalation; output = a source-integrity memo with competing explanations, confidence, protected-disclosure note, and next-review owner; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Hybrid-threat indicator review using sample scenarios and policy thresholds** as "Dissemination-and-Marking Control Lens confirms it" is not enough. The revision ties the claim to deception-aware source review and defensive escalation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Hybrid-threat indicator review using sample scenarios and policy thresholds** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

38.2.4 Irregular Warfare and Special Operations practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Dissemination-and-Marking Control Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Triangulation anchors. In module 26's practice-sequence section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Hybrid-threat indicator review using sample scenarios and policy thresholds, FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds, FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Counterintelligence and Source-Integrity Defense** lane.
2. Frame	Answer the lens question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Hybrid-threat indicator review using sample scenarios and policy thresholds: dissemination map with audience, caveat, marking, records, and feedback fields.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the ambiguous-threshold indicator matrix fields for Hybrid-threat indicator review using sample scenarios and policy thresholds.	Unit profile note.	Evidence artifacts include threshold indicator, attribution caveat.
4. Challenge	Test the misconception that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.	Failure-mode note.	The artifact applies the key distinction: separate defensive awareness from surveillance, handling, or operational security playbooks.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

38.2.4.1 Irregular Warfare and Special Operations instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor

or a human review point. Keep the focus on **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [249, 2026].

38.2.4.2 Irregular Warfare and Special Operations extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 38; [239, 2026].
Have learners swap artifacts and apply the **Dissemination-and-Marking Control Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

38.2.5 Irregular Warfare and Special Operations knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 38; [239, 2026].

1. Explain how **Hybrid-threat indicator review using sample scenarios and policy thresholds** is defined here; name the source descriptor that supports the definition.
2. Contrast **Hybrid-threat indicator review using sample scenarios and policy thresholds** with **FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** using the **Dissemination-and-Marking Control Lens** artifact fields.
3. Identify one failure mode from the **Counterintelligence and Source-Integrity Defense** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which explanation preserves uncertainty without ignoring a possible compromise signal?
5. Correct this misconception: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

38.2.5.1 Irregular Warfare and Special Operations answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Hybrid-threat indicator review using sample scenarios and policy thresholds** without source evidence, uncertainty, or a safe transfer task.

38.3 Irregular Warfare and Special Operations assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 38; [239, 2026].

38.3.1 Irregular Warfare and Special Operations evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 38; [239, 2026].

38.3.2 Irregular Warfare and Special Operations transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 38; [239, 2026].

38.3.2.1 Irregular Warfare and Special Operations lineage and source tradition: profile, concepts, and first anchors This sits in the **Counterintelligence and Source-Integrity Defense** lineage: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. [239, 2026]; [249, 2026].

38.3.2.2 Irregular Warfare and Special Operations working model: inputs, constraints, transforms, outputs, and oversight Evidence anchor. Section 38; [239, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**, with provenance and reviewability throughout.

38.3.2.3 Irregular Warfare and Special Operations knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [239, 2026]; [249, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

38.3.2.4 Irregular Warfare and Special Operations transfer contracts: authority, evidence, tools, and auditable output Evidence anchor. Section 38; [239, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.
- **Evidence contract:** keep the **Counterintelligence and Source-Integrity Defense** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

38.3.2.5 Irregular Warfare and Special Operations profile emphasis and local focus: method stack and topic cluster Evidence anchor. Section 38; [239, 2026].

The matched profile emphasizes defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination. The method stack is threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths; the local topic cluster is **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

38.3.3 Irregular Warfare and Special Operations evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 38; [239, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Counterintelligence and Source-Integrity Defense** profile tells reviewers what evidence is strong enough for the module artifact built around **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

38.3.3.1 Irregular Warfare and Special Operations guide source spine: inherited keys and local citation roles Primary guide citations: [239, 2026]; [249, 2026]; [266, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [112, 2026]; [113, 2026]; [114, 2026]; [115, 2026]; [116, 2026]; [117, 2026]; [118, 2026]; [119, 2026]; [120, 2026]; [308, 2026]; [311, 2026].

38.3.3.2 Irregular Warfare and Special Operations verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [239, 2026]; [249, 2026].

Tier	What counts	How it is used
Source guide	[239, 2026]; [249, 2026]; [266, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [112, 2026]; [113, 2026]; [114, 2026]; [115, 2026]; [116, 2026]; [117, 2026]; [118, 2026]; [119, 2026]; [120, 2026]; [308, 2026]; [311, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 26's source-canon section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** and [239, 2026]; [249, 2026], but only directly verified source URLs are encoded as citations.

38.3.3.3 Irregular Warfare and Special Operations intelligence practice lens: evidence artifact and safety check Practice lens: **Dissemination-and-Marking Control Lens** for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [249, 2026].

Planning question: Which audience, release authority, marking vocabulary, records duty, and feedback loop governs this intelligence artifact?

Evidence artifact: dissemination map with audience, caveat, marking, records, and feedback fields.

Validation rule: verify source authority, public/classification status, CAPCO-safe vocabulary, audience need, and records disposition before reuse. Applied to **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Handoff contract: deliver release-neutral summaries, source metadata, marking rationale, and review ownership as separate fields.

Safety check: exclude classified content, live release decisions, source-method exposure, and improvised control markings.

38.3.3.4 Irregular Warfare and Special Operations runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 38; [239, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	26.99	26.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Irregular Warfare and Special Operations to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	26.101	26.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Irregular Warfare and Special Operations	Cyber-Physical Readiness Lens	tabletop packet with OT asset inventory, architecture record, consequences, injects, and debrief rubric	keep exercises lab-only or tabletop; exclude exploitation, process manipulation, unsafe actuation, and live-control actions
Model-card, recoverability, retention, and learner-support evidence package	26.102	26.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Irregular Warfare and Special Operations	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	26.1	26.1 source title transformed into safe curriculum treatment; original: SF Unconventional Warfare Doctrine: TC 18-01	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Hybrid-threat indicator review using sample scenarios and policy thresholds	26.2	26.2 source title transformed into safe curriculum treatment; original: FM 3-05.130: ARSOF Unconventional Warfare	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	26.3	26.3 source title transformed into safe curriculum treatment; original: FM 3-05.102: ARSOF Intelligence	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Declassified training-manual archive	26.4	26.4 source title transformed into safe curriculum treatment; original: OSS Origins and Training Manuals (1944)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Hybrid-threat indicator review using sample scenarios and policy thresholds	26.5	26.5 source title transformed into safe curriculum treatment; original: Principles of Tradecraft for Resistance Organizations	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	26.6	26.6 source title transformed into safe curriculum treatment; original: Underground Intelligence Networks: Structure, Security, Continuity	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	26.7	26.7 source title transformed into safe curriculum treatment; original: OSS Simple Sabotage Field Manual (1944)	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Hybrid-threat indicator review using sample scenarios and policy thresholds	26.8	26.8 source title transformed into safe curriculum treatment; original: Morale Operations: OSS Psychological Warfare	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

38.3.3.5 Irregular Warfare and Special Operations reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 38; [239, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Declassified training-manual archive	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Principles of Tradecraft for Resistance: Hybrid-threat indicator review using sample scenarios and policy thresholds	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Underground Intelligence Networks: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

Lesson topic	Practice lens	Evidence artifact	Safety check
OSS Simple Sabotage Field Manual: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings
Morale Operations: Hybrid-threat indicator review using sample scenarios and policy thresholds	Dissemination-and-Marking Control Lens	dissemination map with audience, caveat, marking, records, and feedback fields	exclude classified content, live release decisions, source-method exposure, and improvised control markings

38.3.3.6 Irregular Warfare and Special Operations annotated source ledger: real titles and local contribution Each source cited by this **Counterintelligence and Source-Integrity Defense** module is paired below with its real title and a one-line note on what it contributes to **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Source	Cited work	What it contributes	Status
[239, 2026]	Digital Space and Human Rights	Official OHCHR digital rights portal.	original source-guide
[249, 2026]	GovTech: Putting People First	The official page for the World Bank's Global Program on GovTech and Public Sector Innovation, which helps governments use technology and data to improve public services and governance. It describes support for digital transformation in public administration across areas such as tax administration, public financial management, human resource systems, and citizen engagement, with cross-cutting themes including responsible AI and green digital transformation.	verified source-guide
[266, 2026]	PROV Overview	A W3C Working Group Note from 2013 that provides an overview and roadmap for the PROV family of specifications for representing and exchanging provenance information on the web. It defines provenance as information about the entities, activities, and people involved in producing data, used to assess quality, reliability, and trustworthiness.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[277, 2026]	Endorsed WP29 Guidelines	This is a European Data Protection Board webpage listing guidelines and documents originating from the Article 29 Working Party that the EDPB endorsed at its first plenary meeting. The catalogued materials relate to the GDPR and cover topics such as consent and transparency, data breach notification, automated decision-making and profiling, data protection impact assessments, data protection officers, and binding corporate rules.	verified source-guide

Source	Cited work	What it contributes	Status
[284, 2026]	Verifiable Credential Data Integrity 1.0	The W3C Recommendation for Verifiable Credential Data Integrity 1.0, published May 2025, defining mechanisms for ensuring the authenticity and integrity of verifiable credentials using cryptographic proofs. It specifies a process of data transformation, hashing, and proof generation, and a corresponding verification procedure, along with a proof data model containing properties such as type, verification method, purpose, and proof value.	verified source-guide
[288, 2026]	Algorithmic Transparency Recording Standard Hub	A GOV.UK collection page serving as the hub for the UK Algorithmic Transparency Recording Standard (ATRS), maintained by the Government Digital Service. It provides a standardized template for documenting public-sector use of algorithmic tools, completion guidance, policy on scope and compliance, and a searchable repository of published transparency records.	verified source-guide
[289, 2026]	Guidance for Organisations Using the Algorithmic Transparency Recording Standard	This is a GOV.UK guidance page published by the Government Digital Service that instructs public sector organizations on completing the Algorithmic Transparency Recording Standard (ATRS) template and publishing their records to the GOV.UK repository. It applies both to central government bodies required to publish under mandatory policy and to other public sector bodies doing so voluntarily.	verified source-guide
[293, 2026]	Inventory of NARA Artificial Intelligence (AI) Use Cases	The National Archives and Records Administration (NARA) official inventory of its artificial intelligence use cases, documenting 14 projects across deployed, pilot, and planned stages. Deployed efforts include workplace productivity tools, automated tagging for museum experiences, and historical record retrieval, while pilots cover PII detection and redaction, semantic search, and metadata generation, and planned work targets FOIA processing and public search.	verified source-guide
[112, 2026]	Full text of “Special Forces Unconventional Warfare”	This U.S. Army Training Circular (TC 18-01) defines the Special Forces concept for planning and conducting unconventional warfare operations, covering how units enable and support resistance movements in denied or hostile territory. It presents a seven-phase operational framework encompassing psychological preparation, infiltration, organization of underground and guerrilla forces, employment, and transition.	verified source-guide

Source	Cited work	What it contributes	Status
[113, 2026]	FM 3-05.130 Army Special Operations Forces Unconventional	U.S. Army Field Manual FM 3-05.130, "Army Special Operations Forces Unconventional Warfare," published by Headquarters, Department of the Army in September 2008. The manual is organized into chapters covering an introduction to warfare types, the instruments of United States national power, national policy and doctrine, and planning considerations including the seven phases of unconventional warfare and the role of Army Special Operations Forces.	verified source-guide
[114, 2026]	Army Special Operations Forces Unconventional Warfare	FM 3-05.130, Army Special Operations Forces Unconventional Warfare (Headquarters, Department of the Army, 30 September 2008). The manual defines unconventional warfare and situates it within U.S. national power, covering the seven phases of UW operations, Special Forces missions, psychological operations, civil affairs operations in the UW context, and the roles of supporting elements including interagency partners. Distribution was restricted to U.S.	verified source-guide
[115, 2026]	Army Special Operations Forces Intelligence	FM 3-05.102, Army Special Operations Forces Intelligence (Headquarters, Department of the Army). The manual addresses intelligence and electronic warfare (IEW) support across Army Special Operations Force components, covering Special Forces, Rangers, ARSOA, PSYOP, and Civil Affairs operations.	verified source-guide
[116, 2026]	Army Special Operations Forces Intelligence	A U.S. Army field manual, FM 3-05.102 (Army Special Operations Forces Intelligence), dated 2001 and superseding FM 34-36, distributed with restrictions to U.S. government agencies. The manual gives special operations forces commanders and staff a doctrinal overview of intelligence support to their missions, covering force structure, training, and operational requirements consistent with joint doctrine.	verified source-guide
[117, 2026]	Office of Strategic Services (OSS) Manuals	An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia.	verified source-guide
[118, 2026]	Special Operations Field Manual, Strategic Services (provisional	A digitized World War II field manual from the Internet Archive, the Special Operations Field Manual, Strategic Services (provisional), issued July 18, 1944 by the U.S. Office of Strategic Services (OSS). The 32-page manual sets out the authorized functions, operational plans, methods, and organization of OSS Maritime Units and the broader Special Operations Branch.	verified source-guide
[119, 2026]	office of strategic services - ARSOF History	See bibliography for scope.	original source-guide

Source	Cited work	What it contributes	Status
[120, 2026]	PRINCIPLES TRADECRAFT	Principles of Tradecraft, a 1995 publication by Militia Free Press (a subsidiary of The Resister). The document presents an overview of intelligence and espionage concepts, with chapters covering an introduction to espionage, agents (typology, identification, recruitment, and handling), and agent organization and management including personnel and structures. It is framed as an introductory treatment rather than a comprehensive reference on intelligence requirements.	verified source-guide
[308, 2026]	Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure	An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure.	verified source-guide
[311, 2026]	Countering Information Threats	An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering.	verified source-guide

Where this sits. This module's overview is Section 38; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

38.3.4 Irregular Warfare and Special Operations governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 38; [239, 2026].

38.3.5 Irregular Warfare and Special Operations analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 26's governance-boundary section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Counterintelligence and Source-Integrity Defense** for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [249, 2026].

Curriculum topic spine: Hybrid-threat indicator review using sample scenarios and policy thresholds, **FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**, **FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds**. **Verified anchor cluster:** [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]; [Agency, 2009]; [Jr., 2007]; [Burkett, 2013].

Conceptual depth: defending institutions, sources, and judgments against deception, insider risk, foreign-intelligence targeting, and source contamination.

Method stack: threat awareness, source-descriptor audit, corroboration, anomaly review, red-team challenge, and protected disclosure paths.

Composability contract: identity, access, reporting, corroboration, caveats, and confidence are modeled independently so defensive review can happen without exposure.

Known failure modes: source compromise, deception acceptance, identity overconfidence, insider blind spots, and collapsing CI concerns into undifferentiated IT-security triage.

Defensive boundary: CI content supports defensive awareness, source protection, and analytic integrity; it does not provide surveillance or handling playbooks. Applied to **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Anchor	Why it matters here
[Counterintelligence and Center, 2024]	Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 1981]	Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026d]	Official sourcing directive for traceability, citations, source descriptors, and source summaries. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2015]	Official ODNI analytic tradecraft standards directive. Checked as of 2026-05-21; role: source_quality_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.
[Jr., 2007]	Foundational analytic cognition source for bias, mental models, and structured reasoning. Checked as of 2026-06-06; role: curriculum_anchor.
[Burkett, 2013]	A CIA Studies in Intelligence analyst essay arguing that the traditional MICE recruitment-motivation model (Money, Ideology, Compromise, Ego) is better understood through Cialdini's influence principles reframed as RASCLS (Reciprocation, Authority, Scarcity, Commitment/Consistency, Liking, Social Proof), grounding the historical and conceptual lineage of HUMINT recruitment frameworks. Checked as of 2026-06-08; role: curriculum_anchor.

38.3.5.1 Irregular Warfare and Special Operations evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Counterintelligence and Source-Integrity Defense** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [239, 2026]; [249, 2026].

38.3.6 Irregular Warfare and Special Operations agentic boundary: assist, approve, block, and record

Evidence anchor. Section 38; [239, 2026].

AGEINT translation is bounded by the **Counterintelligence and Source-Integrity Defense** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

38.3.6.1 Irregular Warfare and Special Operations permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.**

Section 38; [239, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

38.3.6.2 Irregular Warfare and Special Operations excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [239, 2026]; [249, 2026] and **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

38.3.7 Irregular Warfare and Special Operations governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 38; [239, 2026].
Governance is practiced as a gate on the **Counterintelligence and Source-Integrity Defense** lane. Learners use the **Dissemination-and-Marking Control Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

38.3.7.1 Irregular Warfare and Special Operations governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [239, 2026]; [249, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Counterintelligence and Source-Integrity Defense** failure modes and the **Dissemination-and-Marking Control Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

38.3.7.2 Irregular Warfare and Special Operations evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 38; [239, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Dissemination-and-Marking Control Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

38.3.7.3 Irregular Warfare and Special Operations current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [249, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_ncsc_counterintelligence_strategy` for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**?	The National Counterintelligence Strategy; lane `counterintelligence_source_integrity`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official strategy for defensive CI integration, foreign-intelligence threat awareness, strategic advantage protection, and future readiness.
What does the module inherit from `official_odni_eo_12333` for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Executive Order 12333: United States Intelligence Activities; lane `legal_oversight`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official legal anchor for intelligence authorities, rights-aware collection, analytic competition, oversight, and source-method protection.
What does the module inherit from `official_odni_icd_206` for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Intelligence Community Directive 206: Sourcing Requirements for Disseminated Analytic Products; lane `analytic_tradecraft`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official sourcing directive for traceability, citations, source descriptors, and source summaries.
What does the module inherit from `official_odni_icd_203` for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Intelligence Community Directive 203: Analytic Standards; lane `source_quality_spine`; checked 2026-05-21.	dissemination map with audience, caveat, marking, records, and feedback fields; Official ODNI analytic tradecraft standards directive.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 38; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

38.3.8 Irregular Warfare and Special Operations assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 38; [239, 2026].

38.3.9 Irregular Warfare and Special Operations assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 38; [239, 2026].

38.3.9.1 Irregular Warfare and Special Operations capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.
Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** and [239, 2026]; [249, 2026].

38.3.9.2 Irregular Warfare and Special Operations instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** and [239, 2026]; [249, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

38.3.9.3 Irregular Warfare and Special Operations assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Hybrid-threat indicator review using sample scenarios and policy thresholds	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
FM 3-05 102: Hybrid-threat indicator review using sample scenarios and policy thresholds	Completed **dissemination map with audience, caveat, marking, records, and feedback fields** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

38.3.10 Irregular Warfare and Special Operations refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [239, 2026]; [249, 2026] and **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**.

38.3.10.1 Irregular Warfare and Special Operations refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**. The local signals begin with [239, 2026]; [249, 2026].

38.3.10.2 Irregular Warfare and Special Operations claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**, and the source spine for these checks begins with [239, 2026]; [249, 2026].

38.3.11 Irregular Warfare and Special Operations reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [239, 2026]; [249, 2026].
Triangulation anchors. In module 26's review-checklist section, directly verified anchors for the **Counterintelligence and Source-Integrity Defense** lane include [Counterintelligence and Center, 2024]; [Archives and Administration, 1981]; [of the Director of National Intelligence, 2026d]; [of the Director of National Intelligence, 2015]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds**. [239, 2026]; [249, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.

- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

38.3.12 Irregular Warfare and Special Operations learning-path links: module map, overview, and curriculum atlas

These links keep **Hybrid-threat indicator review using sample scenarios and policy thresholds; FM 3-05 130: Hybrid-threat indicator review using sample scenarios and policy thresholds** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [239, 2026]; [249, 2026].
Section 2, Section 35, Section 37, Section 39

39 HISTORICAL INTELLIGENCE SERVICES

39.1 HISTORICAL INTELLIGENCE SERVICES learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 39; [266, 2026].

39.1.1 declassified-source interpretation discipline spine: domain question and learning focus

Evidence anchor. Section 39; [266, 2026].
This unit teaches **declassified-source interpretation**. Historical intelligence lessons use archives, redaction caveats, institutional context, and reform lessons without reconstructing live tradecraft.

39.1.2 declassified-source interpretation source-use contract: citation roles and evidence limits

Evidence anchor. Section 39; [266, 2026].
Use source-guide citations and official historical-source anchors for release context, provenance, and oversight lessons.

39.1.3 declassified-source interpretation practice artifact: recurring packet and retained evidence

Evidence anchor. Section 39; [266, 2026].
The recurring practice artifact is a **declassified case-to-principle card** that draws on release metadata, redaction caveat, timeline note, and institutional lesson. The unit keeps its learning spine explicit. Learners mark what the record can support, what redaction leaves unknown, and what institutional lesson survives context shift.

39.1.4 declassified-source interpretation safety boundary: accountable, synthetic, and evidence-bounded limits

No current sources-and-methods reconstruction, operational emulation, or tactical transfer.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [266, 2026]; [267, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [266, 2026]; [267, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [266, 2026]; [267, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [266, 2026]; [267, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Historical and Declassified Intelligence Services. Core anchors: [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]. Conceptual focus: turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform. Composability contract: archive source, release channel, historical context, analytic lesson, oversight implication, and modern analogy remain explicitly separated. **Practice lens:** Historical Case-Translation Lens; Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations? [266, 2026]; [267, 2026].

39.1.5 HISTORICAL INTELLIGENCE SERVICES visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 79 and Figure 80 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 38, Section 40.

39.1.6 HISTORICAL INTELLIGENCE SERVICES module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
Soviet and Russian Intelligence	Section 40	[266, 2026]; [267, 2026]; [269, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [121, 2026]; [122, 2026]; [032, 2026]; [021, 2026]; [123, 2026]; [124, 2026]; [125, 2026]; [126, 2026]; [127, 2026]; [022, 2026]; [297, 2026]; [298, 2026].

Module	Section reference	Source spine
American Intelligence History	Section 41	[266, 2026]; [269, 2026]; [271, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [128, 2026]; [129, 2026]; [117, 2026]; [119, 2026]; [118, 2026]; [130, 2026]; [120, 2026]; [088, 2026]; [089, 2026]; [090, 2026]; [091, 2026]; [131, 2026]; [132, 2026]; [133, 2026]; [019, 2026]; [034, 2026]; [047, 2026]; [038, 2026]; [039, 2026]; [036, 2026]; [297, 2026]; [298, 2026].
British and Allied Intelligence	Section 42	[266, 2026]; [269, 2026]; [270, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [007, 2026]; [134, 2026]; [011, 2026]; [135, 2026]; [010, 2026]; [041, 2026]; [042, 2026].
Israeli and Continental Services	Section 43	[266, 2026]; [267, 2026]; [271, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [008, 2026]; [136, 2026]; [297, 2026]; [298, 2026].

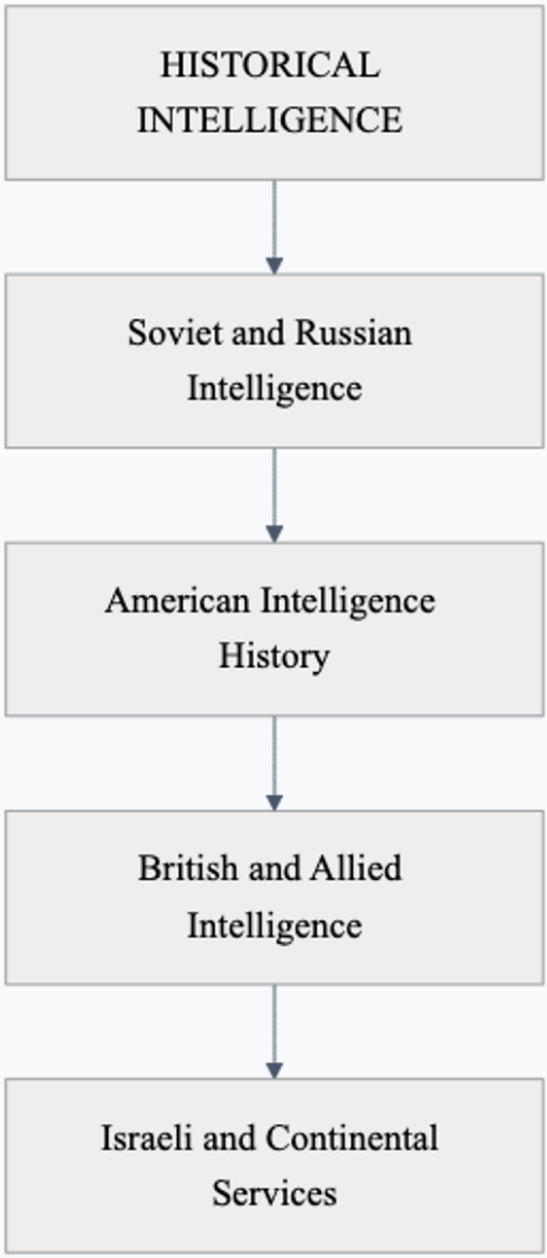

Figure 79: The unit module map traces the part's chapters as a linear reading sequence. In the historical intelligence services section, it lets readers compare 4 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last so the visual functions as a traceable course aid rather than an unscoped assertion.

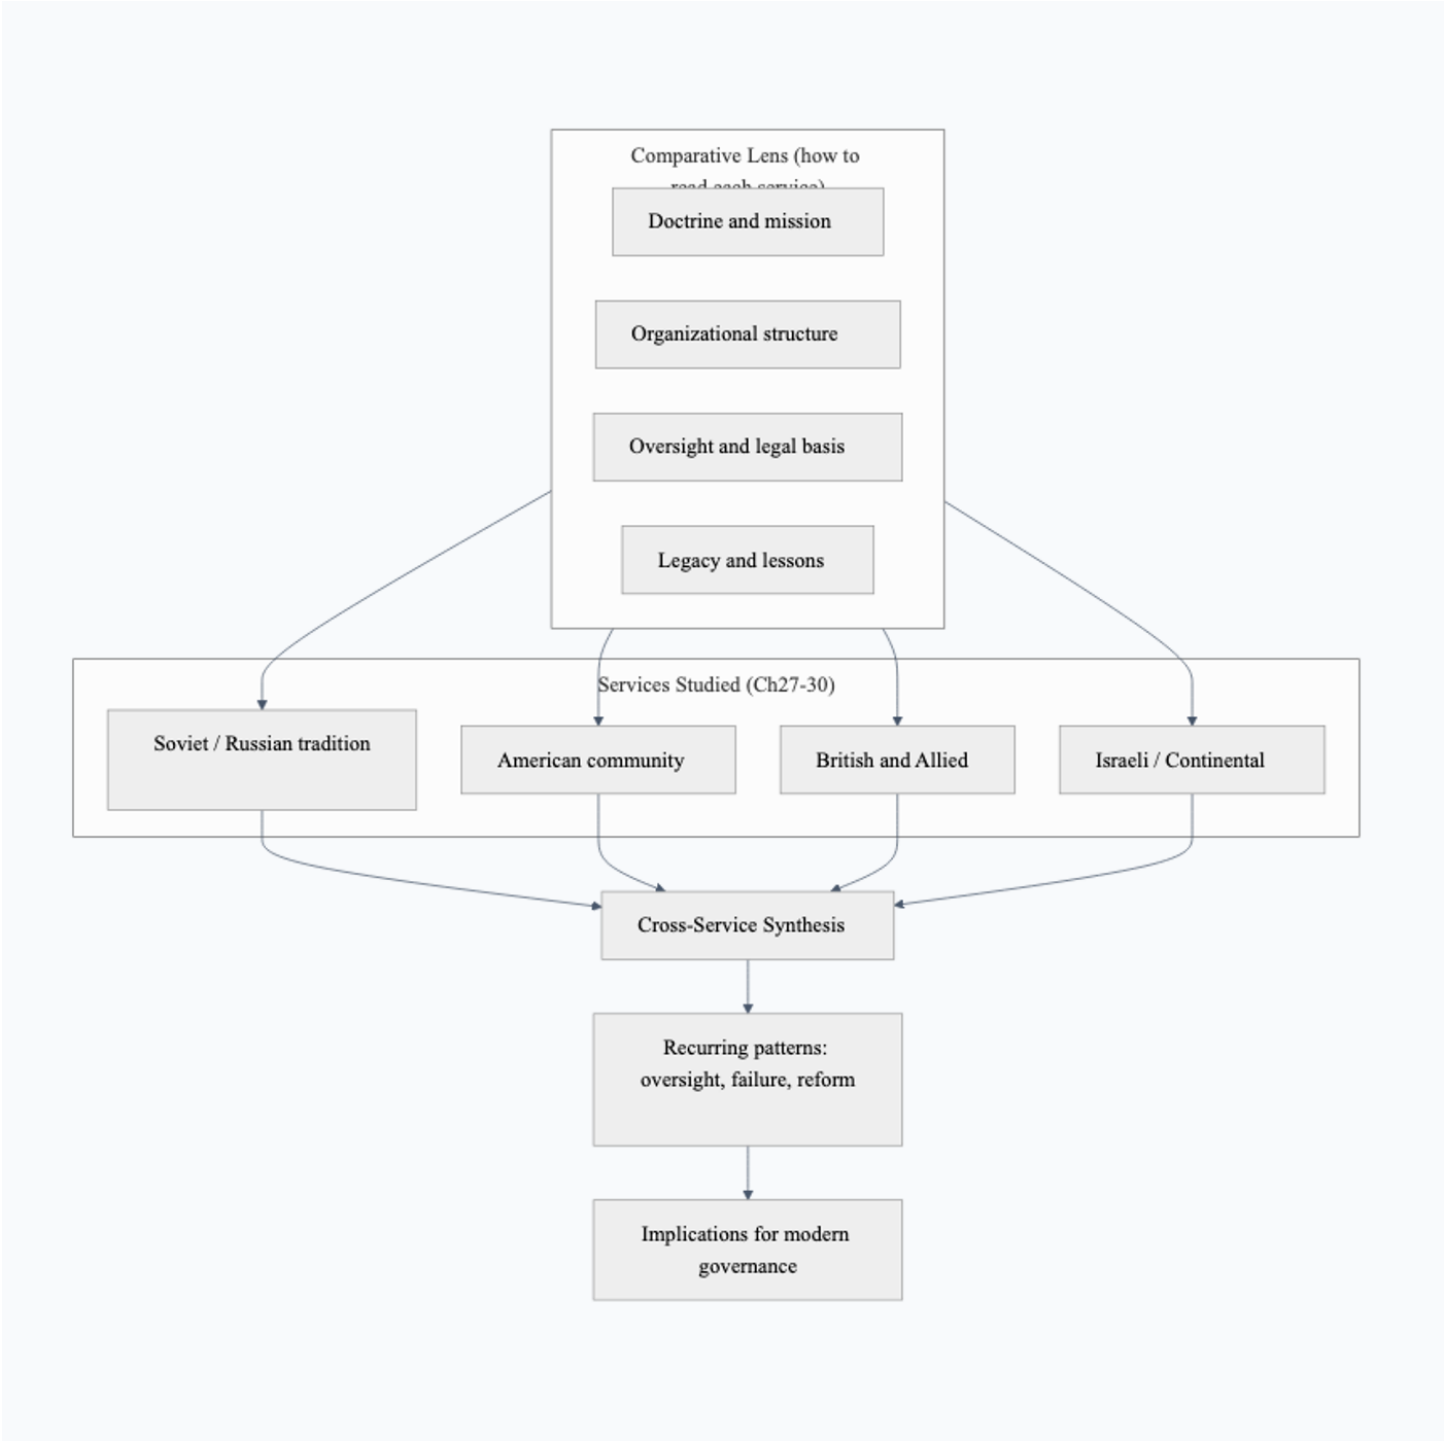

Figure 80: This part applies one comparative lens to four intelligence traditions and folds them into a synthesis that surfaces the recurring patterns of oversight, failure, and reform that shape modern governance. Its reader value is to make Comparative Lens (how to read each service), Doctrine and mission, Organizational structure, and Oversight and legal basis visible at a glance, with the historical intelligence services section as the source section and defensive review as the boundary.

40 Soviet and Russian Intelligence

40.0.1 Soviet and Russian Intelligence figures and course links: visual evidence, source flow, and navigation

The module uses Figure 81 and Figure 79 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 39, Section 41.
This module teaches the **Historical and Declassified Intelligence Services** lane through a bounded, source-backed coursebook chapter. [266, 2026]; [267, 2026].

40.1 Historical and Declassified Intelligence Services frame for Soviet and Russian Intelligence: source context, topic focus, and reader task

Evidence anchor. Section 40; [266, 2026].

40.1.1 Soviet and Russian Intelligence orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 40; [266, 2026].

40.1.2 Soviet and Russian Intelligence conceptual primer: source context, core model, and reader task

This chapter teaches historical intelligence study as declassified evidence review: archives teach institutional lessons when provenance, redaction, context, and modern boundaries are explicit. The chapter uses **Historical Case-Translation Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.
The central distinction is to separate historical lesson from reconstruction of live tactics or current sources and methods. Core topics include **Declassified source-protection and institutional-control case study; Declassified training-manual archive; Declassified source-protection and agent-handling ethics**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [266, 2026]; [267, 2026].
Learners move from vocabulary and the **Historical Case-Translation Lens** distinction through topic lessons on **Declassified source-protection and institutional-control case study** with evidence and misconception checks, then assemble a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with safety and rights gates.

40.1.3 Soviet and Russian Intelligence learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 40; [266, 2026].

- Connect **Declassified source-protection and institutional-control case study and Declassified training-manual archive** to **Historical and Declassified Intelligence Services** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate historical lesson from reconstruction of live tactics or current sources and methods; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as romanticized tradecraft, presentist interpretation, redaction overclaiming, decontextualized case reuse, and translating history into operational instructions, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: historical modules use declassified or public records for analysis and governance lessons only; they do not reconstruct live tactics, sources, methods, or current field procedures.

40.1.4 Soviet and Russian Intelligence core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 40; [266, 2026].

Term	Working definition
Declassification context	the release channel, date, and limits of an official historical source
Redaction caveat	the warning that missing text may change interpretation
Institutional lesson	the durable governance or analytic principle drawn from a case
Presentism	the error of forcing modern assumptions onto a historical record
Modern analogy	a bounded comparison that preserves differences between eras
Oversight failure	a documented breakdown in review, records, or accountability visible in the archive
Source-protection lesson	the historical principle about protecting people and methods without reconstructing live tradecraft
Declassified source-protection and…	Key terms: Declassified, protection, institutional.
Declassified training-manual archive	Key terms: Declassified, training, manual.

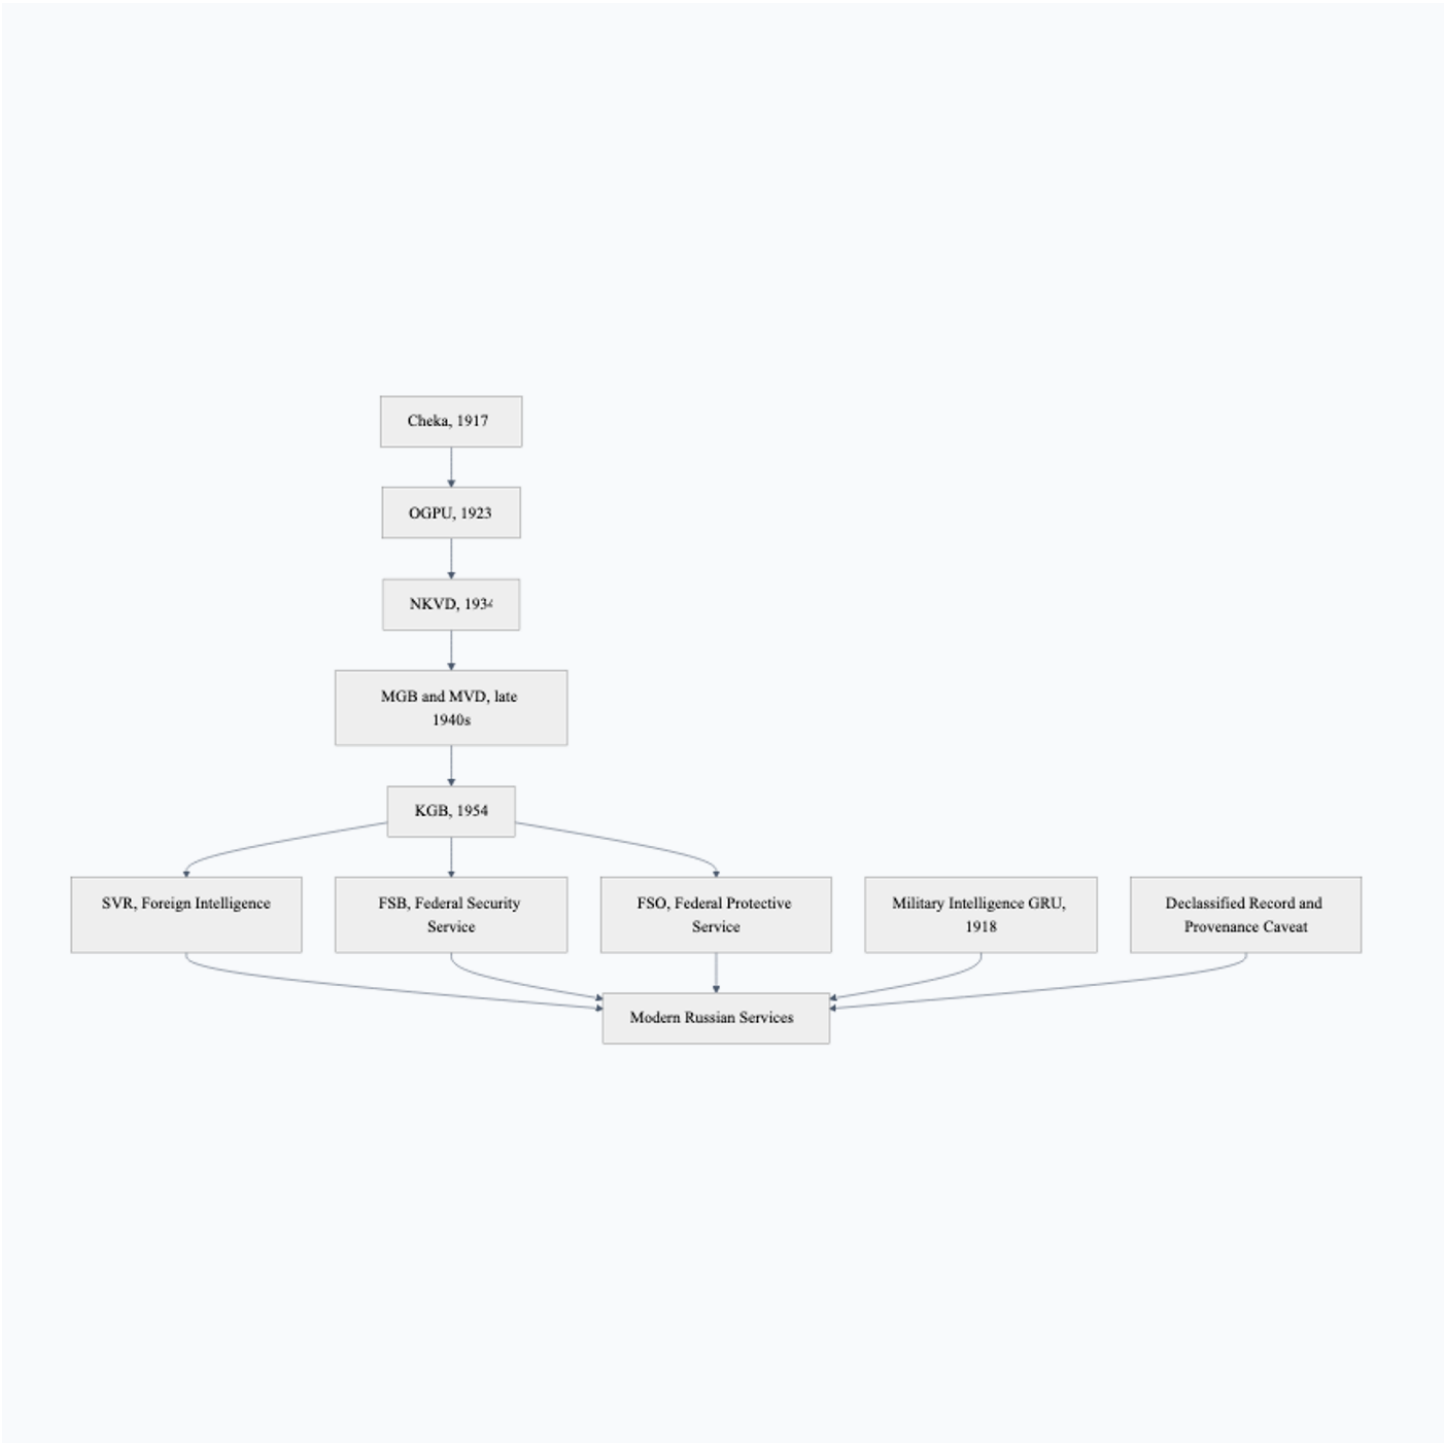

Figure 81: A historical organizational chart tracing the institutional lineage of Soviet and Russian state security from the Cheka to its modern successor services, studied from the declassified record. In the historical intelligence services / soviet and russian intelligence section, it lets readers compare Cheka, 1917, OGPU, 1923, NKVD, 1934, and MGB and MVD, late 1940s so the visual functions as a traceable course aid rather than an unscoped assertion.

40.2 Historical Case-Translation Lens path for Soviet and Russian Intelligence: lesson cluster, safe artifact, and review

Evidence anchor. Section 40; [266, 2026].

40.2.1 Soviet and Russian Intelligence practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 40; [266, 2026].

40.2.2 Soviet and Russian Intelligence topic lessons: source-backed concepts and transfer tasks

This module builds historical intelligence study as declassified evidence review: archives teach institutional lessons when provenance, redaction, context, and modern boundaries are explicit. The sequence opens with **Declassified source-protection and institutional-control case study**, **Declassified training-manual archive**, **Declassified source-protection and agent-handling ethics** and applies the **Historical Case-Translation Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 79; module overview Section 40; curriculum atlas Section 2.

Triangulation anchors. In module 27's topic-lessons section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

40.2.2.1 Lesson 1: Declassified source-protection and institutional-control case study

Concept. Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Analysts use **Declassified source-protection** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. Declassified source-protection and institutional-control case study rests on [121, 2026]. The lead source's own note reads: This is a Blockint blog post by Ludo Block, published in October 2022, analyzing a KGB training manual on information handling released by the Free Russia Foundation. Use it for the working definition that **Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified source-protection**, reason from the sources cited in this row. [121, 2026] This is a Blockint blog post by Ludo Block, published in October 2022, analyzing a KGB training manual on information handling released by the Free Russia Foundation. The manual, written for foreign intelligence officers, sets out six requirements for valuable intelligence and a framework for evaluating sources based on past performance and competence. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Declassified source-protection**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection and institutional-control case**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Declassified source-protection** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **Declassified source-protection** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

40.2.2.2 Lesson 2: Declassified training-manual archive

Concept. Declassified training-manual archive studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Without explicit treatment of **Declassified training-manual archive**, romanticized tradecraft undermines declassified-source interpretation and case-to-principle translation review; the lesson builds the habit to separate historical lesson from reconstruction of live tactics or current sources and methods.

Source support. Declassified training-manual archive rests on [122, 2026]. Use it for the working definition that **Declassified training-manual archive** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Read **Declassified training-manual archive** against the works cited for this row. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified training-manual archive**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Declassified training-manual archive**: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **Declassified training-manual archive** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

40.2.2.3 Lesson 3: Declassified source-protection and agent-handling ethics

Concept. Declassified source-protection and agent-handling ethics treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Analysts use **Declassified source-protection** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. Declassified source-protection and agent-handling ethics rests on [032, 2026]. The most specific cited work observes: The 144-page volume is presented as a historical document on Soviet human-intelligence doctrine and counterintelligence practice. Use it for fixing what **Declassified source-protection and agent-handling ethics** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Read **Declassified source-protection** against the works cited for this row. [032, 2026] A Google Books catalog entry for a 2025 English-translation edition of a Cold War-era Soviet intelligence training manual, published by Century Print Media Group with a translator's note by a retired NATO intelligence officer. The 144-page volume is presented as a historical document on Soviet human-intelligence doctrine and

counterintelligence practice. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Declassified source-protection**: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Apply this module's safe boundary for **Declassified source-protection** to another artifact while keeping declassified-source interpretation and case-to-principle translation and reviewer ownership explicit.

40.2.2.4 Lesson 4: Working with Information in Intelligence (1970s)

Concept. Working with Information in Intelligence (1970s) applies Working, Information, in within Historical and Declassified Intelligence Services: learners use separate historical lesson from reconstruction of live tactics or current sources and methods and declassified-source interpretation and case-to-principle translation evidence before any judgment moves forward.

Why it matters. Without explicit treatment of **Working with Information in Intelligence (1970s)**, romanticized tradecraft undermines declassified-source interpretation and case-to-principle translation review; the lesson builds the habit to separate historical lesson from reconstruction of live tactics or current sources and methods.

Source support. Working with Information in Intelligence (1970s) rests on [121, 2026]. The closest source to this row notes: The manual, written for foreign intelligence officers, sets out six requirements for valuable intelligence and a framework for evaluating sources based on past performance and competence. Use it for pinning down the scope of **Working with Information in Intelligence (1970s)**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Working with Information in Intelligence (1970s)**, work from the cited evidence behind this row. [121, 2026] This is a Blockint blog post by Ludo Block, published in October 2022, analyzing a KGB training manual on information handling released by the Free Russia Foundation. The manual, written for foreign intelligence officers, sets out six requirements for valuable intelligence and a framework for evaluating sources based on past performance and competence. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Working with Information in Intelligence (1970s)**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must name the source descriptor, the bounded claim about **Working with Information in Intelligence**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Working with Information in Intelligence (1970s) is optional whenever separate historical lesson from reconstruction of live tactics or current sources and methods feels inconvenient.

Transfer task. Transfer **Working with Information in Intelligence (1970s)** to a second module by preserving declassified-source interpretation and case-to-principle translation, changing the source evidence, and naming a new reviewer.

40.2.2.5 Lesson 5: Declassified psychological-pressure ethics

Concept. Declassified psychological-pressure ethics studies the declassified record for institutional lessons about source protection, oversight, and the danger of translating historical methods into current practice.

Why it matters. Declassified psychological-pressure ethics matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. Declassified psychological-pressure ethics rests on [021, 2026]. Its anchor reference records: The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Use it for the claim that **Declassified psychological-pressure ethics** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified psychological-pressure ethics**, reason from the sources cited in this row. [021, 2026] A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified psychological-pressure ethics**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as a **declassified case-to-principle card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Declassified psychological-pressure ethics**: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Apply this module's safe boundary for **Declassified psychological-pressure ethics** to another artifact while keeping declassified-source interpretation and case-to-principle translation and reviewer ownership explicit.

40.2.2.6 Lesson 6: Some Aspects of Training Agents Psychologically (1985)

Concept. Some Aspects of Training Agents Psychologically (1985) applies Some, Aspects, Training within Historical and Declassified Intelligence Services: learners use separate historical lesson from reconstruction of live tactics or current sources and methods and declassified-source interpretation and case-to-principle translation evidence before any judgment moves forward.

Why it matters. Some Aspects matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. Some Aspects of Training Agents Psychologically (1985) rests on [021, 2026]. The lead source's own note reads: The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Use it for fixing what **Some Aspects of Training Agents Psychologically (1985)** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Some Aspects**, reason from the sources cited in this row. [021, 2026] A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Some Aspects**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must name the source descriptor, the bounded claim about **Some Aspects of Training Agents**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Some Aspects** work as a **declassified case-to-principle card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Some Aspects of Training Agents Psychologically (1985) replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Some Aspects** to a second module by preserving declassified-source interpretation and case-to-principle translation, changing the source evidence, and naming a new reviewer.

40.2.2.7 Lesson 7: Exposure of Disinformation in Intelligence Materials (1968)

Concept. Exposure of Disinformation in Intelligence Materials (1968) analyzes influence campaigns through provenance, audience harm, attribution caution, and transparent response options.

Why it matters. Analysts use **Exposure of Disinformation in Intelligence Materials (1968)** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. Exposure of Disinformation in Intelligence Materials (1968) rests on [021, 2026]. The most specific cited work observes: The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Use it for fixing what **Exposure of Disinformation in Intelligence Materials (1968)** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Exposure of Disinformation in Intelligence Materials (1968)**, work from the cited evidence behind this row. [021, 2026] A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Exposure of Disinformation in Intelligence Materials (1968)**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must name the source descriptor, the bounded claim about **Exposure of Disinformation in Intelligence**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Exposure of Disinformation in Intelligence Materials (1968) can be used while ignoring the rule to separate historical lesson from reconstruction of live tactics or current sources and methods.

Transfer task. Transfer **Exposure of Disinformation in Intelligence Materials (1968)** to a second module by preserving declassified-source interpretation and case-to-principle translation, changing the source evidence, and naming a new reviewer.

40.2.2.8 Lesson 8: Organizational Structure and Management of Intelligence Residency

Concept. Organizational Structure and Management of Intelligence Residency applies Organizational, Structure, Management within Historical and Declassified Intelligence Services: learners use separate historical lesson from reconstruction of live tactics or current sources and methods and declassified-source interpretation and case-to-principle translation evidence before any judgment moves forward.

Why it matters. Organizational Structure matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. Organizational Structure and Management of Intelligence Residency rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the working definition that **Organizational Structure and Management of Intelligence Residency** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Ground **Organizational Structure** in the evidence the row cites. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Organizational Structure**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must name the source descriptor, the bounded claim about **Organizational Structure and Management of**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Organizational Structure** work as a **declassified case-to-principle card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Organizational Structure and Management of Intelligence Residency is optional whenever separate historical lesson from reconstruction of live tactics or current sources and methods feels inconvenient.

Transfer task. Transfer **Organizational Structure** to a second module by preserving declassified-source interpretation and case-to-principle translation, changing the source evidence, and naming a new reviewer.

40.2.2.9 Lesson 9: Declassified confidential-contact oversight

Concept. Declassified confidential-contact oversight studies the declassified record for institutional lessons about source protection, oversight, and the danger of translating historical methods into current practice.

Why it matters. Declassified confidential-contact oversight connects classroom vocabulary to Historical and Declassified Intelligence Services practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Declassified confidential-contact oversight rests on [122, 2026]. Use it for pinning down the scope of **Declassified confidential-contact oversight**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Ground **Declassified confidential-contact oversight** in the evidence the row cites. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified confidential-contact oversight**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Declassified confidential-contact oversight**: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **Declassified confidential-contact oversight** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

40.2.2.10 Lesson 10: Declassified residency-management oversight **Concept. Declassified residency-management oversight** studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Declassified residency-management oversight matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. Declassified residency-management oversight rests on [122, 2026]. Use it for fixing what **Declassified residency-management oversight** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified residency-management oversight**, work from the cited evidence behind this row. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified residency-management oversight**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Declassified residency-management oversight**: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Apply this module's safe boundary for **Declassified residency-management oversight** to another artifact while keeping declassified-source interpretation and case-to-principle translation and reviewer ownership explicit.

40.2.2.11 Lesson 11: Declassified special-unit oversight case **Concept. Declassified special-unit oversight case** studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Analysts use **Declassified special-unit oversight case** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. Declassified special-unit oversight case rests on [123, 2026]. Its anchor reference records: Dolmatov, accompanied by an extensive preface by Western trainer Jim Shortt. Use it for fixing what **Declassified special-unit oversight case** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified special-unit oversight case**, reason from the sources cited in this row. [123, 2026] A 1993 Paladin Press publication presenting a translated Soviet special-operations training text attributed to A. I. Dolmatov, accompanied by an extensive preface by Western trainer Jim Shortt. The preface traces the evolution of Soviet special forces from the 1917 revolution through the Cold War and describes organizations such as the KGB, MVD, and GRU and units including Alpha, Spetsnaz, and OMON. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified special-unit oversight case**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Declassified special-unit oversight case**: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **Declassified special-unit oversight case** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

40.2.2.12 Lesson 12: Mitrokhin Archive: Declassified source-protection and institutional-control case study **Concept. Mitrokhin Archive: Declassified source-protection and institutional-control case study** studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Without explicit treatment of **Mitrokhin Archive**, romanticized tradecraft undermines declassified-source interpretation and case-to-principle translation review; the lesson builds the habit to separate historical lesson from reconstruction of live tactics or current sources and methods.

Source support. Mitrokhin Archive: Declassified source-protection and institutional-control case study rests on [124, 2026], [125, 2026], and [126, 2026]. The closest source to this row notes: Zinoviev faced professional retaliation including revocation of his doctorate and expulsion from the Communist Party following the publication of satirical anti-Soviet works such as Yawning Heights. Use them for fixing what **Mitrokhin Archive: Declassified source-protection and institutional-control case study** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Mitrokhin Archive**, work from the cited evidence behind this row. [124, 2026] This article draws on the Mitrokhin Archive, compiled by defected KGB archivist Vasili Mitrokhin, to document Soviet state surveillance of dissident philosopher Alexander Zinoviev, who was assigned the codename Logician by the KGB's Fifth Chief Directorate. Zinoviev faced professional retaliation including revocation of his doctorate and expulsion from the Communist Party following the publication of satirical anti-Soviet works such as Yawning Heights. [125, 2026] The Wilson Center Digital Archive link for the Mitrokhin Archive is a dead staging domain. The Mitrokhin Archive documents Soviet KGB history; use the published Cambridge University Press edition or Wilson Center production archive instead. [126, 2026] A Wikipedia article on the Mitrokhin Archive, a collection of handwritten notes made by KGB archivist Vasili Mitrokhin documenting Soviet intelligence operations from the 1930s through the 1980s. Mitrokhin secretly copied files between 1972 and 1984 while overseeing the relocation of KGB foreign intelligence archives, and after the Soviet collapse defected to the UK in 1992 with the material. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Mitrokhin Archive**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Mitrokhin Archive**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Mitrokhin Archive** work as a **declassified case-to-principle card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Mitrokhin Archive** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

40.2.2.13 Lesson 13: GRU: Soviet Military Intelligence Structure **Concept. GRU: Soviet Military Intelligence Structure** applies GRU, Soviet, Military within Historical and Declassified Intelligence Services: learners use separate historical lesson from reconstruction of live tactics or current sources and methods and declassified-source interpretation and case-to-principle translation evidence before any judgment moves forward.

Why it matters. GRU: Soviet Military Intelligence Structure matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. GRU: Soviet Military Intelligence Structure rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the working definition that **GRU: Soviet Military Intelligence Structure** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Read **GRU: Soviet Military Intelligence Structure** against the works cited for this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **GRU**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must name the source descriptor, the bounded claim about **GRU**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **GRU: Soviet Military Intelligence Structure** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that GRU: Soviet Military Intelligence Structure establishes intent without reviewing alternative explanations.

Transfer task. Transfer **GRU: Soviet Military Intelligence Structure** to a second module by preserving declassified-source interpretation and case-to-principle translation, changing the source evidence, and naming a new reviewer.

40.2.2.14 Lesson 14: Interpreter Magazine: Declassified source-protection and institutional-control case study **Concept. Interpreter Magazine: Declassified source-protection and institutional-control case study** studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Interpreter Magazine connects classroom vocabulary to Historical and Declassified Intelligence Services practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Interpreter Magazine: Declassified source-protection and institutional-control case study rests on [022, 2026]. Its anchor reference records: An article from The Interpreter, a publication focused on Russian affairs and disinformation, announcing a project to translate, analyze, and publish previously unpublished Soviet KGB training documents. Use it for the claim that **Interpreter Magazine: Declassified source-protection and institutional-control case study** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Interpreter Magazine**, reason from the sources cited in this row. [022, 2026] An article from The Interpreter, a publication focused on Russian affairs and disinformation, announcing a project to translate, analyze, and publish previously unpublished Soviet KGB training documents. It summarizes a set of newly obtained manuals spanning several decades and describes the topics they cover, including operational terminology, agent classification, information-gathering methods, recruitment and vetting procedures, and counterintelligence concerns. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Interpreter Magazine**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Interpreter Magazine**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Interpreter Magazine** work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Interpreter Magazine** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

40.2.3 Soviet and Russian Intelligence worked safe example: synthetic inputs, evidence, and review

Worked example: a sample seminar studies a declassified reform episode and extracts an oversight lesson without reconstructing current sources and methods. [266, 2026]; [267, 2026].

Triangulation anchors. In module 27's worked-example section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **declassified-source interpretation**. Learners use a **declassified case-to-principle card** and keep this boundary visible: No current sources-and-methods reconstruction, operational emulation, or tactical transfer.

Frame. The classroom question centers on **Declassified source-protection and institutional-control case study**. Excluded actions stay explicit, and the **Historical Case-Translation Lens** planning question is: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?

Inputs. For the **Declassified source-protection and institutional-control case study** scenario, use public archive metadata, a short excerpt, a timeline template, and an oversight-question worksheet. The Historical Case-Translation Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Declassified source-protection and institutional-control case study**, students record provenance, mark redactions, build timeline, distinguish known from unknown, and extract a governance lesson. Pause whenever an inference about Declassified source-protection and institutional-control case study appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Declassified source-protection and institutional-control case study** classroom scenario; unit artifact = declassified case-to-principle card; evidence = allowed inputs; method = declassified-source interpretation and case-to-principle translation; output = a historical case card with release context, caveats, lesson, and evidence-bounded boundary; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Declassified source-protection and institutional-control case study** as "Historical Case-Translation Lens confirms it" is not enough. The revision ties the claim to declassified-source interpretation and case-to-principle translation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Declassified source-protection and institutional-control case study** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

40.2.4 Soviet and Russian Intelligence practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Historical Case-Translation Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

Triangulation anchors. In module 27's practice-sequence section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Declassified source-protection and institutional-control case study, Declassified training-manual archive, Declassified source-protection and agent-handling ethics; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Historical and Declassified Intelligence Services** lane.
2. Frame	Answer the lens question: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Declassified source-protection and institutional-control case study: historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the declassified case-to-principle card fields for Declassified source-protection and institutional-control case study.	Unit profile note.	Evidence artifacts include release metadata, redaction caveat.
4. Challenge	Test the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.	Failure-mode note.	The artifact applies the key distinction: separate historical lesson from reconstruction of live tactics or current sources and methods.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

40.2.4.1 Soviet and Russian Intelligence instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Declassified source-protection and institutional-control case study; Declassified training-manual archive**. [266, 2026]; [267, 2026].

40.2.4.2 Soviet and Russian Intelligence extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 40; [266, 2026].

Have learners swap artifacts and apply the **Historical Case-Translation Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

40.2.5 Soviet and Russian Intelligence knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 40; [266, 2026].

1. Explain how **Declassified source-protection and institutional-control case study** is defined here; name the source descriptor that supports the definition.
2. Contrast **Declassified source-protection and institutional-control case study** with **Declassified training-manual archive** using the **Historical Case-Translation Lens** artifact fields.
3. Identify one failure mode from the **Historical and Declassified Intelligence Services** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which institutional lesson is defensible from the record, and which claim reconstructs live tradecraft?
5. Correct this misconception: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

40.2.5.1 Soviet and Russian Intelligence answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Declassified source-protection and institutional-control case study** without source evidence, uncertainty, or a safe transfer task.

40.3 Soviet and Russian Intelligence assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 40; [266, 2026].

40.3.1 Soviet and Russian Intelligence evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 40; [266, 2026].

40.3.2 Soviet and Russian Intelligence transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 40; [266, 2026].

40.3.2.1 Soviet and Russian Intelligence lineage and source tradition: profile, concepts, and first anchors This sits in the **Historical and Declassified Intelligence Services** lineage: turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform. [266, 2026]; [267, 2026].

40.3.2.2 Soviet and Russian Intelligence working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 40; [266, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**, with provenance and reviewability throughout.

40.3.2.3 Soviet and Russian Intelligence knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [266, 2026]; [267, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

40.3.2.4 Soviet and Russian Intelligence transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 40; [266, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.
- **Evidence contract:** keep the **Historical and Declassified Intelligence Services** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

40.3.2.5 Soviet and Russian Intelligence profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 40; [266, 2026].

The matched profile emphasizes turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform. The method stack is provenance review, declassification-status notation, institutional timeline building, case-to-principle translation, and uncertainty about redacted records; the local topic cluster is **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

40.3.3 Soviet and Russian Intelligence evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 40; [266, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Historical and Declassified Intelligence Services** profile tells reviewers what evidence is strong enough for the module artifact built around **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

40.3.3.1 Soviet and Russian Intelligence guide source spine: inherited keys and local citation roles Primary guide citations: [266, 2026]; [267, 2026]; [269, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [121, 2026]; [122, 2026]; [032, 2026]; [021, 2026]; [123, 2026]; [124, 2026]; [125, 2026]; [126, 2026]; [127, 2026]; [022, 2026]; [297, 2026]; [298, 2026].

40.3.3.2 Soviet and Russian Intelligence verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [266, 2026]; [267, 2026].

Tier	What counts	How it is used
Source guide	[266, 2026]; [267, 2026]; [269, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [121, 2026]; [122, 2026]; [032, 2026]; [021, 2026]; [123, 2026]; [124, 2026]; [125, 2026]; [126, 2026]; [127, 2026]; [022, 2026]; [297, 2026]; [298, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 27's source-canon section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Declassified source-protection and institutional-control case study; Declassified training-manual archive** and [266, 2026]; [267, 2026], but only directly verified source URLs are encoded as citations.

40.3.3.3 Soviet and Russian Intelligence intelligence practice lens: evidence artifact and safety check Practice lens: **Historical Case-Translation Lens** for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**. [266, 2026]; [267, 2026].

Planning question: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?

Evidence artifact: historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary.

Validation rule: distinguish what the record shows, what remains redacted or unknown, and which governance lesson is defensibly transferable. Applied to **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

Handoff contract: handoff preserves archive citation, historical context, analytic lesson, oversight implication, and modern analogy as separate fields.

Safety check: exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material.

40.3.3.4 Soviet and Russian Intelligence runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 40; [266, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	27.99	27.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Soviet and Russian Intelligence to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Bounded autonomy, procurement, incident-response, and assurance studio	27.101	27.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Soviet and Russian Intelligence	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Model-card, recoverability, retention, and learner-support evidence package	27.102	27.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Soviet and Russian Intelligence	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	27.1	27.1 source title transformed into safe curriculum treatment; original: KGB Structure, Culture, and Doctrine: First Chief Directorate	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Declassified training-manual archive	27.2	27.2 source title transformed into safe curriculum treatment; original: The Lubyanka Files: 29 KGB Training Manuals, 1965–1989	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and agent-handling ethics	27.2.1	27.2.1 source title transformed into safe curriculum treatment; original: Working with Agents (Declassified Manual)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Working with Information in Intelligence (1970s)	27.2.2	27.2.2 Working with Information in Intelligence (1970s)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified psychological-pressure ethics	27.2.3	27.2.3 source title transformed into safe curriculum treatment; original: Psychological Methods and Manipulation of Agents (1988)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Some Aspects of Training Agents Psychologically (1985)	27.2.4	27.2.4 Some Aspects of Training Agents Psychologically (1985)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Exposure of Disinformation in Intelligence Materials (1968)	27.2.5	27.2.5 Exposure of Disinformation in Intelligence Materials (1968)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Organizational Structure and Management of Intelligence Residency	27.2.6	27.2.6 Organizational Structure and Management of Intelligence Residency	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified confidential-contact oversight	27.2.7	27.2.7 source title transformed into safe curriculum treatment; original: On Organizing Work with Confidential Contacts	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified residency-management oversight	27.2.8	27.2.8 source title transformed into safe curriculum treatment; original: Tasks of a KGB Resident Abroad	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified special-unit oversight case	27.3	27.3 source title transformed into safe curriculum treatment; original: KGB Alpha Team Training Manual	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	27.4	27.4 source title transformed into safe curriculum treatment; original: The Mitrokhin Archive: KGB Global Operations	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
GRU: Soviet Military Intelligence Structure	27.5	27.5 GRU: Soviet Military Intelligence Structure	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	27.6	27.6 source title transformed into safe curriculum treatment; original: The Interpreter Magazine: KGB Manual Summaries	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

40.3.3.5 Soviet and Russian Intelligence reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 40; [266, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified training-manual archive	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and agent-handling ethics	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Working with Information in Intelligence (1970s)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified psychological-pressure ethics	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Some Aspects of Training Agents Psychologically (1985)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Exposure of Disinformation in Intelligence Materials (1968)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Organizational Structure and Management of Intelligence Residency	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified confidential-contact oversight	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified residency-management oversight	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified special-unit oversight case	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Mitrokhin Archive: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
GRU: Soviet Military Intelligence Structure	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Interpreter Magazine: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

40.3.3.6 Soviet and Russian Intelligence annotated source ledger: real titles and local contribution Each source cited by this **Historical and Declassified Intelligence Services** module is paired below with its real title and a one-line note on what it contributes to **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

Source	Cited work	What it contributes	Status
[266, 2026]	PROV Overview	A W3C Working Group Note from 2013 that provides an overview and roadmap for the PROV family of specifications for representing and exchanging provenance information on the web. It defines provenance as information about the entities, activities, and people involved in producing data, used to assess quality, reliability, and trustworthiness.	verified source-guide
[267, 2026]	PROV-O: The PROV Ontology	The W3C Recommendation for PROV-O, published in April 2013, which expresses the PROV data model as an OWL2 ontology for representing provenance information across systems. It defines three core classes, Entity, Activity, and Agent, and organizes terms into starting-point, expanded, and qualified categories.	verified source-guide
[269, 2026]	Data on the Web Best Practices	A W3C Recommendation, "Data on the Web Best Practices," published January 31, 2017 by the Data on the Web Best Practices Working Group. It offers 35 best practices for publishing and consuming data on the Web, covering metadata, licensing and provenance, data quality, dataset versioning, persistent URIs, machine-readable formats, vocabulary reuse, access methods, preservation, and feedback.	verified source-guide
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide
[279, 2026]	Open Contracting Data Standard	The documentation homepage for the Open Contracting Data Standard, version 1.1.5, maintained by the Open Contracting Partnership to support disclosure of government contracting data across the procurement lifecycle. It provides a common data model spanning planning, tender, award, contract, and implementation stages, along with a primer, implementation guidance, technical schemas, and validation tooling.	verified source-guide
[283, 2026]	Recommendation of the Council on Open Government	An OECD legal instrument document reproducing the Recommendation of the Council on Open Government (OECD/LEGAL/0438), adopted on 14 December 2017. It defines open government as a culture of governance promoting transparency, integrity, accountability, and stakeholder participation in support of democracy and inclusive growth.	verified source-guide

Source	Cited work	What it contributes	Status
[290, 2026]	NIST SP 800-218A: Secure Software Development Practices for Generative AI and Dual-Use Foundation Models	NIST Special Publication 800-218A (July 2024), which augments the Secure Software Development Framework with practices specific to AI model development across the software lifecycle. Produced in response to Executive Order 14110, it addresses AI model producers, developers building on those models, and acquirers of AI systems, and is designed to be used alongside NIST SP 800-218.	verified source-guide
[291, 2026]	Revised 508 Standards and 255 Guidelines	Official documentation from the U.S. Access Board on the Revised 508 Standards and 255 Guidelines for information and communication technology accessibility. It establishes mandatory accessibility requirements for federal agencies and voluntary guidelines for telecommunications manufacturers, covering hardware, software, websites, electronic documents, and support services.	verified source-guide
[294, 2026]	M-25-21: Accelerating Federal Use of AI through Innovation, Governance, and Public Trust	An April 2025 Office of Management and Budget memorandum (M-25-21) directing executive branch agencies on federal use of artificial intelligence. Issued under Executive Order 14179, it instructs agencies to accelerate adoption of AI to improve public services and government efficiency while maintaining safeguards for civil rights, civil liberties, and privacy.	verified source-guide
[121, 2026]	How the KGB handled information - Blockint	This is a Blockint blog post by Ludo Block, published in October 2022, analyzing a KGB training manual on information handling released by the Free Russia Foundation. The manual, written for foreign intelligence officers, sets out six requirements for valuable intelligence and a framework for evaluating sources based on past performance and competence.	verified source-guide
[122, 2026]	The Lubyanka Files - Free Russia Foundation THINK TANK	See bibliography for scope.	verified source-guide
[032, 2026]	Cited source (see bibliography)	A Google Books catalog entry for a 2025 English-translation edition of a Cold War-era Soviet intelligence training manual, published by Century Print Media Group with a translator's note by a retired NATO intelligence officer. The 144-page volume is presented as a historical document on Soviet human-intelligence doctrine and counterintelligence practice.	verified source-guide
[021, 2026]	Learn how to be a spy from previously unpublished KGB training	A July 2019 story from The World (PRX public radio) about a project led by Michael Weiss to translate previously unpublished Soviet-era KGB training manuals from the 1970s-80s into English. The article describes how the manuals cover intelligence methods such as agent recruitment, psychological manipulation, and disinformation detection, and notes the materials remain relevant because related methods persist in modern Russian services.	verified source-guide

Source	Cited work	What it contributes	Status
[123, 2026]	Full text of "KGB Alpha Team Training Manual" - Internet Archive	A 1993 Paladin Press publication presenting a translated Soviet special-operations training text attributed to A. I. Dolmatov, accompanied by an extensive preface by Western trainer Jim Shortt. The preface traces the evolution of Soviet special forces from the 1917 revolution through the Cold War and describes organizations such as the KGB, MVD, and GRU and units including Alpha, Spetsnaz, and OMON.	verified source-guide
[124, 2026]	The Logician (The Zinoviev's case). Folder 46. The Chekist	This article draws on the Mitrokhin Archive, compiled by defected KGB archivist Vasili Mitrokhin, to document Soviet state surveillance of dissident philosopher Alexander Zinoviev, who was assigned the codename Logician by the KGB's Fifth Chief Directorate. Zinoviev faced professional retaliation including revocation of his doctorate and expulsion from the Communist Party following the publication of satirical anti-Soviet works such as Yawning Heights.	verified source-guide
[125, 2026]	Mitrokhin Archive	The Wilson Center Digital Archive link for the Mitrokhin Archive is a dead staging domain. The Mitrokhin Archive documents Soviet KGB history; use the published Cambridge University Press edition or Wilson Center production archive instead.	verified source-guide
[126, 2026]	Mitrokhin Archive	A Wikipedia article on the Mitrokhin Archive, a collection of handwritten notes made by KGB archivist Vasili Mitrokhin documenting Soviet intelligence operations from the 1930s through the 1980s. Mitrokhin secretly copied files between 1972 and 1984 while overseeing the relocation of KGB foreign intelligence archives, and after the Soviet collapse defected to the UK in 1992 with the material.	verified source-guide context; do not use as primary analytic support
[127, 2026]	The Mitrokhin archive : the KGB and the world	An Internet Archive record for The Mitrokhin Archive: The KGB and the World, a two-volume work by Christopher Andrew published in 1999 by Allen Lane, running to roughly 1,050 pages. The volumes draw on materials compiled by former KGB officer Vasili Mitrokhin to document Soviet intelligence operations, with the first volume covering the KGB in Europe and the West and the second addressing the KGB and the wider world.	verified source-guide
[022, 2026]	Summaries of Newly Obtained KGB Training Manuals - The Interpreter	An article from The Interpreter, a publication focused on Russian affairs and disinformation, announcing a project to translate, analyze, and publish previously unpublished Soviet KGB training documents. It summarizes a set of newly obtained manuals spanning several decades and describes the topics they cover, including operational terminology, agent classification, information-gathering methods, recruitment and vetting procedures, and counterintelligence concerns.	verified source-guide

Source	Cited work	What it contributes	Status
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide

Where this sits. This module's overview is Section 40; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

40.3.4 Soviet and Russian Intelligence governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 40; [266, 2026].

40.3.5 Soviet and Russian Intelligence analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 27's governance-boundary section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Historical and Declassified Intelligence Services** for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**. [266, 2026]; [267, 2026].
Curriculum topic spine: Declassified source-protection and institutional-control case study, **Declassified training-manual archive**, **Declassified source-protection and agent-handling ethics**. **Verified anchor cluster:** [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]; [of the Director of National Intelligence, 2026e]; [Jr., 2007]; [Agency, 2009].
Conceptual depth: turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform.
Method stack: provenance review, declassification-status notation, institutional timeline building, case-to-principle translation, and uncertainty about redacted records.
Composability contract: archive source, release channel, historical context, analytic lesson, oversight implication, and modern analogy remain explicitly separated.
Known failure modes: romanticized tradecraft, presentist interpretation, redaction overclaiming, decontextualized case reuse, and translating history into operational instructions.
Defensive boundary: historical modules use declassified or public records for analysis and governance lessons only; they do not reconstruct live tactics, sources, methods, or current field procedures. Applied to **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

Anchor	Why it matters here
[Agency, 2026a]	Official CSI landing page for Studies in Intelligence, declassified professional reflection, analytic history, and institutional learning. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026h]	Official declassified historical-release library for cryptologic history, SIGINT history, COMSEC, oral histories, and historical cases. Checked as of 2026-05-21; role: curriculum_anchor.
[Office, 2026a]	Official declassified satellite-reconnaissance program archive for CORONA, GAMBIT, POPPY, QUILL, and other historical technical-intelligence cases. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 2026b]	Official NARA guide to CIA Record Group 263, archival provenance, record series, and declassified intelligence research pathways. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026e]	Official ODNI explanation of analytic objectivity, ombuds, and tradecraft standards. Checked as of 2026-05-21; role: curriculum_anchor.
[Jr., 2007]	Foundational analytic cognition source for bias, mental models, and structured reasoning. Checked as of 2026-06-06; role: curriculum_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.

40.3.5.1 Soviet and Russian Intelligence evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Historical and Declassified Intelligence Services** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [266, 2026]; [267, 2026].

40.3.6 Soviet and Russian Intelligence agentic boundary: assist, approve, block, and record

Evidence anchor. Section 40; [266, 2026].
AGEINT translation is bounded by the **Historical and Declassified Intelligence Services** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

40.3.6.1 Soviet and Russian Intelligence permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 40; [266, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

40.3.6.2 Soviet and Russian Intelligence excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [266, 2026]; [267, 2026] and **Declassified source-protection and institutional-control case study; Declassified training-manual archive**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

40.3.7 Soviet and Russian Intelligence governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 40; [266, 2026].
Governance is practiced as a gate on the **Historical and Declassified Intelligence Services** lane. Learners use the **Historical Case-Translation Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact

must stop for human review while using **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

40.3.7.1 Soviet and Russian Intelligence governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [266, 2026]; [267, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Historical and Declassified Intelligence Services** failure modes and the **Historical Case-Translation Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

40.3.7.2 Soviet and Russian Intelligence evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 40; [266, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Historical Case-Translation Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

40.3.7.3 Soviet and Russian Intelligence current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Declassified source-protection and institutional-control case study; Declassified training-manual archive**. [266, 2026]; [267, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cia_center_for_study_of_intelligence` for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**?	Center for the Study of Intelligence; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official CSI landing page for Studies in Intelligence, declassified professional reflection, analytic history, and institutional learning.
What does the module inherit from `official_nsa_historical_releases` for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**?	NSA Historical Releases; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official declassified historical-release library for cryptologic history, SIGINT history, COMSEC, oral histories, and historical cases.
What does the module inherit from `official_nro_declassified_programs` for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**?	Declassified NRO Programs and Projects; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official declassified satellite-reconnaissance program archive for CORONA, GAMBIT, POPPY, QUILL, and other historical technical-intelligence cases.
What does the module inherit from `official_nara_cia_records` for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**?	Records of the Central Intelligence Agency; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official NARA guide to CIA Record Group 263, archival provenance, record series, and declassified intelligence research pathways.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 40; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

40.3.8 Soviet and Russian Intelligence assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 40; [266, 2026].

40.3.9 Soviet and Russian Intelligence assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 40; [266, 2026].

40.3.9.1 Soviet and Russian Intelligence capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Declassified source-protection and institutional-control case study; Declassified training-manual archive** and [266, 2026]; [267, 2026].

40.3.9.2 Soviet and Russian Intelligence instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Declassified source-protection and institutional-control case study; Declassified training-manual archive**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Declassified source-protection and institutional-control case study; Declassified training-manual archive** and [266, 2026]; [267, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

40.3.9.3 Soviet and Russian Intelligence assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Declassified source-protection and institutional-control case study	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Declassified training-manual archive	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Declassified source-protection and agent-handling ethics	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Declassified source-protection and institutional-control case study; Declassified training-manual archive** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

40.3.10 Soviet and Russian Intelligence refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [266, 2026]; [267, 2026] and **Declassified source-protection and institutional-control case study; Declassified training-manual archive**.

40.3.10.1 Soviet and Russian Intelligence refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Declassified source-protection and institutional-control case study; Declassified training-manual archive**. The local signals begin with [266, 2026]; [267, 2026].

40.3.10.2 Soviet and Russian Intelligence claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Declassified source-protection and institutional-control case study; Declassified training-manual archive**, and the source spine for these checks begins with [266, 2026]; [267, 2026].

40.3.11 Soviet and Russian Intelligence reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [266, 2026]; [267, 2026].

Triangulation anchors. In module 27's review-checklist section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Declassified source-protection and institutional-control case study; Declassified training-manual archive**. [266, 2026]; [267, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

40.3.12 Soviet and Russian Intelligence learning-path links: module map, overview, and curriculum atlas

These links keep **Declassified source-protection and institutional-control case study; Declassified training-manual archive** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [266, 2026]; [267, 2026].

Section 2, Section 39, Section 41

41 American Intelligence History

41.0.1 American Intelligence History figures and course links: visual evidence, source flow, and navigation

The module uses Figure 82 and Figure 79 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 39, Section 40, Section 42.
This module teaches the **Historical and Declassified Intelligence Services** lane through a bounded, source-backed coursebook chapter. [266, 2026]; [269, 2026].

41.1 Historical and Declassified Intelligence Services frame for American Intelligence History: source context, topic focus, and reader task

Evidence anchor. Section 41; [266, 2026].

41.1.1 American Intelligence History orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 41; [266, 2026].

41.1.2 American Intelligence History conceptual primer: source context, core model, and reader task

This chapter teaches historical intelligence study as declassified evidence review: archives teach institutional lessons when provenance, redaction, context, and modern boundaries are explicit. The chapter uses **Historical Case-Translation Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.
The central distinction is to separate historical lesson from reconstruction of live tactics or current sources and methods. Core topics include **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study; OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [266, 2026]; [269, 2026].
Learners move from vocabulary and the **Historical Case-Translation Lens** distinction through topic lessons on **Declassified source-protection and institutional-control case study** with evidence and misconception checks, then assemble a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with safety and rights gates.

41.1.3 American Intelligence History learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 41; [266, 2026].

- Connect **Declassified source-protection and institutional-control case study and OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study** to **Historical and Declassified Intelligence Services** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate historical lesson from reconstruction of live tactics or current sources and methods; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as romanticized tradecraft, presentist interpretation, redaction overclaiming, decontextualized case reuse, and translating history into operational instructions, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: historical modules use declassified or public records for analysis and governance lessons only; they do not reconstruct live tactics, sources, methods, or current field procedures.

41.1.4 American Intelligence History core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 41; [266, 2026].

Term	Working definition
Declassification context	the release channel, date, and limits of an official historical source
Redaction caveat	the warning that missing text may change interpretation
Institutional lesson	the durable governance or analytic principle drawn from a case
Presentism	the error of forcing modern assumptions onto a historical record
Modern analogy	a bounded comparison that preserves differences between eras
Oversight failure	a documented breakdown in review, records, or accountability visible in the archive
Source-protection lesson	the historical principle about protecting people and methods without reconstructing live tradecraft
Declassified source-protection and…	Key terms: Declassified, protection, institutional.
OSS Secret Intelligence Manual: Declassified…	Key terms: OSS, Secret, Manual.

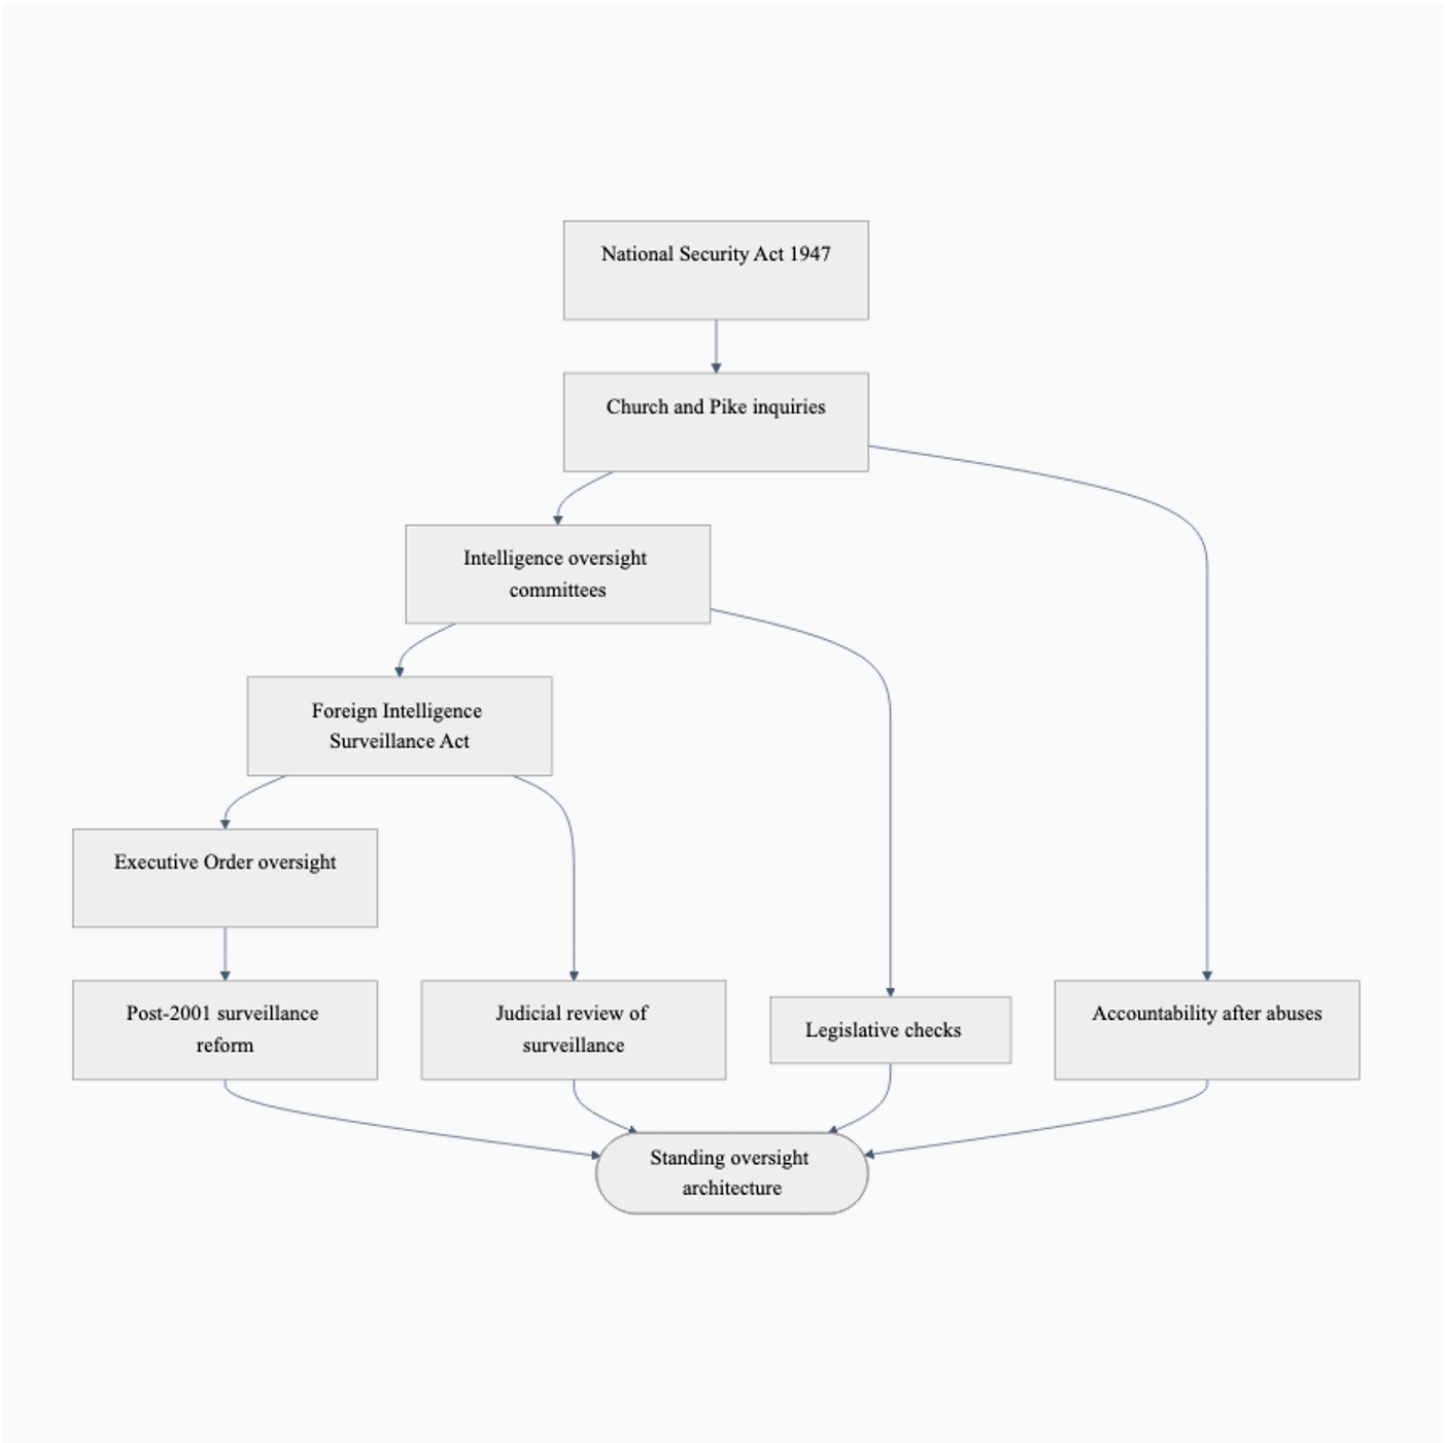

Figure 82: A milestone view of how American intelligence accountability was progressively built through founding statutes, investigations, oversight committees, and surveillance-law reform. Its reader value is to make National Security Act 1947, Church and Pike inquiries, Intelligence oversight committees, and Foreign Intelligence Surveillance Act visible at a glance, with the historical intelligence services / american intelligence history section as the source section and defensive review as the boundary.

41.2 Historical Case-Translation Lens path for American Intelligence History: lesson cluster, safe artifact, and review

Evidence anchor. Section 41; [266, 2026].

41.2.1 American Intelligence History practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 41; [266, 2026].

41.2.2 American Intelligence History topic lessons: source-backed concepts and transfer tasks

This module builds historical intelligence study as declassified evidence review: archives teach institutional lessons when provenance, redaction, context, and modern boundaries are explicit. The sequence opens with **Declassified source-protection and institutional-control case study**, **OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**, **OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study** and applies the **Historical Case-Translation Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 79; module overview Section 41; curriculum atlas Section 2.

Triangulation anchors. In module 28's topic-lessons section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

41.2.2.1 Lesson 1: Declassified source-protection and institutional-control case study

Concept. Declassified source-protection and institutional-control case study studies OSS declassified manuals for oversight, ethics, and limits on translating history into practice.

Why it matters. Declassified source-protection matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. Declassified source-protection and institutional-control case study rests on [128, 2026] and [129, 2026]. Its anchor reference records: The page functions as a curated library of links to external sites covering OSS history, including operations, related organizations, notable figures such as William Donovan and Allen Dulles, educational materials, and geographic theaters. Use them for the working definition that **Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified source-protection**, work from the cited evidence behind this row. [128, 2026] An Internet Archive full-text scan of the proceedings of a 1991 National Archives conference on the Office of Strategic Services (OSS), the U.S. [129, 2026] A resource directory page from the Office of Strategic Services Society, a historical organization dedicated to preserving the record of the WWII-era OSS. The page functions as a curated library of links to external sites covering OSS history, including operations, related organizations, notable figures such as William Donovan and Allen Dulles, educational materials, and geographic theaters. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Declassified source-protection**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection and institutional-control case**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Declassified source-protection** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **Declassified source-protection** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

41.2.2.2 Lesson 2: OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study

Concept. OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study studies OSS declassified manuals for oversight, ethics, and limits on translating history into practice.

Why it matters. Analysts use **OSS Secret Intelligence Manual** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study rests on [117, 2026]. The closest source to this row notes: The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. Use it for pinning down the scope of **OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Read **OSS Secret Intelligence Manual** against the works cited for this row. [117, 2026] An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **OSS Secret Intelligence Manual**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **OSS Secret Intelligence Manual**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **OSS Secret Intelligence Manual** work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **OSS Secret Intelligence Manual** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

41.2.2.3 Lesson 3: OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study

Concept. OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study studies OSS declassified manuals for oversight, ethics, and limits on translating history into practice.

Why it matters. Without explicit treatment of **OSS Provisional Basic Field Manual**, romanticized tradecraft undermines declassified-source interpretation and case-to-principle translation review; the lesson builds the habit to separate historical lesson from reconstruction of live tactics or current sources and methods.

Source support. OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study rests on [119, 2026]. Use it for pinning down the scope of **OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Read **OSS Provisional Basic Field Manual** against the works cited for this row. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **OSS Provisional Basic Field Manual**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **OSS Provisional Basic Field Manual**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **OSS Provisional Basic Field Manual** work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **OSS Provisional Basic Field Manual** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

41.2.2.4 Lesson 4: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Hybrid-threat indicator review using sample scenarios and policy thresholds reads special-operations intelligence as support to accountable planning with explicit authority and oversight fields.

Why it matters. Hybrid-threat indicator review connects classroom vocabulary to Historical and Declassified Intelligence Services practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [118, 2026]. The closest source to this row notes: The 32-page manual sets out the authorized functions, operational plans, methods, and organization of OSS Maritime Units and the broader Special Operations Branch. Use it for pinning down the scope of **Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Hybrid-threat indicator review**, work from the cited evidence behind this row. [118, 2026] A digitized World War II field manual from the Internet Archive, the Special Operations Field Manual, Strategic Services (provisional), issued July 18, 1944 by the U.S. Office of Strategic Services (OSS). The 32-page manual sets out the authorized functions, operational plans, methods, and organization of OSS Maritime Units and the broader Special Operations Branch. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Hybrid-threat indicator review**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must name the indicator descriptor, the bounded claim about **Hybrid-threat indicator review using sample**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Hybrid-threat indicator review** work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Hybrid-threat indicator review**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Apply this module's safe boundary for **Hybrid-threat indicator review** to another artifact while keeping declassified-source interpretation and case-to-principle translation and reviewer ownership explicit.

41.2.2.5 Lesson 5: OSS Special Weapons and Devices: Declassified source-protection and institutional-control case study

Concept. OSS Special Weapons and Devices: Declassified source-protection and institutional-control case study studies OSS declassified manuals for oversight, ethics, and limits on translating history into practice.

Why it matters. OSS Special Weapons and Devices matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. OSS Special Weapons and Devices: Declassified source-protection and institutional-control case study rests on [117, 2026]. The most specific cited work observes: The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. Use it for the working definition that **OSS Special Weapons and Devices: Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Read **OSS Special Weapons and Devices** against the works cited for this row. [117, 2026] An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **OSS Special Weapons and Devices**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **OSS Special Weapons and Devices**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **OSS Special Weapons and Devices** work as a **declassified case-to-principle card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Apply this module's safe boundary for **OSS Special Weapons and Devices** to another artifact while keeping declassified-source interpretation and case-to-principle translation and reviewer ownership explicit.

41.2.2.6 Lesson 6: Simple Sabotage Field Manual: Declassified source-protection and institutional-control case study

Concept. Simple Sabotage Field Manual: Declassified source-protection and institutional-control case study studies OSS declassified manuals for oversight, ethics, and limits on translating history into practice.

Why it matters. Without explicit treatment of **Simple Sabotage Field Manual**, romanticized tradecraft undermines declassified-source interpretation and case-to-principle translation review; the lesson builds the habit to separate historical lesson from reconstruction of live tactics or current sources and methods.

Source support. Simple Sabotage Field Manual: Declassified source-protection and institutional-control case study rests on [117, 2026]. Its anchor reference records: An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. Use it for fixing what **Simple Sabotage Field Manual: Declassified source-protection and institutional-control case study** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Simple Sabotage Field Manual**, work from the cited evidence behind this row. [117, 2026] An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Simple Sabotage Field Manual**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Simple Sabotage Field Manual**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Simple Sabotage Field Manual** work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Simple Sabotage Field Manual** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

41.2.2.7 Lesson 7: Morale Operations Field Manual: Declassified source-protection and institutional-control case study

Concept. Morale Operations Field Manual: Declassified source-protection and institutional-control case study studies OSS declassified manuals for oversight, ethics, and limits on translating history into practice.

Why it matters. Morale Operations Field Manual matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. Morale Operations Field Manual: Declassified source-protection and institutional-control case study rests on [117, 2026]. Its anchor reference records: The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. Use it for pinning down the scope of **Morale Operations Field Manual: Declassified source-protection and institutional-control case study**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Ground **Morale Operations Field Manual** in the evidence the row cites. [117, 2026] An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Morale Operations Field Manual**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Morale Operations Field Manual**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Morale Operations Field Manual** work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Morale Operations Field Manual** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

41.2.2.8 Lesson 8: CIA Cold War Operations: Declassified source-protection and institutional-control case study

Concept. CIA Cold War Operations: Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Analysts use **CIA Cold War Operations** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. CIA Cold War Operations: Declassified source-protection and institutional-control case study rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for fixing what **CIA Cold War Operations: Declassified source-protection and institutional-control case study** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Ground **CIA Cold War Operations** in the evidence the row cites. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **CIA Cold War Operations**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **CIA Cold War Operations**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **CIA Cold War Operations** work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **CIA Cold War Operations** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

41.2.2.9 Lesson 9: CIA Manual of Trickery and: Declassified source-protection and institutional-control case study

Concept. CIA Manual of Trickery and: Declassified source-protection and institutional-control case study compares deception indicators with alternative explanations and uncertainty before any operational inference.

Why it matters. Without explicit treatment of **CIA Manual of Trickery and**, romanticized tradecraft undermines declassified-source interpretation and case-to-principle translation review; the lesson builds the habit to separate historical lesson from reconstruction of live tactics or current sources and methods.

Source support. CIA Manual of Trickery and: Declassified source-protection and institutional-control case study rests on [130, 2026]. Its anchor reference records: A reproduction of a Cold War-era manual written by magician John Mulholland for the CIA, presented with commentary by H. Use it for fixing what **CIA Manual of Trickery and: Declassified source-protection and institutional-control case study** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **CIA Manual of Trickery and**, reason from the sources cited in this row. [130, 2026] A reproduction of a Cold War-era manual written by magician John Mulholland for the CIA, presented with commentary by H. Keith Melton and Robert Wallace as "The Official CIA

Manual of Trickery and Deception." The book situates the manual within the history of the MKULTRA program and the long-missing magic manuals, and reproduces Mulholland's guidance on applying sleight-of-hand and misdirection techniques to covert operational tasks. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **CIA Manual of Trickery and**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **CIA Manual of Trickery**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **CIA Manual of Trickery and** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **CIA Manual of Trickery and** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

41.2.2.10 Lesson 10: Principles of Tradecraft: Declassified source-protection and institutional-control case study

Concept. Principles of Tradecraft: Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about source protection, oversight, and the danger of translating historical methods into current practice.

Why it matters. Principles of Tradecraft matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. Principles of Tradecraft: Declassified source-protection and institutional-control case study rests on [120, 2026]. Its anchor reference records: Principles of Tradecraft, a 1995 publication by Militia Free Press (a subsidiary of The Resister). Use it for pinning down the scope of **Principles of Tradecraft: Declassified source-protection and institutional-control case study**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Read **Principles of Tradecraft** against the works cited for this row. [120, 2026] Principles of Tradecraft, a 1995 publication by Militia Free Press (a subsidiary of The Resister). The document presents an overview of intelligence and espionage concepts, with chapters covering an introduction to espionage, agents (typology, identification, recruitment, and handling), and agent organization and management including personnel and structures. It is framed as an introductory treatment rather than a comprehensive reference on intelligence requirements. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Principles of Tradecraft**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Principles of Tradecraft**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Principles of Tradecraft** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Principles of Tradecraft** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

41.2.2.11 Lesson 11: Cognitive influence-analysis case review using sample materials

Concept. Cognitive influence-analysis case review using sample materials analyzes influence campaigns through provenance, audience harm, attribution caution, and transparent response options.

Why it matters. Without explicit treatment of **Cognitive influence-analysis case review**, treating resilience labels as permission to skip provenance review undermines declassified-source interpretation and case-to-principle translation review; the lesson builds the habit to separate historical lesson from reconstruction of live tactics or current sources and methods.

Source support. Cognitive influence-analysis case review using sample materials rests on [088, 2026], [089, 2026], and [090, 2026]. The most specific cited work observes: A U.S. Use them for the claim that **Cognitive influence-analysis case review using sample materials** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Read **Cognitive influence-analysis case review** against the works cited for this row. [088, 2026] A U.S. Department of State Bureau of Public Affairs report from October 1981, released under FOIA. It catalogs Soviet 'active measures' — the Soviet term for covert influence operations — including written disinformation, control of foreign media, use of front organizations, clandestine broadcasting, blackmail, and political influence operations. Specific cases include Soviet forgeries related to the 1979 Grand Mosque seizure and NATO theater nuclear force debates. [089, 2026] An article by Dennis Kux published in Parameters: Journal of the US Army War College (1985) and preserved in the CIA CREST archive. It defines and distinguishes Soviet 'disinformation' and 'active measures,' situating them within a spectrum of white, gray, and black foreign influence operations. Kux examines KGB front groups, agents of influence, forgeries, and the broader strategic goal of tarnishing Western governments while advancing Soviet foreign policy. [090, 2026] A CIA CREST record (October 1981, released March 2007) comprising a routing and record sheet from the PCS/PGLO office dated February 8, 1982, attached to the same Department of State Special Report No. 88 on Soviet active measures. The document is catalogued as an open-source CREST entry and captures the internal CIA circulation of the State Department's public report on Soviet forgery and disinformation operations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Cognitive influence-analysis case review**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must record the narrative provenance, the bounded claim about **Cognitive influence-analysis case review using**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Cognitive influence-analysis case review** work as a **declassified case-to-principle card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Cognitive influence-analysis case review**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Cognitive influence-analysis case review** to another artifact while keeping declassified-source interpretation and case-to-principle translation and reviewer ownership explicit.

41.2.2.12 Lesson 12: Studies in Intelligence: Declassified source-protection and institutional-control case study

Concept. Studies in Intelligence: Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Studies in Intelligence matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. Studies in Intelligence: Declassified source-protection and institutional-control case study rests on [131, 2026], [132, 2026], and [133, 2026]. The most specific cited work observes: Studies in Intelligence is the CIA's professional journal, published by the Center for the Study of Intelligence (CSI). Use them for the claim that **Studies in Intelligence: Declassified source-protection and institutional-control case study** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Ground **Studies in Intelligence** in the evidence the row cites. [131, 2026] The Center for the Study of Intelligence (CSI) serves as a producer and repository of unclassified. [132, 2026] Studies in Intelligence is the CIA's professional journal, published by the Center for the Study of Intelligence (CSI). It covers historical, analytical, and methodological topics across the intelligence profession, and is issued quarterly in partially declassified extract form. As of 2026 the archive holds 110 issues, with the most recent being Volume 70, No. 1 (March 2026); articles are written by intelligence community professionals under their own names or pen names. [133, 2026] This is a National Security Archive briefing book presenting declassified articles from the CIA's internal journal Studies in Intelligence, first published in 1955. The collection gathers articles obtained through Freedom of Information Act requests and litigation, spanning CIA history from the Kennedy era through the post-9/11 period. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Studies in Intelligence**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Studies in Intelligence**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Studies in Intelligence** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Studies in Intelligence** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

41.2.2.13 Lesson 13: Declassified source-protection and institutional-control case study (28.3.1)

Concept. Declassified source-protection and institutional-control case study (28.3.1) studies the declassified record for institutional lessons about source protection, oversight, and the danger of translating historical methods into current practice.

Why it matters. Analysts use **Declassified source-protection** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. Declassified source-protection and institutional-control case study (28.3.1) rests on [019, 2026] and [034, 2026]. Its anchor reference records: By Thomas Mulligan, a researcher at the RAND Corporation who served in CIA during 2008–14. Use them for the claim that **Declassified source-protection and institutional-control case study (28.3.1)** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified source-protection**, work from the cited evidence behind this row. [019, 2026] By Thomas Mulligan, a researcher at the RAND Corporation who served in CIA during 2008–14. [034, 2026] Thomas Mulligan is a researcher at the RAND Corporation and former CIA officer. Ana P. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Declassified source-protection**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection and institutional-control case**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Declassified source-protection** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Apply this module's safe boundary for **Declassified source-protection** to another artifact while keeping declassified-source interpretation and case-to-principle translation and reviewer ownership explicit.

41.2.2.14 Lesson 14: Declassified source-protection and institutional-control case study (28.3.2)

Concept. Declassified source-protection and institutional-control case study (28.3.2) treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Declassified source-protection matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. Declassified source-protection and institutional-control case study (28.3.2) rests on [047, 2026]. The lead source's own note reads: Plans and strategies for improving open-source intelligence (OSINT) operations in the Intelligence. Use it for fixing what **Declassified source-protection and institutional-control case study (28.3.2)** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified source-protection**, work from the cited evidence behind this row. [047, 2026] Plans and strategies for improving open-source intelligence (OSINT) operations in the Intelligence. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Declassified source-protection**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection and institutional-control case**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Declassified source-protection** work as a **declassified case-to-principle card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Declassified source-protection** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

41.2.2.15 Lesson 15: History of SIGINT at the: Declassified source-protection and institutional-control case study

Concept. History of SIGINT at the: Declassified source-protection and institutional-control case study frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. History of SIGINT at the connects classroom vocabulary to Historical and Declassified Intelligence Services practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. History of SIGINT at the: Declassified source-protection and institutional-control case study rests on [038, 2026] and [039, 2026]. The closest source to this row notes: A 2015 briefing book from the National Security Archive, compiled by Jeffrey T. Use them for the working definition that **History of SIGINT at the: Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Ground **History of SIGINT at the** in the evidence the row cites. [038, 2026] A January 2018 blog post on Open INT recounting the CIA's role in signals intelligence from roughly 1947 to 1970, noting that SIGINT is often associated with the NSA but the CIA also participated. It distinguishes communications intelligence from electronic intelligence and references declassified Cold War operations including U-2 collection and a Berlin communications-tapping effort. [039, 2026] A 2015 briefing book from the National Security Archive, compiled by Jeffrey T. Richelson, presenting declassified documents on the CIA's signals intelligence activities from roughly 1947 to 1970. It documents the CIA's parallel

SIGINT operations alongside the NSA during the Cold War, covering programs and collection efforts as well as recurring friction between the two agencies over mission overlap, budgets, and access to intelligence. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **History of SIGINT at the**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **History of SIGINT**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **History of SIGINT at the** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **History of SIGINT at the** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

41.2.2.16 Lesson 16: NSA WWII Declassified: Declassified source-protection and institutional-control case study

Concept. NSA WWII Declassified: Declassified source-protection and institutional-control case study frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. NSA WWII Declassified connects classroom vocabulary to Historical and Declassified Intelligence Services practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. NSA WWII Declassified: Declassified source-protection and institutional-control case study rests on [036, 2026]. The lead source's own note reads: Volumes 1 - 9 of the European Axis Signal Intelligence in WWII documentation. Use it for fixing what **NSA WWII Declassified: Declassified source-protection and institutional-control case study** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Ground **NSA WWII Declassified** in the evidence the row cites. [036, 2026] Volumes 1 - 9 of the European Axis Signal Intelligence in WWII documentation. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **NSA WWII Declassified**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **NSA WWII Declassified**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **NSA WWII Declassified** work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **NSA WWII Declassified** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

41.2.3 American Intelligence History worked safe example: synthetic inputs, evidence, and review

Worked example: a sample seminar studies a declassified reform episode and extracts an oversight lesson without reconstructing current sources and methods. [266, 2026]; [269, 2026].

Triangulation anchors. In module 28's worked-example section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **declassified-source interpretation**. Learners use a **declassified case-to-principle card** and keep this boundary visible: No current sources-and-methods reconstruction, operational emulation, or tactical transfer.

Frame. The classroom question centers on **Declassified source-protection and institutional-control case study**. Excluded actions stay explicit, and the **Historical Case-Translation Lens** planning question is: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?

Inputs. For the **Declassified source-protection and institutional-control case study** scenario, use public archive metadata, a short excerpt, a timeline template, and an oversight-question worksheet. The Historical Case-Translation Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Declassified source-protection and institutional-control case study**, students record provenance, mark redactions, build timeline, distinguish known from unknown, and extract a governance lesson. Pause whenever an inference about Declassified source-protection and institutional-control case study appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Declassified source-protection and institutional-control case study** classroom scenario; unit artifact = declassified case-to-principle card; evidence = allowed inputs; method = declassified-source interpretation and case-to-principle translation; output = a historical case card with release context, caveats, lesson, and evidence-bounded boundary; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Declassified source-protection and institutional-control case study** as "Historical Case-Translation Lens confirms it" is not enough. The revision ties the claim to declassified-source interpretation and case-to-principle translation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Declassified source-protection and institutional-control case study** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

41.2.4 American Intelligence History practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Historical Case-Translation Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

Triangulation anchors. In module 28's practice-sequence section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Declassified source-protection and institutional-control case study, OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study, OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Historical and Declassified Intelligence Services** lane.
2. Frame	Answer the lens question: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Declassified source-protection and institutional-control case study: historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the declassified case-to-principle card fields for Declassified source-protection and institutional-control case study.	Unit profile note.	Evidence artifacts include release metadata, redaction caveat.
4. Challenge	Test the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.	Failure-mode note.	The artifact applies the key distinction: separate historical lesson from reconstruction of live tactics or current sources and methods.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

41.2.4.1 American Intelligence History instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**. [266, 2026]; [269, 2026].

41.2.4.2 American Intelligence History extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 41; [266, 2026].

Have learners swap artifacts and apply the **Historical Case-Translation Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

41.2.5 American Intelligence History knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 41; [266, 2026].

1. Explain how **Declassified source-protection and institutional-control case study** is defined here; name the source descriptor that supports the definition.
2. Contrast **Declassified source-protection and institutional-control case study** with **OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study** using the **Historical Case-Translation Lens** artifact fields.
3. Identify one failure mode from the **Historical and Declassified Intelligence Services** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which institutional lesson is defensible from the record, and which claim reconstructs live tradecraft?
5. Correct this misconception: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

41.2.5.1 American Intelligence History answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Declassified source-protection and institutional-control case study** without source evidence, uncertainty, or a safe transfer task.

41.3 American Intelligence History assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 41; [266, 2026].

41.3.1 American Intelligence History evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 41; [266, 2026].

41.3.2 American Intelligence History transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 41; [266, 2026].

41.3.2.1 American Intelligence History lineage and source tradition: profile, concepts, and first anchors This sits in the **Historical and Declassified Intelligence Services** lineage: turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform. [266, 2026]; [269, 2026].

41.3.2.2 American Intelligence History working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 41; [266, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**, with provenance and reviewability throughout.

41.3.2.3 American Intelligence History knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [266, 2026]; [269, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

41.3.2.4 American Intelligence History transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 41; [266, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.
- **Evidence contract:** keep the **Historical and Declassified Intelligence Services** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

41.3.2.5 American Intelligence History profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 41; [266, 2026].

The matched profile emphasizes turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform. The method stack is provenance review, declassification-status notation, institutional timeline building, case-to-principle translation, and uncertainty about redacted records; the local topic cluster is **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

41.3.3 American Intelligence History evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 41; [266, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Historical and Declassified Intelligence Services** profile tells reviewers what evidence is strong enough for the module artifact built around **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

41.3.3.1 American Intelligence History guide source spine: inherited keys and local citation roles Primary guide citations: [266, 2026]; [269, 2026]; [271, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [128, 2026]; [129, 2026]; [117, 2026]; [119, 2026]; [118, 2026]; [130, 2026]; [120, 2026]; [088, 2026]; [089, 2026]; [090, 2026]; [091, 2026]; [131, 2026]; [132, 2026]; [133, 2026]; [019, 2026]; [034, 2026]; [047, 2026]; [038, 2026]; [039, 2026]; [036, 2026]; [297, 2026]; [298, 2026].

41.3.3.2 American Intelligence History verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [266, 2026]; [269, 2026].

Tier	What counts	How it is used
Source guide	[266, 2026]; [269, 2026]; [271, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [128, 2026]; [129, 2026]; [117, 2026]; [119, 2026]; [118, 2026]; [130, 2026]; [120, 2026]; [088, 2026]; [089, 2026]; [090, 2026]; [091, 2026]; [131, 2026]; [132, 2026]; [133, 2026]; [019, 2026]; [034, 2026]; [047, 2026]; [038, 2026]; [039, 2026]; [036, 2026]; [297, 2026]; [298, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 28's source-canon section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study** and [266, 2026]; [269, 2026], but only directly verified source URLs are encoded as citations.

41.3.3.3 American Intelligence History intelligence practice lens: evidence artifact and safety check

Practice lens: **Historical Case-Translation Lens** for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**. [266, 2026]; [269, 2026].

Planning question: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?

Evidence artifact: historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary.

Validation rule: distinguish what the record shows, what remains redacted or unknown, and which governance lesson is defensibly transferable. Applied to **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

Handoff contract: handoff preserves archive citation, historical context, analytic lesson, oversight implication, and modern analogy as separate fields.

Safety check: exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material.

41.3.3.4 American Intelligence History runtime-to-reader map: generated sections and verifier surfaces

Evidence anchor. Section 41; [266, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	28.99	28.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind American Intelligence History to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Bounded autonomy, procurement, incident-response, and assurance studio	28.101	28.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for American Intelligence History	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Model-card, recoverability, retention, and learner-support evidence package	28.102	28.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for American Intelligence History	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Declassified source-protection and institutional-control case study	28.1	28.1 source title transformed into safe curriculum treatment; original: OSS in World War II	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

Declassified source-protection and institutional-control case study	28.3.2	28.3.2 source title transformed into safe curriculum treatment; original: Vol. 68, No. 2 (June 2024): OSINT in the IC	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	28.4	28.4 source title transformed into safe curriculum treatment; original: History of SIGINT at the CIA, 1947–1970	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	28.5	28.5 source title transformed into safe curriculum treatment; original: NSA WWII Declassified: European Axis SIGINT (9 Volumes)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

41.3.3.5 American Intelligence History reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 41; [266, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Hybrid-threat indicator review using sample scenarios and policy thresholds	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
OSS Special Weapons and Devices: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Simple Sabotage Field Manual: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Morale Operations Field Manual: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
CIA Cold War Operations: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
CIA Manual of Trickery and: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

Lesson topic	Practice lens	Evidence artifact	Safety check
Principles of Tradecraft: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Cognitive influence-analysis case review using sample materials	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Studies in Intelligence: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study (28.3.1)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study (28.3.2)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
History of SIGINT at the: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
NSA WWII Declassified: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

41.3.3.6 American Intelligence History annotated source ledger: real titles and local contribution Each source cited by this **Historical and Declassified Intelligence Services** module is paired below with its real title and a one-line note on what it contributes to **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

Source	Cited work	What it contributes	Status
[266, 2026]	PROV Overview	A W3C Working Group Note from 2013 that provides an overview and roadmap for the PROV family of specifications for representing and exchanging provenance information on the web. It defines provenance as information about the entities, activities, and people involved in producing data, used to assess quality, reliability, and trustworthiness.	verified source-guide
[269, 2026]	Data on the Web Best Practices	A W3C Recommendation, "Data on the Web Best Practices," published January 31, 2017 by the Data on the Web Best Practices Working Group. It offers 35 best practices for publishing and consuming data on the Web, covering metadata, licensing and provenance, data quality, dataset versioning, persistent URIs, machine-readable formats, vocabulary reuse, access methods, preservation, and feedback.	verified source-guide
[271, 2026]	DataCite Metadata Schema	The DataCite Metadata Schema page, introducing a standardized framework of core metadata properties chosen for accurate and consistent identification of research resources for citation and retrieval. It notes the latest version, 4.7 (March 2026), which adds resource types such as Poster and Presentation along with new identifier and relation-type options.	verified source-guide

Source	Cited work	What it contributes	Status
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide
[281, 2026]	Artificial Intelligence Cybersecurity Challenges	An ENISA (European Union Agency for Cybersecurity) report published December 15, 2020 mapping the cybersecurity challenges of artificial intelligence. It defines AI scope through a lifecycle approach, identifies the assets requiring protection within AI ecosystems, and develops a threat taxonomy classified across lifecycle stages and asset categories.	verified source-guide
[282, 2026]	AI Research: Security and Resilience	A NIST page on AI research focused on security and resilience, framing these as core characteristics of trustworthy AI under the NIST AI Risk Management Framework.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[296, 2026]	Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile	NIST AI 600-1, the Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile, a cross-sectoral companion resource to the NIST AI RMF 1.0 issued pursuant to Executive Order 14110. It identifies risks that are unique to or amplified by generative AI and organizes suggested actions for managing those risks, mapped to the AI RMF functions.	verified source-guide
[128, 2026]	Full text of "The Secret War The Office of Strategic Services in World	An Internet Archive full-text scan of the proceedings of a 1991 National Archives conference on the Office of Strategic Services (OSS), the U.S.	verified source-guide

Source	Cited work	What it contributes	Status
[129, 2026]	OSS Resources - Office of Strategic Services Society	A resource directory page from the Office of Strategic Services Society, a historical organization dedicated to preserving the record of the WWII-era OSS. The page functions as a curated library of links to external sites covering OSS history, including operations, related organizations, notable figures such as William Donovan and Allen Dulles, educational materials, and geographic theaters.	verified source-guide
[117, 2026]	Office of Strategic Services (OSS) Manuals	An article from Small Wars Journal (affiliated with Arizona State University) announcing that The Resistance Hub has compiled declassified Office of Strategic Services (OSS) manuals for public access. The OSS was the WWII predecessor to the CIA, and the documents illustrate how the United States organized clandestine activities in occupied Europe and Asia.	verified source-guide
[119, 2026]	office of strategic services - ARSOF History	See bibliography for scope.	original source-guide
[118, 2026]	Special Operations Field Manual, Strategic Services (provisional	A digitized World War II field manual from the Internet Archive, the Special Operations Field Manual, Strategic Services (provisional), issued July 18, 1944 by the U.S. Office of Strategic Services (OSS). The 32-page manual sets out the authorized functions, operational plans, methods, and organization of OSS Maritime Units and the broader Special Operations Branch.	verified source-guide
[130, 2026]	The Official CIA Manual of Trickery and Deception	A reproduction of a Cold War-era manual written by magician John Mulholland for the CIA, presented with commentary by H. Keith Melton and Robert Wallace as "The Official CIA Manual of Trickery and Deception." The book situates the manual within the history of the MKULTRA program and the long-missing magic manuals, and reproduces Mulholland's guidance on applying sleight-of-hand and misdirection techniques to covert operational tasks.	verified source-guide
[120, 2026]	PRINCIPLES TRADECRAFT	Principles of Tradecraft, a 1995 publication by Militia Free Press (a subsidiary of The Resister). The document presents an overview of intelligence and espionage concepts, with chapters covering an introduction to espionage, agents (typology, identification, recruitment, and handling), and agent organization and management including personnel and structures. It is framed as an introductory treatment rather than a comprehensive reference on intelligence requirements.	verified source-guide

Source	Cited work	What it contributes	Status
[088, 2026]	SOVIET 'ACTIVE MEASURES' FORGERY, DISINFORMATION, POLITICAL OPERATIONS	A U.S. Department of State Bureau of Public Affairs report from October 1981, released under FOIA. It catalogs Soviet 'active measures' — the Soviet term for covert influence operations — including written disinformation, control of foreign media, use of front organizations, clandestine broadcasting, blackmail, and political influence operations. Specific cases include Soviet forgeries related to the 1979 Grand Mosque seizure and NATO theater nuclear force debates.	verified source-guide
[089, 2026]	SOVIET ACTIVE MEASURES AND DISINFORMATION: OVERVIEW AND ASSESSMENT	An article by Dennis Kux published in Parameters: Journal of the US Army War College (1985) and preserved in the CIA CREST archive. It defines and distinguishes Soviet 'disinformation' and 'active measures,' situating them within a spectrum of white, gray, and black foreign influence operations. Kux examines KGB front groups, agents of influence, forgeries, and the broader strategic goal of tarnishing Western governments while advancing Soviet foreign policy.	verified source-guide
[090, 2026]	"SOVIET ACTIVE MEASURES: FORGERY, DISINFORMATION, POLITICAL OPERATIONS"	A CIA CREST record (October 1981, released March 2007) comprising a routing and record sheet from the PCS/PGLO office dated February 8, 1982, attached to the same Department of State Special Report No. 88 on Soviet active measures. The document is catalogued as an open-source CREST entry and captures the internal CIA circulation of the State Department's public report on Soviet forgery and disinformation operations.	verified source-guide
[091, 2026]	SOVIET ACTIVE MEASURES AND DISINFORMATION	A declassified-in-part 1986 CIA speech text on Soviet active measures, prepared by the Foreign Activities Branch, Third World Activities Division, Office of Soviet Analysis. It explains the KGB's use of forgeries, disinformation, and front organizations to covertly influence foreign governments and publics, illustrating with the forged 1984 Olympic KKK leaflet operation designed to discourage participation in the Los Angeles Games.	verified source-guide
[131, 2026]	Center for the Study of Intelligence - CSI	The Center for the Study of Intelligence (CSI) serves as a producer and repository of unclassified.	original source-guide
[132, 2026]	Studies in Intelligence	Studies in Intelligence is the CIA's professional journal, published by the Center for the Study of Intelligence (CSI). It covers historical, analytical, and methodological topics across the intelligence profession, and is issued quarterly in partially declassified extract form. As of 2026 the archive holds 110 issues, with the most recent being Volume 70, No. 1 (March 2026); articles are written by intelligence community professionals under their own names or pen names.	verified source-guide

Source	Cited work	What it contributes	Status
[133, 2026]	Studies in Intelligence: New Articles from The CIA's In-House Journal	This is a National Security Archive briefing book presenting declassified articles from the CIA's internal journal Studies in Intelligence, first published in 1955. The collection gathers articles obtained through Freedom of Information Act requests and litigation, spanning CIA history from the Kennedy era through the post-9/11 period.	verified source-guide
[019, 2026]	Espionage in Our AI Future: Why Human Intelligence Still Matters - CSI	By Thomas Mulligan, a researcher at the RAND Corporation who served in CIA during 2008–14.	original source-guide
[034, 2026]	Studies in Intelligence Vol. 70, No. 1 (Extracts, March 2026) - CSI	Thomas Mulligan is a researcher at the RAND Corporation and former CIA officer. Ana P.	original source-guide
[047, 2026]	How the Intelligence Community Has Held Back Open-Source	Plans and strategies for improving open-source intelligence (OSINT) operations in the Intelligence.	original source-guide
[038, 2026]	History of signals intelligence at the CIA - Open INT	A January 2018 blog post on Open INT recounting the CIA's role in signals intelligence from roughly 1947 to 1970, noting that SIGINT is often associated with the NSA but the CIA also participated. It distinguishes communications intelligence from electronic intelligence and references declassified Cold War operations including U-2 collection and a Berlin communications-tapping effort.	verified source-guide
[039, 2026]	The CIA and Signals Intelligence / National Security Archive	A 2015 briefing book from the National Security Archive, compiled by Jeffrey T. Richelson, presenting declassified documents on the CIA's signals intelligence activities from roughly 1947 to 1970. It documents the CIA's parallel SIGINT operations alongside the NSA during the Cold War, covering programs and collection efforts as well as recurring friction between the two agencies over mission overlap, budgets, and access to intelligence.	verified source-guide
[036, 2026]	European Axis Signal Intelligence in World War II	Volumes 1 - 9 of the European Axis Signal Intelligence in WWII documentation.	original source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide

The remaining 1 cited source(s) appear in the bibliography appendix with the same verification metadata.

Where this sits. This module's overview is Section 41; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

41.3.4 American Intelligence History governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 41; [266, 2026].

41.3.5 American Intelligence History analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 28's governance-boundary section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Historical and Declassified Intelligence Services** for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**. [266, 2026]; [269, 2026].

Curriculum topic spine: Declassified source-protection and institutional-control case study, **OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**, **OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study**. **Verified anchor cluster:** [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]; [of the Director of National Intelligence, 2026e]; [Jr., 2007]; [Agency, 2009].

Conceptual depth: turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform.

Method stack: provenance review, declassification-status notation, institutional timeline building, case-to-principle translation, and uncertainty about redacted records.

Composability contract: archive source, release channel, historical context, analytic lesson, oversight implication, and modern analogy remain explicitly separated.

Known failure modes: romanticized tradecraft, presentist interpretation, redaction overclaiming, decontextualized case reuse, and translating history into operational instructions.

Defensive boundary: historical modules use declassified or public records for analysis and governance lessons only; they do not reconstruct live tactics, sources, methods, or current field procedures. Applied to **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

Anchor	Why it matters here
[Agency, 2026a]	Official CSI landing page for Studies in Intelligence, declassified professional reflection, analytic history, and institutional learning. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026h]	Official declassified historical-release library for cryptologic history, SIGINT history, COMSEC, oral histories, and historical cases. Checked as of 2026-05-21; role: curriculum_anchor.
[Office, 2026a]	Official declassified satellite-reconnaissance program archive for CORONA, GAMBIT, POPPY, QUILL, and other historical technical-intelligence cases. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 2026b]	Official NARA guide to CIA Record Group 263, archival provenance, record series, and declassified intelligence research pathways. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026e]	Official ODNI explanation of analytic objectivity, ombuds, and tradecraft standards. Checked as of 2026-05-21; role: curriculum_anchor.
[Jr., 2007]	Foundational analytic cognition source for bias, mental models, and structured reasoning. Checked as of 2026-06-06; role: curriculum_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.

41.3.5.1 American Intelligence History evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Historical and Declassified Intelligence Services** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [266, 2026]; [269, 2026].

41.3.6 American Intelligence History agentic boundary: assist, approve, block, and record

Evidence anchor. Section 41; [266, 2026].

AGEINT translation is bounded by the **Historical and Declassified Intelligence Services** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

41.3.6.1 American Intelligence History permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 41; [266, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

41.3.6.2 American Intelligence History excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [266, 2026]; [269, 2026] and **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

41.3.7 American Intelligence History governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 41; [266, 2026].

Governance is practiced as a gate on the **Historical and Declassified Intelligence Services** lane. Learners use the **Historical Case-Translation Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted

artifact must stop for human review while using **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

41.3.7.1 American Intelligence History governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [266, 2026]; [269, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Historical and Declassified Intelligence Services** failure modes and the **Historical Case-Translation Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

41.3.7.2 American Intelligence History evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 41; [266, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Historical Case-Translation Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

41.3.7.3 American Intelligence History current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**. [266, 2026]; [269, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cia_center_for_study_of_intelligence` for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**?	Center for the Study of Intelligence; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official CSI landing page for Studies in Intelligence, declassified professional reflection, analytic history, and institutional learning.
What does the module inherit from `official_nsa_historical_releases` for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**?	NSA Historical Releases; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official declassified historical-release library for cryptologic history, SIGINT history, COMSEC, oral histories, and historical cases.
What does the module inherit from `official_nro_declassified_programs` for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**?	Declassified NRO Programs and Projects; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official declassified satellite-reconnaissance program archive for CORONA, GAMBIT, POPPY, QUILL, and other historical technical-intelligence cases.
What does the module inherit from `official_nara_cia_records` for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**?	Records of the Central Intelligence Agency; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official NARA guide to CIA Record Group 263, archival provenance, record series, and declassified intelligence research pathways.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 41; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

41.3.8 American Intelligence History assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 41; [266, 2026].

41.3.9 American Intelligence History assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 41; [266, 2026].

41.3.9.1 American Intelligence History capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study** and [266, 2026]; [269, 2026].

41.3.9.2 American Intelligence History instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study** and [266, 2026]; [269, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

41.3.9.3 American Intelligence History assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Declassified source-protection and institutional-control case study	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
OSS Provisional Basic Field Manual: Declassified source-protection and institutional-control case study	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

41.3.10 American Intelligence History refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [266, 2026]; [269, 2026] and **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**.

41.3.10.1 American Intelligence History refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**. The local signals begin with [266, 2026]; [269, 2026].

41.3.10.2 American Intelligence History claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**, and the source spine for these checks begins with [266, 2026]; [269, 2026].

41.3.11 American Intelligence History reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [266, 2026]; [269, 2026].

Triangulation anchors. In module 28's review-checklist section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study**. [266, 2026]; [269, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.

- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

41.3.12 American Intelligence History learning-path links: module map, overview, and curriculum atlas

These links keep **Declassified source-protection and institutional-control case study; OSS Secret Intelligence Manual: Declassified source-protection and institutional-control case study** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [266, 2026]; [269, 2026].
Section 2, Section 39, Section 40, Section 42

42 British and Allied Intelligence

42.0.1 British and Allied Intelligence figures and course links: visual evidence, source flow, and navigation

The module uses Figure 83 and Figure 79 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.

Navigation links: Section 2, Section 39, Section 41, Section 43.

This module teaches the **Historical and Declassified Intelligence Services** lane through a bounded, source-backed coursebook chapter. [266, 2026]; [269, 2026].

42.1 Historical and Declassified Intelligence Services frame for British and Allied Intelligence: source context, topic focus, and reader task

Evidence anchor. Section 42; [266, 2026].

42.1.1 British and Allied Intelligence orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 42; [266, 2026].

42.1.2 British and Allied Intelligence conceptual primer: source context, core model, and reader task

This chapter teaches historical intelligence study as declassified evidence review: archives teach institutional lessons when provenance, redaction, context, and modern boundaries are explicit. The chapter uses **Historical Case-Translation Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

The central distinction is to separate historical lesson from reconstruction of live tactics or current sources and methods. Core topics include **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds; GCHQ and the BRUSA/UKUSA Agreements**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.

Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [266, 2026]; [269, 2026].

Learners move from vocabulary and the **Historical Case-Translation Lens** distinction through topic lessons on **Declassified source-protection and institutional-control case study** with evidence and misconception checks, then assemble a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with safety and rights gates.

42.1.3 British and Allied Intelligence learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 42; [266, 2026].

- Connect **Declassified source-protection and institutional-control case study and Hybrid-threat indicator review using sample scenarios and policy thresholds** to **Historical and Declassified Intelligence Services** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate historical lesson from reconstruction of live tactics or current sources and methods; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as romanticized tradecraft, presentist interpretation, redaction overclaiming, decontextualized case reuse, and translating history into operational instructions, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: historical modules use declassified or public records for analysis and governance lessons only; they do not reconstruct live tactics, sources, methods, or current field procedures.

42.1.4 British and Allied Intelligence core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 42; [266, 2026].

Term	Working definition
Declassification context	the release channel, date, and limits of an official historical source
Redaction caveat	the warning that missing text may change interpretation
Institutional lesson	the durable governance or analytic principle drawn from a case
Presentism	the error of forcing modern assumptions onto a historical record
Modern analogy	a bounded comparison that preserves differences between eras
Oversight failure	a documented breakdown in review, records, or accountability visible in the archive
Source-protection lesson	the historical principle about protecting people and methods without reconstructing live tradecraft
Declassified source-protection and…	Key terms: Declassified, protection, institutional.
Hybrid-threat indicator review using sample…	Key terms: Hybrid, threat, indicator.

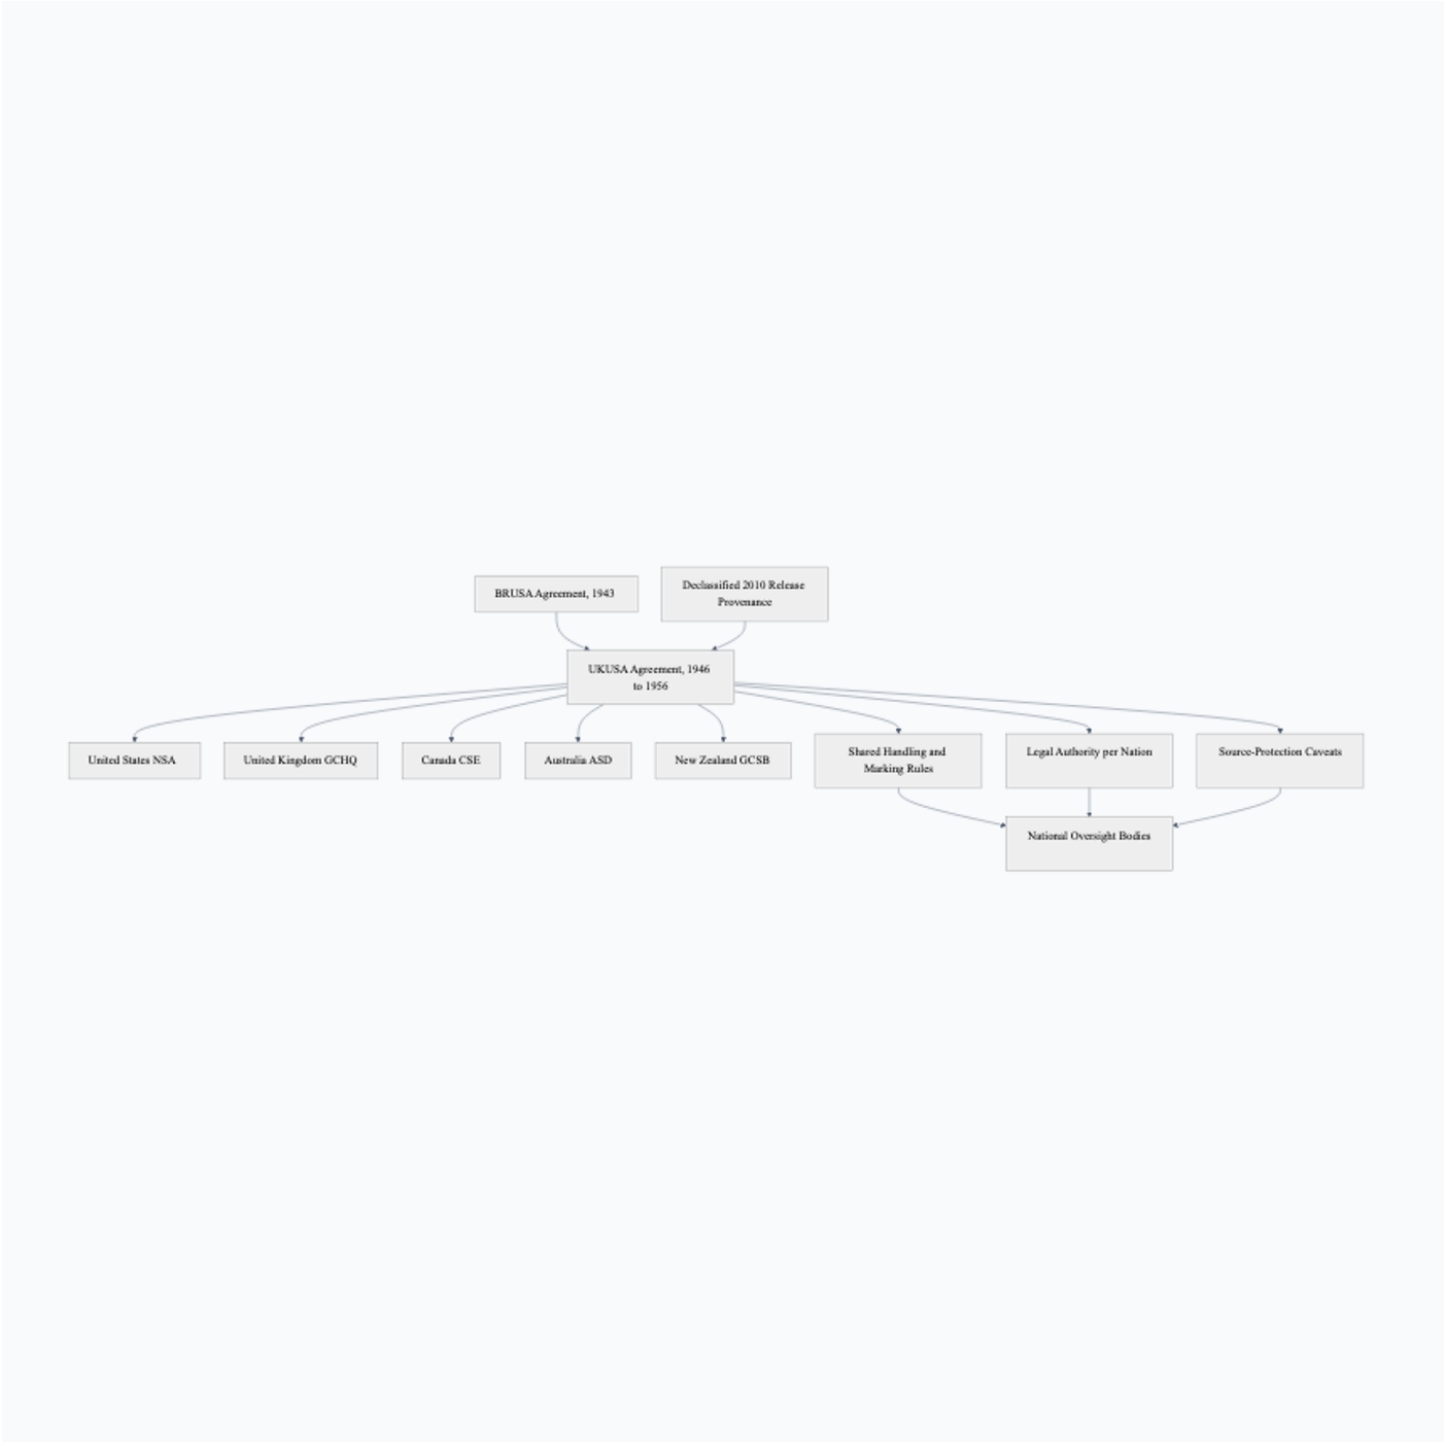

Figure 83: A governance map of the postwar UKUSA signals-intelligence framework showing the Five Eyes partners, the agreements that bind them, and the shared handling and oversight rules. In the historical intelligence services / british and allied intelligence section, it lets readers compare BRUSA Agreement, 1943, UKUSA Agreement, 1946 to 1956, United States NSA, and United Kingdom GCHQ so the visual functions as a traceable course aid rather than an unscoped assertion.

42.2 Historical Case-Translation Lens path for British and Allied Intelligence: lesson cluster, safe artifact, and review

Evidence anchor. Section 42; [266, 2026].

42.2.1 British and Allied Intelligence practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 42; [266, 2026].

42.2.2 British and Allied Intelligence topic lessons: source-backed concepts and transfer tasks

This module builds historical intelligence study as declassified evidence review: archives teach institutional lessons when provenance, redaction, context, and modern boundaries are explicit. The sequence opens with **Declassified source-protection and institutional-control case study**, **Hybrid-threat indicator review using sample scenarios and policy thresholds**, **GCHQ and the BRUSA/UKUSA Agreements** and applies the **Historical Case-Translation Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 79; module overview Section 42; curriculum atlas Section 2.

Triangulation anchors. In module 29's topic-lessons section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

42.2.2.1 Lesson 1: Declassified source-protection and institutional-control case study

Concept. Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Declassified source-protection connects classroom vocabulary to Historical and Declassified Intelligence Services practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Declassified source-protection and institutional-control case study rests on [007, 2026]. The lead source's own note reads: It is SIS's task to pursue policy objectives by unorthodox means and to amass useful information. Use it for the working definition that **Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified source-protection**, reason from the sources cited in this row. [007, 2026] It is SIS's task to pursue policy objectives by unorthodox means and to amass useful information. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Declassified source-protection**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection and institutional-control case**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Declassified source-protection** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Declassified source-protection** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

42.2.2.2 Lesson 2: Hybrid-threat indicator review using sample scenarios and policy thresholds

Concept. Hybrid-threat indicator review using sample scenarios and policy thresholds reads special-operations intelligence as support to accountable planning with explicit authority and oversight fields.

Why it matters. Without explicit treatment of **Hybrid-threat indicator review**, romanticized tradecraft undermines declassified-source interpretation and case-to-principle translation review; the lesson builds the habit to separate historical lesson from reconstruction of live tactics or current sources and methods.

Source support. Hybrid-threat indicator review using sample scenarios and policy thresholds rests on [134, 2026]. The closest source to this row notes: How To Be A Spy: The WW2 SOE Training Manual - Denis Rigden · The CIA Guide to Clandestine. Use it for pinning down the scope of **Hybrid-threat indicator review using sample scenarios and policy thresholds**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Hybrid-threat indicator review**, work from the cited evidence behind this row. [134, 2026] How To Be A Spy: The WW2 SOE Training Manual - Denis Rigden · The CIA Guide to Clandestine. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Hybrid-threat indicator review**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must name the indicator descriptor, the bounded claim about **Hybrid-threat indicator review using sample**, the attribution caveat, the threshold uncertainty, the non-attribution boundary, and the reviewer who approves the policy read. Shape **Hybrid-threat indicator review** work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Hybrid-threat indicator review**: that activity falling below an obvious threshold is therefore ungoverned, rather than still bound by escalation limits and accountable review.

Transfer task. Apply this module's safe boundary for **Hybrid-threat indicator review** to another artifact while keeping declassified-source interpretation and case-to-principle translation and reviewer ownership explicit.

42.2.2.3 Lesson 3: GCHQ and the BRUSA/UKUSA Agreements

Concept. GCHQ and the BRUSA/UKUSA Agreements uses the sharing arrangement to distinguish alliance governance, handling rules, legal authority, and source caveats.

Why it matters. GCHQ and the BRUSA/UKUSA Agreements matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. GCHQ and the BRUSA/UKUSA Agreements rests on [011, 2026] and [135, 2026]. The most specific cited work observes: It traces the 1946 BRUSA agreement on intelligence exchange, Canada's negotiation toward equal partnership in 1949, and the gradual integration of Australia and New Zealand through the 1950s. Use them for pinning down the scope of **GCHQ and the BRUSA/UKUSA Agreements**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **GCHQ and the BRUSA/UKUSA Agreements**, reason from the sources cited in this row. [011, 2026] A curated collection from Unredacted UK presenting documents declassified by the NSA and GCHQ in 2010 relating to US-UK signals intelligence cooperation. It covers the 1946 British-US Communications Agreement (BRUSA), its wartime origins from 1940, and its evolution into the 1956 UKUSA Agreement and the broader Five Eyes alliance. [135, 2026] A briefing from Unredacted, a UK investigative outlet, covering the early development of the UKUSA

Agreement, the postwar US-UK signals-intelligence framework that became the basis for the Five Eyes alliance. It traces the 1946 BRUSA agreement on intelligence exchange, Canada's negotiation toward equal partnership in 1949, and the gradual integration of Australia and New Zealand through the 1950s. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must name the source descriptor, the bounded claim about **GCHQ and the BRUSA/UKUSA Agreements**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that GCHQ and the BRUSA/UKUSA Agreements is optional whenever separate historical lesson from reconstruction of live tactics or current sources and methods feels inconvenient.

Transfer task. Transfer **GCHQ and the BRUSA/UKUSA Agreements** to a second module by preserving declassified-source interpretation and case-to-principle translation, changing the source evidence, and naming a new reviewer.

42.2.2.4 Lesson 4: Five Eyes Archive: Key Declassified Documents

Concept. Five Eyes Archive: Key Declassified Documents uses the sharing arrangement to distinguish alliance governance, handling rules, legal authority, and source caveats.

Why it matters. Five Eyes Archive connects classroom vocabulary to Historical and Declassified Intelligence Services practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Five Eyes Archive: Key Declassified Documents rests on [010, 2026], [041, 2026], and [042, 2026]. The closest source to this row notes: The collection traces the emergence and evolution of bilateral and multilateral agreements from the postwar era, including the BRUSA and UKUSA agreements, drawing on records from UK, US, and Australian agencies plus freedom-of-information releases. Use them for pinning down the scope of **Five Eyes Archive: Key Declassified Documents**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Read **Five Eyes Archive** against the works cited for this row. [010, 2026] An online archive maintained by Unredacted UK that compiles declassified government documents on intelligence sharing among the Five Eyes nations (United States, United Kingdom, Canada, Australia, and New Zealand). The collection traces the emergence and evolution of bilateral and multilateral agreements from the postwar era, including the BRUSA and UKUSA agreements, drawing on records from UK, US, and Australian agencies plus freedom-of-information releases. [041, 2026] A collection page from Unredacted, a UK-based organization focused on declassified government records. It assembles over 70 documents obtained through a 2017 Freedom of Information Act legal challenge led by Privacy International, drawn from US agencies including the NSA, State Department, and Department of Defense. [042, 2026] A briefing from Unredacted examining previously classified Five Eyes documents released to Privacy International following a 2017 US freedom of information request. The materials, spanning 1945 to 2016, trace the development and functioning of the UKUSA Agreement underpinning intelligence cooperation among the US, UK, Canada, Australia, and New Zealand. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Five Eyes Archive**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must name the source descriptor, the bounded claim about **Five Eyes Archive**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Five Eyes Archive** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Five Eyes Archive: Key Declassified Documents establishes intent without reviewing alternative explanations.

Transfer task. Transfer **Five Eyes Archive** to a second module by preserving declassified-source interpretation and case-to-principle translation, changing the source evidence, and naming a new reviewer.

42.2.3 British and Allied Intelligence worked safe example: synthetic inputs, evidence, and review

Worked example: a sample seminar studies a declassified reform episode and extracts an oversight lesson without reconstructing current sources and methods. [266, 2026]; [269, 2026].

Triangulation anchors. In module 29's worked-example section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **declassified-source interpretation**. Learners use a **declassified case-to-principle card** and keep this boundary visible: No current sources-and-methods reconstruction, operational emulation, or tactical transfer.

Frame. The classroom question centers on **Declassified source-protection and institutional-control case study**. Excluded actions stay explicit, and the **Historical Case-Translation Lens** planning question is: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?

Inputs. For the **Declassified source-protection and institutional-control case study** scenario, use public archive metadata, a short excerpt, a timeline template, and an oversight-question worksheet. The Historical Case-Translation Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Declassified source-protection and institutional-control case study**, students record provenance, mark redactions, build timeline, distinguish known from unknown, and extract a governance lesson. Pause whenever an inference about Declassified source-protection and institutional-control case study appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Declassified source-protection and institutional-control case study** classroom scenario; unit artifact = declassified case-to-principle card; evidence = allowed inputs; method = declassified-source interpretation and case-to-principle translation; output = a historical case card with release context, caveats, lesson, and evidence-bounded boundary; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Declassified source-protection and institutional-control case study** as "Historical Case-Translation Lens confirms it" is not enough. The revision ties the claim to declassified-source interpretation and case-to-principle translation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Declassified source-protection and institutional-control case study** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

42.2.4 British and Allied Intelligence practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Historical Case-Translation Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Triangulation anchors. In module 29's practice-sequence section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Declassified source-protection and institutional-control case study, Hybrid-threat indicator review using sample scenarios and policy thresholds, GCHQ and the BRUSA/UKUSA Agreements; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Historical and Declassified Intelligence Services** lane.
2. Frame	Answer the lens question: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Declassified source-protection and institutional-control case study: historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the declassified case-to-principle card fields for Declassified source-protection and institutional-control case study.	Unit profile note.	Evidence artifacts include release metadata, redaction caveat.
4. Challenge	Test the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.	Failure-mode note.	The artifact applies the key distinction: separate historical lesson from reconstruction of live tactics or current sources and methods.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

42.2.4.1 British and Allied Intelligence instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [266, 2026]; [269, 2026].

42.2.4.2 British and Allied Intelligence extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 42; [266, 2026].

Have learners swap artifacts and apply the **Historical Case-Translation Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

42.2.5 British and Allied Intelligence knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 42; [266, 2026].

1. Explain how **Declassified source-protection and institutional-control case study** is defined here; name the source descriptor that supports the definition.
2. Contrast **Declassified source-protection and institutional-control case study** with **Hybrid-threat indicator review using sample scenarios and policy thresholds** using the **Historical Case-Translation Lens** artifact fields.
3. Identify one failure mode from the **Historical and Declassified Intelligence Services** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which institutional lesson is defensible from the record, and which claim reconstructs live tradecraft?
5. Correct this misconception: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

42.2.5.1 British and Allied Intelligence answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Declassified source-protection and institutional-control case study** without source evidence, uncertainty, or a safe transfer task.

42.3 British and Allied Intelligence assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 42; [266, 2026].

42.3.1 British and Allied Intelligence evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 42; [266, 2026].

42.3.2 British and Allied Intelligence transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 42; [266, 2026].

42.3.2.1 British and Allied Intelligence lineage and source tradition: profile, concepts, and first anchors This sits in the **Historical and Declassified Intelligence Services** lineage: turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform. [266, 2026]; [269, 2026].

42.3.2.2 British and Allied Intelligence working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 42; [266, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**, with provenance and reviewability throughout.

42.3.2.3 British and Allied Intelligence knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [266, 2026]; [269, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

42.3.2.4 British and Allied Intelligence transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 42; [266, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.
- **Evidence contract:** keep the **Historical and Declassified Intelligence Services** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

42.3.2.5 British and Allied Intelligence profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 42; [266, 2026].

The matched profile emphasizes turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform. The method stack is provenance review, declassification-status notation, institutional timeline building, case-to-principle translation, and uncertainty about redacted records; the local topic cluster is **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

42.3.3 British and Allied Intelligence evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 42; [266, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Historical and Declassified Intelligence Services** profile tells reviewers what evidence is strong enough for the module artifact built around **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

42.3.3.1 British and Allied Intelligence guide source spine: inherited keys and local citation roles Primary guide citations: [266, 2026]; [269, 2026]; [270, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [007, 2026]; [134, 2026]; [011, 2026]; [135, 2026]; [010, 2026]; [041, 2026]; [042, 2026].

42.3.3.2 British and Allied Intelligence verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [266, 2026]; [269, 2026].

Tier	What counts	How it is used
Source guide	[266, 2026]; [269, 2026]; [270, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [007, 2026]; [134, 2026]; [011, 2026]; [135, 2026]; [010, 2026]; [041, 2026]; [042, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 29's source-canon section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds** and [266, 2026]; [269, 2026], but only directly verified source URLs are encoded as citations.

42.3.3.3 British and Allied Intelligence intelligence practice lens: evidence artifact and safety check Practice lens: **Historical Case-Translation Lens** for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [266, 2026]; [269, 2026].

Planning question: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?

Evidence artifact: historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary.

Validation rule: distinguish what the record shows, what remains redacted or unknown, and which governance lesson is defensibly transferable. Applied to **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Handoff contract: handoff preserves archive citation, historical context, analytic lesson, oversight implication, and modern analogy as separate fields.

Safety check: exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material.

42.3.3.4 British and Allied Intelligence runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 42; [266, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	29.99	29.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind British and Allied Intelligence to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Bounded autonomy, procurement, incident-response, and assurance studio	29.101	29.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for British and Allied Intelligence	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Model-card, recoverability, retention, and learner-support evidence package	29.102	29.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for British and Allied Intelligence	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	29.1	29.1 source title transformed into safe curriculum treatment; original: MI6/SIS: Structure and Cold War Tradecraft	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Hybrid-threat indicator review using sample scenarios and policy thresholds	29.2	29.2 source title transformed into safe curriculum treatment; original: SOE: Special Operations Executive Training (WWII)	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
GCHQ and the BRUSA/UKUSA Agreements	29.3	29.3 GCHQ and the BRUSA/UKUSA Agreements	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Five Eyes Archive: Key Declassified Documents	29.4	29.4 Five Eyes Archive: Key Declassified Documents	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

42.3.3.5 British and Allied Intelligence reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 42; [266, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Hybrid-threat indicator review using sample scenarios and policy thresholds	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
GCHQ and the BRUSA/UKUSA Agreements	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Five Eyes Archive: Key Declassified Documents	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

42.3.3.6 British and Allied Intelligence annotated source ledger: real titles and local contribution Each source cited by this **Historical and Declassified Intelligence Services** module is paired below with its real title and a one-line note on what it contributes to **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Source	Cited work	What it contributes	Status
[266, 2026]	PROV Overview	A W3C Working Group Note from 2013 that provides an overview and roadmap for the PROV family of specifications for representing and exchanging provenance information on the web. It defines provenance as information about the entities, activities, and people involved in producing data, used to assess quality, reliability, and trustworthiness.	verified source-guide
[269, 2026]	Data on the Web Best Practices	A W3C Recommendation, "Data on the Web Best Practices," published January 31, 2017 by the Data on the Web Best Practices Working Group. It offers 35 best practices for publishing and consuming data on the Web, covering metadata, licensing and provenance, data quality, dataset versioning, persistent URIs, machine-readable formats, vocabulary reuse, access methods, preservation, and feedback.	verified source-guide

Source	Cited work	What it contributes	Status
[270, 2026]	NIST Big Data Interoperability Framework	NIST Special Publication 1500-1 (revised edition by Chang and Grady) establishes foundational terminology and consensus definitions for Big Data through the NIST Big Data Public Working Group. The volume defines Big Data characteristics, taxonomy, and a reference architecture assigning roles to Application Providers, Data Consumers, Data Providers, and System Orchestrators.	verified source-guide
[273, 2026]	WCAG 2 Overview	The W3C Web Accessibility Initiative overview of the Web Content Accessibility Guidelines (WCAG), an international standard for making web content accessible to people with disabilities. It explains that WCAG is organized around four principles (perceivable, operable, understandable, robust) with testable success criteria at three conformance levels (A, AA, AAA), and covers versions 2.0, 2.1, and 2.2.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[285, 2026]	NIST AI Resource Center	The NIST AI Resource Center (AIRC), a government platform supporting implementation of the NIST AI Risk Management Framework, a voluntary framework for managing AI risk. It provides the core framework along with a playbook of practical actions, profiles tailored to specific sectors and technologies, use cases, and crosswalks linking the framework to other governance structures.	verified source-guide
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide
[290, 2026]	NIST SP 800-218A: Secure Software Development Practices for Generative AI and Dual-Use Foundation Models	NIST Special Publication 800-218A (July 2024), which augments the Secure Software Development Framework with practices specific to AI model development across the software lifecycle. Produced in response to Executive Order 14110, it addresses AI model producers, developers building on those models, and acquirers of AI systems, and is designed to be used alongside NIST SP 800-218.	verified source-guide

Source	Cited work	What it contributes	Status
[294, 2026]	M-25-21: Accelerating Federal Use of AI through Innovation, Governance, and Public Trust	An April 2025 Office of Management and Budget memorandum (M-25-21) directing executive branch agencies on federal use of artificial intelligence. Issued under Executive Order 14179, it instructs agencies to accelerate adoption of AI to improve public services and government efficiency while maintaining safeguards for civil rights, civil liberties, and privacy.	verified source-guide
[007, 2026]	THE FRIENDS BRITAIN'S POST-WAR SECRET INTELLIGENCE	It is SIS's task to pursue policy objectives by unorthodox means and to amass useful information.	original source-guide
[134, 2026]	What is your reading list for (counter)intelligence/tradecraft?	How To Be A Spy: The WW2 SOE Training Manual - Denis Rigden · The CIA Guide to Clandestine.	original source-guide
[011, 2026]	BRUSA and UKUSA Agreements: GCHQ and NSA	A curated collection from Unredacted UK presenting documents declassified by the NSA and GCHQ in 2010 relating to US-UK signals intelligence cooperation. It covers the 1946 British-US Communications Agreement (BRUSA), its wartime origins from 1940, and its evolution into the 1956 UKUSA Agreement and the broader Five Eyes alliance.	verified source-guide
[135, 2026]	The origins of the UKUSA Agreement	A briefing from Unredacted, a UK investigative outlet, covering the early development of the UKUSA Agreement, the postwar US-UK signals-intelligence framework that became the basis for the Five Eyes alliance. It traces the 1946 BRUSA agreement on intelligence exchange, Canada's negotiation toward equal partnership in 1949, and the gradual integration of Australia and New Zealand through the 1950s.	verified source-guide
[010, 2026]	The Five Eyes Archive	An online archive maintained by Unredacted UK that compiles declassified government documents on intelligence sharing among the Five Eyes nations (United States, United Kingdom, Canada, Australia, and New Zealand). The collection traces the emergence and evolution of bilateral and multilateral agreements from the postwar era, including the BRUSA and UKUSA agreements, drawing on records from UK, US, and Australian agencies plus freedom-of-information releases.	verified source-guide
[041, 2026]	Five Eyes FOIA disclosures	A collection page from Unredacted, a UK-based organization focused on declassified government records. It assembles over 70 documents obtained through a 2017 Freedom of Information Act legal challenge led by Privacy International, drawn from US agencies including the NSA, State Department, and Department of Defense.	verified source-guide

Source	Cited work	What it contributes	Status
[042, 2026]	Five Eyes FOIA disclosures: key documents	A briefing from Unredacted examining previously classified Five Eyes documents released to Privacy International following a 2017 US freedom of information request. The materials, spanning 1945 to 2016, trace the development and functioning of the UKUSA Agreement underpinning intelligence cooperation among the US, UK, Canada, Australia, and New Zealand.	verified source-guide

Where this sits. This module's overview is Section 42; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

42.3.4 British and Allied Intelligence governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 42; [266, 2026].

42.3.5 British and Allied Intelligence analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 29's governance-boundary section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Historical and Declassified Intelligence Services** for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [266, 2026]; [269, 2026].
Curriculum topic spine: Declassified source-protection and institutional-control case study, **Hybrid-threat indicator review using sample scenarios and policy thresholds**, **GCHQ and the BRUSA/UKUSA Agreements**. **Verified anchor cluster:** [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]; [of the Director of National Intelligence, 2026e]; [Jr., 2007]; [Agency, 2009].
Conceptual depth: turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform.
Method stack: provenance review, declassification-status notation, institutional timeline building, case-to-principle translation, and uncertainty about redacted records.
Composability contract: archive source, release channel, historical context, analytic lesson, oversight implication, and modern analogy remain explicitly separated.
Known failure modes: romanticized tradecraft, presentist interpretation, redaction overclaiming, decontextualized case reuse, and translating history into operational instructions.
Defensive boundary: historical modules use declassified or public records for analysis and governance lessons only; they do not reconstruct live tactics, sources, methods, or current field procedures. Applied to **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Anchor	Why it matters here
[Agency, 2026a]	Official CSI landing page for Studies in Intelligence, declassified professional reflection, analytic history, and institutional learning. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026h]	Official declassified historical-release library for cryptologic history, SIGINT history, COMSEC, oral histories, and historical cases. Checked as of 2026-05-21; role: curriculum_anchor.
[Office, 2026a]	Official declassified satellite-reconnaissance program archive for CORONA, GAMBIT, POPPY, QUILL, and other historical technical-intelligence cases. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 2026b]	Official NARA guide to CIA Record Group 263, archival provenance, record series, and declassified intelligence research pathways. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026e]	Official ODNI explanation of analytic objectivity, ombuds, and tradecraft standards. Checked as of 2026-05-21; role: curriculum_anchor.
[Jr., 2007]	Foundational analytic cognition source for bias, mental models, and structured reasoning. Checked as of 2026-06-06; role: curriculum_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.

42.3.5.1 British and Allied Intelligence evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Historical and Declassified Intelligence Services** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [266, 2026]; [269, 2026].

42.3.6 British and Allied Intelligence agentic boundary: assist, approve, block, and record

Evidence anchor. Section 42; [266, 2026].
AGEINT translation is bounded by the **Historical and Declassified Intelligence Services** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

42.3.6.1 British and Allied Intelligence permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 42; [266, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

42.3.6.2 British and Allied Intelligence excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [266, 2026]; [269, 2026] and **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

42.3.7 British and Allied Intelligence governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 42; [266, 2026].
Governance is practiced as a gate on the **Historical and Declassified Intelligence Services** lane. Learners use the **Historical Case-Translation Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact

must stop for human review while using **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

42.3.7.1 British and Allied Intelligence governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [266, 2026]; [269, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Historical and Declassified Intelligence Services** failure modes and the **Historical Case-Translation Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

42.3.7.2 British and Allied Intelligence evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 42; [266, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Historical Case-Translation Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

42.3.7.3 British and Allied Intelligence current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [266, 2026]; [269, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cia_center_for_study_of_intelligence` for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Center for the Study of Intelligence; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official CSI landing page for Studies in Intelligence, declassified professional reflection, analytic history, and institutional learning.
What does the module inherit from `official_nsa_historical_releases` for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**?	NSA Historical Releases; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official declassified historical-release library for cryptologic history, SIGINT history, COMSEC, oral histories, and historical cases.
What does the module inherit from `official_nro_declassified_programs` for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Declassified NRO Programs and Projects; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official declassified satellite-reconnaissance program archive for CORONA, GAMBIT, POPPY, QUILL, and other historical technical-intelligence cases.
What does the module inherit from `official_nara_cia_records` for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**?	Records of the Central Intelligence Agency; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official NARA guide to CIA Record Group 263, archival provenance, record series, and declassified intelligence research pathways.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 42; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

42.3.8 British and Allied Intelligence assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 42; [266, 2026].

42.3.9 British and Allied Intelligence assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 42; [266, 2026].

42.3.9.1 British and Allied Intelligence capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds** and [266, 2026]; [269, 2026].

42.3.9.2 British and Allied Intelligence instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds** and [266, 2026]; [269, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

42.3.9.3 British and Allied Intelligence assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Declassified source-protection and institutional-control case study	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Hybrid-threat indicator review using sample scenarios and policy thresholds	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
GCHQ and the BRUSA/UKUSA Agreements	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

42.3.10 British and Allied Intelligence refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [266, 2026]; [269, 2026] and **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**.

42.3.10.1 British and Allied Intelligence refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**. The local signals begin with [266, 2026]; [269, 2026].

42.3.10.2 British and Allied Intelligence claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**, and the source spine for these checks begins with [266, 2026]; [269, 2026].

42.3.11 British and Allied Intelligence reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [266, 2026]; [269, 2026].

Triangulation anchors. In module 29's review-checklist section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds**. [266, 2026]; [269, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.

- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

42.3.12 British and Allied Intelligence learning-path links: module map, overview, and curriculum atlas

These links keep **Declassified source-protection and institutional-control case study; Hybrid-threat indicator review using sample scenarios and policy thresholds** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [266, 2026]; [269, 2026].

Section 2, Section 39, Section 41, Section 43

43 Israeli and Continental Services

43.0.1 Israeli and Continental Services figures and course links: visual evidence, source flow, and navigation

The module uses Figure 84 and Figure 79 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 39, Section 42, Section 44.
This module teaches the **Historical and Declassified Intelligence Services** lane through a bounded, source-backed coursebook chapter. [266, 2026]; [267, 2026].

43.1 Historical and Declassified Intelligence Services frame for Israeli and Continental Services: source context, topic focus, and reader task

Evidence anchor. Section 43; [266, 2026].

43.1.1 Israeli and Continental Services orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 43; [266, 2026].

43.1.2 Israeli and Continental Services conceptual primer: source context, core model, and reader task

This chapter teaches historical intelligence study as declassified evidence review: archives teach institutional lessons when provenance, redaction, context, and modern boundaries are explicit. The chapter uses **Historical Case-Translation Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.
The central distinction is to separate historical lesson from reconstruction of live tactics or current sources and methods. Core topics include **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case; Declassified covert-action oversight and source-protection case**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [266, 2026]; [267, 2026].
Learners move from vocabulary and the **Historical Case-Translation Lens** distinction through topic lessons on **Declassified source-protection and institutional-control case study** with evidence and misconception checks, then assemble a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with safety and rights gates.

43.1.3 Israeli and Continental Services learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 43; [266, 2026].

- Connect **Declassified source-protection and institutional-control case study and Declassified cover-identity and source-protection case** to **Historical and Declassified Intelligence Services** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate historical lesson from reconstruction of live tactics or current sources and methods; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as romanticized tradecraft, presentist interpretation, redaction overclaiming, decontextualized case reuse, and translating history into operational instructions, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: historical modules use declassified or public records for analysis and governance lessons only; they do not reconstruct live tactics, sources, methods, or current field procedures.

43.1.4 Israeli and Continental Services core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 43; [266, 2026].

Term	Working definition
Declassification context	the release channel, date, and limits of an official historical source
Redaction caveat	the warning that missing text may change interpretation
Institutional lesson	the durable governance or analytic principle drawn from a case
Presentism	the error of forcing modern assumptions onto a historical record
Modern analogy	a bounded comparison that preserves differences between eras
Oversight failure	a documented breakdown in review, records, or accountability visible in the archive
Source-protection lesson	the historical principle about protecting people and methods without reconstructing live tradecraft
Declassified source-protection and…	Key terms: Declassified, protection, institutional.
Declassified cover-identity and…	Key terms: Declassified, cover, identity.

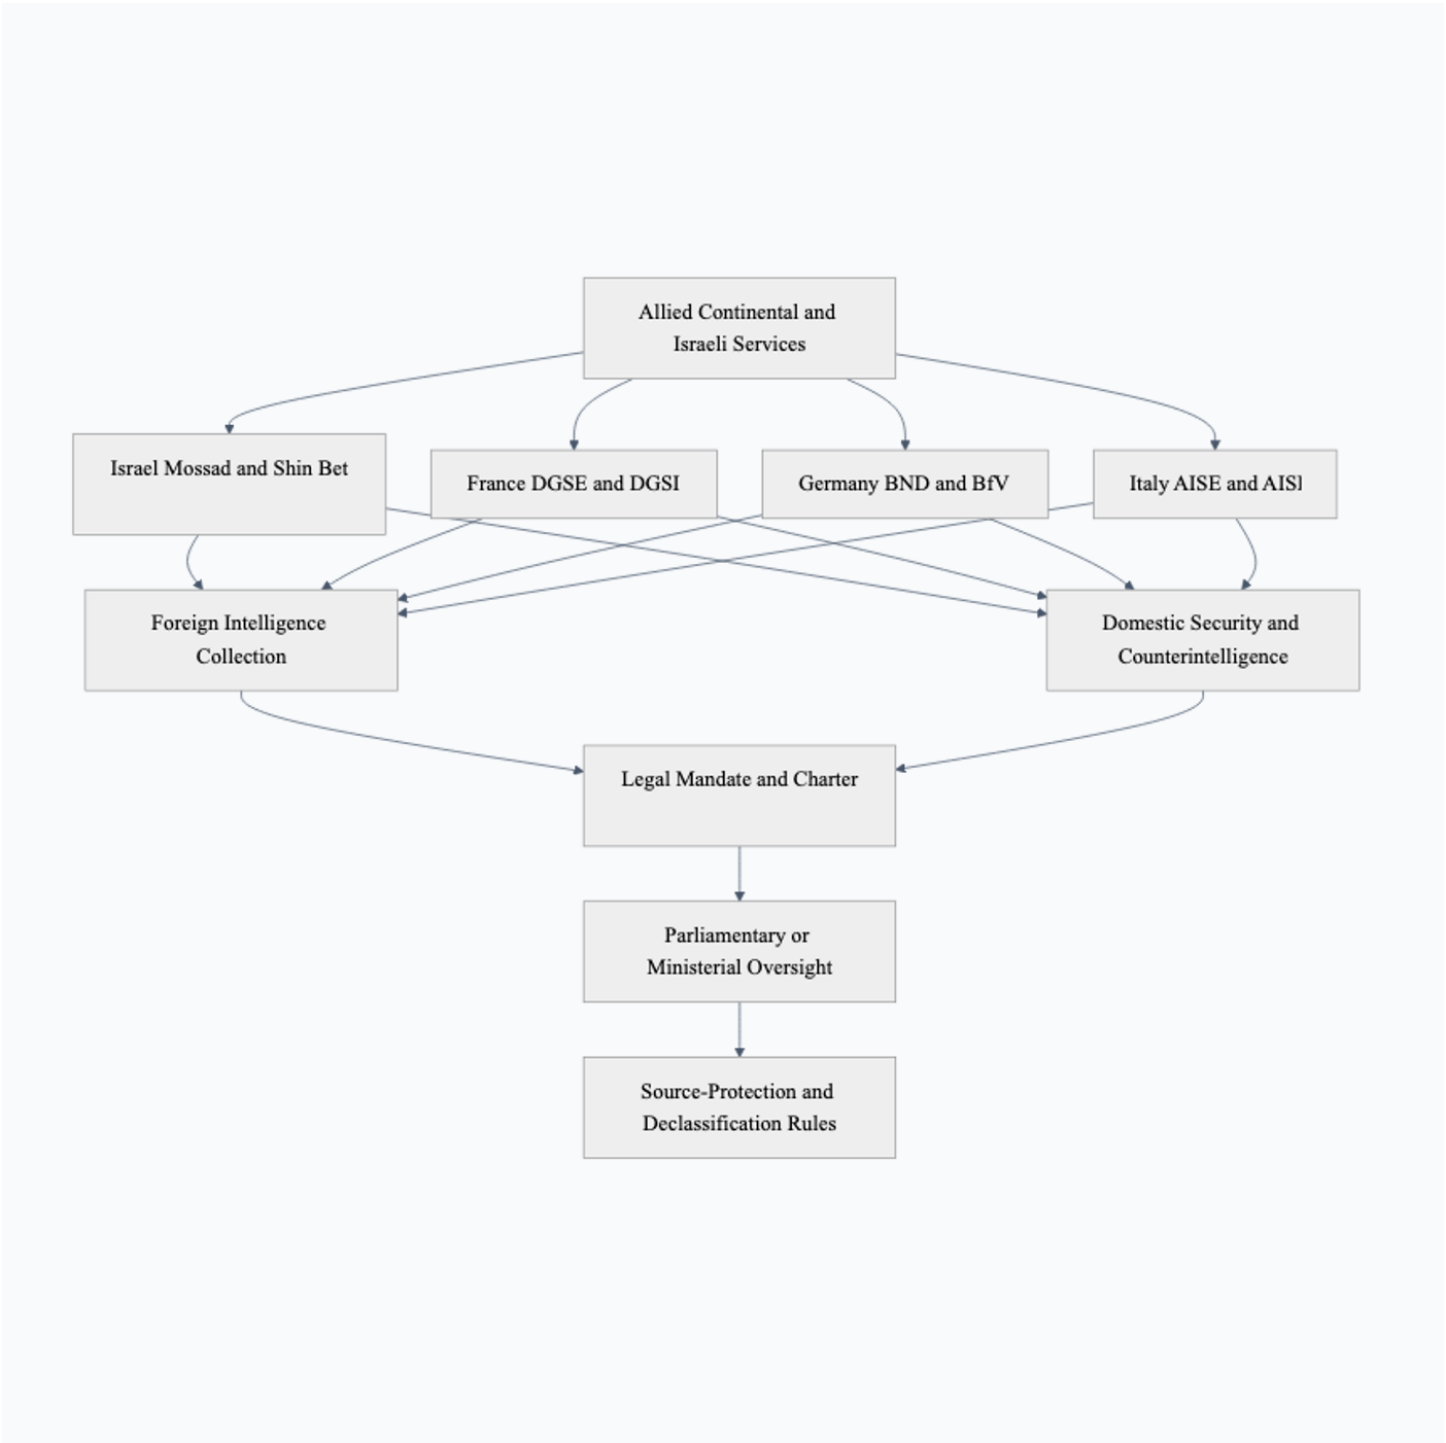

Figure 84: A comparative organizational view of allied continental and Israeli intelligence services showing the shared split between foreign collection, domestic security, and the oversight bodies that govern them. Its reader value is to make Allied Continental and Israeli Services, Israel Mossad and Shin Bet, France DGSE and DGSI, and Germany BND and BfV visible at a glance, with the historical intelligence services / israeli and continental services section as the source section and defensive review as the boundary.

43.2 Historical Case-Translation Lens path for Israeli and Continental Services: lesson cluster, safe artifact, and review

Evidence anchor. Section 43; [266, 2026].

43.2.1 Israeli and Continental Services practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 43; [266, 2026].

43.2.2 Israeli and Continental Services topic lessons: source-backed concepts and transfer tasks

This module builds historical intelligence study as declassified evidence review: archives teach institutional lessons when provenance, redaction, context, and modern boundaries are explicit. The sequence opens with **Declassified source-protection and institutional-control case study**, **Declassified cover-identity and source-protection case**, **Declassified covert-action oversight and source-protection case** and applies the **Historical Case-Translation Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 79; module overview Section 43; curriculum atlas Section 2.

Triangulation anchors. In module 30's topic-lessons section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

43.2.2.1 Lesson 1: Declassified source-protection and institutional-control case study

Concept. Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Declassified source-protection connects classroom vocabulary to Historical and Declassified Intelligence Services practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Declassified source-protection and institutional-control case study rests on [008, 2026]. The lead source's own note reads: An EBSCO Research Starter reference article on the Mossad, Israel's national intelligence agency established in 1949 and responsible for foreign intelligence collection and counterterrorism operations conducted outside Israel's borders. Use it for the working definition that **Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified source-protection**, reason from the sources cited in this row. [008, 2026] An EBSCO Research Starter reference article on the Mossad, Israel's national intelligence agency established in 1949 and responsible for foreign intelligence collection and counterterrorism operations conducted outside Israel's borders. It describes the agency's departmental structure (collection, political action and liaison, research, technology) and reviews historically documented operations including the 1960 capture of Adolf Eichmann and the rescue of Ethiopian Jews. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Declassified source-protection**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified source-protection and institutional-control case**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Declassified source-protection** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Declassified source-protection** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

43.2.2.2 Lesson 2: Declassified cover-identity and source-protection case

Concept. Declassified cover-identity and source-protection case treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Analysts use **Declassified cover-identity** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. Declassified cover-identity and source-protection case rests on [136, 2026]. Its anchor reference records: The Mossad is concerned with foreign intelligence gathering, intelligence analysis. Use it for fixing what **Declassified cover-identity and source-protection case** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. Ground **Declassified cover-identity** in the evidence the row cites. [136, 2026] The Mossad is concerned with foreign intelligence gathering, intelligence analysis. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified cover-identity**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape this subject work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **Declassified cover-identity** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

43.2.2.3 Lesson 3: Declassified covert-action oversight and source-protection case

Concept. Declassified covert-action oversight and source-protection case studies influence doctrine as audience analysis, message integrity, and ethics—not as manipulation technique.

Why it matters. Analysts use **Declassified covert-action oversight** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. Declassified covert-action oversight and source-protection case rests on [297, 2026] and [298, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the working definition that **Declassified covert-action oversight and source-protection case** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Declassified covert-action oversight**, work from the cited evidence behind this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and

accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Declassified covert-action oversight**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Declassified covert-action oversight and source-protection**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Declassified covert-action oversight** work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Apply this module's safe boundary for **Declassified covert-action oversight** to another artifact while keeping declassified-source interpretation and case-to-principle translation and reviewer ownership explicit.

43.2.2.4 Lesson 4: Unit: Declassified source-protection and institutional-control case study

Concept. Unit: Declassified source-protection and institutional-control case study frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. Analysts use **Unit: Declassified source-protection and institutional-control case study** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. Unit: Declassified source-protection and institutional-control case study rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for pinning down the scope of **Unit: Declassified source-protection and institutional-control case study**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Unit: Declassified source-protection and institutional-control case study**, reason from the sources cited in this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Unit**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Unit**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Unit: Declassified source-protection and institutional-control case study** work as a **declassified case-to-principle card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Unit: Declassified source-protection and institutional-control case study** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

43.2.2.5 Lesson 5: SDECE/DGSE: Declassified source-protection and institutional-control case study

Concept. SDECE/DGSE: Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about source protection, oversight, and the danger of translating historical methods into current practice.

Why it matters. SDECE/DGSE connects classroom vocabulary to Historical and Declassified Intelligence Services practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. SDECE/DGSE: Declassified source-protection and institutional-control case study rests on [297, 2026] and [298, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the working definition that **SDECE/DGSE: Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **SDECE/DGSE**, reason from the sources cited in this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **SDECE/DGSE**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **SDECE/DGSE**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **SDECE/DGSE** work as a **declassified case-to-principle card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **SDECE/DGSE** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

43.2.2.6 Lesson 6: BND: Declassified source-protection and institutional-control case study

Concept. BND: Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about source protection, oversight, and the danger of translating historical methods into current practice.

Why it matters. BND: Declassified source-protection and institutional-control case study matters in the **Historical and Declassified Intelligence Services** lane because declassified-source interpretation and case-to-principle translation evidence must stay separate from judgment; romanticized tradecraft is a common failure.

Source support. BND: Declassified source-protection and institutional-control case study rests on [297, 2026] and [298, 2026]. The lead source's own note reads: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the working definition that **BND: Declassified source-protection and institutional-control case study** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **BND: Declassified source-protection and institutional-control case study**, work from the cited evidence behind this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alterna-

tives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **BND**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **BND**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **BND: Declassified source-protection and institutional-control case study** work as a **declassified case-to-principle card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Reuse the **BND: Declassified source-protection and institutional-control case study** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

43.2.2.7 Lesson 7: Stasi: Declassified source-protection and institutional-control case study

Concept. Stasi: Declassified source-protection and institutional-control case study studies the declassified record for institutional lessons about source protection, oversight, and the danger of translating historical methods into current practice.

Why it matters. Analysts use **Stasi: Declassified source-protection and institutional-control case study** to separate historical lesson from reconstruction of live tactics or current sources and methods. A defensible treatment names the judgment it enables for declassified-source interpretation and case-to-principle translation review, the proof limit that romanticized tradecraft would otherwise hide, and the reviewer accountable for challenge.

Source support. Stasi: Declassified source-protection and institutional-control case study rests on [297, 2026] and [298, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for pinning down the scope of **Stasi: Declassified source-protection and institutional-control case study**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Agency, 2026a]; [Agency, 2026h].

Evidence to inspect. For **Stasi: Declassified source-protection and institutional-control case study**, reason from the sources cited in this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Stasi**, build a **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** for this declassified-source interpretation and case-to-principle translation topic. The artifact must cite the declassified source descriptor, the bounded lesson about **Stasi**, the redaction caveat, the attribution uncertainty, the protected-detail boundary, and the reviewer who clears release. Shape **Stasi: Declassified source-protection and institutional-control case study** work as a **declassified case-to-principle card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

Transfer task. Transfer **Stasi: Declassified source-protection and institutional-control case study** from this module to a second motif by preserving declassified-source interpretation and case-to-principle translation, replacing action with audit, and naming the blocked use.

43.2.3 Israeli and Continental Services worked safe example: synthetic inputs, evidence, and review

Worked example: a sample seminar studies a declassified reform episode and extracts an oversight lesson without reconstructing current sources and methods. [266, 2026]; [267, 2026].

Triangulation anchors. In module 30's worked-example section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **declassified-source interpretation**. Learners use a **declassified case-to-principle card** and keep this boundary visible: No current sources-and-methods reconstruction, operational emulation, or tactical transfer.

Frame. The classroom question centers on **Declassified source-protection and institutional-control case study**. Excluded actions stay explicit, and the **Historical Case-Translation Lens** planning question is: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?

Inputs. For the **Declassified source-protection and institutional-control case study** scenario, use public archive metadata, a short excerpt, a timeline template, and an oversight-question worksheet. The Historical Case-Translation Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Declassified source-protection and institutional-control case study**, students record provenance, mark redactions, build timeline, distinguish known from unknown, and extract a governance lesson. Pause whenever an inference about Declassified source-protection and institutional-control case study appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Declassified source-protection and institutional-control case study** classroom scenario; unit artifact = declassified case-to-principle card; evidence = allowed inputs; method = declassified-source interpretation and case-to-principle translation; output = a historical case card with release context, caveats, lesson, and evidence-bounded boundary; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Declassified source-protection and institutional-control case study** as "Historical Case-Translation Lens confirms it" is not enough. The revision ties the claim to declassified-source interpretation and case-to-principle translation, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Declassified source-protection and institutional-control case study** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

43.2.4 Israeli and Continental Services practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Historical Case-Translation Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

Triangulation anchors. In module 30's practice-sequence section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Declassified source-protection and institutional-control case study, Declassified cover-identity and source-protection case, Declassified covert-action oversight and source-protection case; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Historical and Declassified Intelligence Services** lane.
2. Frame	Answer the lens question: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Declassified source-protection and institutional-control case study: historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the declassified case-to-principle card fields for Declassified source-protection and institutional-control case study.	Unit profile note.	Evidence artifacts include release metadata, redaction caveat.
4. Challenge	Test the misconception that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.	Failure-mode note.	The artifact applies the key distinction: separate historical lesson from reconstruction of live tactics or current sources and methods.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

43.2.4.1 Israeli and Continental Services instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**. [266, 2026]; [267, 2026].

43.2.4.2 Israeli and Continental Services extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 43; [266, 2026].

Have learners swap artifacts and apply the **Historical Case-Translation Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

43.2.5 Israeli and Continental Services knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 43; [266, 2026].

1. Explain how **Declassified source-protection and institutional-control case study** is defined here; name the source descriptor that supports the definition.
2. Contrast **Declassified source-protection and institutional-control case study** with **Declassified cover-identity and source-protection case** using the **Historical Case-Translation Lens** artifact fields.
3. Identify one failure mode from the **Historical and Declassified Intelligence Services** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which institutional lesson is defensible from the record, and which claim reconstructs live tradecraft?
5. Correct this misconception: that a source identity is safe to discuss once the operation is historical, when protection obligations and re-identification risk outlast the case itself.

43.2.5.1 Israeli and Continental Services answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Declassified source-protection and institutional-control case study** without source evidence, uncertainty, or a safe transfer task.

43.3 Israeli and Continental Services assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 43; [266, 2026].

43.3.1 Israeli and Continental Services evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 43; [266, 2026].

43.3.2 Israeli and Continental Services transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 43; [266, 2026].

43.3.2.1 Israeli and Continental Services lineage and source tradition: profile, concepts, and first anchors This sits in the **Historical and Declassified Intelligence Services** lineage: turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform. [266, 2026]; [267, 2026].

43.3.2.2 Israeli and Continental Services working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 43; [266, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**, with provenance and reviewability throughout.

43.3.2.3 Israeli and Continental Services knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [266, 2026]; [267, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

43.3.2.4 Israeli and Continental Services transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 43; [266, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.
- **Evidence contract:** keep the **Historical and Declassified Intelligence Services** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

43.3.2.5 Israeli and Continental Services profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 43; [266, 2026].

The matched profile emphasizes turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform. The method stack is provenance review, declassification-status notation, institutional timeline building, case-to-principle translation, and uncertainty about redacted records; the local topic cluster is **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

43.3.3 Israeli and Continental Services evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 43; [266, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Historical and Declassified Intelligence Services** profile tells reviewers what evidence is strong enough for the module artifact built around **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

43.3.3.1 Israeli and Continental Services guide source spine: inherited keys and local citation roles Primary guide citations: [266, 2026]; [267, 2026]; [271, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [008, 2026]; [136, 2026]; [297, 2026]; [298, 2026].

43.3.3.2 Israeli and Continental Services verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [266, 2026]; [267, 2026].

Tier	What counts	How it is used
Source guide	[266, 2026]; [267, 2026]; [271, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [008, 2026]; [136, 2026]; [297, 2026]; [298, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 30's source-canon section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case** and [266, 2026]; [267, 2026], but only directly verified source URLs are encoded as citations.

43.3.3.3 Israeli and Continental Services intelligence practice lens: evidence artifact and safety check Practice lens: **Historical Case-Translation Lens** for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**. [266, 2026]; [267, 2026].

Planning question: Which declassified source, release context, institutional lesson, and modern boundary can be carried forward without recreating operations?

Evidence artifact: historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary.

Validation rule: distinguish what the record shows, what remains redacted or unknown, and which governance lesson is defensibly transferable. Applied to **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

Handoff contract: handoff preserves archive citation, historical context, analytic lesson, oversight implication, and modern analogy as separate fields.

Safety check: exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material.

43.3.3.4 Israeli and Continental Services runtime-to-reader map: generated sections and verifier surfaces **Evidence anchor.** Section 43; [266, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	30.99	30.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Israeli and Continental Services to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Bounded autonomy, procurement, incident-response, and assurance studio	30.101	30.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Israeli and Continental Services	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Model-card, recoverability, retention, and learner-support evidence package	30.102	30.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Israeli and Continental Services	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	30.1	30.1 source title transformed into safe curriculum treatment; original: Mossad: Structure, Culture, Notable Operations	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Declassified cover-identity and source-protection case	30.2	30.2 source title transformed into safe curriculum treatment; original: Eli Cohen: Deep Cover Agent in Syria	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified covert-action oversight and source-protection case	30.3	30.3 source title transformed into safe curriculum treatment; original: Operation Wrath of God: PSYOP and Targeted Killing	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	30.4	30.4 source title transformed into safe curriculum treatment; original: Unit 8200: SIGINT, AI, and Cyber Excellence	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	30.5	30.5 source title transformed into safe curriculum treatment; original: SDECE/DGSE: French Intelligence Tradition	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	30.6	30.6 source title transformed into safe curriculum treatment; original: BND: German Federal Intelligence Service	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified source-protection and institutional-control case study	30.7	30.7 source title transformed into safe curriculum treatment; original: Stasi: East German Pervasive Domestic Intelligence	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

43.3.3.5 Israeli and Continental Services reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 43; [266, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified cover-identity and source-protection case	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Declassified covert-action oversight and source-protection case	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Unit: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
SDECE/DGSE: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
BND: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material
Stasi: Declassified source-protection and institutional-control case study	Historical Case-Translation Lens	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary	exclude reconstruction of current sources, methods, tactics, cover, or collection workflows from historical material

43.3.3.6 Israeli and Continental Services annotated source ledger: real titles and local contribution Each source cited by this **Historical and Declassified Intelligence Services** module is paired below with its real title and a one-line note on what it contributes to **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

Source	Cited work	What it contributes	Status
[266, 2026]	PROV Overview	A W3C Working Group Note from 2013 that provides an overview and roadmap for the PROV family of specifications for representing and exchanging provenance information on the web. It defines provenance as information about the entities, activities, and people involved in producing data, used to assess quality, reliability, and trustworthiness.	verified source-guide
[267, 2026]	PROV-O: The PROV Ontology	The W3C Recommendation for PROV-O, published in April 2013, which expresses the PROV data model as an OWL2 ontology for representing provenance information across systems. It defines three core classes, Entity, Activity, and Agent, and organizes terms into starting-point, expanded, and qualified categories.	verified source-guide
[271, 2026]	DataCite Metadata Schema	The DataCite Metadata Schema page, introducing a standardized framework of core metadata properties chosen for accurate and consistent identification of research resources for citation and retrieval. It notes the latest version, 4.7 (March 2026), which adds resource types such as Poster and Presentation along with new identifier and relation-type options.	verified source-guide
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide

Source	Cited work	What it contributes	Status
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide
[288, 2026]	Algorithmic Transparency Recording Standard Hub	A GOV.UK collection page serving as the hub for the UK Algorithmic Transparency Recording Standard (ATRS), maintained by the Government Digital Service. It provides a standardized template for documenting public-sector use of algorithmic tools, completion guidance, policy on scope and compliance, and a searchable repository of published transparency records.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[008, 2026]	Mossad / Military History and Science	An EBSCO Research Starter reference article on the Mossad, Israel's national intelligence agency established in 1949 and responsible for foreign intelligence collection and counterterrorism operations conducted outside Israel's borders. It describes the agency's departmental structure (collection, political action and liaison, research, technology) and reviews historically documented operations including the 1960 capture of Adolf Eichmann and the rescue of Ethiopian Jews.	verified source-guide
[136, 2026]	Mossad's secretive operations and reputation - Facebook	The Mossad is concerned with foreign intelligence gathering, intelligence analysis.	original source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide

Where this sits. This module's overview is Section 43; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

43.3.4 Israeli and Continental Services governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 43; [266, 2026].

43.3.5 Israeli and Continental Services analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 30's governance-boundary section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Historical and Declassified Intelligence Services** for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**. [266, 2026]; [267, 2026].
Curriculum topic spine: Declassified source-protection and institutional-control case study, **Declassified cover-identity and source-protection case**, **Declassified covert-action oversight and source-protection case**. **Verified anchor cluster:** [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]; [of the Director of National Intelligence, 2026e]; [Jr., 2007]; [Agency, 2009].
Conceptual depth: turning declassified records and official histories into safe institutional lessons about analytic judgment, secrecy, oversight, technical-intelligence evolution, and reform.
Method stack: provenance review, declassification-status notation, institutional timeline building, case-to-principle translation, and uncertainty about redacted records.
Composability contract: archive source, release channel, historical context, analytic lesson, oversight implication, and modern analogy remain explicitly separated.
Known failure modes: romanticized tradecraft, presentist interpretation, redaction overclaiming, decontextualized case reuse, and translating history into operational instructions.
Defensive boundary: historical modules use declassified or public records for analysis and governance lessons only; they do not reconstruct live tactics, sources, methods, or current field procedures. Applied to **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

Anchor	Why it matters here
[Agency, 2026a]	Official CSI landing page for Studies in Intelligence, declassified professional reflection, analytic history, and institutional learning. Checked as of 2026-05-21; role: curriculum_anchor.
[Agency, 2026h]	Official declassified historical-release library for cryptologic history, SIGINT history, COMSEC, oral histories, and historical cases. Checked as of 2026-05-21; role: curriculum_anchor.
[Office, 2026a]	Official declassified satellite-reconnaissance program archive for CORONA, GAMBIT, POPPY, QUILL, and other historical technical-intelligence cases. Checked as of 2026-05-21; role: curriculum_anchor.
[Archives and Administration, 2026b]	Official NARA guide to CIA Record Group 263, archival provenance, record series, and declassified intelligence research pathways. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2026e]	Official ODNI explanation of analytic objectivity, ombuds, and tradecraft standards. Checked as of 2026-05-21; role: curriculum_anchor.
[Jr., 2007]	Foundational analytic cognition source for bias, mental models, and structured reasoning. Checked as of 2026-06-06; role: curriculum_anchor.
[Agency, 2009]	Official structured analytic techniques primer for bias checks, alternatives, and warning analysis. Checked as of 2026-05-21; role: curriculum_anchor.

43.3.5.1 Israeli and Continental Services evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Historical and Declassified Intelligence Services** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [266, 2026]; [267, 2026].

43.3.6 Israeli and Continental Services agentic boundary: assist, approve, block, and record

Evidence anchor. Section 43; [266, 2026].
AGEINT translation is bounded by the **Historical and Declassified Intelligence Services** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

43.3.6.1 Israeli and Continental Services permitted defensive utility: curriculum uses and safe outputs **Evidence anchor.** Section 43; [266, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

43.3.6.2 Israeli and Continental Services excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [266, 2026]; [267, 2026] and **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

43.3.7 Israeli and Continental Services governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 43; [266, 2026].
Governance is practiced as a gate on the **Historical and Declassified Intelligence Services** lane. Learners use the **Historical Case-Translation Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact

must stop for human review while using **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

43.3.7.1 Israeli and Continental Services governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [266, 2026]; [267, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Historical and Declassified Intelligence Services** failure modes and the **Historical Case-Translation Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

43.3.7.2 Israeli and Continental Services evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 43; [266, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Historical Case-Translation Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

43.3.7.3 Israeli and Continental Services current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**. [266, 2026]; [267, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cia_center_for_study_of_intelligence` for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**?	Center for the Study of Intelligence; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official CSI landing page for Studies in Intelligence, declassified professional reflection, analytic history, and institutional learning.
What does the module inherit from `official_nsa_historical_releases` for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**?	NSA Historical Releases; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official declassified historical-release library for cryptologic history, SIGINT history, COMSEC, oral histories, and historical cases.
What does the module inherit from `official_nro_declassified_programs` for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**?	Declassified NRO Programs and Projects; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official declassified satellite-reconnaissance program archive for CORONA, GAMBIT, POPPY, QUILL, and other historical technical-intelligence cases.
What does the module inherit from `official_nara_cia_records` for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**?	Records of the Central Intelligence Agency; lane `historical_declassified_sources`; checked 2026-05-21.	historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary; Official NARA guide to CIA Record Group 263, archival provenance, record series, and declassified intelligence research pathways.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 43; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

43.3.8 Israeli and Continental Services assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 43; [266, 2026].

43.3.9 Israeli and Continental Services assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 43; [266, 2026].

43.3.9.1 Israeli and Continental Services capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case** and [266, 2026]; [267, 2026].

43.3.9.2 Israeli and Continental Services instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case** and [266, 2026]; [267, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

43.3.9.3 Israeli and Continental Services assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Declassified source-protection and institutional-control case study	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Declassified cover-identity and source-protection case	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Declassified covert-action oversight and source-protection case	Completed **historical case card with provenance, redaction caveats, timeline, lesson, and evidence-bounded boundary** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

43.3.10 Israeli and Continental Services refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [266, 2026]; [267, 2026] and **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**.

43.3.10.1 Israeli and Continental Services refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**. The local signals begin with [266, 2026]; [267, 2026].

43.3.10.2 Israeli and Continental Services claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**, and the source spine for these checks begins with [266, 2026]; [267, 2026].

43.3.11 Israeli and Continental Services reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [266, 2026]; [267, 2026].

Triangulation anchors. In module 30's review-checklist section, directly verified anchors for the **Historical and Declassified Intelligence Services** lane include [Agency, 2026a]; [Agency, 2026h]; [Office, 2026a]; [Archives and Administration, 2026b]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case**. [266, 2026]; [267, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

43.3.12 Israeli and Continental Services learning-path links: module map, overview, and curriculum atlas

These links keep **Declassified source-protection and institutional-control case study; Declassified cover-identity and source-protection case** paired with the orientation atlas, the parent unit, and the previous and next modules, so a reader can trace which claims and caveats are inherited rather than re-derived here. Anchored at [266, 2026]; [267, 2026].

Section 2, Section 39, Section 42, Section 44

44 AGEINT — AGENTIC INTELLIGENCE

44.1 AGEINT — AGENTIC INTELLIGENCE learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 44; [232, 2026].

44.1.1 governed agentic intelligence discipline spine: domain question and learning focus

Evidence anchor. Section 44; [232, 2026].
This unit teaches **governed agentic intelligence**. AGEINT lessons treat agents as bounded delegated systems whose identity, tools, memory, logs, stop conditions, and review gates define safe use.

44.1.2 governed agentic intelligence source-use contract: citation roles and evidence limits

Evidence anchor. Section 44; [232, 2026].
Use MCP, AI assurance, secure-development, and public-sector agentic AI anchors for tool boundaries, interoperability, external-memory governance, and oversight claims; use domain-specific agent-memory or cognitive literature for memory taxonomy claims.

44.1.3 governed agentic intelligence practice artifact: recurring packet and retained evidence

Evidence anchor. Section 44; [232, 2026].
The recurring practice artifact is a **agent run and assurance card** that draws on tool-allowlist record, external-memory governance boundary, blocked-action log, and recovery decision. The unit keeps its learning spine explicit. Learners design least-privilege agent roles, verify tool calls, distinguish claim/source memory from cognitive-memory taxonomy, record blocked actions, and define recovery.

44.1.4 governed agentic intelligence safety boundary: accountable, synthetic, and evidence-bounded limits

No autonomous external action, credentialed operations, live-target workflows, or uncontrolled tool use.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [232, 2026]; [235, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [232, 2026]; [235, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [232, 2026]; [235, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [232, 2026]; [235, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Agentic AI Governance and Tool Security. Core anchors: [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]. Conceptual focus: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. Composability contract: agents, tools, credentials, memory, retrieval stores, policies, and logs remain separately inspectable and revocable components. **Practice lens:** Agentic Tool-Governance Lens; Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow? [232, 2026]; [235, 2026].

44.1.5 AGEINT — AGENTIC INTELLIGENCE visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 85, Figure 86, and Figure 87 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 43, Section 45.

44.1.6 AGEINT — AGENTIC INTELLIGENCE module roster and source-lane inventory: citations, lanes, and learner route

Module	Section reference	Source spine
Foundations of AGEINT	Section 45	[232, 2026]; [235, 2026]; [247, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [137, 2026]; [138, 2026]; [139, 2026]; [140, 2026]; [141, 2026]; [142, 2026]; [004, 2026]; [005, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [301, 2026]; [298, 2026].

Module	Section reference	Source spine
AGEINT Design Patterns and Archetypes	Section 46	[233, 2026]; [258, 2026]; [272, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [143, 2026]; [139, 2026]; [144, 2026]; [145, 2026]; [146, 2026]; [147, 2026]; [148, 2026]; [138, 2026]; [004, 2026]; [149, 2026]; [150, 2026]; [076, 2026]; [151, 2026]; [152, 2026]; [137, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [297, 2026]; [298, 2026]; [309, 2026]; [310, 2026]; [300, 2026]; [304, 2026]; [303, 2026]; [305, 2026]; [302, 2026]; [301, 2026]; [307, 2026]; [308, 2026]; [311, 2026].
AGEINT Frameworks and Infrastructure	Section 47	[255, 2026]; [256, 2026]; [258, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [147, 2026]; [153, 2026]; [154, 2026]; [144, 2026]; [155, 2026]; [156, 2026]; [157, 2026]; [158, 2026]; [159, 2026]; [137, 2026]; [146, 2026]; [299, 2026]; [306, 2026]; [312, 2026].
AGEINT Security and Adversarial Considerations	Section 48	[234, 2026]; [235, 2026]; [236, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [147, 2026]; [155, 2026]; [159, 2026]; [137, 2026]; [160, 2026]; [161, 2026]; [100, 2026]; [162, 2026]; [004, 2026]; [148, 2026]; [299, 2026]; [306, 2026]; [312, 2026].
Active Inference and AGEINT	Section 49	[247, 2026]; [248, 2026]; [265, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [106, 2026]; [003, 2026]; [163, 2026]; [164, 2026]; [105, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [309, 2026]; [310, 2026]; [300, 2026].
AGEINT Python Code Library	Section 50	[242, 2026]; [243, 2026]; [246, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [309, 2026]; [310, 2026]; [300, 2026]; [304, 2026]; [303, 2026]; [305, 2026]; [307, 2026]; [301, 2026]; [298, 2026]; [308, 2026]; [311, 2026].

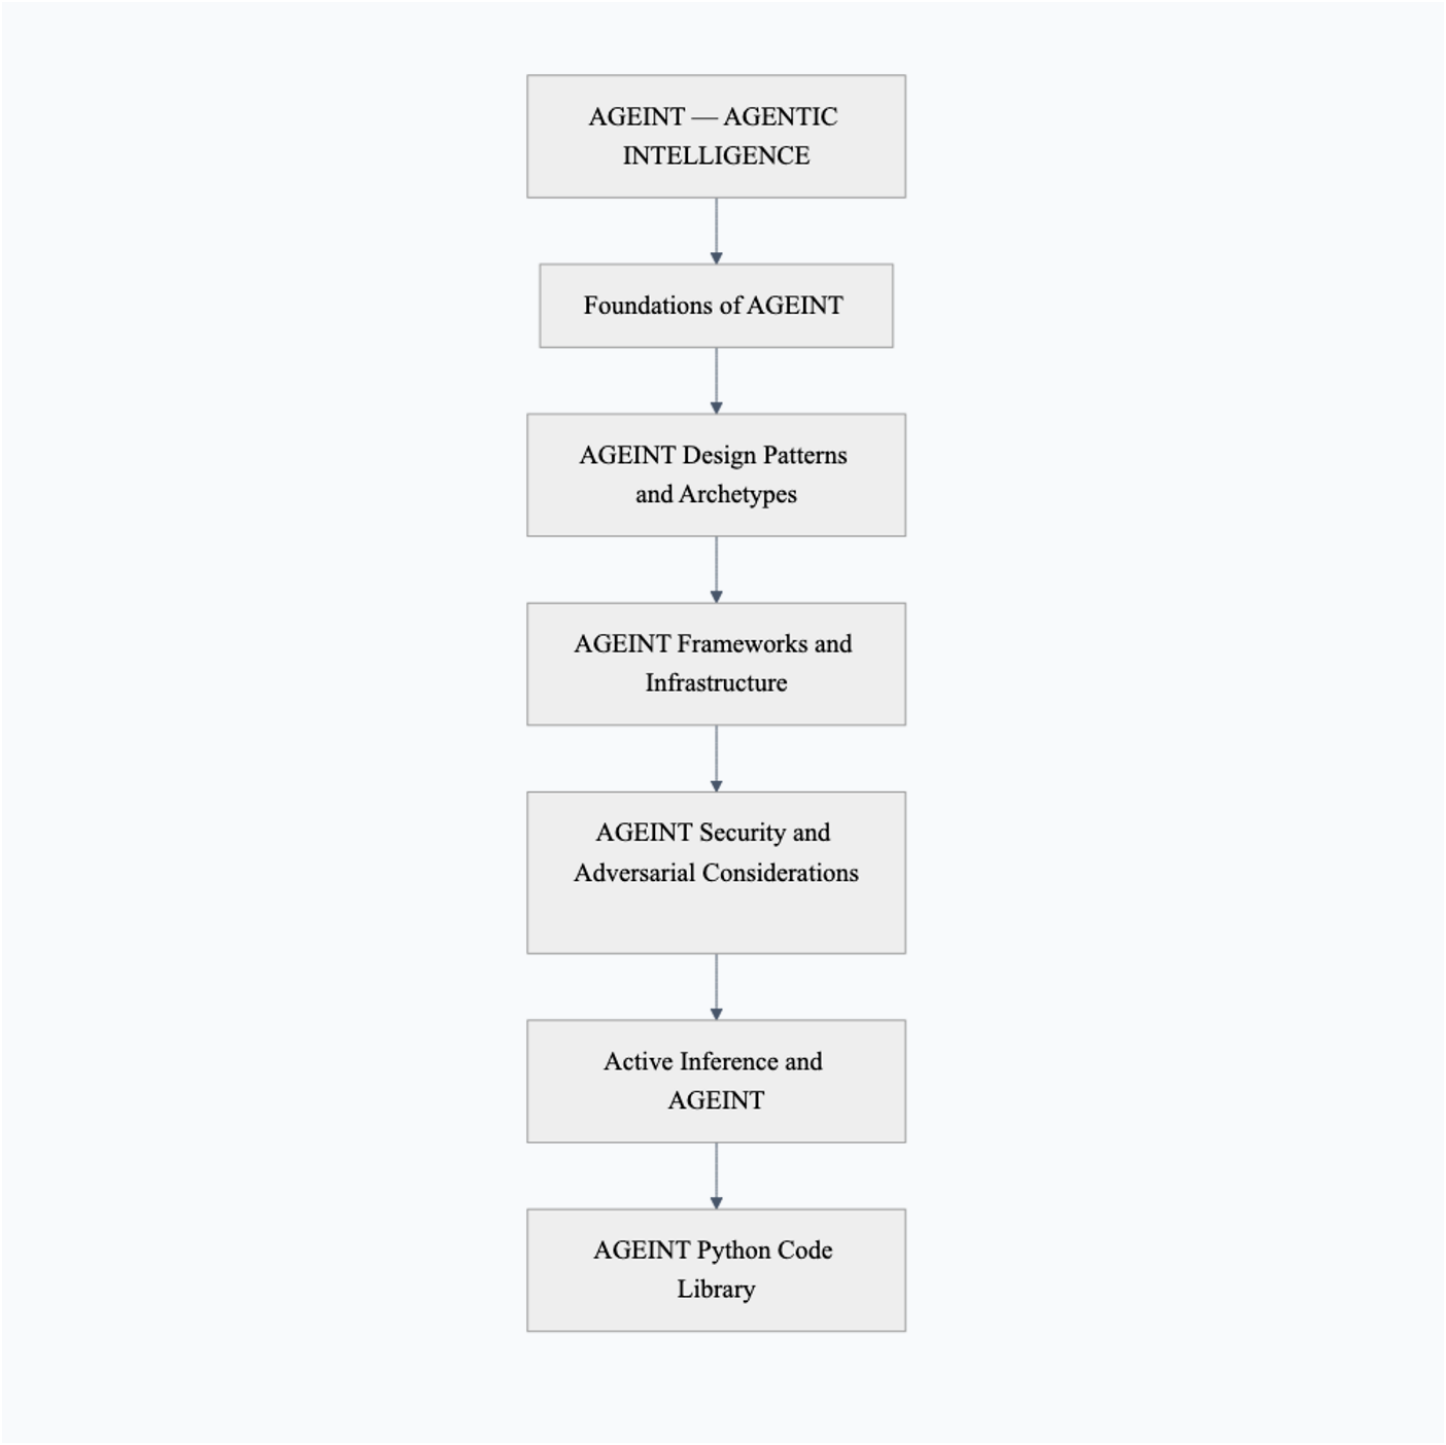

Figure 85: The unit module map traces the part's chapters as a linear reading sequence. Its reader value is to make 6 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last visible at a glance, with the ageint agentic intelligence section as the source section and defensive review as the boundary.

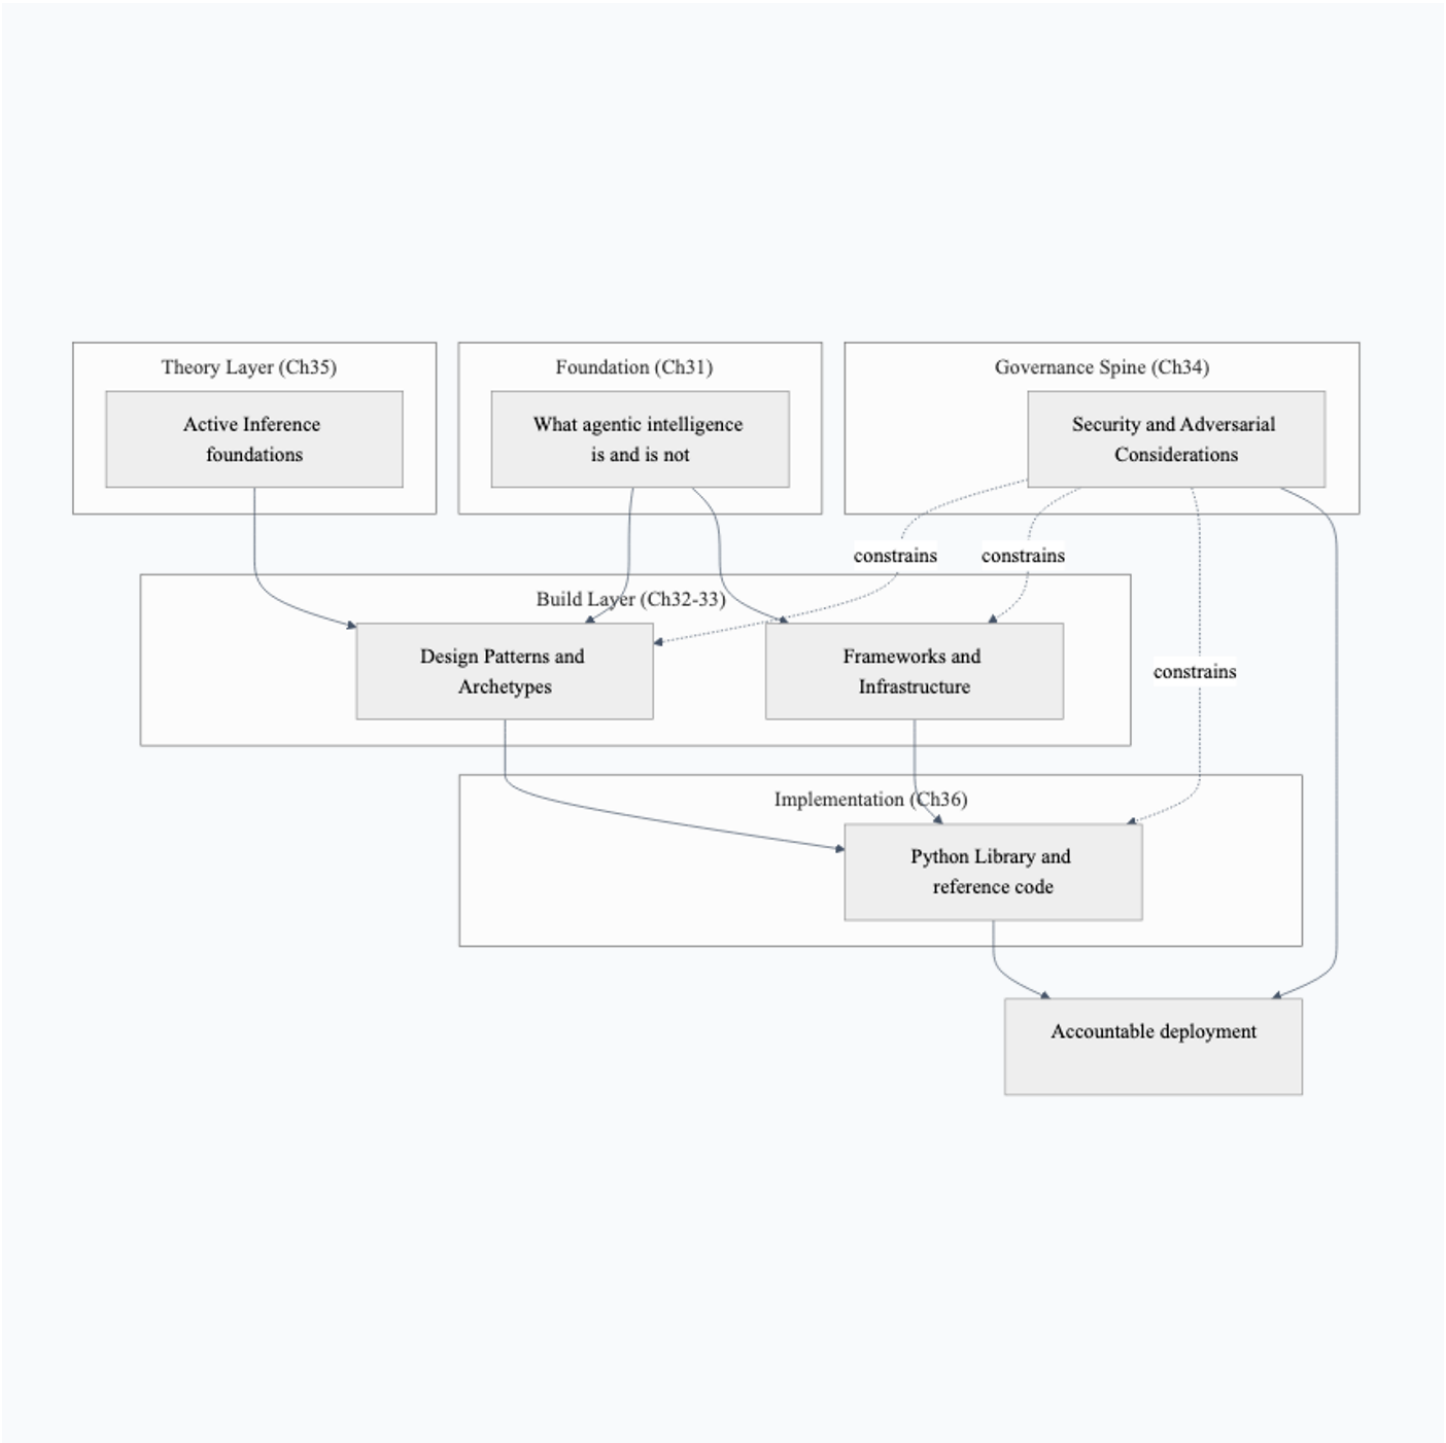

Figure 86: This part builds from foundations through design patterns, frameworks, and a Python library to accountable deployment, with security and adversarial considerations running as a governance spine that constrains every build layer. Its reader value is to make Foundation (Ch31), What agentic intelligence is and is not, Build Layer (Ch32-33), and Design Patterns and Archetypes visible at a glance, with the ageint agentic intelligence section as the source section and defensive review as the boundary.

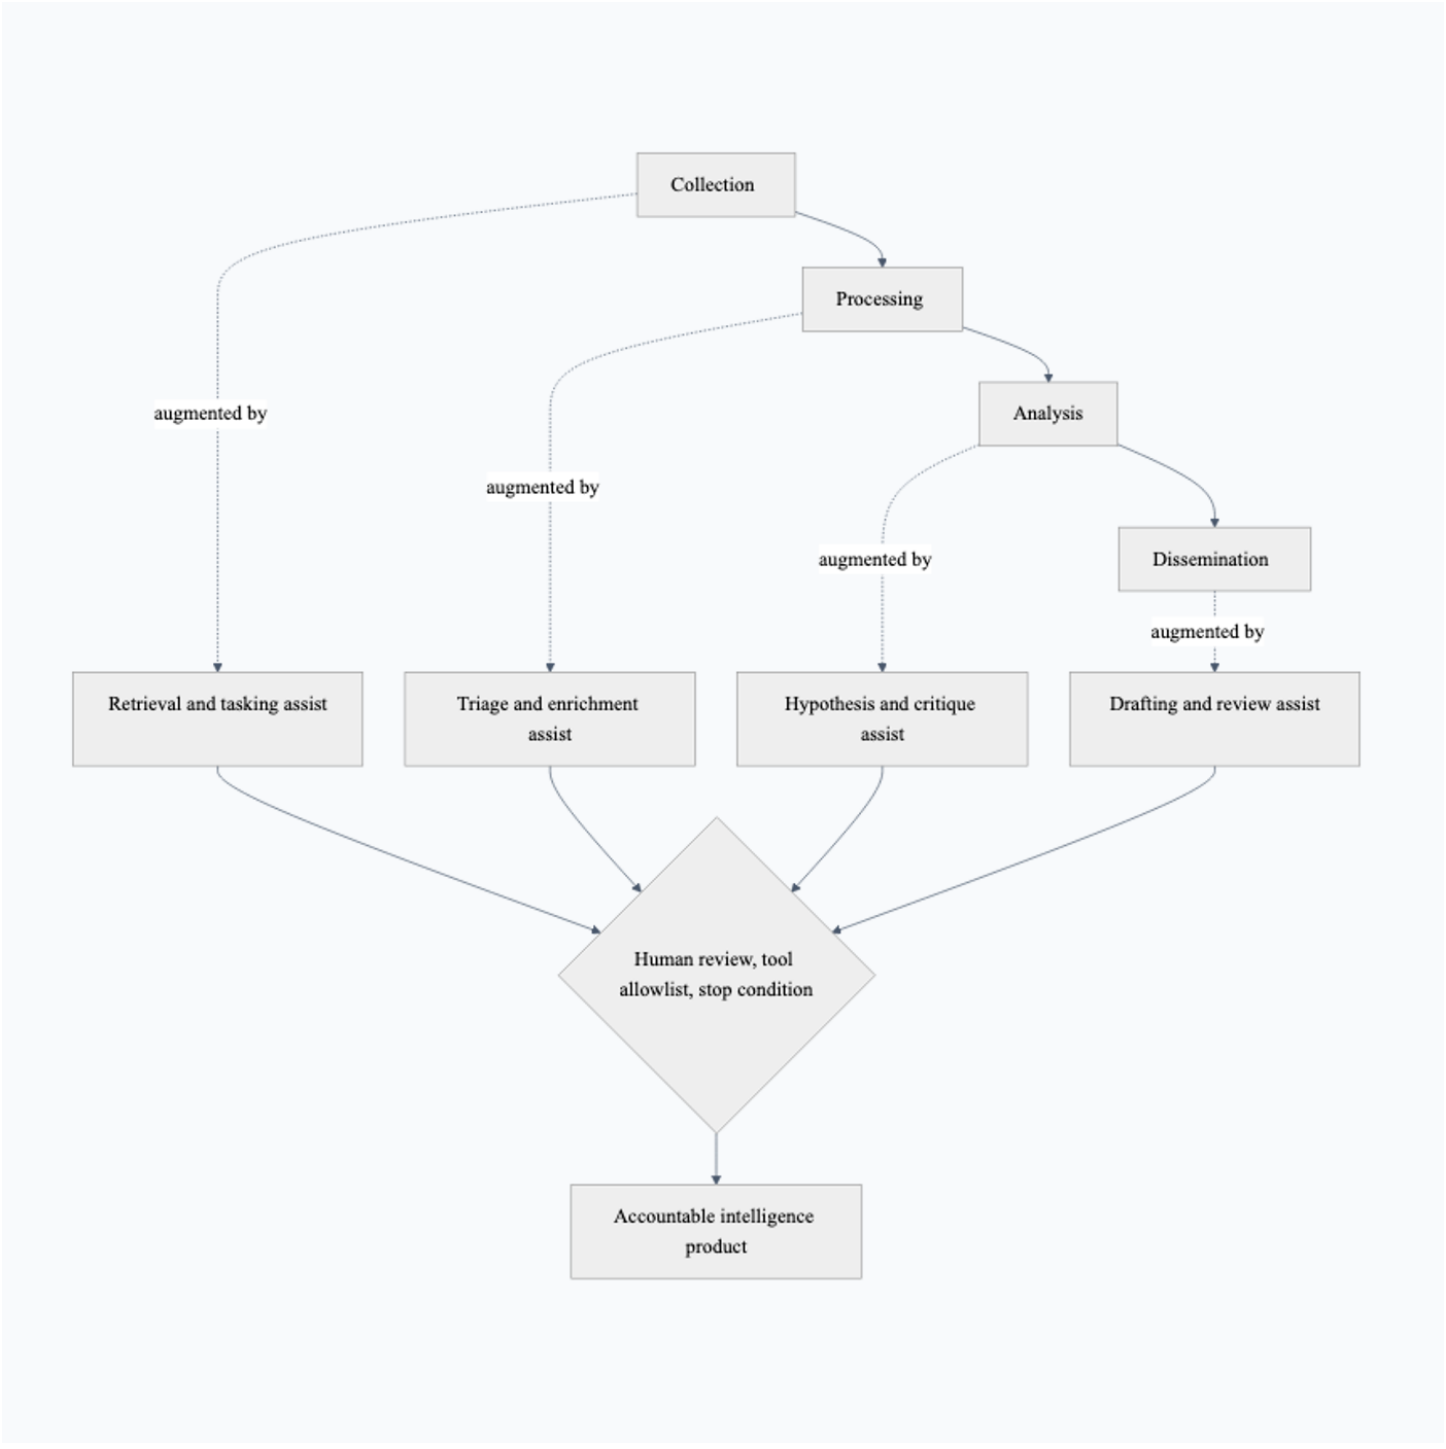

Figure 87: Conceptual/pedagogical schematic: AGEINT does not replace the intelligence cycle; it illustrates bounded assistance under human review, tool allowlists, and stop conditions. Its reader value is to make Collection, Retrieval and tasking assist, Processing, and Triage and enrichment assist visible at a glance, with the ageint agentic intelligence section as the source section and defensive review as the boundary.

45 Foundations of AGEINT

45.0.1 Foundations of AGEINT figures and course links: visual evidence, source flow, and navigation

The module uses Figure 88 and Figure 85 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 44, Section 46.
This module teaches the **Agentic AI Governance and Tool Security** lane through a bounded, source-backed coursebook chapter. [232, 2026]; [235, 2026].

45.1 Agentic AI Governance and Tool Security frame for Foundations of AGEINT: source context, topic focus, and reader task

Evidence anchor. Section 45; [232, 2026].

45.1.1 Foundations of AGEINT orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 45; [232, 2026].

45.1.2 Foundations of AGEINT conceptual primer: source context, core model, and reader task

This chapter teaches agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The chapter uses **Agentic Tool-Governance Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.
The central distinction is to separate agent assistance from autonomous external action. Core topics include **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack; Unified Taxonomy: Perception → Brain → Planning → Action → Collaboration**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [232, 2026]; [235, 2026].
Learners move from vocabulary and the **Agentic Tool-Governance Lens** distinction through topic lessons on **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems** with evidence and misconception checks, then assemble an **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with safety and rights gates.

45.1.3 Foundations of AGEINT learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 45; [232, 2026].

- Connect **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems and From LLMs to Agents: The Cognitive Controller Stack** to **Agentic AI Governance and Tool Security** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build an **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate agent assistance from autonomous external action; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists.

45.1.4 Foundations of AGEINT core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 45; [232, 2026].

Term	Working definition
Agent identity	the named software actor, role, and authorization context for a run
Tool allowlist	the bounded set of actions the agent may request
Delegation	the handoff of a task under explicit human authority and review
Bounded autonomy	the documented ceiling on what an agent may decide or request without review
Recoverability	the path back to a known-safe state after a bad output or action request
AI incident	a logged event where an AI system creates or plausibly creates harm or loss of control
Prompt injection	untrusted content that attempts to override instructions or authority boundaries
Pattern registry	the catalog of approved agent behaviors, prompts, and evaluation hooks
Adversarial eval	structured tests that probe agent misuse, injection, and over-delegation before release
Defining AGEINT: From AI Agents to Autonomous…	Key terms: Defining, AGEINT, AI.
From LLMs to Agents: The Cognitive Controller…	Key terms: LLMs, Agents, Cognitive.

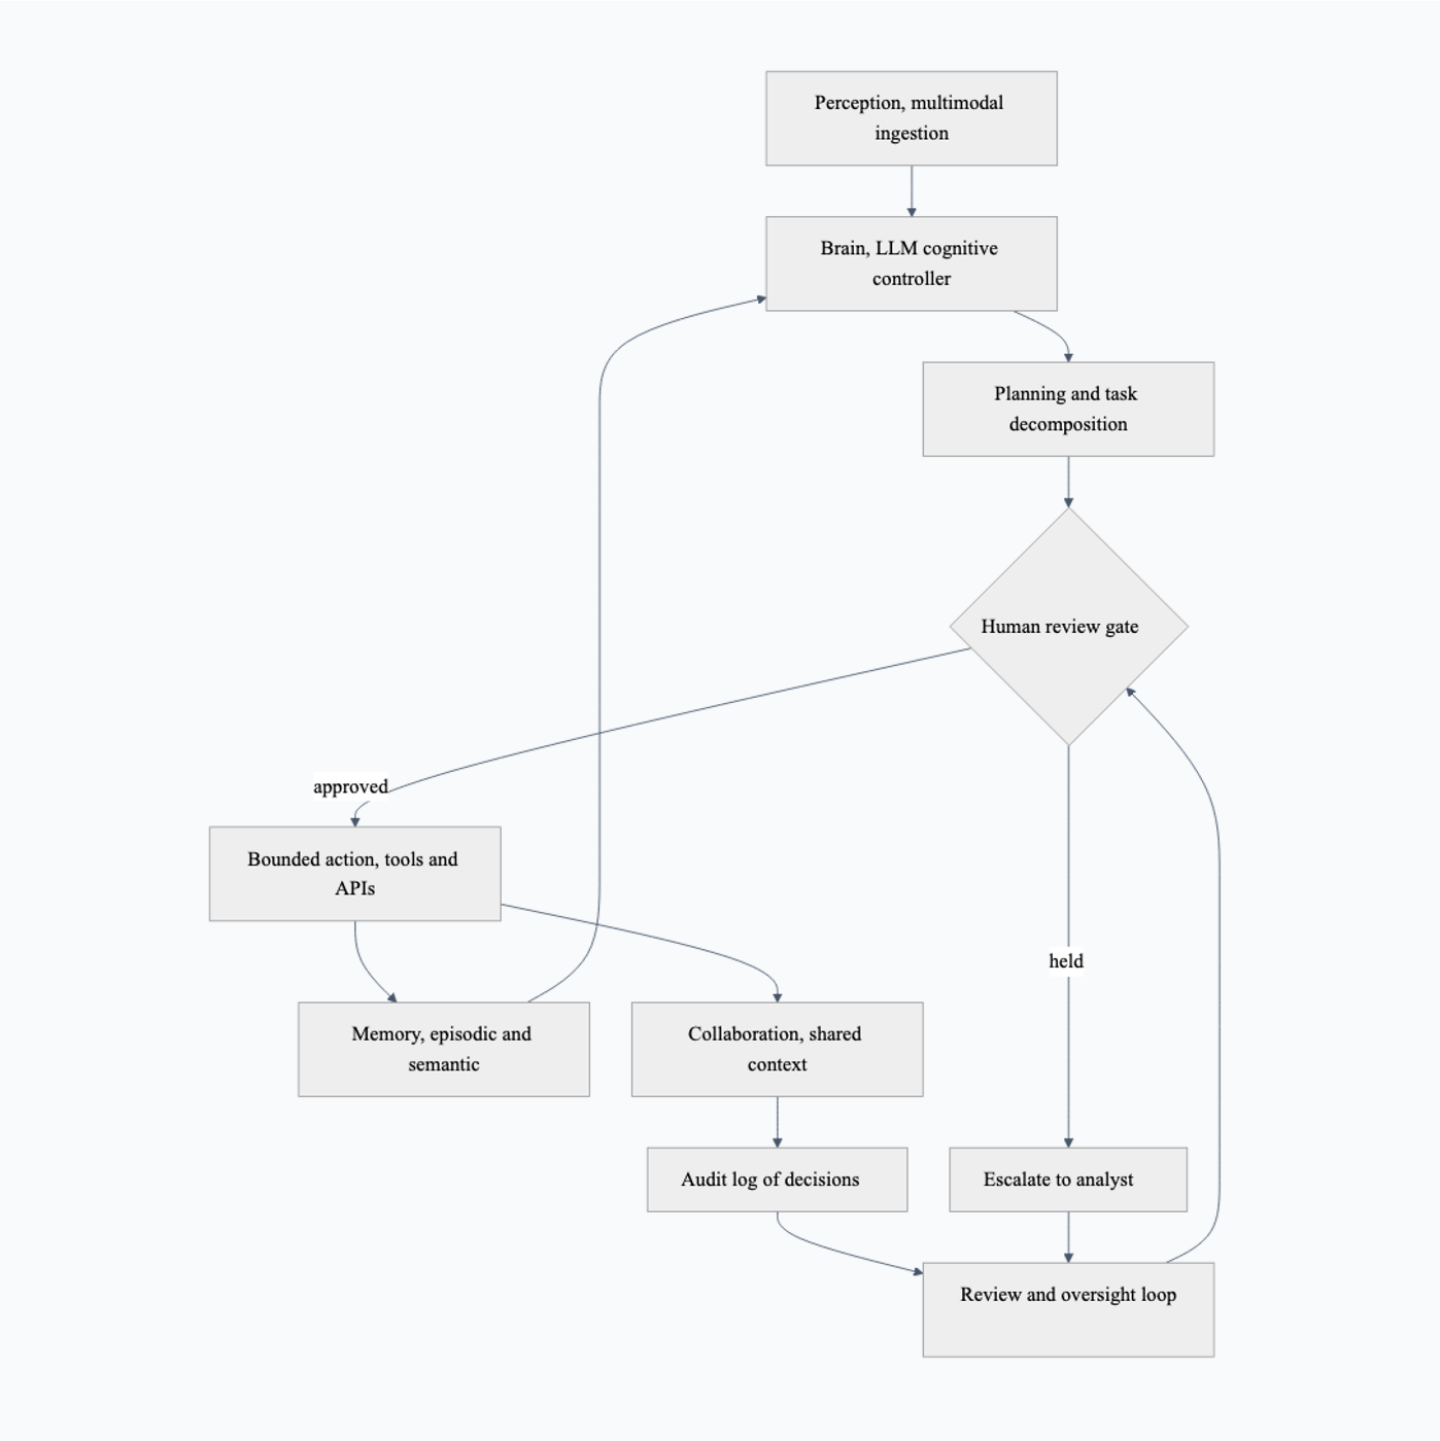

Figure 88: A conceptual view of how an agentic intelligence system layers perception, reasoning, memory, planning, and bounded action under continuous human oversight. In the ageint agentic intelligence / foundations of ageint section, it lets readers compare Perception, multimodal ingestion, Brain, LLM cognitive controller, Memory, episodic and semantic, and Planning and task decomposition so the visual functions as a traceable course aid rather than an unscoped assertion.

45.2 Agentic Tool-Governance Lens path for Foundations of AGEINT: lesson cluster, safe artifact, and review

Evidence anchor. Section 45; [232, 2026].

45.2.1 Foundations of AGEINT practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 45; [232, 2026].

45.2.2 Foundations of AGEINT topic lessons: source-backed concepts and transfer tasks

This module builds agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The sequence opens with **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems**, **From LLMs to Agents: The Cognitive Controller Stack**, **Unified Taxonomy: Perception → Brain → Planning → Action → Collaboration** and applies the **Agentic Tool-Governance Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 85; module overview Section 45; curriculum atlas Section 2.

Triangulation anchors. In module 31's topic-lessons section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

45.2.2.1 Lesson 1: Defining AGEINT: From AI Agents to Autonomous Intelligence Systems

Concept. Defining AGEINT: From AI Agents to Autonomous Intelligence Systems uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Defining AGEINT connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Defining AGEINT: From AI Agents to Autonomous Intelligence Systems rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Defining AGEINT** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Defining AGEINT**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Defining AGEINT**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Defining AGEINT** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Defining AGEINT**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Defining AGEINT** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.2 Lesson 2: From LLMs to Agents: The Cognitive Controller Stack

Concept. From LLMs to Agents: The Cognitive Controller Stack uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **From LLMs to Agents**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. From LLMs to Agents: The Cognitive Controller Stack rests on [137, 2026]. The most specific cited work observes: It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration. Use it for the claim that **From LLMs to Agents: The Cognitive Controller Stack** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **From LLMs to Agents**, reason from the sources cited in this row. [137, 2026] An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **From LLMs to Agents**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **LLMs to Agents**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **From LLMs to Agents** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **From LLMs to Agents**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **From LLMs to Agents** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.3 Lesson 3: Unified Taxonomy: Perception → Brain → Planning → Action → Collaboration

Concept. Unified Taxonomy: Perception → Brain → Planning → Action → Collaboration connects cognitive science claims to analytic bias literacy: what the brain prioritizes, what it misses, and how review compensates.

Why it matters. Analysts use **Unified Taxonomy** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Unified Taxonomy: Perception → Brain → Planning → Action → Collaboration rests on [137, 2026]. The most specific cited work observes: It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration. Use it for fixing what **Unified Taxonomy: Perception → Brain → Planning → Action → Collaboration** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Unified Taxonomy**, work from the cited evidence behind this row. [137, 2026] An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Unified Taxonomy**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Unified Taxonomy**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Unified Taxonomy** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Unified Taxonomy**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Unified Taxonomy** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.4 Lesson 4: Perception Modules: Multimodal Ingestion (Text, Vision, Audio, Sensor)

Concept. Perception Modules: Multimodal Ingestion (Text, Vision, Audio, Sensor) connects cognitive science claims to analytic bias literacy: what the brain prioritizes, what it misses, and how review compensates.

Why it matters. Perception Modules matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Perception Modules: Multimodal Ingestion (Text, Vision, Audio, Sensor) rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the claim that **Perception Modules: Multimodal Ingestion (Text, Vision, Audio, Sensor)** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Perception Modules** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Perception Modules**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Perception Modules**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Perception Modules** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Perception Modules**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Perception Modules** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.5 Lesson 5: Brain/Reasoning: LLM as Cognitive Controller

Concept. Brain/Reasoning: LLM as Cognitive Controller connects cognitive science claims to analytic bias literacy: what the brain prioritizes, what it misses, and how review compensates.

Why it matters. Brain/Reasoning connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Brain/Reasoning: LLM as Cognitive Controller rests on [138, 2026]. The most specific cited work observes: It proposes a unified taxonomy decomposing LLM-based agents into six dimensions: core components, cognitive architecture, learning paradigms, multi-agent systems, environments and domains, and evaluation and safety. Use it for fixing what **Brain/Reasoning: LLM as Cognitive Controller** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Brain/Reasoning**, reason from the sources cited in this row. [138, 2026] An arXiv survey paper on agentic AI examining the shift from generative systems to autonomous agents that perceive, reason, plan, and act. It proposes a unified taxonomy decomposing LLM-based agents into six dimensions: core components, cognitive architecture, learning paradigms, multi-agent systems, environments and domains, and evaluation and safety. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Brain/Reasoning**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Brain/Reasoning**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Brain/Reasoning** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Brain/Reasoning**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Brain/Reasoning** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.6 Lesson 6: Memory: In-Context, External VectorDB, Episodic, Semantic, Procedural

Concept. Memory: In-Context, External VectorDB, Episodic, Semantic, Procedural treats agent memory terms as a pedagogical taxonomy unless a domain memory source is cited; MCP and official agentic-AI guidance support external-memory governance, tool boundaries, logs, retention, and reviewer control.

Why it matters. Memory: In-Context, External VectorDB, Episodic, Semantic, Procedural matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Memory: In-Context, External VectorDB, Episodic, Semantic, Procedural rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the claim that **Memory: In-Context, External VectorDB, Episodic, Semantic, Procedural** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Memory: In-Context, External VectorDB, Episodic, Semantic, Procedural** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to

external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Memory**, build an agent-memory boundary card that separates source/change ledgers, external stores, retention rules, and reviewer controls from unsupported cognitive-memory taxonomy claims. Shape **Memory: In-Context, External VectorDB, Episodic, Semantic, Procedural** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Memory: In-Context, External VectorDB, Episodic, Semantic, Procedural**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Memory: In-Context, External VectorDB, Episodic, Semantic, Procedural** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.7 Lesson 7: Agentic cyber-misuse control review using sample prompt records, fabricated logs, and deny-by-default tool policies

Concept. Agentic cyber-misuse control review using sample prompt records, fabricated logs, and deny-by-default tool policies treats the topic as a misuse-case control problem: identify the agent permission, prompt path, tool boundary, and blocked outcome.

Why it matters. Agentic cyber-misuse control review matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating misuse taxonomy as tool permission is a common failure.

Source support. Agentic cyber-misuse control review using sample prompt records, fabricated logs, and deny-by-default tool policies rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the claim that **Agentic cyber-misuse control review using sample prompt records, fabricated logs, and deny-by-default tool policies** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Agentic cyber-misuse control review**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Agentic cyber-misuse control review**, build a blocked-request control card with tool permission, unsafe outcome, deny rule, log evidence, and reviewer disposition. Shape **Agentic cyber-misuse control review** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Agentic cyber-misuse control review**: that a misuse taxonomy describing what an autonomous agent could do is permission or a recipe to make it do so.

Transfer task. Reuse the **Agentic cyber-misuse control review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

45.2.2.8 Lesson 8: Collaboration: A2A Messaging, Shared Context, Role Specialization

Concept. Collaboration: A2A Messaging, Shared Context, Role Specialization uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Collaboration: A2A Messaging, Shared Context, Role Specialization matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Collaboration: A2A Messaging, Shared Context, Role Specialization rests on [139, 2026]. The most specific cited work observes: A LinkedIn post by Aishwarya Srinivasan discussing agentic AI design patterns for building production-grade AI agents. Use it for pinning down the scope of **Collaboration: A2A Messaging, Shared Context, Role Specialization**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Collaboration: A2A Messaging, Shared Context, Role Specialization** in the evidence the row cites. [139, 2026] A LinkedIn post by Aishwarya Srinivasan discussing agentic AI design patterns for building production-grade AI agents. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Collaboration**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Collaboration**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Collaboration: A2A Messaging, Shared Context, Role Specialization** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Collaboration: A2A Messaging, Shared Context, Role Specialization**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Collaboration: A2A Messaging, Shared Context, Role Specialization** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.9 Lesson 9: The OECD Agentic AI Landscape and Conceptual Foundations (2026)

Concept. The OECD Agentic AI Landscape and Conceptual Foundations (2026) evaluates agentic-AI governance claims against OECD principles: transparency, accountability, and human oversight.

Why it matters. The OECD Agentic AI Landscape connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. The OECD Agentic AI Landscape and Conceptual Foundations (2026) rests on [140, 2026]. Its anchor reference records: 56, February 2026) titled "The Agentic AI Landscape and Its Conceptual Foundations," prepared by OECD staff with an expert group. Use it for the claim that **The OECD Agentic AI Landscape and Conceptual Foundations (2026)** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **The OECD Agentic AI Landscape** in the evidence the row cites. [140, 2026] An OECD Artificial Intelligence Paper (No. 56, February 2026) titled "The Agentic AI Landscape and Its Conceptual Foundations," prepared by OECD staff with an expert group. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **The OECD Agentic AI Landscape**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **OECD Agentic AI Landscape and**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the

reviewer accountable for challenge. Shape **The OECD Agentic AI Landscape** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **The OECD Agentic AI Landscape**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **The OECD Agentic AI Landscape** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.10 Lesson 10: MIT Sloan Explanation of Agentic AI

Concept. MIT Sloan Explanation of Agentic AI evaluates agentic-AI governance claims against OECD principles: transparency, accountability, and human oversight.

Why it matters. MIT Sloan Explanation connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. MIT Sloan Explanation of Agentic AI rests on [141, 2026]. The most specific cited work observes: An MIT Sloan explainer article on agentic AI, defining autonomous software systems that perceive, reason, and act to complete multi-step tasks with minimal human intervention. Use it for pinning down the scope of **MIT Sloan Explanation of Agentic AI**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **MIT Sloan Explanation**, reason from the sources cited in this row. [141, 2026] An MIT Sloan explainer article on agentic AI, defining autonomous software systems that perceive, reason, and act to complete multi-step tasks with minimal human intervention. It distinguishes such agents from chatbots, cites a 2025 MIT Sloan/BCG survey finding 35% of companies had deployed agents with 44% planning to, and reviews business applications such as fraud detection and customer service. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **MIT Sloan Explanation**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **MIT Sloan Explanation of Agentic**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **MIT Sloan Explanation** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **MIT Sloan Explanation**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **MIT Sloan Explanation** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.11 Lesson 11: AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis: A Capability Matrix

Concept. AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis: A Capability Matrix treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis: A Capability Matrix rests on [301, 2026] and [298, 2026]. Its anchor reference records: Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. Use them for fixing what **AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis: A Capability Matrix** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis** against the works cited for this row. [301, 2026] Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **AGEINT vs Traditional OSINT vs**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **AGEINT vs. Traditional OSINT vs. AI-Assisted Analysis** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.12 Lesson 12: Dual-Paradigm Framework: Symbolic/Classical vs. Neural/Generative Agents

Concept. Dual-Paradigm Framework: Symbolic/Classical vs. Neural/Generative Agents uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Dual-Paradigm Framework connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Dual-Paradigm Framework: Symbolic/Classical vs. Neural/Generative Agents rests on [142, 2026]. The lead source's own note reads: The arXiv abstract page for "Agentic AI: A Comprehensive Survey of Architectures, Applications," a 2025 paper by Mohamad Abou Ali and Fadi Dornaika. Use it for pinning down the scope of **Dual-Paradigm Framework: Symbolic/Classical vs. Neural/Generative Agents**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Dual-Paradigm Framework**, work from the cited evidence behind this row. [142, 2026] The arXiv abstract page for "Agentic AI: A Comprehensive Survey of Architectures, Applications," a 2025 paper by Mohamad Abou Ali and Fadi Dornaika. Based on a PRISMA systematic review of roughly 90 studies from 2018 to 2025, it proposes a dual-paradigm framework distinguishing symbolic/classical systems based on algorithmic planning and persistent state from neural/generative systems driven by stochastic generation and prompt orchestration. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Dual-Paradigm Framework**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Dual-Paradigm Framework**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Dual-Paradigm Framework** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Dual-Paradigm Framework**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Dual-Paradigm Framework** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.2.13 Lesson 13: The Return to HUMINT as Agentic AI Degrades Digital Trust Concept. The Return to HUMINT as Agentic AI Degrades Digital Trust

The Return to HUMINT as Agentic AI Degrades Digital Trust treats human-source work as a governed relationship: validation, consent, reporting, source protection, and oversight—not contact activity.

Why it matters. Without explicit treatment of **The Return to HUMINT as Agentic AI Degrades Digital Trust**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. The Return to HUMINT as Agentic AI Degrades Digital Trust rests on [004, 2026] and [005, 2026]. The closest source to this row notes: 70, No. Use them for the working definition that **The Return to HUMINT as Agentic AI Degrades Digital Trust** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **The Return to HUMINT as Agentic AI Degrades Digital Trust** against the works cited for this row. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. [005, 2026] A blog post on SemperVerus summarizing a CIA Studies in Intelligence article, "Espionage in Our AI Future: Why Human Intelligence Still Matters" (Vol. 70, No. 1, March 2026). It argues that as AI makes technical intelligence cheaper and AI-driven fabrication more pervasive, human intelligence becomes relatively more valuable, since human specialists are needed to verify source reliability over time. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **The Return to HUMINT as Agentic AI Degrades Digital Trust**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Return to HUMINT as Agentic**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **The Return to HUMINT as Agentic AI Degrades Digital Trust**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **The Return to HUMINT as Agentic AI Degrades Digital Trust** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

45.2.3 Foundations of AGEINT worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic research assistant agent organizes public readings for an instructor. [232, 2026]; [235, 2026].

Triangulation anchors. In module 31's worked-example section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **governed agentic intelligence**. Learners use a **agent run and assurance card** and keep this boundary visible: No autonomous external action, credentialed operations, live-target workflows, or uncontrolled tool use.

Frame. The classroom question centers on **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems**. Excluded actions stay explicit, and the **Agentic Tool-Governance Lens** planning question is: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?

Inputs. For the **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems** scenario, use public URLs, a fixed retrieval tool, a summarization prompt, a time budget, and a stop condition. The Agentic Tool-Governance Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems**, students bind the agent identity, list allowed tools, set autonomy limits, capture sources, block unsafe requests, and log approvals. Pause whenever an inference about Defining AGEINT: From AI Agents to Autonomous Intelligence Systems appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems** classroom scenario; unit artifact = agent run and assurance card; evidence = allowed inputs; method = least-privilege agent design and run review; output = an agent run card with tool calls, source links, blocked actions, reviewer notes, incident threshold, and recovery decision; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems** as "Agentic Tool-Governance Lens confirms it" is not enough. The revision ties the claim to least-privilege agent design and run review, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

45.2.4 Foundations of AGEINT practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Agentic Tool-Governance Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

Triangulation anchors. In module 31's practice-sequence section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Defining AGEINT: From AI Agents to Autonomous Intelligence Systems, From LLMs to Agents: The Cognitive Controller Stack, Unified Taxonomy: Perception → Brain → Planning → Action → Collaboration; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Agentic AI Governance and Tool Security** lane.

Move	Learner action	Output	Check
2. Frame	Answer the lens question: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Defining AGEINT: From AI Agents to Autonomous Intelligence Systems: agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the agent run and assurance card fields for Defining AGEINT: From AI Agents to Autonomous Intelligence Systems.	Unit profile note.	Evidence artifacts include tool-allowlist record, external-memory governance boundary.
4. Challenge	Test the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.	Failure-mode note.	The artifact applies the key distinction: separate agent assistance from autonomous external action.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

45.2.4.1 Foundations of AGEINT instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**. [232, 2026]; [235, 2026].

45.2.4.2 Foundations of AGEINT extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 45; [232, 2026].
Have learners swap artifacts and apply the **Agentic Tool-Governance Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

45.2.5 Foundations of AGEINT knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 45; [232, 2026].

1. Explain how **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems** is defined here; name the source descriptor that supports the definition.
2. Contrast **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems** with **From LLMs to Agents: The Cognitive Controller Stack** using the **Agentic Tool-Governance Lens** artifact fields.
3. Identify one failure mode from the **Agentic AI Governance and Tool Security** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which permission can be removed while preserving the learning objective?
5. Correct this misconception: that naming an agent pattern certifies it is safe to deploy without governance gates.

45.2.5.1 Foundations of AGEINT answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems** without source evidence, uncertainty, or a safe transfer task.

45.3 Foundations of AGEINT assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 45; [232, 2026].

45.3.1 Foundations of AGEINT evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 45; [232, 2026].

45.3.2 Foundations of AGEINT transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 45; [232, 2026].

45.3.2.1 Foundations of AGEINT lineage and source tradition: profile, concepts, and first anchors This sits in the **Agentic AI Governance and Tool Security** lineage: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. [232, 2026]; [235, 2026].

45.3.2.2 Foundations of AGEINT working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 45; [232, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**, with provenance and reviewability throughout.

45.3.2.3 Foundations of AGEINT knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [232, 2026]; [235, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

45.3.2.4 Foundations of AGEINT transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 45; [232, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.
- **Evidence contract:** keep the **Agentic AI Governance and Tool Security** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

45.3.2.5 Foundations of AGEINT profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 45; [232, 2026].

The matched profile emphasizes delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. The method stack is AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills; the local topic cluster is **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

45.3.3 Foundations of AGEINT evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 45; [232, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Agentic AI Governance and Tool Security** profile tells reviewers what evidence is strong enough for the module artifact built around **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

45.3.3.1 Foundations of AGEINT guide source spine: inherited keys and local citation roles Primary guide citations: [232, 2026]; [235, 2026]; [247, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [137, 2026]; [138, 2026]; [139, 2026]; [140, 2026]; [141, 2026]; [142, 2026]; [004, 2026]; [005, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [301, 2026]; [298, 2026].

45.3.3.2 Foundations of AGEINT verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [232, 2026]; [235, 2026].

Tier	What counts	How it is used
Source guide	[232, 2026]; [235, 2026]; [247, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [137, 2026]; [138, 2026]; [139, 2026]; [140, 2026]; [141, 2026]; [142, 2026]; [004, 2026]; [005, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [301, 2026]; [298, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 31's source-canon section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack** and [232, 2026]; [235, 2026], but only directly verified source URLs are encoded as citations.

45.3.3.3 Foundations of AGEINT intelligence practice lens: evidence artifact and safety check Practice lens: **Agentic Tool-Governance Lens** for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**. [232, 2026]; [235, 2026].

Planning question: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?

Evidence artifact: agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path.

Validation rule: verify least privilege, prompt-injection exposure, provenance, observability, stop conditions, and incident-reporting triggers. Applied to **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

Handoff contract: export agent traces, tool calls, retrieved sources, policy decisions, and human approvals separately.

Safety check: block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions.

45.3.3.4 Foundations of AGEINT runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 45; [232, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	31.99	31.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Foundations of AGEINT to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
AGEINT pattern registry, agent identity, and interface-contract studio	31.100	31.100 source title transformed into safe curriculum treatment; original: V2 AGEINT-depth extension: add agent evaluation and public-sector adoption gates that bind agency authority, AI Office-style accountability, impact assessment, and human review before any classroom agent workflow is rehearsed	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

The Return to HUMINT as Agentic AI Degrades Digital Trust	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

45.3.3.6 Foundations of AGEINT annotated source ledger: real titles and local contribution Each source cited by this **Agentic AI Governance and Tool Security** module is paired below with its real title and a one-line note on what it contributes to **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

Source	Cited work	What it contributes	Status
[232, 2026]	European AI Office	The European AI Office is the European Commission's central hub for developing and implementing AI governance across the EU, established to support trustworthy AI adoption while protecting people from associated risks. Its responsibilities include enforcing regulations for general-purpose AI models, implementing the AI Act, developing evaluation tools and benchmarks for assessing AI capabilities, and investigating potential regulatory violations.	verified source-guide
[235, 2026]	ISO/IEC 42005:2025 AI System Impact Assessment	ISO standard page for AI system impact assessment.	original source-guide
[247, 2026]	AI in the Public Sector	Official OECD.AI public-sector AI theme page.	original source-guide
[279, 2026]	Open Contracting Data Standard	The documentation homepage for the Open Contracting Data Standard, version 1.1.5, maintained by the Open Contracting Partnership to support disclosure of government contracting data across the procurement lifecycle. It provides a common data model spanning planning, tender, award, contract, and implementation stages, along with a primer, implementation guidance, technical schemas, and validation tooling.	verified source-guide
[282, 2026]	AI Research: Security and Resilience	A NIST page on AI research focused on security and resilience, framing these as core characteristics of trustworthy AI under the NIST AI Risk Management Framework.	verified source-guide
[284, 2026]	Verifiable Credential Data Integrity 1.0	The W3C Recommendation for Verifiable Credential Data Integrity 1.0, published May 2025, defining mechanisms for ensuring the authenticity and integrity of verifiable credentials using cryptographic proofs. It specifies a process of data transformation, hashing, and proof generation, and a corresponding verification procedure, along with a proof data model containing properties such as type, verification method, purpose, and proof value.	verified source-guide
[289, 2026]	Guidance for Organisations Using the Algorithmic Transparency Recording Standard	This is a GOV.UK guidance page published by the Government Digital Service that instructs public sector organizations on completing the Algorithmic Transparency Recording Standard (ATRS) template and publishing their records to the GOV.UK repository. It applies both to central government bodies required to publish under mandatory policy and to other public sector bodies doing so voluntarily.	verified source-guide
[291, 2026]	Revised 508 Standards and 255 Guidelines	Official documentation from the U.S. Access Board on the Revised 508 Standards and 255 Guidelines for information and communication technology accessibility. It establishes mandatory accessibility requirements for federal agencies and voluntary guidelines for telecommunications manufacturers, covering hardware, software, websites, electronic documents, and support services.	verified source-guide

Source	Cited work	What it contributes	Status
[296, 2026]	Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile	NIST AI 600-1, the Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile, a cross-sectoral companion resource to the NIST AI RMF 1.0 issued pursuant to Executive Order 14110. It identifies risks that are unique to or amplified by generative AI and organizes suggested actions for managing those risks, mapped to the AI RMF functions.	verified source-guide
[137, 2026]	[2601.12560] Agentic Artificial Intelligence (AI)	An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration.	verified source-guide
[138, 2026]	Agentic Artificial Intelligence (AI): Architectures, Taxonomies	An arXiv survey paper on agentic AI examining the shift from generative systems to autonomous agents that perceive, reason, plan, and act. It proposes a unified taxonomy decomposing LLM-based agents into six dimensions: core components, cognitive architecture, learning paradigms, multi-agent systems, environments and domains, and evaluation and safety.	verified source-guide
[139, 2026]	Agentic AI Design Patterns by Andrew Ng	A LinkedIn post by Aishwarya Srinivasan discussing agentic AI design patterns for building production-grade AI agents.	verified practitioner context; secondary evidence only
[140, 2026]	The agentic AI landscape and its conceptual foundations	An OECD Artificial Intelligence Paper (No. 56, February 2026) titled “The Agentic AI Landscape and Its Conceptual Foundations,” prepared by OECD staff with an expert group.	verified source-guide
[141, 2026]	Agentic AI, explained	An MIT Sloan explainer article on agentic AI, defining autonomous software systems that perceive, reason, and act to complete multi-step tasks with minimal human intervention. It distinguishes such agents from chatbots, cites a 2025 MIT Sloan/BCG survey finding 35% of companies had deployed agents with 44% planning to, and reviews business applications such as fraud detection and customer service.	verified practitioner context; secondary evidence only
[142, 2026]	Agentic AI: A Comprehensive Survey of Architectures, Applications	The arXiv abstract page for “Agentic AI: A Comprehensive Survey of Architectures, Applications,” a 2025 paper by Mohamad Abou Ali and Fadi Dornaika. Based on a PRISMA systematic review of roughly 90 studies from 2018 to 2025, it proposes a dual-paradigm framework distinguishing symbolic/classical systems based on algorithmic planning and persistent state from neural/generative systems driven by stochastic generation and prompt orchestration.	verified source-guide

Source	Cited work	What it contributes	Status
[004, 2026]	AI Won't Replace Spies—It Will Make Them More Powerful Than Ever	Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools.	verified source-guide
[005, 2026]	CIA: Studies in AI and Human Intelligence - SemperVerus	A blog post on SemperVerus summarizing a CIA Studies in Intelligence article, "Espionage in Our AI Future: Why Human Intelligence Still Matters" (Vol. 70, No. 1, March 2026). It argues that as AI makes technical intelligence cheaper and AI-driven fabrication more pervasive, human intelligence becomes relatively more valuable, since human specialists are needed to verify source reliability over time.	verified source-guide
[299, 2026]	Model Context Protocol Specification	The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation).	verified source-guide context; use pinned MCP anchor for normative claims
[306, 2026]	Artificial Intelligence	Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support.	original source-guide
[312, 2026]	Guide on the Use of Agentic Artificial Intelligence	Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support.	original source-guide
[301, 2026]	The IC OSINT Strategy 2024-2026	Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide

Where this sits. This module's overview is Section 45; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

45.3.4 Foundations of AGEINT governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 45; [232, 2026].

45.3.5 Foundations of AGEINT analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 31's governance-boundary section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Agentic AI Governance and Tool Security** for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**. [232, 2026]; [235, 2026].
Curriculum topic spine: Defining AGEINT: From AI Agents to Autonomous Intelligence Systems, **From LLMs to Agents: The Cognitive Controller Stack**, **Unified Taxonomy: Perception → Brain → Planning → Action → Collaboration**. **Verified anchor cluster:** [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]; [Community, 2020b]; [Community, 2020a]; [of the Director of National Intelligence, 2025b].
Conceptual depth: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation.
Method stack: AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills.
Composability contract: agents, tools, credentials, memory, retrieval stores, policies, and logs remain separately inspectable and revocable components.
Known failure modes: excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains.
Defensive boundary: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists. Applied to **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

Anchor	Why it matters here
[OECD, 2026a]	Official OECD conceptual foundation for agentic AI. Checked as of 2026-05-21; role: source_quality_anchor.
[of Canada Secretariat, 2026a]	Government of Canada guide for accountable public-sector use of agentic AI, including governance, risk, transparency, testing, monitoring, and human oversight considerations. Checked as of 2026-05-24; role: curriculum_anchor.
[of Standards and Technology, 2023]	Official NIST.AI.100-1 risk-management framework. Checked as of 2026-05-21; role: source_quality_anchor.
[of Standards and Technology, 2024d]	Official NIST AI 600-1 generative AI profile. Checked as of 2026-05-21; role: source_quality_anchor.
[Community, 2020b]	Official IC principles for lawful, accountable, objective, human-centered, secure, resilient, and science-informed AI. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2025b]	Official IC AI governance directive covering CAIO roles, oversight, interoperability, civil-liberties review, training data, and impact assessment. Checked as of 2026-05-21; role: curriculum_anchor.

45.3.5.1 Foundations of AGEINT evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Agentic AI Governance and Tool Security** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [232, 2026]; [235, 2026].

45.3.6 Foundations of AGEINT agentic boundary: assist, approve, block, and record

Evidence anchor. Section 45; [232, 2026].
AGEINT translation is bounded by the **Agentic AI Governance and Tool Security** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

45.3.6.1 Foundations of AGEINT permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 45; [232, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

45.3.6.2 Foundations of AGEINT excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [232, 2026]; [235, 2026] and **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

45.3.7 Foundations of AGEINT governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 45; [232, 2026].
Governance is practiced as a gate on the **Agentic AI Governance and Tool Security** lane. Learners use the **Agentic Tool-Governance Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

45.3.7.1 Foundations of AGEINT governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [232, 2026]; [235, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Agentic AI Governance and Tool Security** failure modes and the **Agentic Tool-Governance Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

45.3.7.2 Foundations of AGEINT evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 45; [232, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Agentic Tool-Governance Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

45.3.7.3 Foundations of AGEINT current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**. [232, 2026]; [235, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_oecd_agentic_ai` for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**?	The Agentic AI Landscape and Its Conceptual Foundations; lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official OECD conceptual foundation for agentic AI.
What does the module inherit from `official_canada_agentic_ai_guide` for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**?	Guide on the Use of Agentic Artificial Intelligence; lane `public_sector_agentic_ai`; checked 2026-05-24.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; bounded-autonomy run card, recoverability review, approval threshold, monitoring evidence, and public-sector service assurance
What does the module inherit from `official_nist_ai_rmf` for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**?	Artificial Intelligence Risk Management Framework (AI RMF 1.0); lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official NIST.AI.100-1 risk-management framework.
What does the module inherit from `official_nist_ai_600_1` for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**?	Artificial Intelligence Risk Management Framework: Generative AI Profile; lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official NIST AI 600-1 generative AI profile.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 45; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

45.3.8 Foundations of AGEINT assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 45; [232, 2026].

45.3.9 Foundations of AGEINT assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 45; [232, 2026].

45.3.9.1 Foundations of AGEINT capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack** and [232, 2026]; [235, 2026].

45.3.9.2 Foundations of AGEINT instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack** and [232, 2026]; [235, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

45.3.9.3 Foundations of AGEINT assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Defining AGEINT: From AI Agents to Autonomous Intelligence Systems	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
From LLMs to Agents: The Cognitive Controller Stack	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Unified Taxonomy: Perception → Brain → Planning → Action → Collaboration	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

45.3.10 Foundations of AGEINT refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [232, 2026]; [235, 2026] and **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**.

45.3.10.1 Foundations of AGEINT refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**. The local signals begin with [232, 2026]; [235, 2026].

45.3.10.2 Foundations of AGEINT claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**, and the source spine for these checks begins with [232, 2026]; [235, 2026].

45.3.11 Foundations of AGEINT reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [232, 2026]; [235, 2026].

Triangulation anchors. In module 31's review-checklist section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack**. [232, 2026]; [235, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

45.3.12 Foundations of AGEINT learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **Defining AGEINT: From AI Agents to Autonomous Intelligence Systems; From LLMs to Agents: The Cognitive Controller Stack** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [232, 2026]; [235, 2026].

Section 2, Section 44, Section 46

46 AGEINT Design Patterns and Archetypes

46.0.1 AGEINT Design Patterns and Archetypes figures and course links: visual evidence, source flow, and navigation

The module uses Figure 89, Figure 90, and Figure 85 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 44, Section 45, Section 47.
This module teaches the **Agentic AI Governance and Tool Security** lane through a bounded, source-backed coursebook chapter. [233, 2026]; [258, 2026].

46.1 Agentic AI Governance and Tool Security frame for AGEINT Design Patterns and Archetypes: source context, topic focus, and reader task

Evidence anchor. Section 46; [233, 2026].

46.1.1 AGEINT Design Patterns and Archetypes orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 46; [233, 2026].

46.1.2 AGEINT Design Patterns and Archetypes conceptual primer: source context, core model, and reader task

This chapter teaches agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The chapter uses **Agentic Tool-Governance Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.
The central distinction is to separate agent assistance from autonomous external action. Core topics include **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes; Safe defensive application: single public-source report critique with provenance and uncertainty fields**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [233, 2026]; [258, 2026].
Learners move from vocabulary and the **Agentic Tool-Governance Lens** distinction through topic lessons on **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action** with evidence and misconception checks, then assemble an **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with safety and rights gates.

46.1.3 AGEINT Design Patterns and Archetypes learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 46; [233, 2026].

- Connect **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action and Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes** to **Agentic AI Governance and Tool Security** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build an **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate agent assistance from autonomous external action; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists.

46.1.4 AGEINT Design Patterns and Archetypes core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 46; [233, 2026].

Term	Working definition
Agent identity	the named software actor, role, and authorization context for a run
Tool allowlist	the bounded set of actions the agent may request
Delegation	the handoff of a task under explicit human authority and review
Bounded autonomy	the documented ceiling on what an agent may decide or request without review
Recoverability	the path back to a known-safe state after a bad output or action request
AI incident	a logged event where an AI system creates or plausibly creates harm or loss of control
Prompt injection	untrusted content that attempts to override instructions or authority boundaries
Pattern registry	the catalog of approved agent behaviors, prompts, and evaluation hooks
Adversarial eval	structured tests that probe agent misuse, injection, and over-delegation before release
Pattern 1: Focused Analytic Reasoner (source…	Key terms: Pattern, Focused, Analytic.
Safe methods: bounded source reading, explicit…	Key terms: methods, bounded, reading.

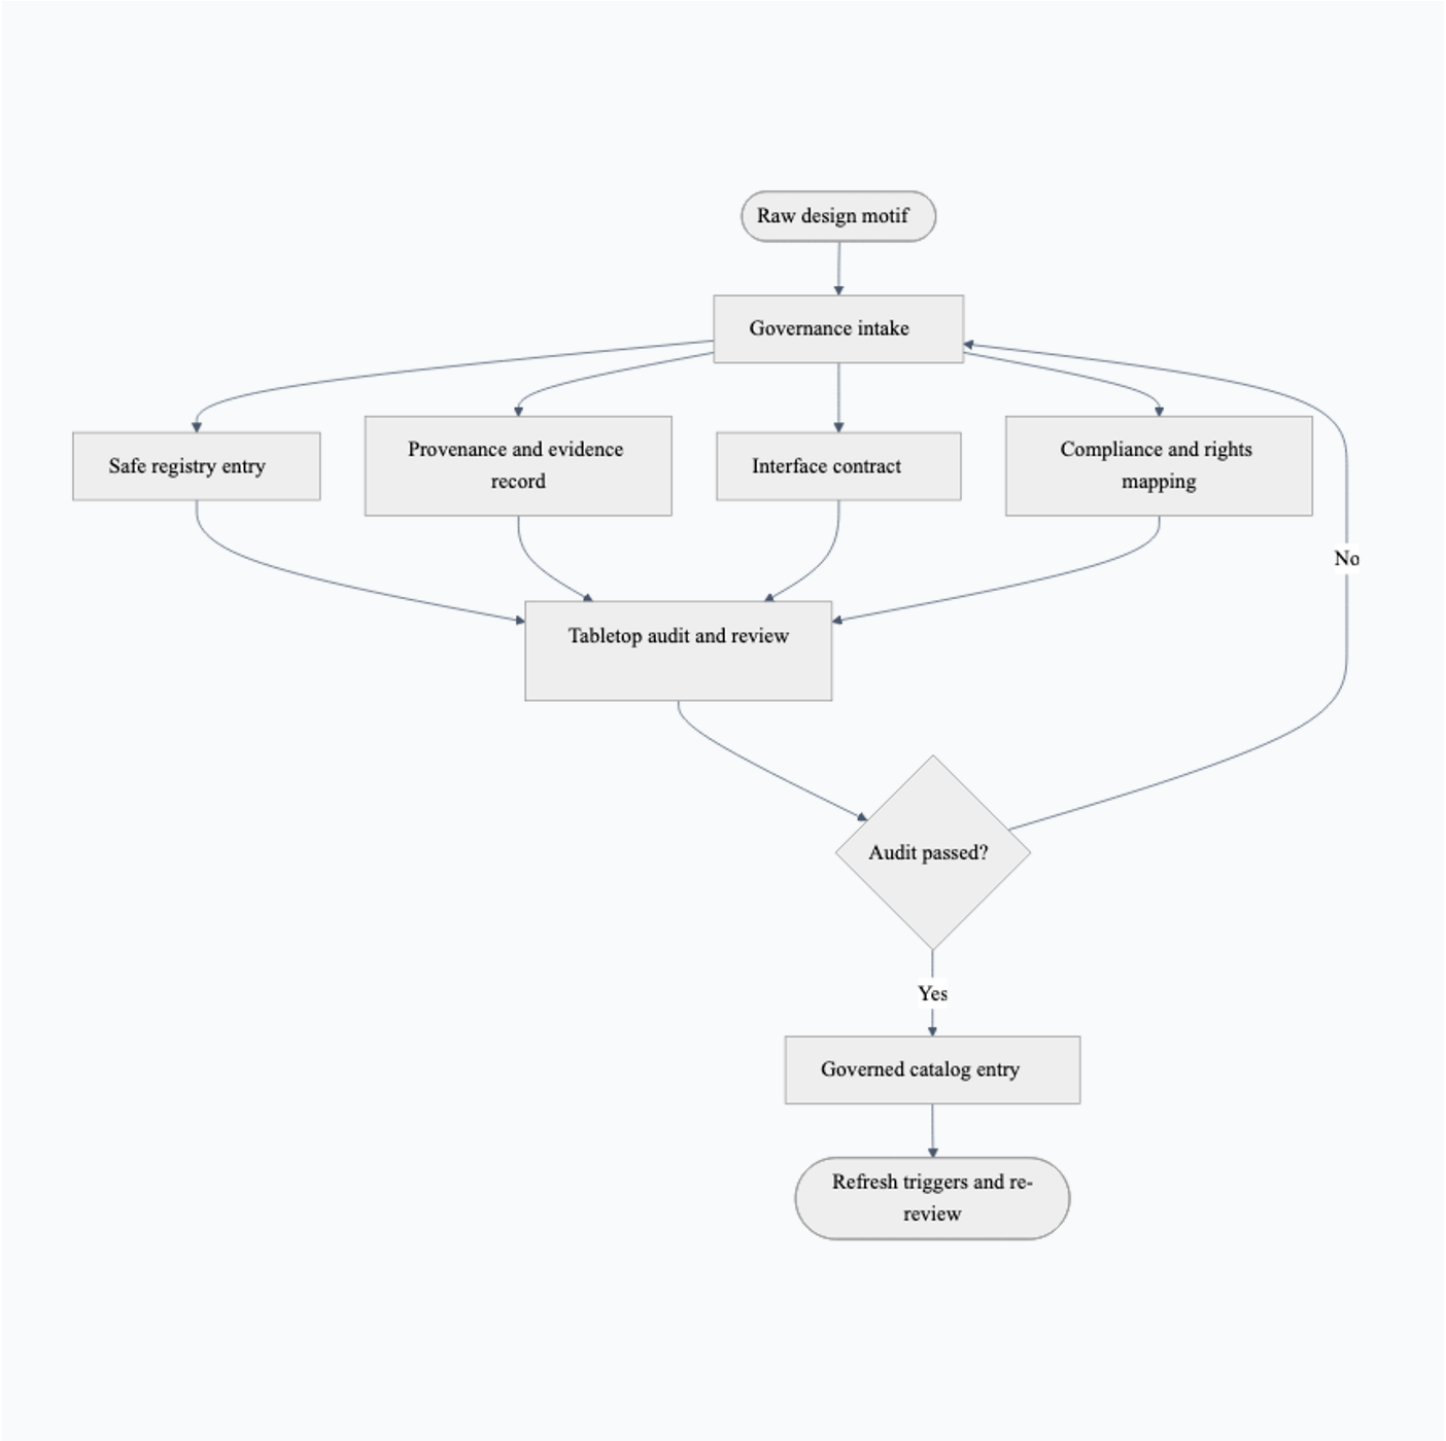

Figure 89: This diagram shows how each AGEINT design pattern is converted into a documented, auditable governance artifact rather than an operational deployment. In the ageint agentic intelligence / ageint design patterns and archetypes section, it lets readers compare A top-to-bottom transform. A raw design motif enters a governance intake. It splits into four parallel artifacts: a safe registry entry, a provenance, evidence record, and an interface contract so the visual functions as a traceable course aid rather than an unscoped assertion.

Figure 90: The pattern taxonomy groups AGEINT design patterns by safe curriculum role. The captioned view belongs to the ageint agentic intelligence / ageint design patterns and archetypes section and should be read as a map of pattern taxonomy categories, denominators, evidence lanes, limitations, and reviewer-use cautions, not as a capability score or live-task instruction.

46.2 Agentic Tool-Governance Lens path for AGEINT Design Patterns and Archetypes: lesson cluster, safe artifact, and review

Evidence anchor. Section 46; [233, 2026].

46.2.1 AGEINT Design Patterns and Archetypes practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 46; [233, 2026].

46.2.2 AGEINT Design Patterns and Archetypes topic lessons: source-backed concepts and transfer tasks

This module builds agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The sequence opens with **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action**, **Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**, **Safe defensive application: single public-source report critique with provenance and uncertainty fields** and applies the **Agentic Tool-Governance Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 85; module overview Section 46; curriculum atlas Section 2.

Triangulation anchors. In module 32's topic-lessons section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

46.2.2.1 Lesson 1: Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action

Concept. Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Analysts use **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action rests on [143, 2026]. The most specific cited work observes: A Medium article by Anil Jain (2025) surveying agentic AI system architectures and design patterns. Use it for the working definition that **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action**, reason from the sources cited in this row. [143, 2026] A Medium article by Anil Jain (2025) surveying agentic AI system architectures and design patterns. It defines agentic AI as systems capable of independent decision-making, reviews frameworks such as LangChain, LlamaIndex, and AutoGen, and describes five system components: perception, decision-making, action, memory, and communication. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Pattern 1**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 1**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.2 Lesson 2: Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes

Concept. Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Safe methods connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes rests on [309, 2026], [310, 2026], and [300, 2026]. The most specific cited work observes: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for the claim that **Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe methods** in the evidence the row cites. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.3 Lesson 3: Safe defensive application: single public-source report critique with provenance and uncertainty fields

Concept. Safe defensive application: single public-source report critique with provenance and uncertainty fields uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **Safe defensive application**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe defensive application: single public-source report critique with provenance and uncertainty fields rests on [309, 2026], [310, 2026], and [300, 2026]. The most specific cited work observes: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for the claim that **Safe defensive application: single public-source report critique with provenance and uncertainty fields** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe defensive application** against the works cited for this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.4 Lesson 4: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Focused Analytic Reasoner

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Focused Analytic Reasoner uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Safe architecture artifact**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Focused Analytic Reasoner rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the working definition that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Focused Analytic Reasoner** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe architecture artifact** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.5 Lesson 5: Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment

Concept. Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment rests on [139, 2026]. The closest source to this row notes: A LinkedIn post by Aishwarya Srinivasan discussing agentic AI design patterns for building production-grade AI agents. Use it for the working definition that **Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment**, reason from the sources cited in this row. [139, 2026] A LinkedIn post by Aishwarya Srinivasan discussing agentic AI design patterns for building production-grade AI agents. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Pattern 2**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern**

2, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.6 Lesson 6: Safe methods: rubric-based critique, source-quality scoring, and trajectory validation

Concept. Safe methods: rubric-based critique, source-quality scoring, and trajectory validation uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Safe methods matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe methods: rubric-based critique, source-quality scoring, and trajectory validation rests on [306, 2026] and [312, 2026]. The lead source's own note reads: Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Use them for the working definition that **Safe methods: rubric-based critique, source-quality scoring, and trajectory validation** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe methods** against the works cited for this row. [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.7 Lesson 7: Safe defensive application: analytic-bias review over a synthetic or public-source evidence packet

Concept. Safe defensive application: analytic-bias review over a synthetic or public-source evidence packet treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Analysts use **Safe defensive application** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Safe defensive application: analytic-bias review over a synthetic or public-source evidence packet rests on [297, 2026] and [298, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the working definition that **Safe defensive application: analytic-bias review over a synthetic or public-source evidence packet** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe defensive application**, reason from the sources cited in this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.8 Lesson 8: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Reflection and Bias-Check Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Reflection and Bias-Check Agent uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Safe architecture artifact connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Reflection and Bias-Check Agent rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the working definition that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Reflection and Bias-Check Agent** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.9 Lesson 9: Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling

Concept. Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling rests on [144, 2026]. The closest source to this row notes: An AWS Prescriptive Guidance document (July 2025) introducing agentic AI patterns and workflows. Use it for pinning down the scope of **Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling**, reason from the sources cited in this row. [144, 2026] An AWS Prescriptive Guidance document (July 2025) introducing agentic AI patterns and workflows. It presents reusable design templates for building AI agent systems that operate with autonomy while remaining controllable and aligned with goals, aimed at architects, developers, and product leaders. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Pattern 3**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 3**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.10 Lesson 10: Safe methods: schema-bound tool calls, public-source retrieval, allowlisted connectors, and grounded summaries

Concept. Safe methods: schema-bound tool calls, public-source retrieval, allowlisted connectors, and grounded summaries evaluates retrieval pipelines by source provenance, injection risk, citation fidelity, and reviewer verification of answers.

Why it matters. Safe methods matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe methods: schema-bound tool calls, public-source retrieval, allowlisted connectors, and grounded summaries rests on [309, 2026], [310, 2026], and [300, 2026]. The most specific cited work observes: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for fixing what **Safe methods: schema-bound tool calls, public-source retrieval, allowlisted connectors, and grounded summaries** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe methods** against the works cited for this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.11 Lesson 11: Safe defensive application: accountable bibliography, source inventory, or standards-mapping exercise

Concept. Safe defensive application: accountable bibliography, source inventory, or standards-mapping exercise uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Safe defensive application connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe defensive application: accountable bibliography, source inventory, or standards-mapping exercise rests on [309, 2026], [310, 2026], and [300, 2026]. Its anchor reference records: The OASIS Standard specification for TAXII (Trusted Automated Exchange of

Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. Use them for pinning down the scope of **Safe defensive application: accountable bibliography, source inventory, or standards-mapping exercise**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe defensive application** in the evidence the row cites. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.12 Lesson 12: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Tool-Allowlist Research Assistant Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Tool-Allowlist Research Assistant

uses sharing standards to document indicator context, handling, confidence, and consumer responsibilities—not raw indicator hoarding.

Why it matters. Safe architecture artifact connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Tool-Allowlist Research Assistant rests on [309, 2026], [310, 2026], and [300, 2026]. The closest source to this row notes: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for the claim that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Tool-Allowlist Research Assistant** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, work from the cited evidence behind this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.13 Lesson 13: Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking Concept. Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking

uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Analysts use **Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking rests on [139, 2026] and [145, 2026]. The lead source's own note reads: This is an arXiv research paper by Sivasathivel Kandasamy titled "Control Plane as a Tool: A Scalable Design Pattern for Agentic AI Systems." It proposes an architectural pattern in which AI agents interact with a single control-plane interface that handles tool routing and selection, rather than exposing many tools directly. Use them for the claim that **Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking**, work from the cited evidence behind this row. [139, 2026] A LinkedIn post by Aishwarya Srinivasan discussing agentic AI design patterns for building production-grade AI agents. [145, 2026] This is an arXiv research paper by Sivasathivel Kandasamy titled "Control Plane as a Tool: A Scalable Design Pattern for Agentic AI Systems." It proposes an architectural pattern in which AI agents interact with a single control-plane interface that handles tool routing and selection, rather than exposing many tools directly. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Pattern 4**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 4**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and

the stop condition.

Misconception check. Correct the misconception about **Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.14 Lesson 14: Safe methods: milestone decomposition, approval gates, dependency checks, and rollback notes

Concept. Safe methods: milestone decomposition, approval gates, dependency checks, and rollback notes connects cognitive science claims to analytic bias literacy: what the brain prioritizes, what it misses, and how review compensates.

Why it matters. Safe methods connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe methods: milestone decomposition, approval gates, dependency checks, and rollback notes rests on [299, 2026], [306, 2026], and [312, 2026]. The most specific cited work observes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the claim that **Safe methods: milestone decomposition, approval gates, dependency checks, and rollback notes** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe methods**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.15 Lesson 15: Safe defensive application: classroom project plan for evidence review, policy analysis, or tabletop preparation

Concept. Safe defensive application: classroom project plan for evidence review, policy analysis, or tabletop preparation — Match intelligence requirements to least-intrusive source disciplines with explicit minimization and feedback to the customer.

Why it matters. Safe defensive application connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe defensive application: classroom project plan for evidence review, policy analysis, or tabletop preparation rests on [309, 2026], [310, 2026], and [300, 2026]. The most specific cited work observes: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for fixing what **Safe defensive application: classroom project plan for evidence review, policy analysis, or tabletop preparation** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe defensive application**, work from the cited evidence behind this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.16 Lesson 16: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Governed Planner-Executor

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Governed Planner-Executor uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Safe architecture artifact connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Governed Planner-Executor rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Governed Planner-Executor** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-

infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.17 Lesson 17: Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion

Concept. Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion rests on [144, 2026]. The closest source to this row notes: An AWS Prescriptive Guidance document (July 2025) introducing agentic AI patterns and workflows. Use it for the working definition that **Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion**, work from the cited evidence behind this row. [144, 2026] An AWS Prescriptive Guidance document (July 2025) introducing agentic AI patterns and workflows. It presents reusable design templates for building AI agent systems that operate with autonomy while remaining controllable and aligned with goals, aimed at architects, developers, and product leaders. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Pattern 5**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 5**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.18 Lesson 18: Safe methods: bounded concurrent retrieval, deduplication, contradiction capture, and source descriptors

Concept. Safe methods: bounded concurrent retrieval, deduplication, contradiction capture, and source descriptors evaluates retrieval pipelines by source provenance, injection risk, citation fidelity, and reviewer verification of answers.

Why it matters. Safe methods connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe methods: bounded concurrent retrieval, deduplication, contradiction capture, and source descriptors rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for pinning down the scope of **Safe methods: bounded concurrent retrieval, deduplication, contradiction capture, and source descriptors**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe methods**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.19 Lesson 19: Safe defensive application: side-by-side comparison of public official, standards, and scholarly sources

Concept. Safe defensive application: side-by-side comparison of public official, standards, and scholarly sources frames SIGINT as authority-bound collection with minimization, handling rules, and communications-security implications.

Why it matters. Safe defensive application matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe defensive application: side-by-side comparison of public official, standards, and scholarly sources rests on [301, 2026] and [298, 2026]. The closest source to this row notes: Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. Use them for the working definition that **Safe defensive application: side-by-side comparison of public official, standards, and scholarly sources** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe defensive application**, work from the cited evidence behind this row. [301, 2026] Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.20 Lesson 20: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Parallel Source-Corroboration Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Parallel Source-Corroboration Agent uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Safe architecture artifact**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Parallel Source-Corroboration Agent rests on [299, 2026], [306, 2026], and [312, 2026]. The most specific cited work observes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for fixing what **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Parallel Source-Corroboration Agent** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.21 Lesson 21: Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts

Concept. Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Analysts use **Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts rests on [139, 2026] and [146, 2026]. The most specific cited work observes: It outlines core elements such as agent coordination, tool integration, memory management, workflow definition, and deployment monitoring, and reviews eight frameworks including LangGraph, AutoGen, CrewAI, LlamaIndex, Haystack, DSPy, and Semantic Kernel. Use them for the working definition that **Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts** in the evidence the row cites. [139, 2026] A LinkedIn post by Aishwarya Srinivasan discussing agentic AI design patterns for building production-grade AI agents. [146, 2026] An Exabeam explainer describing agentic AI frameworks as software toolkits that provide pre-built components and architectures for building autonomous AI agents. It outlines core elements such as agent coordination, tool integration, memory management, workflow definition, and deployment monitoring, and reviews eight frameworks including LangGraph, AutoGen, CrewAI, LlamaIndex, Haystack, DSPy, and Semantic Kernel. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Pattern 6**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 6**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts**: that naming an agent pattern certifies it is safe to deploy

without governance gates.

Transfer task. Transfer **Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.22 Lesson 22: Safe methods: planner, retriever, validator, safety reviewer, and reporter roles

Concept. Safe methods: planner, retriever, validator, safety reviewer, and reporter roles uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Safe methods connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe methods: planner, retriever, validator, safety reviewer, and reporter roles rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the claim that **Safe methods: planner, retriever, validator, safety reviewer, and reporter roles** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe methods**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.23 Lesson 23: Safe defensive application: tabletop red-team critique of an analytic memo, not an operational exercise

Concept. Safe defensive application: tabletop red-team critique of an analytic memo, not an operational exercise uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Safe defensive application connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe defensive application: tabletop red-team critique of an analytic memo, not an operational exercise rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the claim that **Safe defensive application: tabletop red-team critique of an analytic memo, not an operational exercise** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe defensive application**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.24 Lesson 24: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Role-Separated Review Crew

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Role-Separated Review Crew uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Safe architecture artifact**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Role-Separated Review Crew rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the working definition that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Role-Separated Review Crew** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable

for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.25 Lesson 25: Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content

Concept. Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content rests on [147, 2026]. The closest source to this row notes: Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Use it for the working definition that **Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content**, work from the cited evidence behind this row. [147, 2026] Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Pattern 7**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 7**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.26 Lesson 26: Safe methods: alternative generation, evidence challenge, dissent capture, and judge rubric

Concept. Safe methods: alternative generation, evidence challenge, dissent capture, and judge rubric uses structured devil's advocacy to surface disconfirming evidence and overconfidence before dissemination.

Why it matters. Safe methods connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe methods: alternative generation, evidence challenge, dissent capture, and judge rubric rests on [297, 2026] and [298, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the claim that **Safe methods: alternative generation, evidence challenge, dissent capture, and judge rubric** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe methods**, work from the cited evidence behind this row. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe methods**: that listing one favored hypothesis is enough without testing alternatives.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.27 Lesson 27: Safe defensive application: ACH-style review of a classroom claim with clearly separated evidence and judgment

Concept. Safe defensive application: ACH-style review of a classroom claim with clearly separated evidence and judgment uses the method to keep alternatives, disconfirming evidence, and confidence visible.

Why it matters. Safe defensive application matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe defensive application: ACH-style review of a classroom claim with clearly separated evidence and judgment rests on [297, 2026] and [298, 2026]. The most specific cited work observes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the claim that **Safe defensive application: ACH-style review of a classroom claim with clearly separated evidence and judgment** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe defensive application** in the evidence the row cites. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for

challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe defensive application**: that listing one favored hypothesis is enough without testing alternatives.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.28 Lesson 28: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Competing-Hypotheses Debate Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Competing-Hypotheses Debate Agent uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Safe architecture artifact connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Competing-Hypotheses Debate Agent rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for fixing what **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Competing-Hypotheses Debate Agent** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe architecture artifact** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.29 Lesson 29: Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections

Concept. Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections rests on [148, 2026]. The closest source to this row notes: This article by Riverside Research traces AI's evolution from large language models through retrieval-augmented systems, single-task agents, collaborative agentic systems, and toward emergent multi-agent autonomy capable of managing surveillance and decision support at operational speed. Use it for the working definition that **Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections** in the evidence the row cites. [148, 2026] This article by Riverside Research traces AI's evolution from large language models through retrieval-augmented systems, single-task agents, collaborative agentic systems, and toward emergent multi-agent autonomy capable of managing surveillance and decision support at operational speed. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Pattern 8**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 8**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.30 Lesson 30: Safe methods: curated corpus retrieval, hybrid ranking, source snippets, and citation audits

Concept. Safe methods: curated corpus retrieval, hybrid ranking, source snippets, and citation audits evaluates retrieval pipelines by source provenance, injection risk, citation fidelity, and reviewer verification of answers.

Why it matters. Without explicit treatment of **Safe methods**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe methods: curated corpus retrieval, hybrid ranking, source snippets, and citation audits rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for pinning down the scope of **Safe methods: curated corpus retrieval, hybrid ranking, source snippets, and citation audits**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe methods**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0

messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.31 Lesson 31: Safe defensive application: course-pack retrieval over provided readings, standards, and official guidance Concept. Safe defensive application: course-pack retrieval over provided readings, standards, and official guidance evaluates retrieval pipelines by source provenance, injection risk, citation fidelity, and reviewer verification of answers.

Why it matters. Safe defensive application connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe defensive application: course-pack retrieval over provided readings, standards, and official guidance rests on [309, 2026], [310, 2026], and [300, 2026]. Its anchor reference records: The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. Use them for the working definition that **Safe defensive application: course-pack retrieval over provided readings, standards, and official guidance** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe defensive application** in the evidence the row cites. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.32 Lesson 32: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Provenance-Bound Retrieval Operator Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Provenance-Bound Retrieval Operator uses sharing standards to document indicator context, handling, confidence, and consumer responsibilities—not raw indicator hoarding.

Why it matters. Analysts use **Safe architecture artifact** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Provenance-Bound Retrieval Operator rests on [309, 2026], [310, 2026], and [300, 2026]. Its anchor reference records: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for the working definition that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Provenance-Bound Retrieval Operator** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe architecture artifact** against the works cited for this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.33 Lesson 33: Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns Concept. Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns rests on [138, 2026]. The lead source's own note reads: An arXiv survey paper on agentic AI examining the shift from generative systems to autonomous agents that perceive, reason, plan, and act. Use it for the working definition that **Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns**, reason from the sources cited in this row. [138, 2026] An arXiv survey paper on agentic AI examining the shift from generative systems to autonomous agents that perceive, reason, plan, and act. It proposes a unified taxonomy decomposing LLM-based agents into six dimensions: core components, cognitive architecture, learning paradigms, multi-agent systems, environments

and domains, and evaluation and safety. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Pattern 9**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 9**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.34 Lesson 34: Safe methods: episodic note cards, retention limits, consolidation, and source change logs

Concept. Safe methods: episodic note cards, retention limits, consolidation, and source change logs connects cognitive science claims to analytic bias literacy: what the brain prioritizes, what it misses, and how review compensates.

Why it matters. Without explicit treatment of **Safe methods**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe methods: episodic note cards, retention limits, consolidation, and source change logs rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for pinning down the scope of **Safe methods: episodic note cards, retention limits, consolidation, and source change logs**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe methods** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.35 Lesson 35: Safe defensive application: longitudinal claim ledger for curriculum evidence and revision history

Concept. Safe defensive application: longitudinal claim ledger for curriculum evidence and revision history uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **Safe defensive application**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe defensive application: longitudinal claim ledger for curriculum evidence and revision history rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the claim that **Safe defensive application: longitudinal claim ledger for curriculum evidence and revision history** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe defensive application** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.36 Lesson 36: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Evidence-Memory State Machine

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Evidence-Memory State Machine uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Safe architecture artifact**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Evidence-Memory State Machine rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Evidence-Memory State Machine** covers,

marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.37 Lesson 37: Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions

Concept. Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions rests on [145, 2026]. The most specific cited work observes: This is an arXiv research paper by Sivasathivel Kandasamy titled "Control Plane as a Tool: A Scalable Design Pattern for Agentic AI Systems." It proposes an architectural pattern in which AI agents interact with a single control-plane interface that handles tool routing and selection, rather than exposing many tools directly. Use it for the claim that **Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions**, reason from the sources cited in this row. [145, 2026] This is an arXiv research paper by Sivasathivel Kandasamy titled "Control Plane as a Tool: A Scalable Design Pattern for Agentic AI Systems." It proposes an architectural pattern in which AI agents interact with a single control-plane interface that handles tool routing and selection, rather than exposing many tools directly. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Pattern 10**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 10**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.38 Lesson 38: Safe methods: single-interface routing, policy checks, budget limits, and audit logs

Concept. Safe methods: single-interface routing, policy checks, budget limits, and audit logs uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **Safe methods**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe methods: single-interface routing, policy checks, budget limits, and audit logs rests on [309, 2026], [310, 2026], and [300, 2026]. The lead source's own note reads: The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. Use them for fixing what **Safe methods: single-interface routing, policy checks, budget limits, and audit logs** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe methods**, work from the cited evidence behind this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.39 Lesson 39: Safe defensive application: tool-governance demo that routes among benign summarization and validation utilities Concept. Safe defensive application: tool-governance demo that routes among benign summarization and validation utilities uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Analysts use **Safe defensive application** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Safe defensive application: tool-governance demo that routes among benign summarization and validation utilities rests on [309, 2026], [310, 2026], and [300, 2026]. The closest source to this row notes: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for the claim that **Safe defensive application: tool-governance demo that routes among benign summarization and validation utilities** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe defensive application** in the evidence the row cites. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.40 Lesson 40: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Permissioned Control Plane Agent Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Permissioned Control Plane Agent uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Safe architecture artifact connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Permissioned Control Plane Agent rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the claim that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Permissioned Control Plane Agent** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe architecture artifact** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.41 Lesson 41: Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure Concept. Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the claim that **Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data

sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Pattern 11**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 11**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.42 Lesson 42: Safe methods: synthetic event polling, threshold rationale, alert review, and escalation logging

Concept. Safe methods: synthetic event polling, threshold rationale, alert review, and escalation logging uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **Safe methods**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe methods: synthetic event polling, threshold rationale, alert review, and escalation logging rests on [309, 2026], [310, 2026], and [300, 2026]. The lead source's own note reads: The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. Use them for the working definition that **Safe methods: synthetic event polling, threshold rationale, alert review, and escalation logging** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe methods** against the works cited for this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.43 Lesson 43: Safe defensive application: accountable monitoring governance exercise over toy asset-health records

Concept. Safe defensive application: accountable monitoring governance exercise over toy asset-health records — Discuss dark-web sources only through governance: legality, safety, provenance limits, and instructor-provided synthetic records.

Why it matters. Without explicit treatment of **Safe defensive application**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe defensive application: accountable monitoring governance exercise over toy asset-health records rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the working definition that **Safe defensive application: accountable monitoring governance exercise over toy asset-health records** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe defensive application** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.44 Lesson 44: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Monitoring-Governance Tabletop Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Monitoring-Governance Tabletop Agent uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Analysts use **Safe architecture artifact** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Monitoring-Governance Tabletop Agent rests on [307, 2026], [305, 2026], and [304, 2026]. The lead source's own note reads: NIST SP 800-218, the Secure Software Development

Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for fixing what **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Monitoring-Governance Tabletop Agent** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, work from the cited evidence behind this row. [307, 2026] Official CISA Industrial Control Systems recommended practices page for defensive ICS/OT safety, resilience, and incident-preparation guidance. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.45 Lesson 45: Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution

Concept. Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution rests on [147, 2026]. The most specific cited work observes: Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Use it for pinning down the scope of **Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution**, work from the cited evidence behind this row. [147, 2026] Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Pattern 12**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 12**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.46 Lesson 46: Safe methods: policy-safe scenario cards, control mapping, misuse-case review, and mitigation scoring

Concept. Safe methods: policy-safe scenario cards, control mapping, misuse-case review, and mitigation scoring uses the model as defensive vocabulary for sequencing observations, not as a checklist of adversary actions.

Why it matters. Safe methods connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe methods: policy-safe scenario cards, control mapping, misuse-case review, and mitigation scoring rests on [300, 2026], [304, 2026], and [306, 2026]. The most specific cited work observes: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for the claim that **Safe methods: policy-safe scenario cards, control mapping, misuse-case review, and mitigation scoring** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe methods**, work from the cited evidence behind this row. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe methods**: that a defensive taxonomy is an instruction sequence.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.47 Lesson 47: Safe defensive application: defensive tabletop review of controls against published high-level tactics

Concept. Safe defensive application: defensive tabletop review of controls against published high-level tactics treats the vulnerability record as

an assurance case: severity, affected component, provenance, mitigation status, and uncertainty stay separate.

Why it matters. Without explicit treatment of **Safe defensive application**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe defensive application: defensive tabletop review of controls against published high-level tactics rests on [300, 2026], [304, 2026], and [306, 2026]. The closest source to this row notes: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for the working definition that **Safe defensive application: defensive tabletop review of controls against published high-level tactics** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe defensive application**, work from the cited evidence behind this row. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.48 Lesson 48: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Control-Coverage Critique Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Control-Coverage Critique Agent uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Safe architecture artifact connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Control-Coverage Critique Agent rests on [300, 2026], [304, 2026], and [306, 2026]. Its anchor reference records: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for fixing what **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Control-Coverage Critique Agent** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe architecture artifact** against the works cited for this row. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.49 Lesson 49: Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support

Concept. Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the working definition that **Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state

its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Pattern 13**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 13**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.50 Lesson 50: Safe methods: synthetic persona-risk critique, provenance labeling, and consistency-error detection **Concept. Safe methods: synthetic persona-risk critique, provenance labeling, and consistency-error detection** uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Analysts use **Safe methods** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Safe methods: synthetic persona-risk critique, provenance labeling, and consistency-error detection rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for pinning down the scope of **Safe methods: synthetic persona-risk critique, provenance labeling, and consistency-error detection**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe methods** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.51 Lesson 51: Safe defensive application: ethics exercise that detects fabricated identity artifacts in clearly synthetic materials **Concept. Safe defensive application: ethics exercise that detects fabricated identity artifacts in clearly synthetic materials** uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Safe defensive application matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe defensive application: ethics exercise that detects fabricated identity artifacts in clearly synthetic materials rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **Safe defensive application: ethics exercise that detects fabricated identity artifacts in clearly synthetic materials** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe defensive application** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.52 Lesson 52: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Identity-and-Provenance Fiction Audit **Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Identity-and-Provenance Fiction Audit** uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Safe architecture artifact**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Identity-and-Provenance Fiction Audit rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for pinning down the scope of **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Identity-and-**

Provenance Fiction Audit, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe architecture artifact** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.53 Lesson 53: Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people

Concept. Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people applies verification steps: source identity, chain, recency, corroboration, and explicit uncertainty before a claim enters analysis.

Why it matters. Without explicit treatment of **Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the working definition that **Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Pattern 14**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 14**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.54 Lesson 54: Safe methods: corroboration, metadata review, provenance checks, and content-authenticity labels

Concept. Safe methods: corroboration, metadata review, provenance checks, and content-authenticity labels treats metadata as a distinct evidence class with its own minimization, correlation limits, and legal review requirements.

Why it matters. Analysts use **Safe methods** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Safe methods: corroboration, metadata review, provenance checks, and content-authenticity labels rests on [309, 2026], [310, 2026], and [300, 2026]. Its anchor reference records: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for the working definition that **Safe methods: corroboration, metadata review, provenance checks, and content-authenticity labels** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe methods** against the works cited for this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape

Safe methods work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.55 Lesson 55: Safe defensive application: public-source validation packet with uncertainty and review escalations

Concept. Safe defensive application: public-source validation packet with uncertainty and review escalations connects source-protection duties to reporting quality, compartmentation, and counterintelligence review without recreating handling tradecraft.

Why it matters. Safe defensive application matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe defensive application: public-source validation packet with uncertainty and review escalations rests on [308, 2026] and [311, 2026]. The closest source to this row notes: It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Use them for the claim that **Safe defensive application: public-source validation packet with uncertainty and review escalations** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe defensive application**, reason from the sources cited in this row. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.56 Lesson 56: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Source-Reliability Verification Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Source-Reliability Verification Agent applies verification steps: source identity, chain, recency, corroboration, and explicit uncertainty before a claim enters analysis.

Why it matters. Safe architecture artifact connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Source-Reliability Verification Agent rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for pinning down the scope of **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Source-Reliability Verification Agent**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe architecture artifact** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.57 Lesson 57: Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision

Concept. Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision rests on [004, 2026]. The closest source to this row notes: He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. Use it for the working definition that **Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision**, reason from the sources cited in this row. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence

lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Pattern 15**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 15**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.58 Lesson 58: Safe methods: interrupt gates, confidence thresholds, human approvals, and audit handoffs **Concept. Safe methods: interrupt gates, confidence thresholds, human approvals, and audit handoffs** uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **Safe methods**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe methods: interrupt gates, confidence thresholds, human approvals, and audit handoffs rests on [297, 2026] and [298, 2026]. The closest source to this row notes: Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Use them for the claim that **Safe methods: interrupt gates, confidence thresholds, human approvals, and audit handoffs** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe methods** in the evidence the row cites. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.59 Lesson 59: Safe defensive application: supervised classroom analysis workflow for compliance-constrained exercises **Concept. Safe defensive application: supervised classroom analysis workflow for compliance-constrained exercises** documents workflow stages with inputs, transforms, reviewers, and blocked actions at each handoff.

Why it matters. Safe defensive application matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe defensive application: supervised classroom analysis workflow for compliance-constrained exercises rests on [299, 2026], [306, 2026], and [312, 2026]. The most specific cited work observes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for pinning down the scope of **Safe defensive application: supervised classroom analysis workflow for compliance-constrained exercises**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe defensive application** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.60 Lesson 60: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Analyst-in-the-Loop Review Agent **Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Analyst-in-the-Loop Review Agent** uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Safe architecture artifact matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Analyst-in-the-Loop Review Agent rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the working definition that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Analyst-in-the-Loop Review Agent** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.61 Lesson 61: Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact

Concept. Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact rests on [149, 2026] and [150, 2026]. Its anchor reference records: An article from Cybersecurity Tribe examining where autonomous AI should and should not operate within security operations, drawing on survey data and commentary from numerous security experts. Use them for fixing what **Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact** in the evidence the row cites. [149, 2026] A 2025 blog article from Simbian AI explaining the application of agentic AI to security operations centers. It describes an architecture organized into perception, cognitive, and action modules, and a coordinated framework of specialized agents for tasks such as alert triage, threat investigation, and vulnerability management. [150, 2026] An article from Cybersecurity Tribe examining where autonomous AI should and should not operate within security operations, drawing on survey data and commentary from numerous security experts. It identifies high-volume, repetitive tasks such as alert triage and policy validation as well suited to automation, while warning against autonomous handling of irreversible or high-impact decisions affecting infrastructure and access. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Pattern 16**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 16**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.62 Lesson 62: Safe methods: synthetic alert enrichment, ATT&CK mapping, severity rationale, and debrief notes

Concept. Safe methods: synthetic alert enrichment, ATT&CK mapping, severity rationale, and debrief notes uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Safe methods connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe methods: synthetic alert enrichment, ATT&CK mapping, severity rationale, and debrief notes rests on [302, 2026] and [297, 2026]. The most specific cited work observes: Department of Defense and intelligence community organization. Use them for pinning down the scope of **Safe methods: synthetic alert enrichment, ATT&CK mapping, severity rationale, and debrief notes**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe methods** in the evidence the row cites. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.63 Lesson 63: Safe defensive application: tier-1 incident tabletop over fabricated logs and published technique descriptions

Concept. Safe defensive application: tier-1 incident tabletop over fabricated logs and published technique descriptions uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **Safe defensive application**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe defensive application: tier-1 incident tabletop over fabricated logs and published technique descriptions rests on [299, 2026], [306, 2026], and [312, 2026]. The most specific cited work observes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the working definition that **Safe defensive application: tier-1 incident tabletop over fabricated logs and published technique descriptions** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe defensive application** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.64 Lesson 64: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for SOC Tabletop Triage Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for SOC Tabletop Triage Agent uses sharing standards to document indicator context, handling, confidence, and consumer responsibilities—not raw indicator hoarding.

Why it matters. Safe architecture artifact connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for SOC Tabletop Triage Agent rests on [309, 2026], [310, 2026], and [300, 2026]. The closest source to this row notes: The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. Use them for the working definition that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for SOC Tabletop Triage Agent** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe architecture artifact** in the evidence the row cites. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded

claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.65 Lesson 65: Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence

Concept. Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence rests on [303, 2026], [304, 2026], and [305, 2026]. Its anchor reference records: An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. Use them for fixing what **Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence** in the evidence the row cites. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Pattern 17**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 17**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.66 Lesson 66: Safe methods: SBOM reading, dependency graph review, advisory matching, and integrity questions

Concept. Safe methods: SBOM reading, dependency graph review, advisory matching, and integrity questions shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Safe methods connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe methods: SBOM reading, dependency graph review, advisory matching, and integrity questions rests on [303, 2026], [304, 2026], and [305, 2026]. The lead source's own note reads: An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. Use them for the working definition that **Safe methods: SBOM reading, dependency graph review, advisory matching, and integrity questions** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe methods**, work from the cited evidence behind this row. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.67 Lesson 67: Safe defensive application: defensive package-governance exercise over sample manifests and public advisories

Concept. Safe defensive application: defensive package-governance exercise over sample manifests and public advisories shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Safe defensive application connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe defensive application: defensive package-governance exercise over sample manifests and public advisories rests on [076, 2026]. Its anchor reference records: In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library

in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. Use it for the working definition that **Safe defensive application: defensive package-governance exercise over sample manifests and public advisories** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe defensive application**, reason from the sources cited in this row. [076, 2026] In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. The perpetrator, operating under the pseudonym Jia Tan, spent over two years building trust as a contributor before inserting the exploit, which received a maximum CVSS score of 10.0. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.68 Lesson 68: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Software Provenance Review Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Software Provenance Review Agent shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Analysts use **Safe architecture artifact** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Software Provenance Review Agent rests on [303, 2026], [304, 2026], and [305, 2026]. The lead source's own note reads: An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. Use them for the working definition that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Software Provenance Review Agent** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, work from the cited evidence behind this row. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.69 Lesson 69: Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples

Concept. Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples treats metadata as a distinct evidence class with its own minimization, correlation limits, and legal review requirements.

Why it matters. Without explicit treatment of **Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples rests on [302, 2026] and [297, 2026]. The closest source to this row notes: It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. Use them for the working definition that **Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples**, reason from the sources cited in this row. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Pattern 18**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 18**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in**

pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples: that a visible feature is enough for a confident geospatial claim.

Transfer task. Transfer **Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.70 Lesson 70: Safe methods: provided-image annotation, quality flags, geospatial metadata review, and caveat writing

Concept. Safe methods: provided-image annotation, quality flags, geospatial metadata review, and caveat writing treats metadata as a distinct evidence class with its own minimization, correlation limits, and legal review requirements.

Why it matters. Safe methods matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe methods: provided-image annotation, quality flags, geospatial metadata review, and caveat writing rests on [302, 2026] and [297, 2026]. The most specific cited work observes: Department of Defense and intelligence community organization. Use them for the claim that **Safe methods: provided-image annotation, quality flags, geospatial metadata review, and caveat writing** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe methods** in the evidence the row cites. [302, 2026] The official "About Us" page of the National Geospatial-Intelligence Agency (NGA), a U.S. Department of Defense and intelligence community organization. It describes NGA's mission of delivering geospatial intelligence, or GEOINT, to support military operations, policymakers, and first responders, spanning imagery analysis, mapping, geodesy, and navigation safety. [297, 2026] Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.71 Lesson 71: Safe defensive application: synthetic imagery-change exercise focused on uncertainty and data quality

Concept. Safe defensive application: synthetic imagery-change exercise focused on uncertainty and data quality treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. Safe defensive application connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe defensive application: synthetic imagery-change exercise focused on uncertainty and data quality rests on [299, 2026], [306, 2026], and [312, 2026]. The most specific cited work observes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for fixing what **Safe defensive application: synthetic imagery-change exercise focused on uncertainty and data quality** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe defensive application** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe defensive application**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.72 Lesson 72: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for GEOINT Data-Quality Audit Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for GEOINT Data-Quality Audit Agent treats location evidence as a quality and uncertainty problem, separating map interpretation from targeting or attribution.

Why it matters. Analysts use **Safe architecture artifact** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for GEOINT Data-Quality Audit Agent rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for GEOINT Data-Quality Audit Agent** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe architecture artifact** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded

claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe architecture artifact**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.73 Lesson 73: Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content

Concept. Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content uses inoculation methods as evidence-informed, bounded, and context-dependent resilience education with transparent labels, source checks, non-manipulative corrections, and explicit measurement limits.

Why it matters. Without explicit treatment of **Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content rests on [151, 2026]. The most specific cited work observes: Grounded in inoculation theory, it describes how exposing people to weakened forms of manipulative content can help them develop resistance before they encounter it in the wild. Use it for the claim that **Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content**, work from the cited evidence behind this row. [151, 2026] A practitioner guide from Inoculation Science explaining prebunking as a proactive strategy to build preemptive resilience to misinformation. Grounded in inoculation theory, it describes how exposing people to weakened forms of manipulative content can help them develop resistance before they encounter it in the wild. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Pattern 19**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 19**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.74 Lesson 74: Safe methods: manipulation-technique labeling, transparent prebunking, and audience-harm

Concept. Safe methods: manipulation-technique labeling, transparent prebunking, and audience-harm uses inoculation methods as evidence-informed, bounded, and context-dependent resilience education with transparent labels, source checks, non-manipulative corrections, and explicit measurement limits.

Why it matters. Without explicit treatment of **Safe methods**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe methods: manipulation-technique labeling, transparent prebunking, and audience-harm rests on [308, 2026] and [311, 2026]. Its anchor reference records: An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. Use them for pinning down the scope of **Safe methods: manipulation-technique labeling, transparent prebunking, and audience-harm**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe methods** in the evidence the row cites. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.75 Lesson 75: Safe defensive application: opt-in media-literacy micro-lesson for a sample classroom scenario

Concept. Safe defensive application: opt-in media-literacy micro-lesson for a sample classroom scenario compares resolution, accuracy, and temporal fitness before drawing a geospatial conclusion from imagery or map products.

Why it matters. Safe defensive application connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Safe defensive application: opt-in media-literacy micro-lesson for a sample classroom scenario rests on [152, 2026]. The closest source to this row notes: A University of Cambridge news article describing a large study, conducted with Bristol University and Google's Jigsaw, testing whether short animated videos can help people resist online manipulation. Use it for the claim that **Safe defensive application:**

opt-in media-literacy micro-lesson for a sample classroom scenario lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Safe defensive application** in the evidence the row cites. [152, 2026] A University of Cambridge news article describing a large study, conducted with Bristol University and Google's Jigsaw, testing whether short animated videos can help people resist online manipulation. The 90-second clips expose common manipulation techniques such as scapegoating, false dichotomies, and emotionally manipulative language, an approach the researchers call prebunking. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.76 Lesson 76: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Cognitive-Resilience Education Agent

Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Cognitive-Resilience Education Agent uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Safe architecture artifact**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Cognitive-Resilience Education Agent rests on [305, 2026], [304, 2026], and [303, 2026]. The lead source's own note reads: An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. Use them for the working definition that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Cognitive-Resilience Education Agent** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, reason from the sources cited in this row. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.77 Lesson 77: Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates

Concept. Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Without explicit treatment of **Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates rests on [139, 2026] and [137, 2026]. The lead source's own note reads: An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. Use them for the working definition that **Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates** against the works cited for this row. [139, 2026] A LinkedIn post by Aishwarya Srinivasan discussing agentic AI design patterns for building production-grade AI agents. [137, 2026] An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Pattern 20**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Pattern 20**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.78 Lesson 78: Safe methods: role delegation, output aggregation, exception routing, and failure recovery drills **Concept. Safe methods: role delegation, output aggregation, exception routing, and failure recovery drills** uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Safe methods matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Safe methods: role delegation, output aggregation, exception routing, and failure recovery drills rests on [299, 2026], [306, 2026], and [312, 2026]. The most specific cited work observes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for fixing what **Safe methods: role delegation, output aggregation, exception routing, and failure recovery drills** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Safe methods** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe methods**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe methods**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe methods** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe methods**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe methods** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.79 Lesson 79: Safe defensive application: multi-domain capstone coordination across benign module artifacts **Concept. Safe defensive application: multi-domain capstone coordination across benign module artifacts** uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **Safe defensive application**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Safe defensive application: multi-domain capstone coordination across benign module artifacts rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **Safe defensive application: multi-domain capstone coordination across benign module artifacts** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe defensive application**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Safe defensive application**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe defensive application**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe defensive application** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Safe defensive application**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Safe defensive application** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.2.80 Lesson 80: Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Hierarchical Curriculum Orchestrator **Concept. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Hierarchical Curriculum Orchestrator** uses pattern names as architectural vocabulary for allowlisted, logged, revocable workflows—not as operational playbooks.

Why it matters. Analysts use **Safe architecture artifact** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Hierarchical Curriculum Orchestrator rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the claim that **Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Hierarchical Curriculum Orchestrator** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Safe architecture artifact**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Safe architecture artifact**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Safe architecture artifact**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Safe architecture artifact** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Safe architecture artifact**: that naming an agent pattern certifies it is safe to deploy

without governance gates.

Transfer task. Transfer **Safe architecture artifact** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

46.2.3 AGEINT Design Patterns and Archetypes worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic research assistant agent organizes public readings for an instructor. [233, 2026]; [258, 2026].

Triangulation anchors. In module 32's worked-example section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **governed agentic intelligence**. Learners use a **agent run and assurance card** and keep this boundary visible: No autonomous external action, credentialed operations, live-target workflows, or uncontrolled tool use.

Frame. The classroom question centers on **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action**. Excluded actions stay explicit, and the **Agentic Tool-Governance Lens** planning question is: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?

Inputs. For the **Pattern 1: Focused Analytic Reasoner** scenario, use public URLs, a fixed retrieval tool, a summarization prompt, a time budget, and a stop condition. The Agentic Tool-Governance Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Pattern 1: Focused Analytic Reasoner**, students bind the agent identity, list allowed tools, set autonomy limits, capture sources, block unsafe requests, and log approvals. Pause whenever an inference about Pattern 1: Focused Analytic Reasoner appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Pattern 1: Focused Analytic Reasoner** classroom scenario; unit artifact = agent run and assurance card; evidence = allowed inputs; method = least-privilege agent design and run review; output = an agent run card with tool calls, source links, blocked actions, reviewer notes, incident threshold, and recovery decision; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Pattern 1: Focused Analytic Reasoner** as "Agentic Tool-Governance Lens confirms it" is not enough. The revision ties the claim to least-privilege agent design and run review, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Pattern 1: Focused Analytic Reasoner** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

46.2.4 AGEINT Design Patterns and Archetypes practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Agentic Tool-Governance Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

Triangulation anchors. In module 32's practice-sequence section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Pattern 1: Focused Analytic Reasoner, Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes, Safe defensive application: single public-source report critique with provenance and uncertainty fields; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Agentic AI Governance and Tool Security** lane.
2. Frame	Answer the lens question: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Pattern 1: Focused Analytic Reasoner: agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the agent run and assurance card fields for Pattern 1: Focused Analytic Reasoner.	Unit profile note.	Evidence artifacts include tool-allowlist record, external-memory governance boundary.
4. Challenge	Test the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.	Failure-mode note.	The artifact applies the key distinction: separate agent assistance from autonomous external action.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

46.2.4.1 AGEINT Design Patterns and Archetypes instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**. [233, 2026]; [258, 2026].

46.2.4.2 AGEINT Design Patterns and Archetypes extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 46; [233, 2026].

Have learners swap artifacts and apply the **Agentic Tool-Governance Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

46.2.5 AGEINT Design Patterns and Archetypes knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 46; [233, 2026].

1. Explain how **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action** is defined here; name the source descriptor that supports the definition.
2. Contrast **Pattern 1: Focused Analytic Reasoner** with **Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes** using the **Agentic Tool-Governance Lens** artifact fields.
3. Identify one failure mode from the **Agentic AI Governance and Tool Security** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which permission can be removed while preserving the learning objective?
5. Correct this misconception: that naming an agent pattern certifies it is safe to deploy without governance gates.

46.2.5.1 AGEINT Design Patterns and Archetypes answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Pattern 1: Focused Analytic Reasoner** without source evidence, uncertainty, or a safe transfer task.

46.3 AGEINT Design Patterns and Archetypes assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 46; [233, 2026].

46.3.1 AGEINT Design Patterns and Archetypes evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 46; [233, 2026].

46.3.2 AGEINT Design Patterns and Archetypes transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 46; [233, 2026].

46.3.2.1 AGEINT Design Patterns and Archetypes lineage and source tradition: profile, concepts, and first anchors This sits in the **Agentic AI Governance and Tool Security** lineage: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. [233, 2026]; [258, 2026].

46.3.2.2 AGEINT Design Patterns and Archetypes working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 46; [233, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**, with provenance and reviewability throughout.

46.3.2.3 AGEINT Design Patterns and Archetypes knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [233, 2026]; [258, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

46.3.2.4 AGEINT Design Patterns and Archetypes transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 46; [233, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.
- **Evidence contract:** keep the **Agentic AI Governance and Tool Security** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

46.3.2.5 AGEINT Design Patterns and Archetypes profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 46; [233, 2026].

The matched profile emphasizes delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. The method stack is AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills; the local topic cluster is **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

46.3.3 AGEINT Design Patterns and Archetypes evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 46; [233, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Agentic AI Governance and Tool Security** profile tells reviewers what evidence is strong enough for the module artifact built around **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

46.3.3.1 AGEINT Design Patterns and Archetypes guide source spine: inherited keys and local citation roles Primary guide citations: [233, 2026]; [258, 2026]; [272, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [143, 2026]; [139, 2026]; [144, 2026]; [145, 2026]; [146, 2026]; [147, 2026]; [148, 2026]; [138, 2026]; [004, 2026]; [149, 2026]; [150, 2026]; [076, 2026]; [151, 2026]; [152, 2026]; [137, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [297, 2026]; [298, 2026]; [309, 2026]; [310, 2026]; [300, 2026]; [304, 2026]; [303, 2026]; [305, 2026]; [302, 2026]; [301, 2026]; [307, 2026]; [308, 2026]; [311, 2026].

46.3.3.2 AGEINT Design Patterns and Archetypes verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [233, 2026]; [258, 2026].

Tier	What counts	How it is used
Source guide	[233, 2026]; [258, 2026]; [272, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [143, 2026]; [139, 2026]; [144, 2026]; [145, 2026]; [146, 2026]; [147, 2026]; [148, 2026]; [138, 2026]; [004, 2026]; [149, 2026]; [150, 2026]; [076, 2026]; [151, 2026]; [152, 2026]; [137, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [297, 2026]; [298, 2026]; [309, 2026]; [310, 2026]; [300, 2026]; [304, 2026]; [303, 2026]; [305, 2026]; [302, 2026]; [301, 2026]; [307, 2026]; [308, 2026]; [311, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 32's source-canon section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes** and [233, 2026]; [258, 2026], but only directly verified source URLs are encoded as citations.

46.3.3.3 AGEINT Design Patterns and Archetypes intelligence practice lens: evidence artifact and safety check Practice lens: **Agentic Tool-Governance Lens** for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**. [233, 2026]; [258, 2026].

Planning question: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?

Evidence artifact: agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path.

Validation rule: verify least privilege, prompt-injection exposure, provenance, observability, stop conditions, and incident-reporting triggers. Applied to **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

Handoff contract: export agent traces, tool calls, retrieved sources, policy decisions, and human approvals separately.

Safety check: block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions.

46.3.3.4 AGEINT Design Patterns and Archetypes runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 46; [233, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	32.99	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
AGEINT pattern registry, agent identity, and interface-contract studio	32.100	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Bounded autonomy, procurement, incident-response, and assurance studio	32.101	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Model-card, recoverability, retention, and learner-support evidence package	32.102	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: curated corpus retrieval, hybrid ranking, source snippets, and citation audits	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: course-pack retrieval over provided readings, standards, and official guidance	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Provenance-Bound Retrieval Operator	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: episodic note cards, retention limits, consolidation, and source change logs	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: longitudinal claim ledger for curriculum evidence and revision history	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Evidence-Memory State Machine	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Safe methods: single-interface routing, policy checks, budget limits, and audit logs	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: tool-governance demo that routes among benign summarization and validation utilities	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Permissioned Control Plane Agent	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: synthetic event polling, threshold rationale, alert review, and escalation logging	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: accountable monitoring governance exercise over toy asset-health records	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Monitoring-Governance Tabletop Agent	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: policy-safe scenario cards, control mapping, misuse-case review, and mitigation scoring	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: defensive tabletop review of controls against published high-level tactics	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Control-Coverage Critique Agent	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: synthetic persona-risk critique, provenance labeling, and consistency-error detection	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: ethics exercise that detects fabricated identity artifacts in clearly synthetic materials	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Identity-and-Provenance Fiction Audit	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: corroboration, metadata review, provenance checks, and content-authenticity labels	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: public-source validation packet with uncertainty and review escalations	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Source-Reliability Verification Agent	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: interrupt gates, confidence thresholds, human approvals, and audit handoffs	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: supervised classroom analysis workflow for compliance-constrained exercises	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Analyst-in-the-Loop Review Agent	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: synthetic alert enrichment, ATT&CK mapping, severity rationale, and debrief notes	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: tier-1 incident tabletop over fabricated logs and published technique descriptions	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for SOC Tabletop Triage Agent	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: SBOM reading, dependency graph review, advisory matching, and integrity questions	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: defensive package-governance exercise over sample manifests and public advisories	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Software Provenance Review Agent	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples	module section	Source identity preserved in pattern registry with safe classroom treatment	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Safe methods: provided-image annotation, quality flags, geospatial metadata review, and caveat writing	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Safe defensive application: synthetic imagery-change exercise focused on uncertainty and data quality	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for GEOINT Data-Quality Audit Agent	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: manipulation-technique labeling, transparent prebunking, and audience-harm review	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: opt-in media-literacy micro-lesson for a sample classroom scenario	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Cognitive-Resilience Education Agent	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: role delegation, output aggregation, exception routing, and failure recovery drills	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: multi-domain capstone coordination across benign module artifacts	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Hierarchical Curriculum Orchestrator	module section	Source identity preserved in pattern registry with safe classroom treatment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

46.3.3.5 AGEINT Design Patterns and Archetypes reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 46; [233, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: single public-source report critique with provenance and uncertainty fields	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Focused Analytic Reasoner	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 2: Reflection and Bias-Check Agent (source identity preserved in pattern registry) - supports quality review and never replaces accountable human judgment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: rubric-based critique, source-quality scoring, and trajectory validation	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: analytic-bias review over a synthetic or public-source evidence packet	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Reflection and Bias-Check Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 3: Tool-Allowlist Research Assistant (source identity preserved in pattern registry) - excludes broad scraping, credentialed collection, and exposure-search tooling	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Safe methods: schema-bound tool calls, public-source retrieval, allowlisted connectors, and grounded summaries	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: accountable bibliography, source inventory, or standards-mapping exercise	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Tool-Allowlist Research Assistant	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 4: Governed Planner-Executor (source identity preserved in pattern registry) - plans curriculum artifacts only and does not create live operational tasking	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: milestone decomposition, approval gates, dependency checks, and rollback notes	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: classroom project plan for evidence review, policy analysis, or tabletop preparation	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Governed Planner-Executor	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 5: Parallel Source-Corroboration Agent (source identity preserved in pattern registry) - uses public or provided materials and avoids intelligence collection expansion	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Lesson topic	Practice lens	Evidence artifact	Safety check
Safe methods: bounded concurrent retrieval, deduplication, contradiction capture, and source descriptors	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: side-by-side comparison of public official, standards, and scholarly sources	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Parallel Source-Corroboration Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 6: Role-Separated Review Crew (source identity preserved in pattern registry) - keeps roles educational, logged, and constrained to benign artifacts	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: planner, retriever, validator, safety reviewer, and reporter roles	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: tabletop red-team critique of an analytic memo, not an operational exercise	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Role-Separated Review Crew	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 7: Competing-Hypotheses Debate Agent (source identity preserved in pattern registry) - does not generate adversarial persuasion or policy advocacy content	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: alternative generation, evidence challenge, dissent capture, and judge rubric	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: ACH-style review of a classroom claim with clearly separated evidence and judgment	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Competing-Hypotheses Debate Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 8: Provenance-Bound Retrieval Operator (source identity preserved in pattern registry) - does not connect to live sensitive stores or unapproved data collections	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: curated corpus retrieval, hybrid ranking, source snippets, and citation audits	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: course-pack retrieval over provided readings, standards, and official guidance	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Provenance-Bound Retrieval Operator	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 9: Evidence-Memory State Machine (source identity preserved in pattern registry) - tracks claims and sources, not people, assets, or behavioral patterns	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: episodic note cards, retention limits, consolidation, and source change logs	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: longitudinal claim ledger for curriculum evidence and revision history	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Lesson topic	Practice lens	Evidence artifact	Safety check
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Evidence-Memory State Machine	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 10: Permissioned Control Plane Agent (source identity preserved in pattern registry) - keeps every tool revocable, observable, and constrained to evidence-bounded actions	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: single-interface routing, policy checks, budget limits, and audit logs	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: tool-governance demo that routes among benign summarization and validation utilities	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Permissioned Control Plane Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 11: Monitoring-Governance Tabletop Agent (source identity preserved in pattern registry) - prohibits tracking real people, real targets, private forums, or infrastructure	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: synthetic event polling, threshold rationale, alert review, and escalation logging	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: accountable monitoring governance exercise over toy asset-health records	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Monitoring-Governance Tabletop Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 12: Control-Coverage Critique Agent (source identity preserved in pattern registry) - does not automate exploitation, weakness discovery, or attack-chain execution	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: policy-safe scenario cards, control mapping, misuse-case review, and mitigation scoring	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: defensive tabletop review of controls against published high-level tactics	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Control-Coverage Critique Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 13: Identity-and-Provenance Fiction Audit (source identity preserved in pattern registry) - prohibits impersonation, false identity creation, and operational-security support	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: synthetic persona-risk critique, provenance labeling, and consistency-error detection	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: ethics exercise that detects fabricated identity artifacts in clearly synthetic materials	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Identity-and-Provenance Fiction Audit	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Lesson topic	Practice lens	Evidence artifact	Safety check
Pattern 14: Source-Reliability Verification Agent (source identity preserved in pattern registry) - supports verification and does not accuse, deanonymize, or profile real people	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: corroboration, metadata review, provenance checks, and content-authenticity labels	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: public-source validation packet with uncertainty and review escalations	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Source-Reliability Verification Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 15: Analyst-in-the-Loop Review Agent (source identity preserved in pattern registry) - requires accountable human review before any external communication or decision	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: interrupt gates, confidence thresholds, human approvals, and audit handoffs	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: supervised classroom analysis workflow for compliance-constrained exercises	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Analyst-in-the-Loop Review Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 16: SOC Tabletop Triage Agent (source identity preserved in pattern registry) - does not run response actions, touch production systems, or publish indicators as fact	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: synthetic alert enrichment, ATT&CK mapping, severity rationale, and debrief notes	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: tier-1 incident tabletop over fabricated logs and published technique descriptions	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for SOC Tabletop Triage Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 17: Software Provenance Review Agent (source identity preserved in pattern registry) - does not hunt real maintainers or produce exploitability claims without evidence	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: SBOM reading, dependency graph review, advisory matching, and integrity questions	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: defensive package-governance exercise over sample manifests and public advisories	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Software Provenance Review Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 18: GEOINT Data-Quality Audit Agent (source identity preserved in pattern registry) - limits work to non-sensitive metadata quality, uncertainty notes, and synthetic location examples	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure

Lesson topic	Practice lens	Evidence artifact	Safety check
Safe methods: provided-image annotation, quality flags, geospatial metadata review, and caveat writing	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: synthetic imagery-change exercise focused on uncertainty and data quality	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for GEOINT Data-Quality Audit Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 19: Cognitive-Resilience Education Agent (source identity preserved in pattern registry) - does not design persuasion campaigns, microtargeting, or covert influence content	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: manipulation-technique labeling, transparent prebunking, and audience-harm	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: opt-in media-literacy micro-lesson for a sample classroom scenario	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Cognitive-Resilience Education Agent	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Pattern 20: Hierarchical Curriculum Orchestrator (source identity preserved in pattern registry) - orchestrates learning artifacts only and preserves human authorization gates	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe methods: role delegation, output aggregation, exception routing, and failure recovery drills	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe defensive application: multi-domain capstone coordination across benign module artifacts	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Safe architecture artifact: diagram an allowlisted, logged, revocable workflow for Hierarchical Curriculum Orchestrator	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

46.3.3.6 AGEINT Design Patterns and Archetypes annotated source ledger: real titles and local contribution Each source cited by this **Agentic AI Governance and Tool Security** module is paired below with its real title and a one-line note on what it contributes to **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

Source	Cited work	What it contributes	Status
[233, 2026]	General-Purpose AI Code of Practice	An official European Commission Digital Strategy webpage documenting the General-Purpose AI Code of Practice, a voluntary guidance document helping general-purpose AI providers comply with the EU AI Act's rules on safety, transparency, and copyright. It describes an iterative drafting process involving nearly 1,000 stakeholders across four working groups, running from September 2024 through July 2025.	verified source-guide

Source	Cited work	What it contributes	Status
[258, 2026]	OpenAPI Specification	The official OpenAPI Initiative publications page, serving as a central index for the OpenAPI Specification and related standards including the Arazzo and Overlay specifications. It provides access to multiple specification versions (2.0, 3.0, 3.1, and 3.2) and their corresponding downloadable schemas identified by release date, along with a registry of extensions, formats, media types, and other resources.	verified source-guide
[272, 2026]	C2PA Specifications	The specifications hub for the C2PA (Coalition for Content Provenance and Authenticity), a standards initiative that develops technical methods for certifying the source and history of media content to counter misleading information. It publishes the core Content Credentials specification along with related material such as attestations and a soft-binding API, plus implementation, security, and user-experience guidance including for AI-generated content.	verified source-guide
[275, 2026]	Fact Sheet: New Rule on the Accessibility of Web Content and Mobile Apps Provided by State and Local Governments	A US Department of Justice fact sheet explaining the 2024 ADA Title II rule requiring state and local governments to make their web content and mobile apps accessible. It establishes WCAG 2.1 Level AA as the technical standard, applies to entities such as schools, courts, libraries, and transit agencies, and sets compliance deadlines of April 2027 for larger jurisdictions and April 2028 for smaller ones.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[283, 2026]	Recommendation of the Council on Open Government	An OECD legal instrument document reproducing the Recommendation of the Council on Open Government (OECD/LEGAL/0438), adopted on 14 December 2017. It defines open government as a culture of governance promoting transparency, integrity, accountability, and stakeholder participation in support of democracy and inclusive growth.	verified source-guide
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide

Source	Cited work	What it contributes	Status
[293, 2026]	Inventory of NARA Artificial Intelligence (AI) Use Cases	The National Archives and Records Administration (NARA) official inventory of its artificial intelligence use cases, documenting 14 projects across deployed, pilot, and planned stages. Deployed efforts include workplace productivity tools, automated tagging for museum experiences, and historical record retrieval, while pilots cover PII detection and redaction, semantic search, and metadata generation, and planned work targets FOIA processing and public search.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[143, 2026]	Agentic AI Architectures And Design Patterns / by Anil Jain	A Medium article by Anil Jain (2025) surveying agentic AI system architectures and design patterns. It defines agentic AI as systems capable of independent decision-making, reviews frameworks such as LangChain, LlamaIndex, and AutoGen, and describes five system components: perception, decision-making, action, memory, and communication.	verified practitioner context; secondary evidence only
[139, 2026]	Agentic AI Design Patterns by Andrew Ng	A LinkedIn post by Aishwarya Srinivasan discussing agentic AI design patterns for building production-grade AI agents.	verified practitioner context; secondary evidence only
[144, 2026]	Agentic AI patterns and workflows on AWS	An AWS Prescriptive Guidance document (July 2025) introducing agentic AI patterns and workflows. It presents reusable design templates for building AI agent systems that operate with autonomy while remaining controllable and aligned with goals, aimed at architects, developers, and product leaders.	verified practitioner context; secondary evidence only
[145, 2026]	A Scalable Design Pattern for Agentic AI Systems	This is an arXiv research paper by Sivasathivel Kandasamy titled "Control Plane as a Tool: A Scalable Design Pattern for Agentic AI Systems." It proposes an architectural pattern in which AI agents interact with a single control-plane interface that handles tool routing and selection, rather than exposing many tools directly.	verified source-guide
[146, 2026]	Agentic AI Frameworks: Key Components & Top 8 Options in 2026	An Exabeam explainer describing agentic AI frameworks as software toolkits that provide pre-built components and architectures for building autonomous AI agents. It outlines core elements such as agent coordination, tool integration, memory management, workflow definition, and deployment monitoring, and reviews eight frameworks including LangGraph, AutoGen, CrewAI, LlamaIndex, Haystack, DSPy, and Semantic Kernel.	verified source-guide

Source	Cited work	What it contributes	Status
[147, 2026]	Agent Framework Security	Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic.	original practitioner context; secondary evidence only
[148, 2026]	How Riverside Research Advances Agentic AI for National Security	This article by Riverside Research traces AI's evolution from large language models through retrieval-augmented systems, single-task agents, collaborative agentic systems, and toward emergent multi-agent autonomy capable of managing surveillance and decision support at operational speed.	verified source-guide
[138, 2026]	Agentic Artificial Intelligence (AI): Architectures, Taxonomies	An arXiv survey paper on agentic AI examining the shift from generative systems to autonomous agents that perceive, reason, plan, and act. It proposes a unified taxonomy decomposing LLM-based agents into six dimensions: core components, cognitive architecture, learning paradigms, multi-agent systems, environments and domains, and evaluation and safety.	verified source-guide
[004, 2026]	AI Won't Replace Spies—It Will Make Them More Powerful Than Ever	Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools.	verified source-guide
[149, 2026]	Cited source (see bibliography)	A 2025 blog article from Simbian AI explaining the application of agentic AI to security operations centers. It describes an architecture organized into perception, cognitive, and action modules, and a coordinated framework of specialized agents for tasks such as alert triage, threat investigation, and vulnerability management.	verified source-guide
[150, 2026]	The Right Role for Agentic AI in Security Operations	An article from Cybersecurity Tribe examining where autonomous AI should and should not operate within security operations, drawing on survey data and commentary from numerous security experts. It identifies high-volume, repetitive tasks such as alert triage and policy validation as well suited to automation, while warning against autonomous handling of irreversible or high-impact decisions affecting infrastructure and access.	verified source-guide
[076, 2026]	XZ Utils backdoor	In early 2024, a malicious backdoor was discovered embedded in XZ Utils, a widely used compression library in Linux distributions, designed to enable unauthorized remote code execution via OpenSSH using an Ed448 private key. The perpetrator, operating under the pseudonym Jia Tan, spent over two years building trust as a contributor before inserting the exploit, which received a maximum CVSS score of 10.0.	verified source-guide context; do not use as primary analytic support

Source	Cited work	What it contributes	Status
[151, 2026]	A Practical Guide to Prebunking Misinformation - Inoculation Science	A practitioner guide from Inoculation Science explaining prebunking as a proactive strategy to build preemptive resilience to misinformation. Grounded in inoculation theory, it describes how exposing people to weakened forms of manipulative content can help them develop resistance before they encounter it in the wild.	verified source-guide
[152, 2026]	Social media experiment reveals potential to 'inoculate' millions	A University of Cambridge news article describing a large study, conducted with Bristol University and Google's Jigsaw, testing whether short animated videos can help people resist online manipulation. The 90-second clips expose common manipulation techniques such as scapegoating, false dichotomies, and emotionally manipulative language, an approach the researchers call prebunking.	verified source-guide
[137, 2026]	[2601.12560] Agentic Artificial Intelligence (AI)	An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration.	verified source-guide
[299, 2026]	Model Context Protocol Specification	The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation).	verified source-guide context; use pinned MCP anchor for normative claims
[306, 2026]	Artificial Intelligence	Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support.	original source-guide
[312, 2026]	Guide on the Use of Agentic Artificial Intelligence	Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support.	original source-guide
[297, 2026]	Intelligence Community Directive 203: Analytic Standards	Official ODNI Intelligence Community Directive 203 analytic standards source for objectivity, independence, timeliness, alternatives, confidence, sourcing, and accuracy in analytic products.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide

Source	Cited work	What it contributes	Status
[309, 2026]	STIX Version 2.1	An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection.	verified source-guide

The remaining 10 cited source(s) appear in the bibliography appendix with the same verification metadata.

Where this sits. This module's overview is Section 46; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

46.3.4 AGEINT Design Patterns and Archetypes governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 46; [233, 2026].

46.3.5 AGEINT Design Patterns and Archetypes analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 32's governance-boundary section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Agentic AI Governance and Tool Security** for **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**. [233, 2026]; [258, 2026].

Curriculum topic spine: Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action, **Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**, **Safe defensive application: single public-source report critique with provenance and uncertainty fields**. **Verified anchor cluster:** [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]; [Community, 2020b]; [Community, 2020a]; [of the Director of National Intelligence, 2025b].

Conceptual depth: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation.

Method stack: AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills.

Composability contract: agents, tools, credentials, memory, retrieval stores, policies, and logs remain separately inspectable and revocable components.

Known failure modes: excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains.

Defensive boundary: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists. Applied to **Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

Anchor	Why it matters here
[OECD, 2026a]	Official OECD conceptual foundation for agentic AI. Checked as of 2026-05-21; role: source_quality_anchor.
[of Canada Secretariat, 2026a]	Government of Canada guide for accountable public-sector use of agentic AI, including governance, risk, transparency, testing, monitoring, and human oversight considerations. Checked as of 2026-05-24; role: curriculum_anchor.
[of Standards and Technology, 2023]	Official NIST.AI.100-1 risk-management framework. Checked as of 2026-05-21; role: source_quality_anchor.
[of Standards and Technology, 2024d]	Official NIST AI 600-1 generative AI profile. Checked as of 2026-05-21; role: source_quality_anchor.
[Community, 2020b]	Official IC principles for lawful, accountable, objective, human-centered, secure, resilient, and science-informed AI. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2025b]	Official IC AI governance directive covering CAIO roles, oversight, interoperability, civil-liberties review, training data, and impact assessment. Checked as of 2026-05-21; role: curriculum_anchor.

46.3.5.1 AGEINT Design Patterns and Archetypes evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Agentic AI Governance and Tool Security** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [233, 2026]; [258, 2026].

46.3.6 AGEINT Design Patterns and Archetypes agentic boundary: assist, approve, block, and record

Evidence anchor. Section 46; [233, 2026].

AGEINT translation is bounded by the **Agentic AI Governance and Tool Security** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

46.3.6.1 AGEINT Design Patterns and Archetypes permitted defensive utility: curriculum uses and safe outputs Evidence anchor.

Section 46; [233, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

46.3.6.2 AGEINT Design Patterns and Archetypes excluded operational boundary: blocked actions and stop rules Evidence anchor.

Section 46; [233, 2026].

Raw design-pattern motifs are transformed into accountable tabletop, audit, provenance, control-coverage, and governance exercises. The module preserves source identity in the pattern registry while rewriting methods, applications, and architecture artifacts for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes** into evidence-bounded curriculum treatments.

46.3.7 AGEINT Design Patterns and Archetypes governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 46; [233, 2026].
Governance is practiced as a gate on the **Agentic AI Governance and Tool Security** lane. Learners use the **Agentic Tool-Governance Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

46.3.7.1 AGEINT Design Patterns and Archetypes governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [233, 2026]; [258, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Agentic AI Governance and Tool Security** failure modes and the **Agentic Tool-Governance Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

46.3.7.2 AGEINT Design Patterns and Archetypes evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 46; [233, 2026].
Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Agentic Tool-Governance Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

46.3.7.3 AGEINT Design Patterns and Archetypes current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**. [233, 2026]; [258, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_oecd_agentic_ai` for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**?	The Agentic AI Landscape and Its Conceptual Foundations; lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official OECD conceptual foundation for agentic AI.
What does the module inherit from `official_canada_agentic_ai_guide` for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**?	Guide on the Use of Agentic Artificial Intelligence; lane `public_sector_agentic_ai`; checked 2026-05-24.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; bounded-autonomy run card, recoverability review, approval threshold, monitoring evidence, and public-sector service assurance
What does the module inherit from `official_nist_ai_rmf` for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**?	Artificial Intelligence Risk Management Framework (AI RMF 1.0); lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official NIST.AI.100-1 risk-management framework.
What does the module inherit from `official_nist_ai_600_1` for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**?	Artificial Intelligence Risk Management Framework: Generative AI Profile; lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official NIST AI 600-1 generative AI profile.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 46; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

46.3.8 AGEINT Design Patterns and Archetypes assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 46; [233, 2026].

46.3.9 AGEINT Design Patterns and Archetypes assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 46; [233, 2026].

46.3.9.1 AGEINT Design Patterns and Archetypes capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.
Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes** and [233, 2026]; [258, 2026].

46.3.9.2 AGEINT Design Patterns and Archetypes instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes** and [233, 2026]; [258, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

46.3.9.3 AGEINT Design Patterns and Archetypes assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Pattern 1: Focused Analytic Reasoner (source identity preserved in pattern registry) - keeps reasoning reviewable without exposing hidden reasoning or delegating action	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Safe defensive application: single public-source report critique with provenance and uncertainty fields	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

46.3.10 AGEINT Design Patterns and Archetypes refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [233, 2026]; [258, 2026] and **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**.

46.3.10.1 AGEINT Design Patterns and Archetypes refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**. The local signals begin with [233, 2026]; [258, 2026].

46.3.10.2 AGEINT Design Patterns and Archetypes claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**, and the source spine for these checks begins with [233, 2026]; [258, 2026].

46.3.11 AGEINT Design Patterns and Archetypes reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [233, 2026]; [258, 2026].
Triangulation anchors. In module 32's review-checklist section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes**. [233, 2026]; [258, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.

- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

46.3.12 AGEINT Design Patterns and Archetypes learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **Pattern 1: Focused Analytic Reasoner; Safe methods: bounded source reading, explicit assumptions, self-critique, and confidence notes** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [233, 2026]; [258, 2026].

Section 2, Section 44, Section 45, Section 47

47 AGEINT Frameworks and Infrastructure

47.0.1 AGEINT Frameworks and Infrastructure figures and course links: visual evidence, source flow, and navigation

The module uses Figure 91 and Figure 85 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 44, Section 46, Section 48.
This module teaches the **Agentic AI Governance and Tool Security** lane through a bounded, source-backed coursebook chapter. [255, 2026]; [256, 2026].

47.1 Agentic AI Governance and Tool Security frame for AGEINT Frameworks and Infrastructure: source context, topic focus, and reader task

Evidence anchor. Section 47; [255, 2026].

47.1.1 AGEINT Frameworks and Infrastructure orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 47; [255, 2026].

47.1.2 AGEINT Frameworks and Infrastructure conceptual primer: source context, core model, and reader task

This chapter teaches agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The chapter uses **Agentic Tool-Governance Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.
The central distinction is to separate agent assistance from autonomous external action. Core topics include **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language; LangGraph: Stateful, Cyclical Agentic Workflows**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [255, 2026]; [256, 2026].
Learners move from vocabulary and the **Agentic Tool-Governance Lens** distinction through topic lessons on **LangChain/LangGraph: State Machine Orchestration** with evidence and misconception checks, then assemble an **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with safety and rights gates.

47.1.3 AGEINT Frameworks and Infrastructure learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 47; [255, 2026].

- Connect **LangChain/LangGraph: State Machine Orchestration and LCEL: LangChain Expression Language** to **Agentic AI Governance and Tool Security** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build an **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate agent assistance from autonomous external action; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists.

47.1.4 AGEINT Frameworks and Infrastructure core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 47; [255, 2026].

Term	Working definition
Agent identity	the named software actor, role, and authorization context for a run
Tool allowlist	the bounded set of actions the agent may request
Delegation	the handoff of a task under explicit human authority and review
Bounded autonomy	the documented ceiling on what an agent may decide or request without review
Recoverability	the path back to a known-safe state after a bad output or action request
AI incident	a logged event where an AI system creates or plausibly creates harm or loss of control
Prompt injection	untrusted content that attempts to override instructions or authority boundaries
Pattern registry	the catalog of approved agent behaviors, prompts, and evaluation hooks
Adversarial eval	structured tests that probe agent misuse, injection, and over-delegation before release
LangChain/LangGraph: State Machine Orchestration	Key terms: LangChain, LangGraph, State.
LCEL: LangChain Expression Language	Key terms: LCEL, LangChain, Expression.

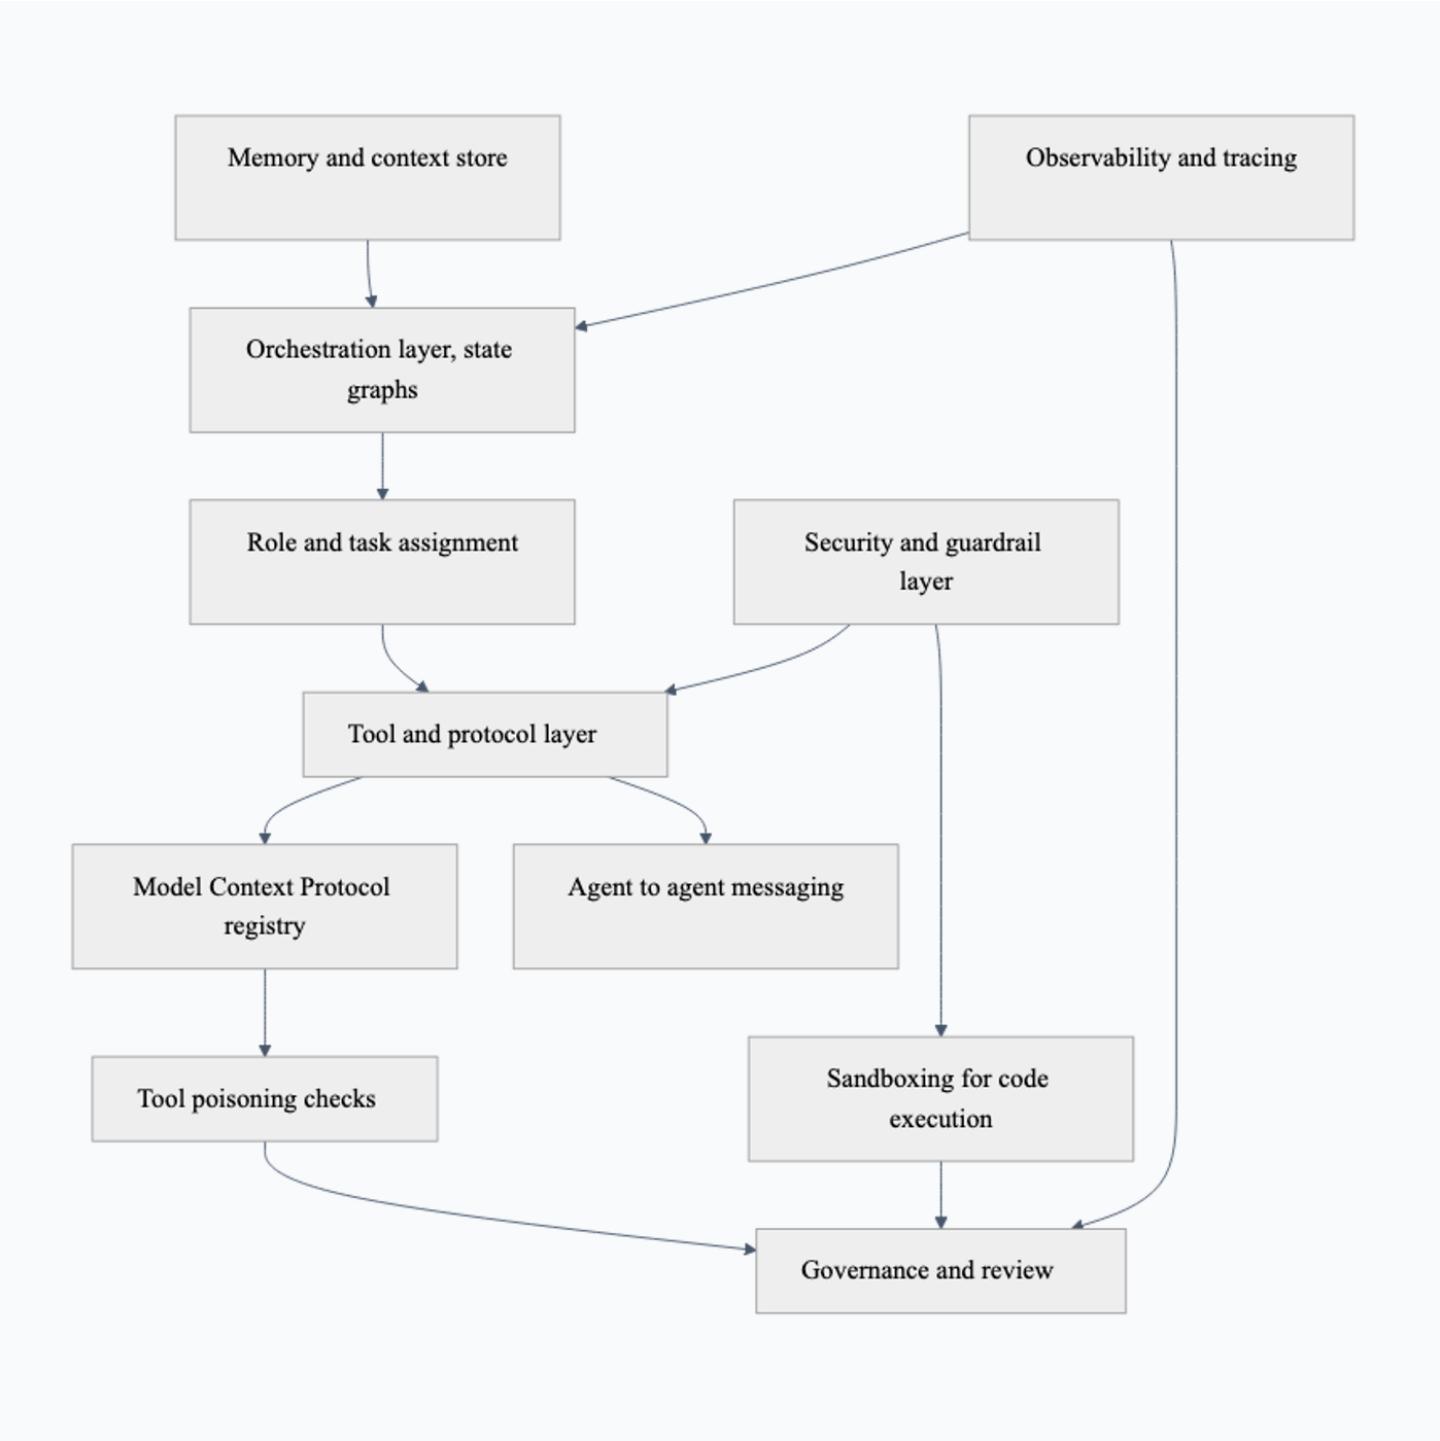

Figure 91: A layered map of agentic infrastructure showing how orchestration, tool protocols, memory, and security guardrails fit together for governed intelligence workflows. Its reader value is to make Orchestration layer, state graphs, Role and task assignment, Tool and protocol layer, and Model Context Protocol registry visible at a glance, with the ageint agentic intelligence / ageint frameworks and infrastructure section as the source section and defensive review as the boundary.

47.2 Agentic Tool-Governance Lens path for AGEINT Frameworks and Infrastructure: lesson cluster, safe artifact, and review

Evidence anchor. Section 47; [255, 2026].

47.2.1 AGEINT Frameworks and Infrastructure practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 47; [255, 2026].

47.2.2 AGEINT Frameworks and Infrastructure topic lessons: source-backed concepts and transfer tasks

This module builds agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The sequence opens with **LangChain/LangGraph: State Machine Orchestration**, **LCEL: LangChain Expression Language**, **LangGraph: Stateful, Cyclical Agentic Workflows** and applies the **Agentic Tool-Governance Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 85; module overview Section 47; curriculum atlas Section 2.

Triangulation anchors. In module 33's topic-lessons section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

47.2.2.1 Lesson 1: LangChain/LangGraph: State Machine Orchestration

Concept. LangChain/LangGraph: State Machine Orchestration documents workflow stages with inputs, transforms, reviewers, and blocked actions at each handoff.

Why it matters. LangChain/LangGraph connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. LangChain/LangGraph: State Machine Orchestration rests on [147, 2026] and [153, 2026]. The lead source's own note reads: Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Use them for pinning down the scope of **LangChain/LangGraph: State Machine Orchestration**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **LangChain/LangGraph**, reason from the sources cited in this row. [147, 2026] Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. [153, 2026] The second half of the framework highlights common agentic frameworks. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **LangChain/LangGraph**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **LangChain/LangGraph**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **LangChain/LangGraph** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **LangChain/LangGraph**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **LangChain/LangGraph** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.2 Lesson 2: LCEL: LangChain Expression Language

Concept. LCEL: LangChain Expression Language evaluates agent frameworks by logging, tool allowlists, human approval, and blocked external actions—not production deployment recipes.

Why it matters. Without explicit treatment of **LCEL: LangChain Expression Language**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. LCEL: LangChain Expression Language rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **LCEL: LangChain Expression Language** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **LCEL: LangChain Expression Language** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **LCEL**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **LCEL**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **LCEL: LangChain Expression Language** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **LCEL: LangChain Expression Language**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **LCEL: LangChain Expression Language** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.3 Lesson 3: LangGraph: Stateful, Cyclical Agentic Workflows

Concept. LangGraph: Stateful, Cyclical Agentic Workflows evaluates agent frameworks by logging, tool allowlists, human approval, and blocked external actions—not production deployment recipes.

Why it matters. Analysts use **LangGraph: Stateful, Cyclical Agentic Workflows** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. LangGraph: Stateful, Cyclical Agentic Workflows rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **LangGraph: Stateful, Cyclical Agentic Workflows** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **LangGraph: Stateful, Cyclical Agentic Workflows**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data

sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **LangGraph**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **LangGraph**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **LangGraph: Stateful, Cyclical Agentic Workflows** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **LangGraph: Stateful, Cyclical Agentic Workflows**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **LangGraph: Stateful, Cyclical Agentic Workflows** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.4 Lesson 4: LangSmith: Observability and Tracing

Concept. LangSmith: Observability and Tracing evaluates agent frameworks by logging, tool allowlists, human approval, and blocked external actions—not production deployment recipes.

Why it matters. LangSmith: Observability and Tracing matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. LangSmith: Observability and Tracing rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for pinning down the scope of **LangSmith: Observability and Tracing**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **LangSmith: Observability and Tracing**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **LangSmith**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **LangSmith**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **LangSmith: Observability and Tracing** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **LangSmith: Observability and Tracing**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **LangSmith: Observability and Tracing** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.5 Lesson 5: CrewAI: Role-Based Multi-Agent Collaboration

Concept. CrewAI: Role-Based Multi-Agent Collaboration treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. CrewAI: Role-Based Multi-Agent Collaboration connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. CrewAI: Role-Based Multi-Agent Collaboration rests on [154, 2026] and [153, 2026]. The lead source's own note reads: The homepage of CrewAI, a commercial platform for building, deploying, and managing AI agents at scale for enterprises. Use them for fixing what **CrewAI: Role-Based Multi-Agent Collaboration** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **CrewAI: Role-Based Multi-Agent Collaboration** against the works cited for this row. [154, 2026] The homepage of CrewAI, a commercial platform for building, deploying, and managing AI agents at scale for enterprises. It presents the product as covering the full lifecycle from identifying automation opportunities to launching and optimizing multi-agent workflows while maintaining enterprise-level control. [153, 2026] The second half of the framework highlights common agentic frameworks. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **CrewAI**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **CrewAI**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **CrewAI: Role-Based Multi-Agent Collaboration** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **CrewAI: Role-Based Multi-Agent Collaboration**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **CrewAI: Role-Based Multi-Agent Collaboration** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.6 Lesson 6: Crew, Agent, Task, and Process Objects

Concept. Crew, Agent, Task, and Process Objects treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Without explicit treatment of **Crew, Agent, Task, and Process Objects**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Crew, Agent, Task, and Process Objects rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the working definition that **Crew, Agent, Task, and Process Objects** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Crew, Agent, Task, and Process Objects** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector

agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Crew, Agent, Task, and Process Objects**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Crew Agent Task and Process**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Crew, Agent, Task, and Process Objects**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Crew, Agent, Task, and Process Objects** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.7 Lesson 7: Sequential, Parallel, and Hierarchical Process Modes

Concept. Sequential, Parallel, and Hierarchical Process Modes uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Analysts use **Sequential, Parallel, and Hierarchical Process Modes** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Sequential, Parallel, and Hierarchical Process Modes rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the working definition that **Sequential, Parallel, and Hierarchical Process Modes** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Sequential, Parallel, and Hierarchical Process Modes** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Sequential, Parallel, and Hierarchical Process Modes**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Sequential Parallel and Hierarchical Process**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Sequential, Parallel, and Hierarchical Process Modes**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Sequential, Parallel, and Hierarchical Process Modes** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.8 Lesson 8: Built-in Tool Ecosystem

Concept. Built-in Tool Ecosystem uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **Built-in Tool Ecosystem**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Built-in Tool Ecosystem rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the working definition that **Built-in Tool Ecosystem** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Built-in Tool Ecosystem** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Built-in Tool Ecosystem**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Built-in Tool Ecosystem**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Built-in Tool Ecosystem** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.9 Lesson 9: AutoGen (Microsoft): Multi-Agent Conversation Patterns

Concept. AutoGen (Microsoft): Multi-Agent Conversation Patterns treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. AutoGen (Microsoft) connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. AutoGen (Microsoft): Multi-Agent Conversation Patterns rests on [147, 2026] and [153, 2026]. The most specific cited work observes: Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Use them for the working definition that **AutoGen (Microsoft): Multi-Agent Conversation Patterns** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **AutoGen (Microsoft)** against the works cited for this row. [147, 2026] Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. [153, 2026] The second half of the framework highlights common agentic frameworks. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **AutoGen (Microsoft)**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **AutoGen**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape

AutoGen (Microsoft) work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **AutoGen (Microsoft)**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **AutoGen (Microsoft)** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.10 Lesson 10: AssistantAgent and UserProxyAgent Pattern

Concept. AssistantAgent and UserProxyAgent Pattern uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Analysts use **AssistantAgent and UserProxyAgent Pattern** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. AssistantAgent and UserProxyAgent Pattern rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for fixing what **AssistantAgent and UserProxyAgent Pattern** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **AssistantAgent and UserProxyAgent Pattern**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **AssistantAgent and UserProxyAgent Pattern**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **AssistantAgent and UserProxyAgent Pattern**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **AssistantAgent and UserProxyAgent Pattern** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.11 Lesson 11: GroupChat with RoundRobin and AutoSelect Managers

Concept. GroupChat with RoundRobin and AutoSelect Managers uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **GroupChat with RoundRobin and AutoSelect Managers**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. GroupChat with RoundRobin and AutoSelect Managers rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for fixing what **GroupChat with RoundRobin and AutoSelect Managers** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **GroupChat with RoundRobin and AutoSelect Managers**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **GroupChat with RoundRobin and AutoSelect Managers**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **GroupChat with RoundRobin and AutoSelect**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **GroupChat with RoundRobin and AutoSelect Managers**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **GroupChat with RoundRobin and AutoSelect Managers** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.12 Lesson 12: Agentic cyber-misuse control review using sample prompt records, fabricated logs, and deny-by-default tool policies

Concept. Agentic cyber-misuse control review using sample prompt records, fabricated logs, and deny-by-default tool policies treats the topic as a misuse-case control problem: identify the agent permission, prompt path, tool boundary, and blocked outcome.

Why it matters. Analysts use **Agentic cyber-misuse control review** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating misuse taxonomy as tool permission would otherwise hide, and the reviewer accountable for challenge.

Source support. Agentic cyber-misuse control review using sample prompt records, fabricated logs, and deny-by-default tool policies rests on [147, 2026]. The lead source's own note reads: Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Use it for pinning down the scope of **Agentic cyber-misuse control review using sample prompt records, fabricated logs, and deny-by-default tool policies**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Agentic cyber-misuse control review** against the works cited for this row. [147, 2026] Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Agentic cyber-misuse control review**, build a blocked-request control card with tool permission, unsafe outcome, deny rule, log evidence, and reviewer disposition. Shape **Agentic cyber-misuse control review** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Agentic cyber-misuse control review**: that a misuse taxonomy describing what an autonomous agent could do is permission or a recipe to make it do so.

Transfer task. Reuse the **Agentic cyber-misuse control review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

47.2.2.13 Lesson 13: Semantic Kernel: Enterprise AI Orchestration

Concept. Semantic Kernel: Enterprise AI Orchestration documents workflow stages with inputs, transforms, reviewers, and blocked actions at each handoff.

Why it matters. Semantic Kernel matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Semantic Kernel: Enterprise AI Orchestration rests on [147, 2026]. The lead source's own note reads: Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Use it for pinning down the scope of **Semantic Kernel: Enterprise AI Orchestration**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Semantic Kernel** in the evidence the row cites. [147, 2026] Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Semantic Kernel**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Semantic Kernel**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Semantic Kernel** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Semantic Kernel**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Semantic Kernel** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.14 Lesson 14: AWS Agentic Patterns: Production Architecture Guide

Concept. AWS Agentic Patterns: Production Architecture Guide uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. AWS Agentic Patterns: Production Architecture Guide connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. AWS Agentic Patterns: Production Architecture Guide rests on [144, 2026]. The lead source's own note reads: An AWS Prescriptive Guidance document (July 2025) introducing agentic AI patterns and workflows. Use it for the working definition that **AWS Agentic Patterns: Production Architecture Guide** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **AWS Agentic Patterns: Production Architecture Guide** in the evidence the row cites. [144, 2026] An AWS Prescriptive Guidance document (July 2025) introducing agentic AI patterns and workflows. It presents reusable design templates for building AI agent systems that operate with autonomy while remaining controllable and aligned with goals, aimed at architects, developers, and product leaders. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **AWS Agentic Patterns**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **AWS Agentic Patterns**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **AWS Agentic Patterns: Production Architecture Guide** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **AWS Agentic Patterns: Production Architecture Guide**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **AWS Agentic Patterns: Production Architecture Guide** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.15 Lesson 15: Basic Reasoning Agents

Concept. Basic Reasoning Agents connects cognitive science claims to analytic bias literacy: what the brain prioritizes, what it misses, and how review compensates.

Why it matters. Basic Reasoning Agents matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Basic Reasoning Agents rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the working definition that **Basic Reasoning Agents** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Basic Reasoning Agents** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Basic Reasoning Agents**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Basic Reasoning Agents**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Basic Reasoning Agents** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.16 Lesson 16: Tool-Based Agents (Function Calling and MCP Servers)

Concept. Tool-Based Agents (Function Calling and MCP Servers) evaluates tool protocols by allowlists, logging, provenance of retrieved content, and deny-by-default policies.

Why it matters. Tool-Based Agents (Function Calling and MCP Servers) connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Tool-Based Agents (Function Calling and MCP Servers) rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the working definition that **Tool-Based Agents (Function Calling and MCP Servers)** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Tool-Based Agents (Function Calling and MCP Servers)**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Tool-Based Agents (Function Calling and MCP Servers)**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Tool-Based Agents**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Tool-Based Agents (Function Calling and MCP Servers)**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Tool-Based Agents (Function Calling and MCP Servers)** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.17 Lesson 17: Computer-Use Agents

Concept. Computer-Use Agents uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Computer-Use Agents matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. Computer-Use Agents rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **Computer-Use Agents** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Computer-Use Agents**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Computer-Use Agents**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Computer-Use Agents**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Computer-Use Agents** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.18 Lesson 18: Coding Agents

Concept. Coding Agents uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Analysts use **Coding Agents** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Coding Agents rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for the working definition that **Coding Agents** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Coding Agents** in the evidence the row cites. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Coding Agents**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Coding Agents**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Coding Agents** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.19 Lesson 19: Speech-to-Speech Agents

Concept. Speech-to-Speech Agents uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. Without explicit treatment of **Speech-to-Speech Agents**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Speech-to-Speech Agents rests on [299, 2026], [306, 2026], and [312, 2026]. The closest source to this row notes: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots,

elicitation). Use them for pinning down the scope of **Speech-to-Speech Agents**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Speech-to-Speech Agents**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Speech-to-Speech Agents**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Speech-to-Speech Agents**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Speech-to-Speech Agents** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.20 Lesson 20: Orchestration Patterns: Supervisor, Parallel, Subgraph Concept. Orchestration Patterns: Supervisor, Parallel, Subgraph documents workflow stages with inputs, transforms, reviewers, and blocked actions at each handoff.

Why it matters. Without explicit treatment of **Orchestration Patterns**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Orchestration Patterns: Supervisor, Parallel, Subgraph rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **Orchestration Patterns: Supervisor, Parallel, Subgraph** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Orchestration Patterns**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Orchestration Patterns**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Orchestration Patterns**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Orchestration Patterns** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Orchestration Patterns**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Orchestration Patterns** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.21 Lesson 21: Model Context Protocol (MCP): The USB Standard for Agentic AI Concept. Model Context Protocol (MCP): The USB Standard for Agentic AI evaluates tool protocols by allowlists, logging, provenance of retrieved content, and deny-by-default policies.

Why it matters. Analysts use **Model Context Protocol (MCP)** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. Model Context Protocol (MCP): The USB Standard for Agentic AI rests on [155, 2026], [156, 2026], and [157, 2026]. The closest source to this row notes: The article explains how MCP acts as middleware between models and downstream services and surveys associated security risks, including overly broad permissions, unvetted servers, exposed endpoints, and limited monitoring. Use them for the working definition that **Model Context Protocol (MCP): The USB Standard for Agentic AI** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Model Context Protocol (MCP)** in the evidence the row cites. [155, 2026] Radosevich and Halloran (2025) audit security vulnerabilities in Anthropic's Model Context Protocol (MCP), which allows LLMs to integrate with external tools and data sources. The authors demonstrate that language models using MCP can be manipulated through prompt injection to execute malicious code, enable remote access, and steal credentials. [156, 2026] A Protect AI blog post (April 2025) introducing the Model Context Protocol (MCP), the open-source layer Anthropic introduced in November 2024 to standardize how large language model applications connect to data sources and tools. The article explains how MCP acts as middleware between models and downstream services and surveys associated security risks, including overly broad permissions, unvetted servers, exposed endpoints, and limited monitoring. [157, 2026] This is a Bandwidth blog post explaining how the Model Context Protocol (MCP) supports agentic AI systems that can assess context and take actions rather than only respond to prompts. Using a contact-center voice agent example, it describes MCP as a standard for letting AI models interact securely with external tools, APIs, and data sources, and covers instructions versus multi-step workflows. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Model Context Protocol (MCP)**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Model Context Protocol**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Model Context Protocol (MCP)** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Model Context Protocol (MCP)**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Model Context Protocol (MCP)** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.22 Lesson 22: MCP Architecture: Client, Server, Host Concept. MCP Architecture: Client, Server, Host evaluates tool protocols by allowlists, logging, provenance of retrieved content, and deny-by-default policies.

Why it matters. MCP Architecture: Client, Server, Host matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. MCP Architecture: Client, Server, Host rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the claim that **MCP Architecture: Client, Server, Host** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **MCP Architecture: Client, Server, Host**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **MCP Architecture**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **MCP Architecture**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **MCP Architecture: Client, Server, Host** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **MCP Architecture: Client, Server, Host**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **MCP Architecture: Client, Server, Host** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.23 Lesson 23: NSA Security Design Considerations for MCP

Concept. NSA Security Design Considerations for MCP studies the declassified record for institutional lessons about oversight, source protection, and limits on translating history into practice.

Why it matters. Analysts use **NSA Security Design Considerations** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating pattern names as deployment playbooks would otherwise hide, and the reviewer accountable for challenge.

Source support. NSA Security Design Considerations for MCP rests on [155, 2026]. The closest source to this row notes: Radosevich and Halloran (2025) audit security vulnerabilities in Anthropic's Model Context Protocol (MCP), which allows LLMs to integrate with external tools and data sources. Use it for pinning down the scope of **NSA Security Design Considerations for MCP**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **NSA Security Design Considerations**, work from the cited evidence behind this row. [155, 2026] Radosevich and Halloran (2025) audit security vulnerabilities in Anthropic's Model Context Protocol (MCP), which allows LLMs to integrate with external tools and data sources. The authors demonstrate that language models using MCP can be manipulated through prompt injection to execute malicious code, enable remote access, and steal credentials. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **NSA Security Design Considerations**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **NSA Security Design Considerations for**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **NSA Security Design Considerations** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **NSA Security Design Considerations**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **NSA Security Design Considerations** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.24 Lesson 24: MCP Security Risks: Tool Poisoning, Prompt Injection via Server

Concept. MCP Security Risks: Tool Poisoning, Prompt Injection via Server evaluates tool protocols by allowlists, logging, provenance of retrieved content, and deny-by-default policies.

Why it matters. MCP Security Risks matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating pattern names as deployment playbooks is a common failure.

Source support. MCP Security Risks: Tool Poisoning, Prompt Injection via Server rests on [159, 2026]. Its anchor reference records: It identifies concerns including weak default authentication, supply-chain exposure from compromised tools, over-permissioned access tokens, injection and context-poisoning attacks, and gaps in audit logging for agentic workflows. Use it for fixing what **MCP Security Risks: Tool Poisoning, Prompt Injection via Server** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **MCP Security Risks**, reason from the sources cited in this row. [159, 2026] A September 2025 Bitdefender Business Insights article by Martin Zugec examining security risks in the Model Context Protocol, the standard introduced by Anthropic for connecting AI agents to external tools and data. It identifies concerns including weak default authentication, supply-chain exposure from compromised tools, over-permissioned access tokens, injection and context-poisoning attacks, and gaps in audit logging for agentic workflows. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **MCP Security Risks**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **MCP Security Risks**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **MCP Security Risks** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **MCP Security Risks**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **MCP Security Risks** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.25 Lesson 25: MCP in Intelligence Workflows: Structured Tool Registration

Concept. MCP in Intelligence Workflows: Structured Tool Registration evaluates tool protocols by allowlists, logging, provenance of retrieved content, and deny-by-default policies.

Why it matters. MCP in Intelligence Workflows connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. MCP in Intelligence Workflows: Structured Tool Registration rests on [299, 2026], [306, 2026], and [312, 2026]. The most specific cited work observes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM

applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the claim that **MCP in Intelligence Workflows: Structured Tool Registration** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **MCP in Intelligence Workflows** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **MCP in Intelligence Workflows**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **MCP in Intelligence Workflows**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **MCP in Intelligence Workflows** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **MCP in Intelligence Workflows**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **MCP in Intelligence Workflows** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.26 Lesson 26: Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks

Concept. Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Without explicit treatment of **Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks rests on [137, 2026]. The closest source to this row notes: An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. Use it for the working definition that **Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks** in the evidence the row cites. [137, 2026] An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Agent-to-Agent (A2A) Protocols**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Agent-to-Agent Protocols**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.27 Lesson 27: n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines

Concept. n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines uses the pattern name as safe architectural vocabulary: allowlisted tools, logging, human approval, and blocked external action.

Why it matters. n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines rests on [153, 2026]. Its anchor reference records: The second half of the framework highlights common agentic frameworks. Use it for the working definition that **n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines** in the evidence the row cites. [153, 2026] The second half of the framework highlights common agentic frameworks. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **n8n and Make.com**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **n8n and Make com**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape **n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.2.28 Lesson 28: Top 8 Agentic AI Frameworks Comparison (2026)

Concept. Top 8 Agentic AI Frameworks Comparison (2026) evaluates agentic-AI governance claims against OECD principles: transparency, accountability, and human oversight.

Why it matters. Without explicit treatment of **Top 8 Agentic AI Frameworks Comparison (2026)**, treating pattern names as deployment playbooks undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Top 8 Agentic AI Frameworks Comparison (2026) rests on [146, 2026]. The closest source to this row notes: An Exabeam explainer describing agentic AI frameworks as software toolkits that provide pre-built components and architectures for building autonomous AI agents. Use it for fixing what **Top 8 Agentic AI Frameworks Comparison (2026)** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Top 8 Agentic AI Frameworks Comparison (2026)**, work from the cited evidence behind this row. [146, 2026] An Exabeam explainer describing agentic AI frameworks as software toolkits that provide pre-built components and architectures for building autonomous AI agents. It outlines core elements such as agent coordination, tool integration, memory management, workflow definition, and deployment monitoring, and reviews eight frameworks including LangGraph, AutoGen, CrewAI, LlamaIndex, Haystack, DSPy, and Semantic Kernel. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Top 8 Agentic AI Frameworks Comparison (2026)**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the pattern descriptor, the bounded claim about **Top 8 Agentic AI Frameworks**, the safe-substitution caveat, the uncertainty note, the no-deployment boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Top 8 Agentic AI Frameworks Comparison (2026)**: that naming an agent pattern certifies it is safe to deploy without governance gates.

Transfer task. Transfer **Top 8 Agentic AI Frameworks Comparison (2026)** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

47.2.3 AGEINT Frameworks and Infrastructure worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic research assistant agent organizes public readings for an instructor. [255, 2026]; [256, 2026].

Triangulation anchors. In module 33's worked-example section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **governed agentic intelligence**. Learners use a **agent run and assurance card** and keep this boundary visible: No autonomous external action, credentialed operations, live-target workflows, or uncontrolled tool use.

Frame. The classroom question centers on **LangChain/LangGraph: State Machine Orchestration**. Excluded actions stay explicit, and the **Agentic Tool-Governance Lens** planning question is: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?

Inputs. For the **LangChain/LangGraph: State Machine Orchestration** scenario, use public URLs, a fixed retrieval tool, a summarization prompt, a time budget, and a stop condition. The Agentic Tool-Governance Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **LangChain/LangGraph: State Machine Orchestration**, students bind the agent identity, list allowed tools, set autonomy limits, capture sources, block unsafe requests, and log approvals. Pause whenever an inference about LangChain/LangGraph: State Machine Orchestration appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **LangChain/LangGraph: State Machine Orchestration** classroom scenario; unit artifact = agent run and assurance card; evidence = allowed inputs; method = least-privilege agent design and run review; output = an agent run card with tool calls, source links, blocked actions, reviewer notes, incident threshold, and recovery decision; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **LangChain/LangGraph: State Machine Orchestration** as "Agentic Tool-Governance Lens confirms it" is not enough. The revision ties the claim to least-privilege agent design and run review, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **LangChain/LangGraph: State Machine Orchestration** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

47.2.4 Agentic Tool-Governance Lens path for AGEINT Frameworks and Infrastructure: lesson cluster, safe artifact, and review (continued 2)

Evidence anchor. Section 47; [OECD, 2026a].

47.2.5 AGEINT Frameworks and Infrastructure practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Agentic Tool-Governance Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**. **Triangulation anchors.** In module 33's practice-sequence section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare LangChain/LangGraph: State Machine Orchestration, LCEL: LangChain Expression Language, LangGraph: Stateful, Cyclical Agentic Workflows; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Agentic AI Governance and Tool Security** lane.
2. Frame	Answer the lens question: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for LangChain/LangGraph: State Machine Orchestration: agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the agent run and assurance card fields for LangChain/LangGraph: State Machine Orchestration.	Unit profile note.	Evidence artifacts include tool-allowlist record, external-memory governance boundary.
4. Challenge	Test the misconception that naming an agent pattern certifies it is safe to deploy without governance gates.	Failure-mode note.	The artifact applies the key distinction: separate agent assistance from autonomous external action.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

47.2.5.1 AGEINT Frameworks and Infrastructure instructor notes: source reasoning, review points, and studio focus Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**. [255, 2026]; [256, 2026].

47.2.5.2 AGEINT Frameworks and Infrastructure extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 47; [255, 2026].

Have learners swap artifacts and apply the **Agentic Tool-Governance Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

47.2.6 AGEINT Frameworks and Infrastructure knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 47; [255, 2026].

1. Explain how **LangChain/LangGraph: State Machine Orchestration** is defined here; name the source descriptor that supports the definition.
2. Contrast **LangChain/LangGraph: State Machine Orchestration** with **LCEL: LangChain Expression Language** using the **Agentic Tool-Governance Lens** artifact fields.
3. Identify one failure mode from the **Agentic AI Governance and Tool Security** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which permission can be removed while preserving the learning objective?
5. Correct this misconception: that naming an agent pattern certifies it is safe to deploy without governance gates.

47.2.6.1 AGEINT Frameworks and Infrastructure answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **LangChain/LangGraph: State Machine Orchestration** without source evidence, uncertainty, or a safe transfer task.

47.3 AGEINT Frameworks and Infrastructure assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 47; [255, 2026].

47.3.1 AGEINT Frameworks and Infrastructure evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 47; [255, 2026].

47.3.2 AGEINT Frameworks and Infrastructure transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 47; [255, 2026].

47.3.2.1 AGEINT Frameworks and Infrastructure lineage and source tradition: profile, concepts, and first anchors This sits in the **Agentic AI Governance and Tool Security** lineage: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. [255, 2026]; [256, 2026].

47.3.2.2 AGEINT Frameworks and Infrastructure working model: inputs, constraints, transforms, outputs, and oversight Evidence anchor. Section 47; [255, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**, with provenance and reviewability throughout.

47.3.2.3 AGEINT Frameworks and Infrastructure knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [255, 2026]; [256, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

47.3.2.4 AGEINT Frameworks and Infrastructure transfer contracts: authority, evidence, tools, and auditable output Evidence anchor. Section 47; [255, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.
- **Evidence contract:** keep the **Agentic AI Governance and Tool Security** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

47.3.2.5 AGEINT Frameworks and Infrastructure profile emphasis and local focus: method stack and topic cluster Evidence anchor. Section 47; [255, 2026].

The matched profile emphasizes delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. The method stack is AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills; the local topic cluster is **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

47.3.3 AGEINT Frameworks and Infrastructure evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 47; [255, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Agentic AI Governance and Tool Security** profile tells reviewers what evidence is strong enough for the module artifact built around **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

47.3.3.1 AGEINT Frameworks and Infrastructure guide source spine: inherited keys and local citation roles Primary guide citations: [255, 2026]; [256, 2026]; [258, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [147, 2026]; [153, 2026]; [154, 2026]; [144, 2026]; [155, 2026]; [156, 2026]; [157, 2026]; [158, 2026]; [159, 2026]; [137, 2026]; [146, 2026]; [299, 2026]; [306, 2026]; [312, 2026].

47.3.3.2 AGEINT Frameworks and Infrastructure verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [255, 2026]; [256, 2026].

Tier	What counts	How it is used
Source guide	[255, 2026]; [256, 2026]; [258, 2026]; [273, 2026]; [274, 2026]; [275, 2026]; [286, 2026]; [287, 2026]; [292, 2026]; [147, 2026]; [153, 2026]; [154, 2026]; [144, 2026]; [155, 2026]; [156, 2026]; [157, 2026]; [158, 2026]; [159, 2026]; [137, 2026]; [146, 2026]; [299, 2026]; [306, 2026]; [312, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 33's source-canon section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language** and [255, 2026]; [256, 2026], but only directly verified source URLs are encoded as citations.

47.3.3.3 AGEINT Frameworks and Infrastructure intelligence practice lens: evidence artifact and safety check Practice lens: **Agentic Tool-Governance Lens** for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**. [255, 2026]; [256, 2026].

Planning question: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?

Evidence artifact: agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path.

Validation rule: verify least privilege, prompt-injection exposure, provenance, observability, stop conditions, and incident-reporting triggers. Applied to **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

Handoff contract: export agent traces, tool calls, retrieved sources, policy decisions, and human approvals separately.

Safety check: block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions.

47.3.3.4 AGEINT Frameworks and Infrastructure runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 47; [255, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	33.99	33.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind AGEINT Frameworks and Infrastructure to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
AGEINT pattern registry, agent identity, and interface-contract studio	33.100	33.100 source title transformed into safe curriculum treatment; original: V2 AGEINT-depth extension: map frameworks to interoperable tool descriptions, Web of Things affordances, OpenAPI contracts, credential semantics, revocation, and error-handling evidence	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Bounded autonomy, procurement, incident-response, and assurance studio	33.101	33.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for AGEINT Frameworks and Infrastructure	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Orchestration Patterns: Supervisor, Parallel, Subgraph	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Model Context Protocol (MCP): The USB Standard for Agentic AI	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
MCP Architecture: Client, Server, Host	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
NSA Security Design Considerations for MCP	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
MCP Security Risks: Tool Poisoning, Prompt Injection via Server	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
MCP in Intelligence Workflows: Structured Tool Registration	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Agent-to-Agent (A2A) Protocols: Interoperability Between Frameworks	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
n8n and Make.com: No-Code/Low-Code Agentic Intelligence Pipelines	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Top 8 Agentic AI Frameworks Comparison (2026)	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

47.3.3.6 AGEINT Frameworks and Infrastructure annotated source ledger: real titles and local contribution Each source cited by this **Agentic AI Governance and Tool Security** module is paired below with its real title and a one-line note on what it contributes to **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

Source	Cited work	What it contributes	Status
[255, 2026]	Web of Things (WoT) Architecture 1.1	The W3C Recommendation for Web of Things Architecture 1.1, published in December 2023, defining an abstract architecture for interoperability across diverse Internet of Things platforms. It introduces core concepts including Things described by machine-readable Thing Descriptions, reusable Thing Models, and Consumers that interpret descriptions to interact via Properties, Actions, and Events.	verified source-guide
[256, 2026]	Web of Things (WoT) Thing Description 1.1	The W3C WoT Thing Description 1.1 is a formal information model and standardized representation format enabling IoT devices to describe their metadata and interaction capabilities in a machine-readable way, facilitating interoperability across diverse ecosystems.	verified source-guide
[258, 2026]	OpenAPI Specification	The official OpenAPI Initiative publications page, serving as a central index for the OpenAPI Specification and related standards including the Arazzo and Overlay specifications. It provides access to multiple specification versions (2.0, 3.0, 3.1, and 3.2) and their corresponding downloadable schemas identified by release date, along with a registry of extensions, formats, media types, and other resources.	verified source-guide
[273, 2026]	WCAG 2 Overview	The W3C Web Accessibility Initiative overview of the Web Content Accessibility Guidelines (WCAG), an international standard for making web content accessible to people with disabilities. It explains that WCAG is organized around four principles (perceivable, operable, understandable, robust) with testable success criteria at three conformance levels (A, AA, AAA), and covers versions 2.0, 2.1, and 2.2.	verified source-guide
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide
[275, 2026]	Fact Sheet: New Rule on the Accessibility of Web Content and Mobile Apps Provided by State and Local Governments	A US Department of Justice fact sheet explaining the 2024 ADA Title II rule requiring state and local governments to make their web content and mobile apps accessible. It establishes WCAG 2.1 Level AA as the technical standard, applies to entities such as schools, courts, libraries, and transit agencies, and sets compliance deadlines of April 2027 for larger jurisdictions and April 2028 for smaller ones.	verified source-guide

Source	Cited work	What it contributes	Status
[286, 2026]	Model Cards for Model Reporting	The arXiv abstract for "Model Cards for Model Reporting" (2018) by Mitchell, Wu, Zaldivar, and colleagues, which introduces a framework for transparent documentation of machine learning models. Model cards are short accompanying documents that report a model's benchmarked performance across varied conditions, including different cultural, demographic, and phenotypic groups, along with intended use, evaluation methodology, and deployment considerations.	verified source-guide
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide
[147, 2026]	Agent Framework Security	Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic.	original practitioner context; secondary evidence only
[153, 2026]	Agentic AI is exploding, but which framework should you bet on?	The second half of the framework highlights common agentic frameworks.	original practitioner context; secondary evidence only
[154, 2026]	CrewAI	The homepage of CrewAI, a commercial platform for building, deploying, and managing AI agents at scale for enterprises. It presents the product as covering the full lifecycle from identifying automation opportunities to launching and optimizing multi-agent workflows while maintaining enterprise-level control.	verified source-guide
[144, 2026]	Agentic AI patterns and workflows on AWS	An AWS Prescriptive Guidance document (July 2025) introducing agentic AI patterns and workflows. It presents reusable design templates for building AI agent systems that operate with autonomy while remaining controllable and aligned with goals, aimed at architects, developers, and product leaders.	verified practitioner context; secondary evidence only

Source	Cited work	What it contributes	Status
[155, 2026]	Model Context Protocol (MCP): Security Design Considerations	Radosevich and Halloran (2025) audit security vulnerabilities in Anthropic's Model Context Protocol (MCP), which allows LLMs to integrate with external tools and data sources. The authors demonstrate that language models using MCP can be manipulated through prompt injection to execute malicious code, enable remote access, and steal credentials.	verified source-guide
[156, 2026]	MCP Security 101: A New Protocol for Agentic AI - Protect AI	A Protect AI blog post (April 2025) introducing the Model Context Protocol (MCP), the open-source layer Anthropic introduced in November 2024 to standardize how large language model applications connect to data sources and tools. The article explains how MCP acts as middleware between models and downstream services and surveys associated security risks, including overly broad permissions, unvetted servers, exposed endpoints, and limited monitoring.	verified practitioner context; secondary evidence only
[157, 2026]	Building Agentic AI with MCP - Bandwidth	This is a Bandwidth blog post explaining how the Model Context Protocol (MCP) supports agentic AI systems that can assess context and take actions rather than only respond to prompts. Using a contact-center voice agent example, it describes MCP as a standard for letting AI models interact securely with external tools, APIs, and data sources, and covers instructions versus multi-step workflows.	verified practitioner context; secondary evidence only
[158, 2026]	AI Spotlight: MCP (Model Context Protocol) and Agentic AI systems	A Gravitee blog post explaining the Model Context Protocol (MCP), an open standard developed by Anthropic for how applications provide context and tools to large language models. It compares MCP to a universal connector that replaces custom per-tool integrations, describing an architecture of hosts, clients, and servers and benefits such as reusability, provider flexibility, and improved access controls. The post situates MCP within the broader growth of agentic AI systems.	verified practitioner context; secondary evidence only
[159, 2026]	Security Risks of Agentic AI: A Model Context Protocol (MCP	A September 2025 Bitdefender Business Insights article by Martin Zugec examining security risks in the Model Context Protocol, the standard introduced by Anthropic for connecting AI agents to external tools and data. It identifies concerns including weak default authentication, supply-chain exposure from compromised tools, over-permissioned access tokens, injection and context-poisoning attacks, and gaps in audit logging for agentic workflows.	verified practitioner context; secondary evidence only

Source	Cited work	What it contributes	Status
[137, 2026]	[2601.12560] Agentic Artificial Intelligence (AI)	An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration.	verified source-guide
[146, 2026]	Agentic AI Frameworks: Key Components & Top 8 Options in 2026	An Exabeam explainer describing agentic AI frameworks as software toolkits that provide pre-built components and architectures for building autonomous AI agents. It outlines core elements such as agent coordination, tool integration, memory management, workflow definition, and deployment monitoring, and reviews eight frameworks including LangGraph, AutoGen, CrewAI, LlamaIndex, Haystack, DSPy, and Semantic Kernel.	verified source-guide
[299, 2026]	Model Context Protocol Specification	The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation).	verified source-guide context; use pinned MCP anchor for normative claims
[306, 2026]	Artificial Intelligence	Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support.	original source-guide
[312, 2026]	Guide on the Use of Agentic Artificial Intelligence	Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support.	original source-guide

Where this sits. This module's overview is Section 47; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

47.3.4 AGEINT Frameworks and Infrastructure governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 47; [255, 2026].

47.3.5 AGEINT Frameworks and Infrastructure analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 33's governance-boundary section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Agentic AI Governance and Tool Security** for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**. [255, 2026]; [256, 2026].

Curriculum topic spine: LangChain/LangGraph: State Machine Orchestration, **LCEL: LangChain Expression Language**, **LangGraph: Stateful, Cyclical Agentic Workflows**. **Verified anchor cluster:** [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]; [Community, 2020b]; [Community, 2020a]; [of the Director of National Intelligence, 2025b].

Conceptual depth: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation.

Method stack: AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills.

Composability contract: agents, tools, credentials, memory, retrieval stores, policies, and logs remain separately inspectable and revocable components.

Known failure modes: excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains.

Defensive boundary: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists. Applied to **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

Anchor	Why it matters here
[OECD, 2026a]	Official OECD conceptual foundation for agentic AI. Checked as of 2026-05-21; role: source_quality_anchor.
[of Canada Secretariat, 2026a]	Government of Canada guide for accountable public-sector use of agentic AI, including governance, risk, transparency, testing, monitoring, and human oversight considerations. Checked as of 2026-05-24; role: curriculum_anchor.
[of Standards and Technology, 2023]	Official NIST.AI.100-1 risk-management framework. Checked as of 2026-05-21; role: source_quality_anchor.
[of Standards and Technology, 2024d]	Official NIST AI 600-1 generative AI profile. Checked as of 2026-05-21; role: source_quality_anchor.
[Community, 2020b]	Official IC principles for lawful, accountable, objective, human-centered, secure, resilient, and science-informed AI. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2025b]	Official IC AI governance directive covering CAIO roles, oversight, interoperability, civil-liberties review, training data, and impact assessment. Checked as of 2026-05-21; role: curriculum_anchor.

47.3.5.1 AGEINT Frameworks and Infrastructure evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Agentic AI Governance and Tool Security** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [255, 2026]; [256, 2026].

47.3.6 AGEINT Frameworks and Infrastructure agentic boundary: assist, approve, block, and record

Evidence anchor. Section 47; [255, 2026].

AGEINT translation is bounded by the **Agentic AI Governance and Tool Security** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

47.3.6.1 AGEINT Frameworks and Infrastructure permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 47; [255, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

47.3.6.2 AGEINT Frameworks and Infrastructure excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [255, 2026]; [256, 2026] and **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

47.3.7 AGEINT Frameworks and Infrastructure governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 47; [255, 2026].

Governance is practiced as a gate on the **Agentic AI Governance and Tool Security** lane. Learners use the **Agentic Tool-Governance Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

47.3.7.1 AGEINT Frameworks and Infrastructure governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [255, 2026]; [256, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Agentic AI Governance and Tool Security** failure modes and the **Agentic Tool-Governance Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

47.3.7.2 AGEINT Frameworks and Infrastructure evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 47; [255, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Agentic Tool-Governance Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

47.3.7.3 AGEINT Frameworks and Infrastructure current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**. [255, 2026]; [256, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_oecd_agentic_ai` for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**?	The Agentic AI Landscape and Its Conceptual Foundations; lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official OECD conceptual foundation for agentic AI.
What does the module inherit from `official_canada_agentic_ai_guide` for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**?	Guide on the Use of Agentic Artificial Intelligence; lane `public_sector_agentic_ai`; checked 2026-05-24.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; bounded-autonomy run card, recoverability review, approval threshold, monitoring evidence, and public-sector service assurance
What does the module inherit from `official_nist_ai_rmf` for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**?	Artificial Intelligence Risk Management Framework (AI RMF 1.0); lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official NIST.AI.100-1 risk-management framework.
What does the module inherit from `official_nist_ai_600_1` for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**?	Artificial Intelligence Risk Management Framework: Generative AI Profile; lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official NIST AI 600-1 generative AI profile.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 47; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

47.3.8 AGEINT Frameworks and Infrastructure assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 47; [255, 2026].

47.3.9 AGEINT Frameworks and Infrastructure assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 47; [255, 2026].

47.3.9.1 AGEINT Frameworks and Infrastructure capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.
Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language** and [255, 2026]; [256, 2026].

47.3.9.2 AGEINT Frameworks and Infrastructure instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language** and [255, 2026]; [256, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

47.3.9.3 AGEINT Frameworks and Infrastructure assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
LangChain/LangGraph: State Machine Orchestration	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
LCEL: LangChain Expression Language	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
LangGraph: Stateful, Cyclical Agentic Workflows	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

47.3.10 AGEINT Frameworks and Infrastructure refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [255, 2026]; [256, 2026] and **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**.

47.3.10.1 AGEINT Frameworks and Infrastructure refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**. The local signals begin with [255, 2026]; [256, 2026].

47.3.10.2 AGEINT Frameworks and Infrastructure claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**, and the source spine for these checks begins with [255, 2026]; [256, 2026].

47.3.11 AGEINT Frameworks and Infrastructure reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [255, 2026]; [256, 2026].
Triangulation anchors. In module 33's review-checklist section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language**. [255, 2026]; [256, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

47.3.12 AGEINT Frameworks and Infrastructure learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **LangChain/LangGraph: State Machine Orchestration; LCEL: LangChain Expression Language** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [255, 2026]; [256, 2026].

Section 2, Section 44, Section 46, Section 48

48 AGEINT Security and Adversarial Considerations

48.0.1 AGEINT Security and Adversarial Considerations figures and course links: visual evidence, source flow, and navigation

The module uses Figure 92, Figure 93, Figure 94, Figure 95, Figure 96, Figure 97, Figure 98, Figure 99, Figure 100, Figure 101, Figure 102, Figure 103, and Figure 85 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.

Navigation links: Section 2, Section 44, Section 47, Section 49.

This module teaches the **Agentic AI Governance and Tool Security** lane through a bounded, source-backed coursebook chapter. [234, 2026]; [235, 2026].

48.1 Agentic AI Governance and Tool Security frame for AGEINT Security and Adversarial Considerations: source context, topic focus, and reader task

Evidence anchor. Section 48; [234, 2026].

48.1.1 AGEINT Security and Adversarial Considerations orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 48; [234, 2026].

48.1.2 AGEINT Security and Adversarial Considerations conceptual primer: source context, core model, and reader task

This chapter teaches agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The chapter uses **Defensive Cyber-Intelligence Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

The central distinction is to separate agent assistance from autonomous external action. Core topics include **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate; Cyber credential-and-movement taxonomy review using fabricated alerts**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.

Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [234, 2026]; [235, 2026].

Learners move from vocabulary and the **Defensive Cyber-Intelligence Lens** distinction through topic lessons on **Agent Framework Security Vulnerabilities** with evidence and misconception checks, then assemble a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with safety and rights gates.

48.1.3 AGEINT Security and Adversarial Considerations learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 48; [234, 2026].

- Connect **Agent Framework Security Vulnerabilities and Python REPL sandbox and approval-gate** to **Agentic AI Governance and Tool Security** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate agent assistance from autonomous external action; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists.

48.1.4 AGEINT Security and Adversarial Considerations core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 48; [234, 2026].

Term	Working definition
Agent identity	the named software actor, role, and authorization context for a run
Tool allowlist	the bounded set of actions the agent may request
Delegation	the handoff of a task under explicit human authority and review
Bounded autonomy	the documented ceiling on what an agent may decide or request without review
Recoverability	the path back to a known-safe state after a bad output or action request
AI incident	a logged event where an AI system creates or plausibly creates harm or loss of control
Prompt injection	untrusted content that attempts to override instructions or authority boundaries
Pattern registry	the catalog of approved agent behaviors, prompts, and evaluation hooks
Adversarial eval	structured tests that probe agent misuse, injection, and over-delegation before release
Agent Framework Security Vulnerabilities	Key terms: Agent, Framework, Security.
Python REPL sandbox and approval-gate	Key terms: Python, REPL, sandbox.

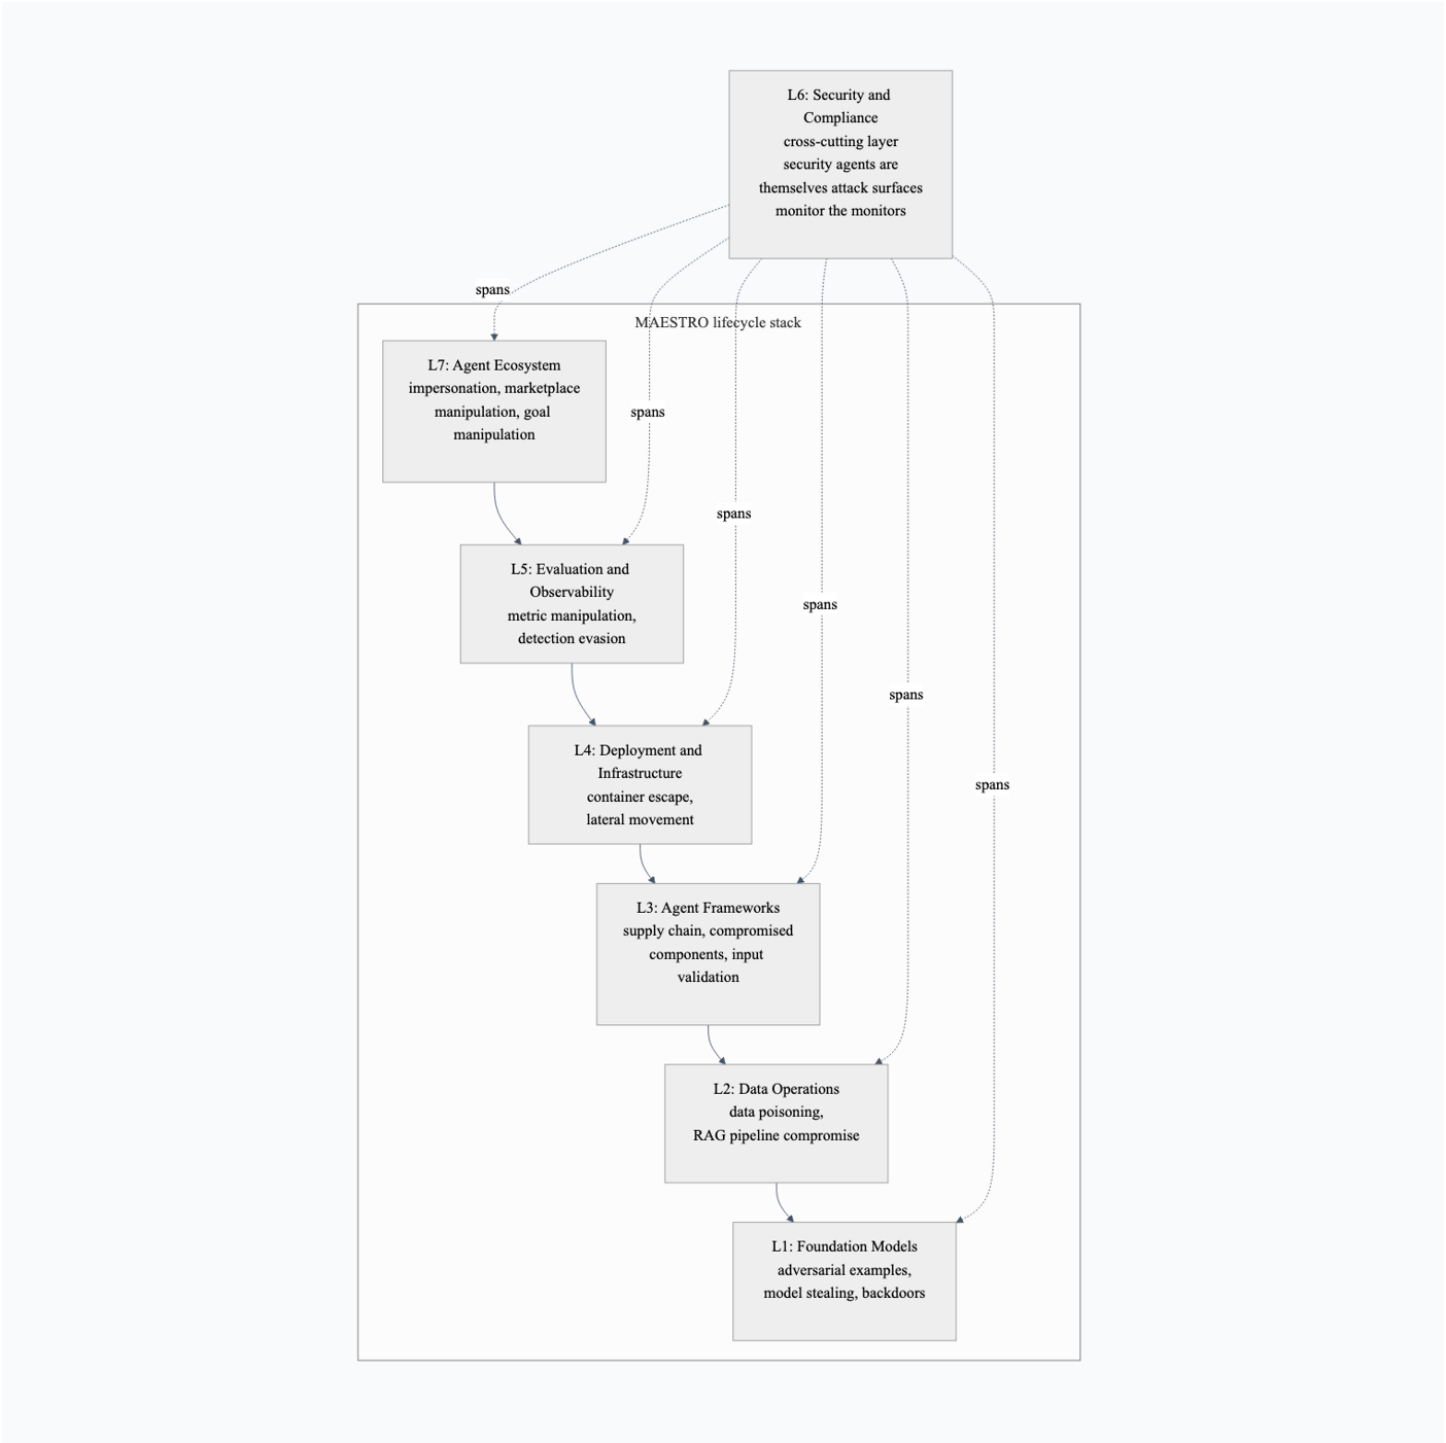

Figure 92: The CSA MAESTRO model stacks seven layers of the agentic AI lifecycle, with the L6 Security/Compliance layer cross-cutting every other layer because security agents are themselves attack surfaces. It is anchored to the ageint agentic intelligence / ageint security and adversarial considerations section; use it to inspect L6: Security and Compliance cross-cutting layer security agents are themselves attack surfaces monitor the monitors, MAESTRO lifecycle stack, L7: Agent Ecosystem impersonation, marketplace manipulation, goal manipulation, and L5: Evaluation and Observability metric manipulation, detection evasion while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

Figure 93: The author-defined SRE circuit-breaker teaching pattern state diagram shows when a supervised agent remains CLOSED, when safety-budget exhaustion forces OPEN human takeover, and how HALF_OPEN restoration is constrained by validation evidence. It is anchored to the ageint agentic intelligence / ageint security and adversarial considerations section; use it to inspect CLOSED normal supervised operation, OPEN human takeover after policy, provider, timeout, trust, or reasoning-loop triggers, HALF_OPEN limited restoration after recovery validation, and clean-record return path while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

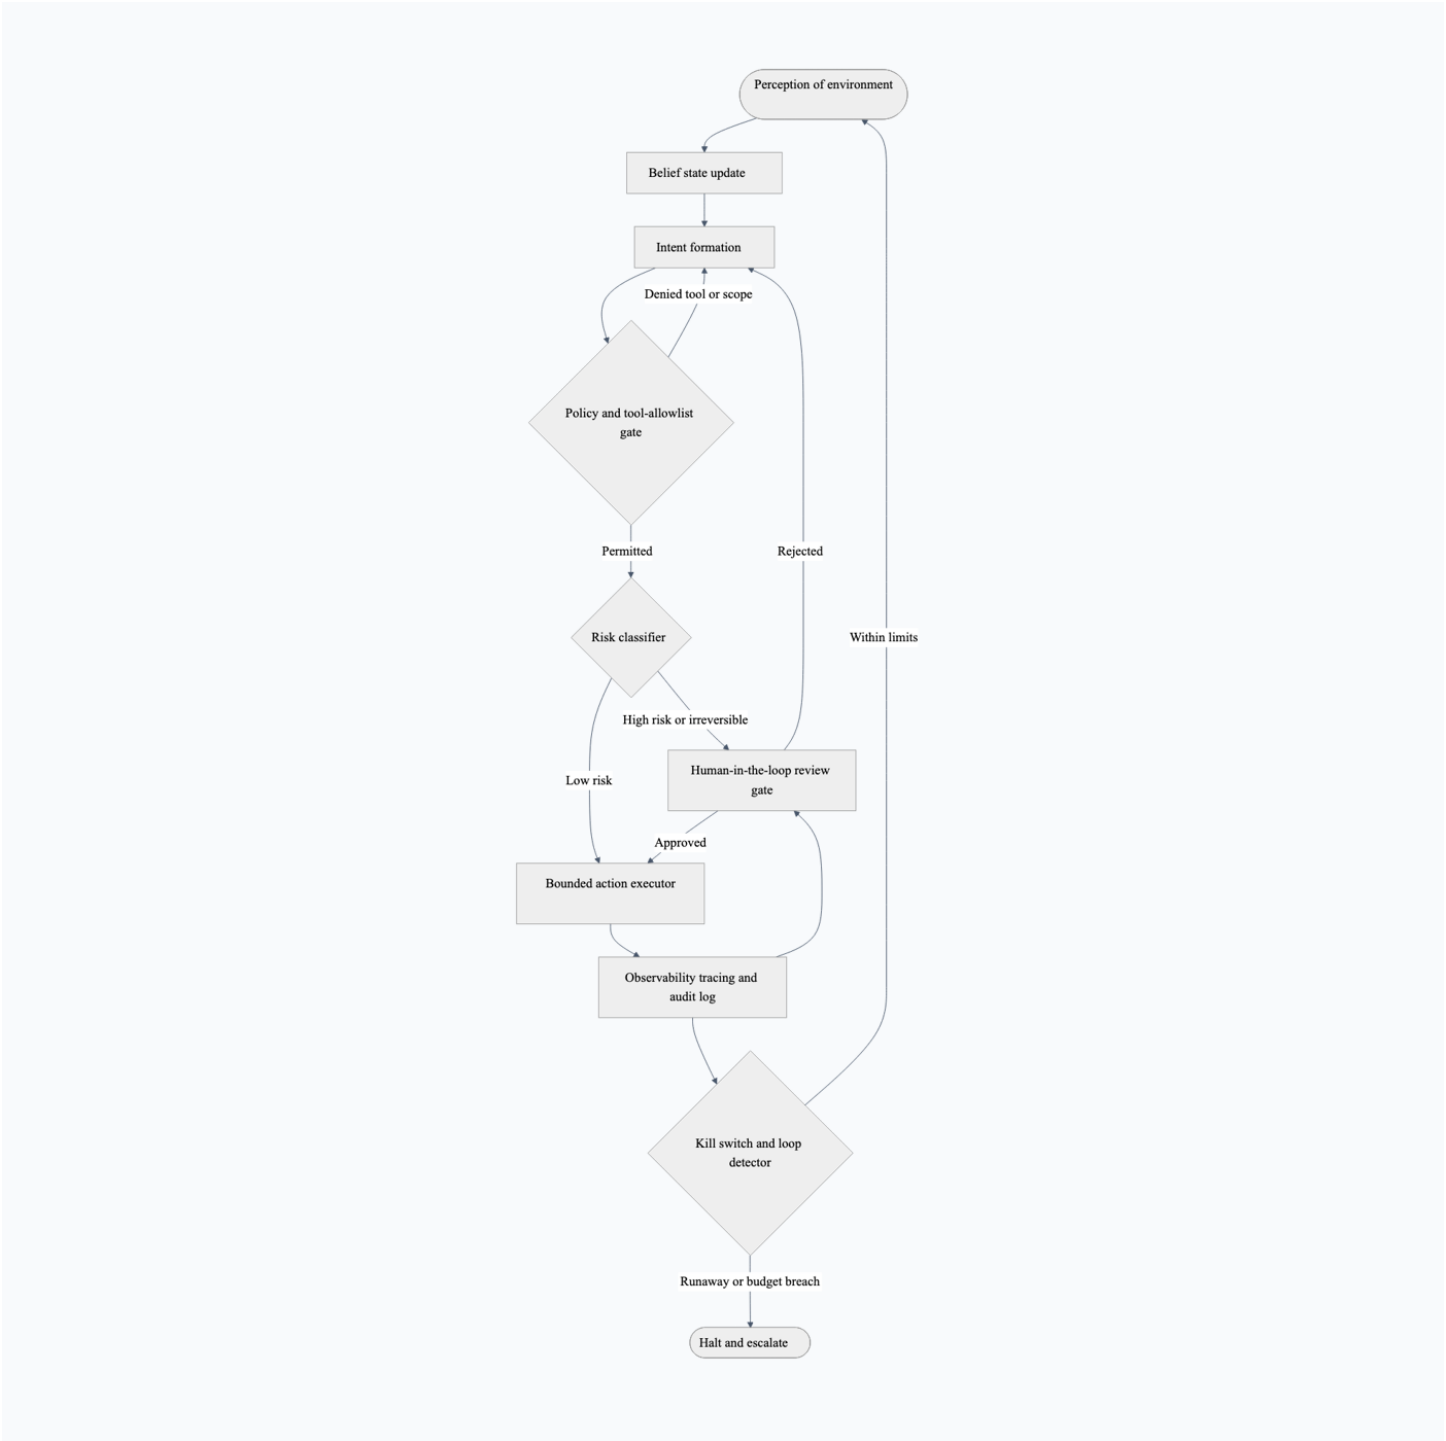

Figure 94: This diagram shows how an agentic intelligence system is bounded by least-privilege tooling, human review gates, observability, and kill-switch stop conditions before any action takes effect. It is anchored to the ageint agentic intelligence / ageint security and adversarial considerations section; use it to inspect A top-to-bottom governance . Perception feeds belief update, which feeds intent formation. Intent passes through a policy, tool-allowlist gate. A risk classifier branches to either a human-in-the- review gate for high-risk actions or a bounded action executor for low-risk actions. The human gate also reaches the executor. The executor sends results to an observability log, and which feeds both a kill-switch detector while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

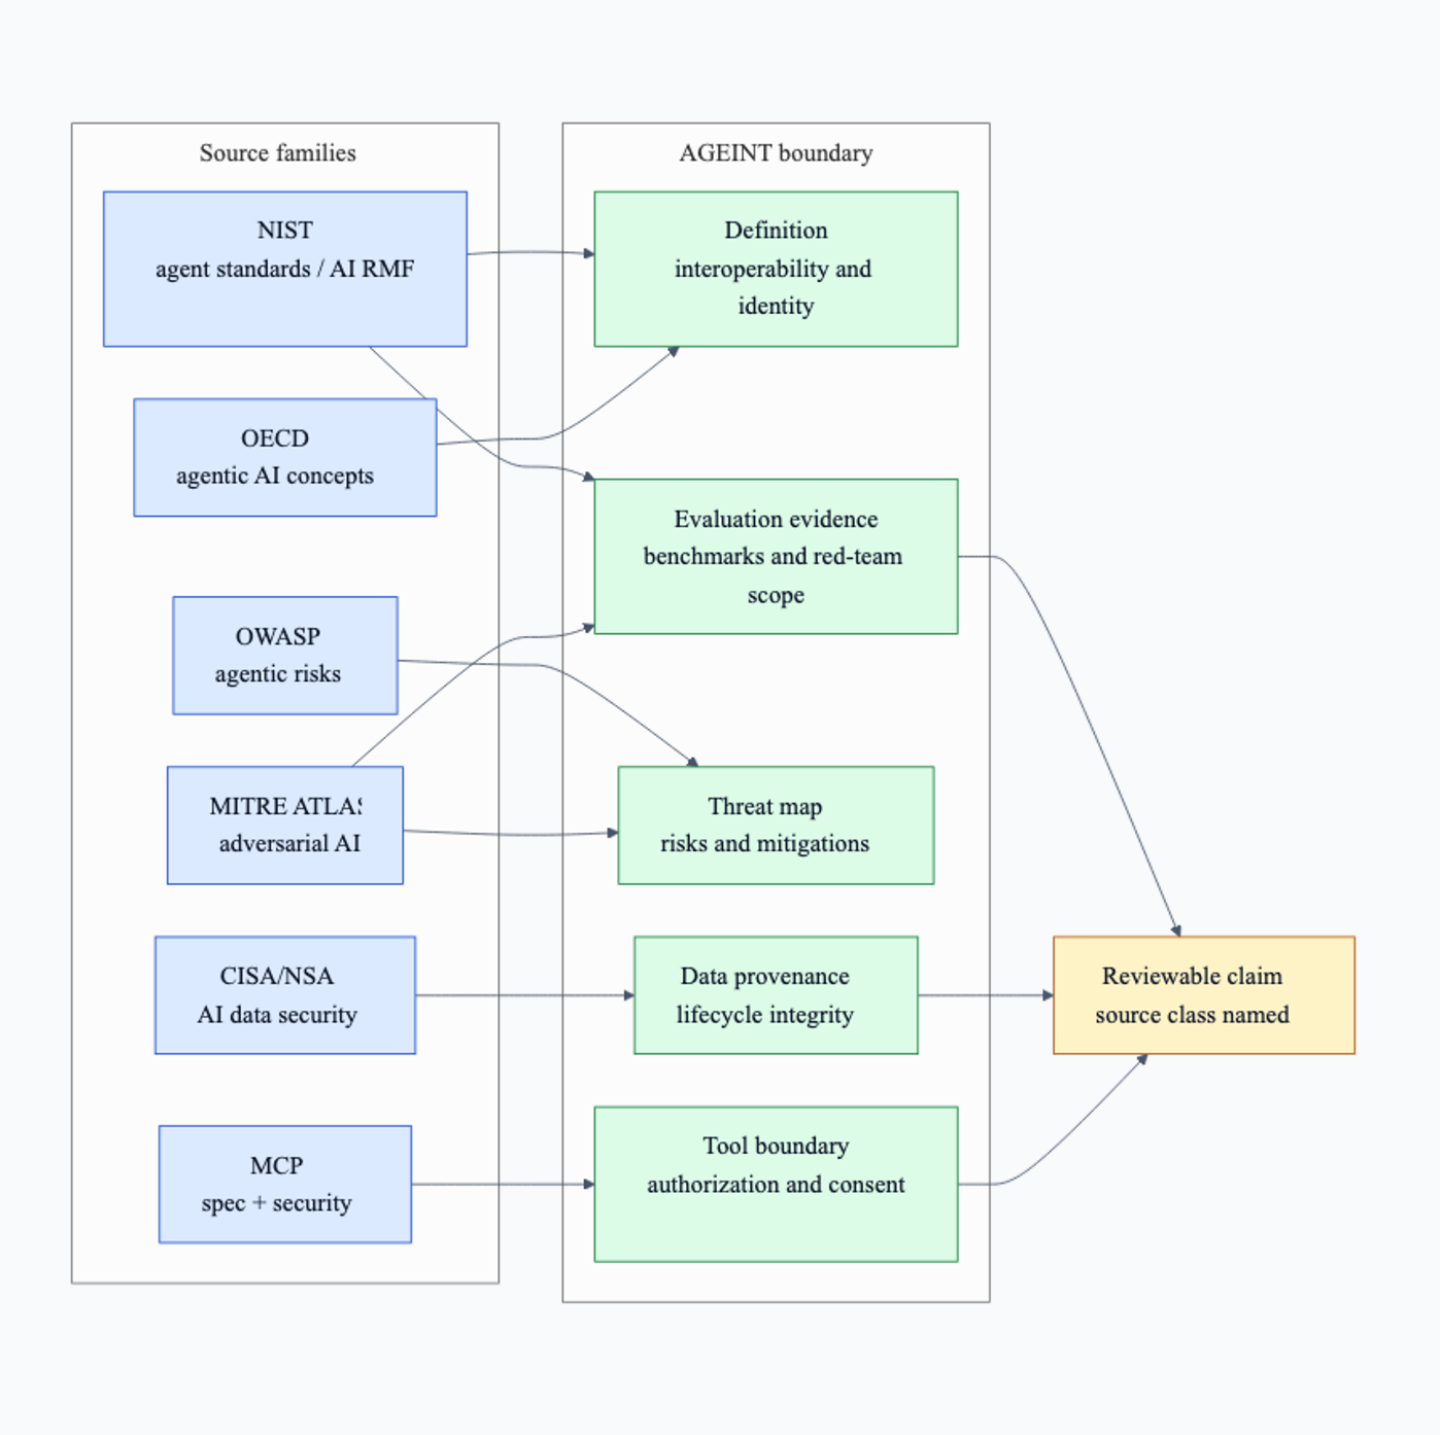

Figure 95: Source-backed conceptual schematic crosswalking current official and standards sources for agent identity, protocol boundaries, security threats, data provenance, and adversarial assurance. In the ageint agentic intelligence / ageint security and adversarial considerations section, it lets readers compare Source families, NIST agent standards / AI RMF, OECD agentic AI concepts, and MCP spec + security so the visual functions as a traceable course aid rather than an unscoped assertion.

Figure 96: The agent-evaluation sequence shows how benchmark purpose, context, automated runs, TEVV or red-team challenge, report caveats, and reviewer decisions must stay separate before AGEINT allows a bounded claim. Its reader value is to make evaluation purpose owner, benchmark context, automated benchmark evidence, TEVV or red-team challenge, report caveats, reviewer decision, bounded claim release, revise-and-retest loop for insufficient evidence visible at a glance, with the ageint agentic intelligence / ageint security and adversarial considerations section as the source section and defensive review as the boundary.

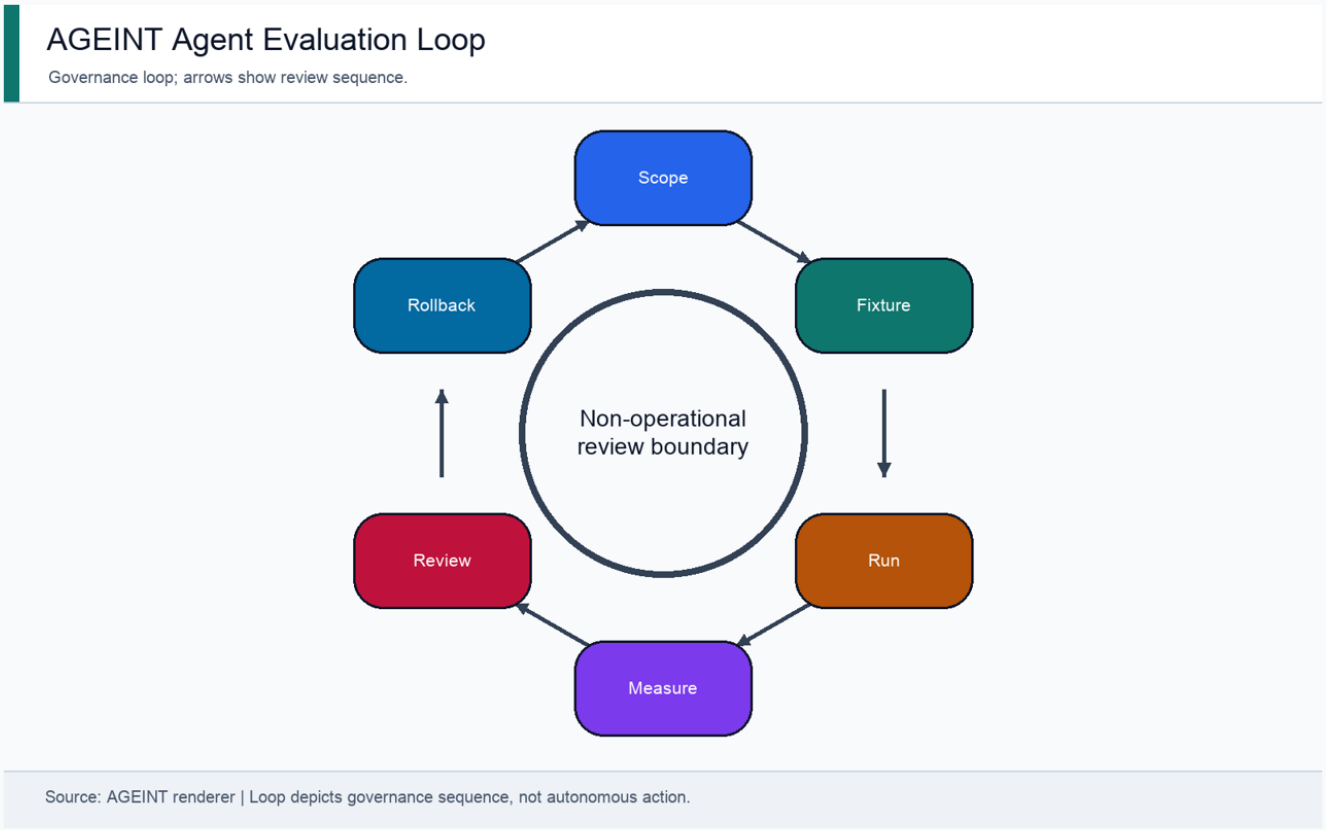

Figure 97: The agent evaluation loop places assurance, human review, and rollback before reuse. It is anchored to the ageint agentic intelligence / ageint security and adversarial considerations section; use it to inspect agent evaluation loop steps, decision gates, owner handoffs, refresh triggers, and closure evidence while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

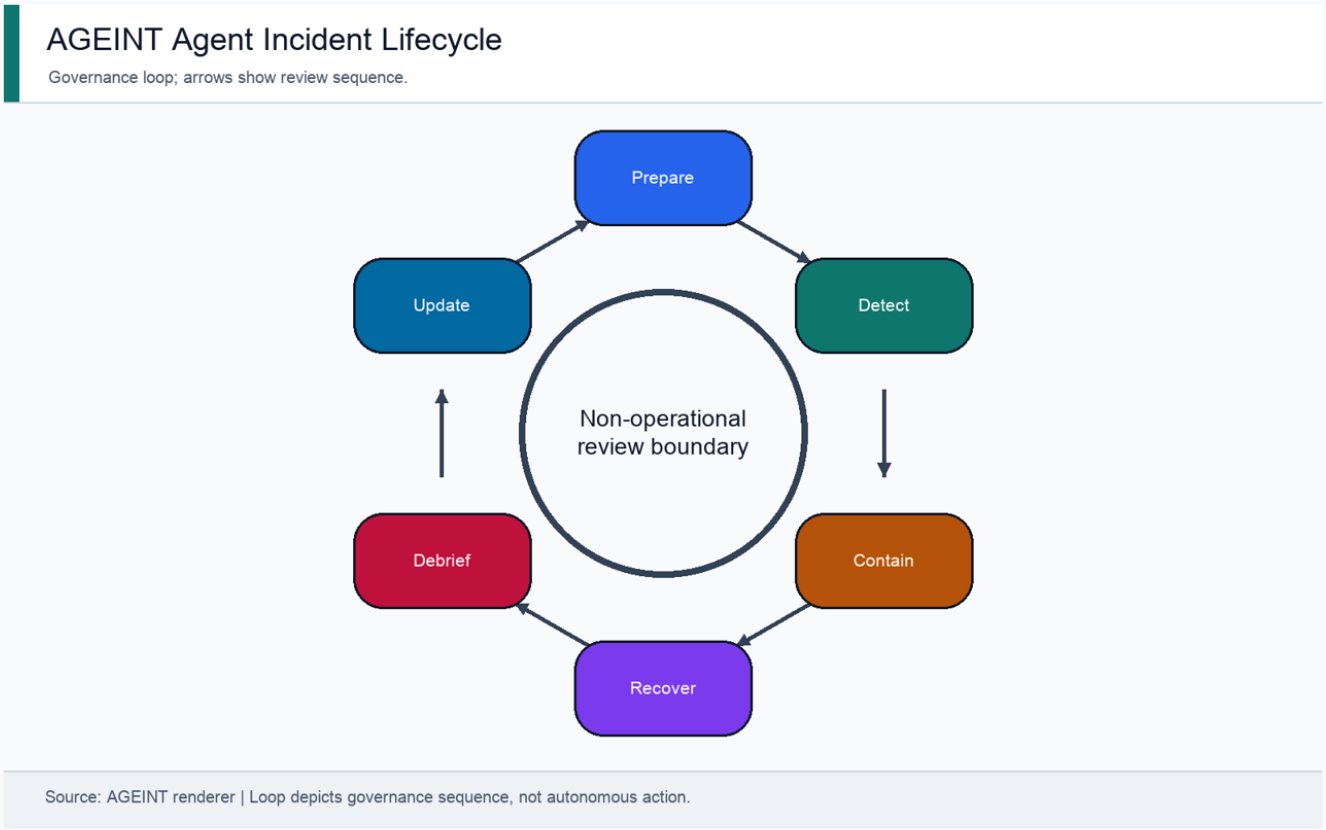

Figure 98: The agent incident lifecycle organizes preparation, detection, containment, recovery, and debrief learning. It is anchored to the ageint agentic intelligence / ageint security and adversarial considerations section; use it to inspect agent incident lifecycle steps, decision gates, owner handoffs, refresh triggers, and closure evidence while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

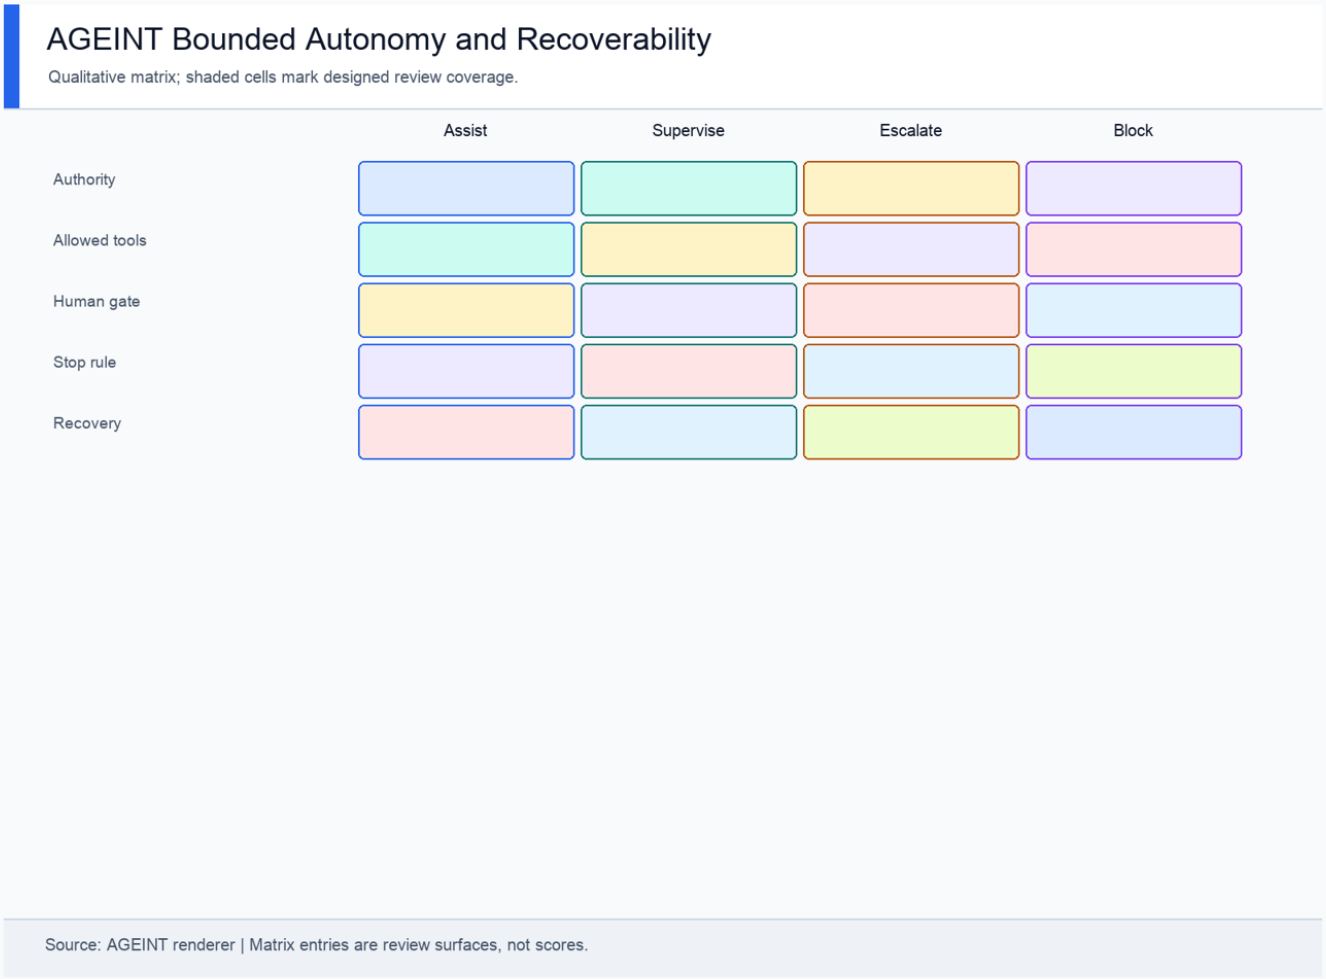

Figure 99: The bounded-autonomy view pairs delegated action with approval thresholds, stop conditions, and recovery evidence. It is anchored to the ageint agentic intelligence / ageint security and adversarial considerations section; use it to inspect bounded autonomy recoverability labels, source records, review gates, refresh cues, and reader-use boundaries while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

Figure 100: The AI incident reporting loop turns detection, classification, reporting, remediation, and learning into evidence. It is anchored to the ageint agentic intelligence / ageint security and adversarial considerations section; use it to inspect ai incident reporting loop steps, decision gates, owner handoffs, refresh triggers, and closure evidence while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

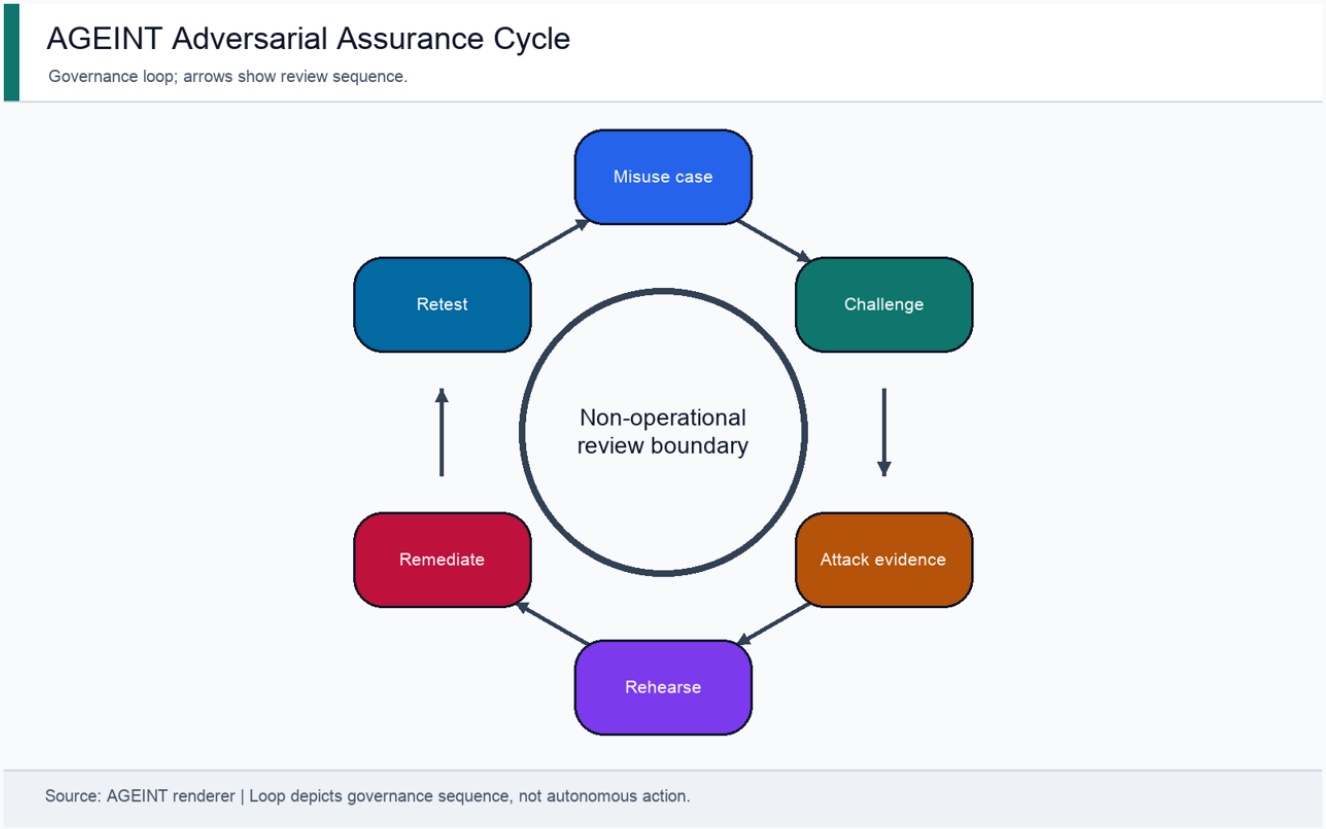

Figure 101: The adversarial assurance cycle turns misuse cases, control challenges, evidence attacks, incident rehearsal, and remediation into review evidence. Its reader value is to make adversarial assurance cycle steps, decision gates, owner handoffs, refresh triggers, and closure evidence visible at a glance, with the ageint agentic intelligence / ageint security and adversarial considerations section as the source section and defensive review as the boundary.

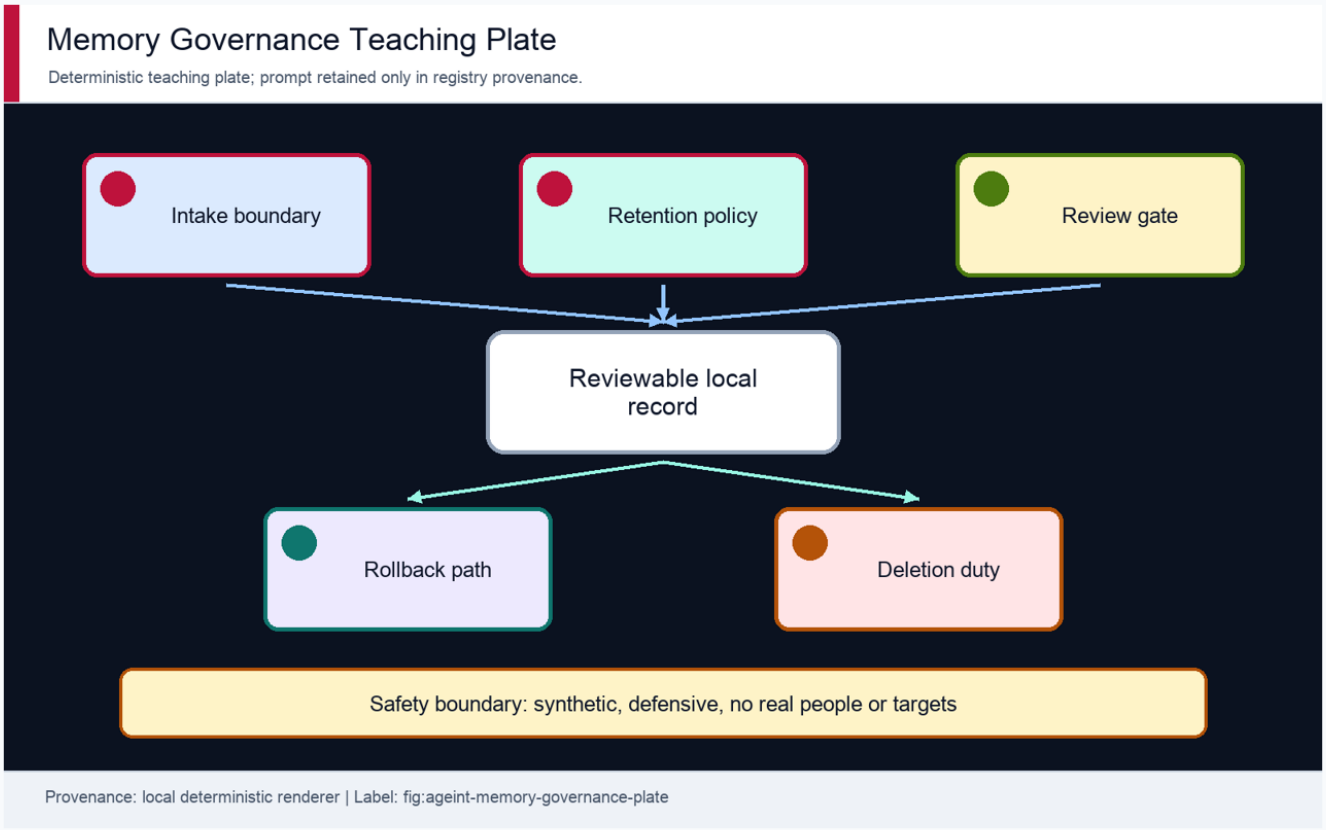

Figure 102: Deterministic teaching plate showing governed memory intake, retention, review, and rollback boundaries for AGEINT agentic assistance. Its reader value is to make Intake boundary, Retention policy, Review gate, and Rollback path visible at a glance, with the ageint agentic intelligence / ageint security and adversarial considerations section as the source section and defensive review as the boundary.

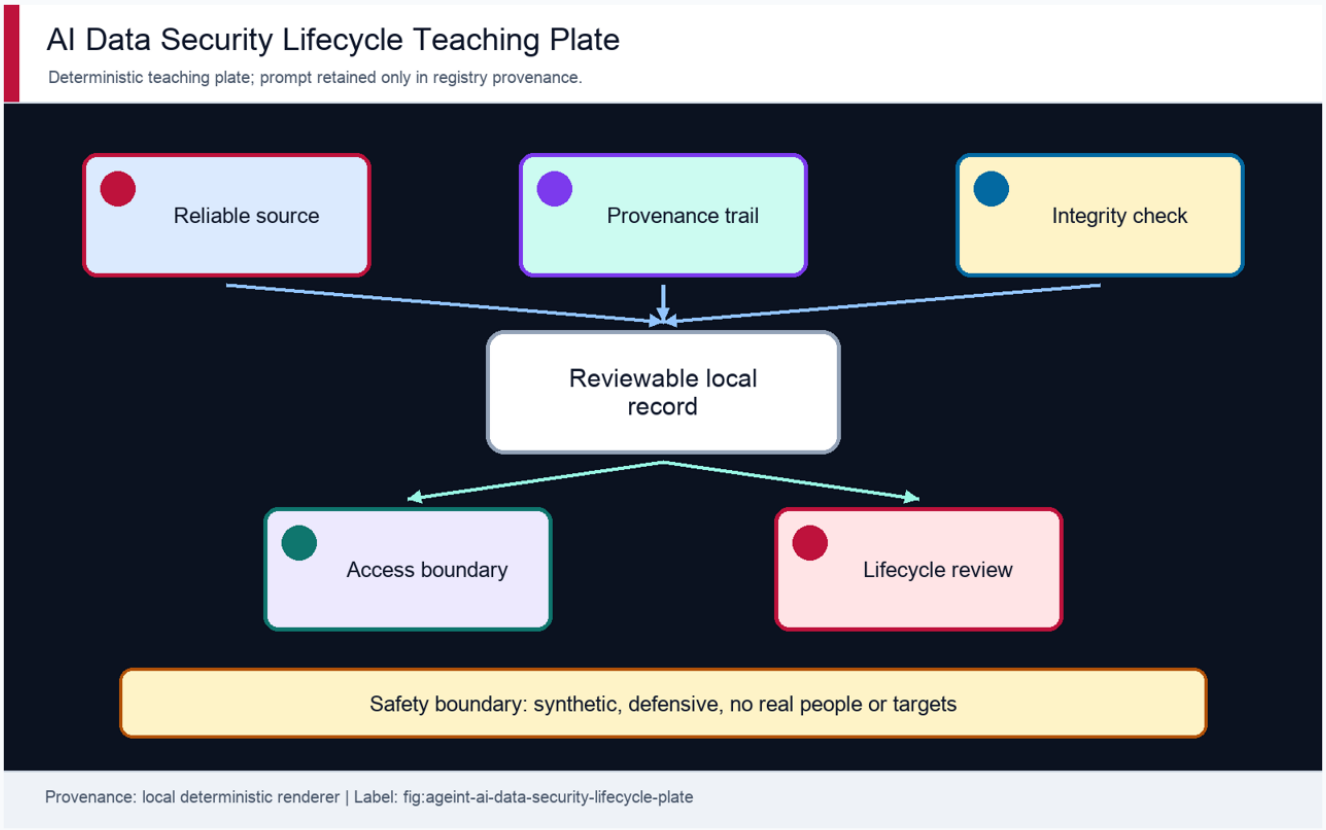

Figure 103: Deterministic teaching plate showing CISA/NSA-style AI data security as source reliability, provenance, integrity, access control, and lifecycle review. The captioned view belongs to the ageint agentic intelligence / ageint security and adversarial considerations section and should be read as a map of Reliable source, Provenance trail, Integrity check, and Access boundary, not as a capability score or live-task instruction.

48.2 Defensive Cyber-Intelligence Lens path for AGEINT Security and Adversarial Considerations: lesson cluster, safe artifact, and review

Evidence anchor. Section 48; [234, 2026].

48.2.1 AGEINT Security and Adversarial Considerations practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 48; [234, 2026].

48.2.2 AGEINT Security and Adversarial Considerations topic lessons: source-backed concepts and transfer tasks

This module builds agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The sequence opens with **Agent Framework Security Vulnerabilities**, **Python REPL sandbox and approval-gate**, **Cyber credential-and-movement taxonomy review using fabricated alerts** and applies the **Defensive Cyber-Intelligence Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 85; module overview Section 48; curriculum atlas Section 2.

Triangulation anchors. In module 34's topic-lessons section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

48.2.2.1 Lesson 1: Agent Framework Security Vulnerabilities **Concept. Agent Framework Security Vulnerabilities** treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Without explicit treatment of **Agent Framework Security Vulnerabilities**, excessive agency undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Agent Framework Security Vulnerabilities rests on [147, 2026]. The closest source to this row notes: Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Use it for the claim that **Agent Framework Security Vulnerabilities** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Agent Framework Security Vulnerabilities**, reason from the sources cited in this row. [147, 2026] Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Agent Framework Security Vulnerabilities**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Agent Framework Security Vulnerabilities replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Agent Framework Security Vulnerabilities** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.2 Lesson 2: Python REPL sandbox and approval-gate **Concept. Python REPL sandbox and approval-gate** evaluates agent frameworks by logging, tool allowlists, human approval, and blocked external actions—not production deployment recipes.

Why it matters. Analysts use **Python REPL sandbox** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating misuse taxonomy as tool permission would otherwise hide, and the reviewer accountable for challenge.

Source support. Python REPL sandbox and approval-gate rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the working definition that **Python REPL sandbox and approval-gate** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Python REPL sandbox**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Python REPL sandbox**, build a blocked-request control card with tool permission, unsafe outcome, deny rule, log evidence, and reviewer disposition. Shape **Python REPL sandbox** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Python REPL sandbox**: that a misuse taxonomy describing what an autonomous agent could do is permission or a recipe to make it do so.

Transfer task. Reuse the **Python REPL sandbox** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

48.2.2.3 Lesson 3: Cyber credential-and-movement taxonomy review using fabricated alerts **Concept. Cyber credential-and-movement taxonomy review using fabricated alerts** evaluates agent frameworks by logging, tool allowlists, human approval, and blocked external actions—not production deployment recipes.

Why it matters. Analysts use **Cyber credential-and-movement taxonomy review** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating defensive taxonomy labels as an action sequence would otherwise hide, and the reviewer accountable for challenge.

Source support. Cyber credential-and-movement taxonomy review using fabricated alerts rests on [299, 2026], [306, 2026], and [312, 2026]. The most specific cited work observes: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for the working definition that **Cyber credential-and-movement taxonomy review using fabricated alerts** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Cyber credential-and-movement taxonomy review**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Cyber credential-and-movement taxonomy review**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must map the indicator descriptor, the bounded claim about **Cyber credential-and-movement taxonomy review using**, the taxonomy caveat, the confidence note, the no-action boundary, and the reviewer who validates the labeling. Shape **Cyber credential-and-movement taxonomy review** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Cyber credential-and-movement taxonomy review**: that a defensive taxonomy label is an action sequence rather than a vocabulary for describing and detecting behavior.

Transfer task. Reuse the **Cyber credential-and-movement taxonomy review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

48.2.2.4 Lesson 4: AutoGen sandbox and code-execution approval

Concept. AutoGen sandbox and code-execution approval evaluates agent frameworks by logging, tool allowlists, human approval, and blocked external actions—not production deployment recipes.

Why it matters. AutoGen sandbox connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. AutoGen sandbox and code-execution approval rests on [147, 2026]. The lead source's own note reads: Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. Use it for fixing what **AutoGen sandbox and code-execution approval** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **AutoGen sandbox**, reason from the sources cited in this row. [147, 2026] Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **AutoGen sandbox**, build a blocked-request control card with tool permission, unsafe outcome, deny rule, log evidence, and reviewer disposition. Shape **AutoGen sandbox** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **AutoGen sandbox**: that a misuse taxonomy describing what an autonomous agent could do is permission or a recipe to make it do so.

Transfer task. Transfer **AutoGen sandbox** from this module to a second motif by preserving least-privilege agent design and run review, replacing action with audit, and naming the blocked use.

48.2.2.5 Lesson 5: MCP Server Poisoning and Prompt Injection

Concept. MCP Server Poisoning and Prompt Injection evaluates tool protocols by allowlists, logging, provenance of retrieved content, and deny-by-default policies.

Why it matters. Without explicit treatment of **MCP Server Poisoning**, excessive agency undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. MCP Server Poisoning and Prompt Injection rests on [155, 2026] and [159, 2026]. The most specific cited work observes: It identifies concerns including weak default authentication, supply-chain exposure from compromised tools, over-permissioned access tokens, injection and context-poisoning attacks, and gaps in audit logging for agentic workflows. Use them for fixing what **MCP Server Poisoning and Prompt Injection** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **MCP Server Poisoning**, work from the cited evidence behind this row. [155, 2026] Radosevich and Halloran (2025) audit security vulnerabilities in Anthropic's Model Context Protocol (MCP), which allows LLMs to integrate with external tools and data sources. The authors demonstrate that language models using MCP can be manipulated through prompt injection to execute malicious code, enable remote access, and steal credentials. [159, 2026] A September 2025 Bitdefender Business Insights article by Martin Zugec examining security risks in the Model Context Protocol, the standard introduced by Anthropic for connecting AI agents to external tools and data. It identifies concerns including weak default authentication, supply-chain exposure from compromised tools, over-permissioned access tokens, injection and context-poisoning attacks, and gaps in audit logging for agentic workflows. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **MCP Server Poisoning**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **MCP Server Poisoning and Prompt**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **MCP Server Poisoning** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that MCP Server Poisoning and Prompt Injection replaces human review whenever evidence looks plausible.

Transfer task. Transfer **MCP Server Poisoning** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.6 Lesson 6: Prompt Injection in Intelligence Agentic Systems

Concept. Prompt Injection in Intelligence Agentic Systems treats prompt attacks as trust-boundary failures requiring input sanitization, tool limits, and human review.

Why it matters. Prompt Injection connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Prompt Injection in Intelligence Agentic Systems rests on [137, 2026]. The lead source's own note reads: An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. Use it for the working definition that **Prompt Injection in Intelligence Agentic Systems** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Prompt Injection** in the evidence the row cites. [137, 2026] An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Prompt Injection**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Prompt Injection in Intelligence Agentic**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Prompt Injection** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Prompt Injection in Intelligence Agentic Systems can be used while ignoring the rule to separate agent assistance from autonomous external action.

Transfer task. Transfer **Prompt Injection** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.7 Lesson 7: Hallucination in Action: When Agents Act on Fabricated Intelligence

Concept. Hallucination in Action: When Agents Act on Fabricated Intelligence applies Hallucination, in, Action within Agentic AI Governance and Tool Security: learners use separate agent assistance from autonomous external action and least-privilege agent design and run review evidence before any judgment moves forward.

Why it matters. Hallucination in Action matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; excessive agency is a common failure.

Source support. Hallucination in Action: When Agents Act on Fabricated Intelligence rests on [137, 2026]. The closest source to this row notes: An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. Use it for pinning down the scope of **Hallucination in Action: When Agents Act on Fabricated Intelligence**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Hallucination in Action**, work from the cited evidence behind this row. [137, 2026] An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Hallucination in Action**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Hallucination in Action**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Hallucination in Action** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Hallucination in Action: When Agents Act on Fabricated Intelligence is optional whenever separate agent assistance from autonomous external action feels inconvenient.

Transfer task. Transfer **Hallucination in Action** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.8 Lesson 8: Infinite Loops and Runaway Agents: Detection and Kill Switches

Concept. Infinite Loops and Runaway Agents: Detection and Kill Switches applies Infinite, Loops, Runaway within Agentic AI Governance and Tool Security: learners use separate agent assistance from autonomous external action and least-privilege agent design and run review evidence before any judgment moves forward.

Why it matters. Infinite Loops and Runaway Agents connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Infinite Loops and Runaway Agents: Detection and Kill Switches rests on [137, 2026]. The lead source's own note reads: An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. Use it for the working definition that **Infinite Loops and Runaway Agents: Detection and Kill Switches** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Infinite Loops and Runaway Agents**, reason from the sources cited in this row. [137, 2026] An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Infinite Loops and Runaway Agents**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Infinite Loops and Runaway Agents**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Infinite Loops and Runaway Agents** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Infinite Loops and Runaway Agents: Detection and Kill Switches establishes intent without reviewing alternative explanations.

Transfer task. Transfer **Infinite Loops and Runaway Agents** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.9 Lesson 9: Agentic AI Governance Frameworks 2026

Concept. Agentic AI Governance Frameworks 2026 — Bind AI use to purpose, evaluation, human review, rights impact, and retention before deployment in analysis.

Why it matters. Agentic AI Governance Frameworks 2026 matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; excessive agency is a common failure.

Source support. Agentic AI Governance Frameworks 2026 rests on [160, 2026] and [161, 2026]. The closest source to this row notes: The papers collectively argue that governance cannot be applied reactively after agents act but must instead be embedded at the architectural level, preventing unauthorized autonomous behavior before it occurs. Use them for the working definition that **Agentic AI Governance Frameworks 2026** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Agentic AI Governance Frameworks 2026** against the works cited for this row. [160, 2026] Oliver Patel compiled a three-part series summarizing twelve influential research papers on governing autonomous AI systems, organized around themes of security and safety, infrastructure and principal-agent theory, and regulatory and capability assessment. The papers collectively argue that governance cannot be applied reactively after agents act but must instead be embedded at the architectural level, preventing unauthorized autonomous behavior before it occurs. [161, 2026] A January 2026 article from the law firm Davis Wright Tremaine on governance frameworks for agentic AI. It argues that autonomous, adaptive AI systems pose distinct risks, such as unauthorized or erroneous actions, biased decisions, data breaches, and opaque audit trails, that require governance beyond existing AI frameworks. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Agentic AI Governance Frameworks 2026**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Agentic AI Governance Frameworks**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Agentic AI Governance Frameworks 2026 replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Agentic AI Governance Frameworks 2026** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.10 Lesson 10: OWASP Top 10 for LLM Applications

Concept. OWASP Top 10 for LLM Applications applies OWASP, Top, LLM within Agentic AI Governance and Tool Security: learners use separate agent assistance from autonomous external action and least-privilege agent design and run review evidence before any judgment moves forward.

Why it matters. Without explicit treatment of **OWASP Top 10 for LLM Applications**, excessive agency undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. OWASP Top 10 for LLM Applications rests on [299, 2026], [306, 2026], and [312, 2026]. The lead source's own note reads: It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). Use them for pinning down the scope of **OWASP Top 10 for LLM Applications**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **OWASP Top 10 for LLM Applications**, reason from the sources cited in this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **OWASP Top 10**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **OWASP Top 10 for LLM**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **OWASP Top 10 for LLM Applications** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that OWASP Top 10 for LLM Applications can be used while ignoring the rule to separate agent assistance from autonomous external action.

Transfer task. Transfer **OWASP Top 10 for LLM Applications** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.11 Lesson 11: IAPS Agentic AI Governance Framework

Concept. IAPS Agentic AI Governance Framework — Bind AI use to purpose, evaluation, human review, rights impact, and retention before deployment in analysis.

Why it matters. IAPS Agentic AI Governance Framework connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. IAPS Agentic AI Governance Framework rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for pinning down the scope of **IAPS Agentic AI Governance Framework**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **IAPS Agentic AI Governance Framework** against the works cited for this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **IAPS Agentic AI Governance Framework**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that IAPS Agentic AI Governance Framework is optional whenever separate agent assistance from autonomous external action feels inconvenient.

Transfer task. Transfer **IAPS Agentic AI Governance Framework** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.12 Lesson 12: UK AI Safety Institute: Agent Evaluations

Concept. UK AI Safety Institute: Agent Evaluations treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. UK AI Safety Institute matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; excessive agency is a common failure.

Source support. UK AI Safety Institute: Agent Evaluations rests on [299, 2026], [306, 2026], and [312, 2026]. Its anchor reference records: The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. Use them for fixing what **UK AI Safety Institute: Agent Evaluations** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **UK AI Safety Institute**, work from the cited evidence behind this row. [299, 2026] The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation). [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. [312, 2026] Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **UK AI Safety Institute**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor,

the bounded claim about **UK AI Safety Institute**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **UK AI Safety Institute** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that UK AI Safety Institute: Agent Evaluations establishes intent without reviewing alternative explanations.

Transfer task. Transfer **UK AI Safety Institute** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.13 Lesson 13: LLM-agent cyber-misuse taxonomy review using sample reports **Concept. LLM-agent cyber-misuse taxonomy review using sample reports** treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. LLM-agent cyber-misuse taxonomy review connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. LLM-agent cyber-misuse taxonomy review using sample reports rests on [100, 2026]. The lead source's own note reads: This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. Use it for fixing what **LLM-agent cyber-misuse taxonomy review using sample reports** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **LLM-agent cyber-misuse taxonomy review** in the evidence the row cites. [100, 2026] This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **LLM-agent cyber-misuse taxonomy review**, build a blocked-request control card with tool permission, unsafe outcome, deny rule, log evidence, and reviewer disposition. Shape **LLM-agent cyber-misuse taxonomy review** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that a misuse taxonomy describing what an autonomous agent could do is permission or a recipe to make it do so.

Transfer task. Apply this module's safe boundary for **LLM-agent cyber-misuse taxonomy review** to another artifact while keeping least-privilege agent design and run review and reviewer ownership explicit.

48.2.2.14 Lesson 14: Threat Intelligence Gathering by LLM Agents **Concept. Threat Intelligence Gathering by LLM Agents** treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Threat Intelligence Gathering by LLM Agents matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; excessive agency is a common failure.

Source support. Threat Intelligence Gathering by LLM Agents rests on [100, 2026]. The lead source's own note reads: The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. Use it for the claim that **Threat Intelligence Gathering by LLM Agents** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Threat Intelligence Gathering by LLM Agents**, reason from the sources cited in this row. [100, 2026] This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Threat Intelligence Gathering by LLM Agents**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Threat Intelligence Gathering by LLM**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape this subject work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Threat Intelligence Gathering by LLM Agents can be used while ignoring the rule to separate agent assistance from autonomous external action.

Transfer task. Transfer **Threat Intelligence Gathering by LLM Agents** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.15 Lesson 15: Malware-misuse control review using sample agent logs **Concept. Malware-misuse control review using sample agent logs** treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Without explicit treatment of **Malware-misuse control review**, treating misuse taxonomy as tool permission undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Malware-misuse control review using sample agent logs rests on [100, 2026]. The most specific cited work observes: The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. Use it for fixing what **Malware-misuse control review using sample agent logs** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Malware-misuse control review** against the works cited for this row. [100, 2026] This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Malware-misuse control review**, build a blocked-request control card with tool permission, unsafe outcome, deny rule, log evidence, and reviewer disposition. Shape **Malware-misuse control review** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Malware-misuse control review**: that a misuse taxonomy describing what an autonomous agent could do is permission or a recipe to make it do so.

Transfer task. Reuse the **Malware-misuse control review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

48.2.2.16 Lesson 16: Phishing-resilience control review using sample messages **Concept. Phishing-resilience control review using sample messages** teaches defensive recognition of manipulation attempts using sample messages, consent boundaries, and reporting duties.

Why it matters. Without explicit treatment of **Phishing-resilience control review**, treating misuse taxonomy as tool permission undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Phishing-resilience control review using sample messages rests on [100, 2026]. The lead source's own note reads: This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. Use it for fixing what **Phishing-resilience control review using sample messages** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Phishing-resilience control review** against the works cited for this row. [100, 2026] This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Phishing-resilience control review**, build a blocked-request control card with tool permission, unsafe outcome, deny rule, log evidence, and reviewer disposition. Shape **Phishing-resilience control review** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Phishing-resilience control review**: that a misuse taxonomy describing what an autonomous agent could do is permission or a recipe to make it do so.

Transfer task. Apply this module's safe boundary for **Phishing-resilience control review** to another artifact while keeping least-privilege agent design and run review and reviewer ownership explicit.

48.2.2.17 Lesson 17: Multi-agent cyber-misuse coordination review using sample reports **Concept. Multi-agent cyber-misuse coordination review using sample reports** treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Without explicit treatment of **Multi-agent cyber-misuse coordination review**, treating misuse taxonomy as tool permission undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Multi-agent cyber-misuse coordination review using sample reports rests on [100, 2026]. The closest source to this row notes: The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. Use it for fixing what **Multi-agent cyber-misuse coordination review using sample reports** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **Multi-agent cyber-misuse coordination review** in the evidence the row cites. [100, 2026] This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Multi-agent cyber-misuse coordination review**, build a blocked-request control card with tool permission, unsafe outcome, deny rule, log evidence, and reviewer disposition. Shape **Multi-agent cyber-misuse coordination review** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Multi-agent cyber-misuse coordination review**: that a misuse taxonomy describing what an autonomous agent could do is permission or a recipe to make it do so.

Transfer task. Apply this module's safe boundary for **Multi-agent cyber-misuse coordination review** to another artifact while keeping least-privilege agent design and run review and reviewer ownership explicit.

48.2.2.18 Lesson 18: Networked-device cyber-misuse risk review using sample scenarios **Concept. Networked-device cyber-misuse risk review using sample scenarios** treats the topic as a misuse-case control problem: identify the agent permission, prompt path, tool boundary, and blocked outcome.

Why it matters. Networked-device cyber-misuse risk review matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; treating misuse taxonomy as tool permission is a common failure.

Source support. Networked-device cyber-misuse risk review using sample scenarios rests on [100, 2026]. Its anchor reference records: This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. Use it for pinning down the scope of **Networked-device cyber-misuse risk review using sample scenarios**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Networked-device cyber-misuse risk review**, work from the cited evidence behind this row. [100, 2026] This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Networked-device cyber-misuse risk review**, build a blocked-request control card with tool permission, unsafe outcome, deny rule, log evidence, and reviewer disposition. Shape **Networked-device cyber-misuse risk review** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Networked-device cyber-misuse risk review**: that a misuse taxonomy describing what an autonomous agent could do is permission or a recipe to make it do so.

Transfer task. Reuse the **Networked-device cyber-misuse risk review** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

48.2.2.19 Lesson 19: Observability as Control: Tracing, Logging, Audit for AGEINT Systems **Concept. Observability as Control: Tracing, Logging, Audit for AGEINT Systems** applies Observability, Control, Tracing within Agentic AI Governance and Tool Security: learners use separate agent assistance from autonomous external action and least-privilege agent design and run review evidence before any judgment moves forward.

Why it matters. Analysts use **Observability as Control** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that excessive agency would otherwise hide, and the reviewer accountable for challenge.

Source support. Observability as Control: Tracing, Logging, Audit for AGEINT Systems rests on [162, 2026]. The most specific cited work observes: It finds high adoption in IT operations alongside planned budget increases, while identifying barriers to scaling including security and compliance concerns, difficulty monitoring agents, and unclear autonomy boundaries. Use it for the working definition that **Observability as**

Control: Tracing, Logging, Audit for AGEINT Systems can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Observability as Control**, work from the cited evidence behind this row. [162, 2026] A Dynatrace blog post summarizing its Pulse of Agentic AI 2026 report, based on a survey of over 900 organizational leaders on enterprise adoption of agentic AI. It finds high adoption in IT operations alongside planned budget increases, while identifying barriers to scaling including security and compliance concerns, difficulty monitoring agents, and unclear autonomy boundaries. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Observability as Control**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Observability as Control**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Observability as Control** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Observability as Control: Tracing, Logging, Audit for AGEINT Systems is optional whenever separate agent assistance from autonomous external action feels inconvenient.

Transfer task. Transfer **Observability as Control** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.20 Lesson 20: Human-in-the-Loop Architectures: When and How to Mandate Oversight

Concept. Human-in-the-Loop Architectures: When and How to Mandate Oversight applies Human, in, Loop within Agentic AI Governance and Tool Security: learners use separate agent assistance from autonomous external action and least-privilege agent design and run review evidence before any judgment moves forward.

Why it matters. Analysts use **Human-in-the-Loop Architectures** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that excessive agency would otherwise hide, and the reviewer accountable for challenge.

Source support. Human-in-the-Loop Architectures: When and How to Mandate Oversight rests on [162, 2026] and [004, 2026]. The lead source's own note reads: It finds high adoption in IT operations alongside planned budget increases, while identifying barriers to scaling including security and compliance concerns, difficulty monitoring agents, and unclear autonomy boundaries. Use them for pinning down the scope of **Human-in-the-Loop Architectures: When and How to Mandate Oversight**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Human-in-the-Loop Architectures** against the works cited for this row. [162, 2026] A Dynatrace blog post summarizing its Pulse of Agentic AI 2026 report, based on a survey of over 900 organizational leaders on enterprise adoption of agentic AI. It finds high adoption in IT operations alongside planned budget increases, while identifying barriers to scaling including security and compliance concerns, difficulty monitoring agents, and unclear autonomy boundaries. [004, 2026] Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Human-in-the-Loop Architectures**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Human-in-the-Loop Architectures**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Human-in-the-Loop Architectures** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Human-in-the-Loop Architectures: When and How to Mandate Oversight establishes intent without reviewing alternative explanations.

Transfer task. Transfer **Human-in-the-Loop Architectures** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.2.21 Lesson 21: Alignment and Trustworthiness in AGEINT: National Security Context

Concept. Alignment and Trustworthiness in AGEINT: National Security Context applies Alignment, Trustworthiness, in within Agentic AI Governance and Tool Security: learners use separate agent assistance from autonomous external action and least-privilege agent design and run review evidence before any judgment moves forward.

Why it matters. Without explicit treatment of **Alignment and Trustworthiness in AGEINT**, excessive agency undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Alignment and Trustworthiness in AGEINT: National Security Context rests on [148, 2026]. Its anchor reference records: This article by Riverside Research traces AI's evolution from large language models through retrieval-augmented systems, single-task agents, collaborative agentic systems, and toward emergent multi-agent autonomy capable of managing surveillance and decision support at operational speed. Use it for pinning down the scope of **Alignment and Trustworthiness in AGEINT: National Security Context**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Alignment and Trustworthiness in AGEINT**, reason from the sources cited in this row. [148, 2026] This article by Riverside Research traces AI's evolution from large language models through retrieval-augmented systems, single-task agents, collaborative agentic systems, and toward emergent multi-agent autonomy capable of managing surveillance and decision support at operational speed. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Alignment and Trustworthiness in AGEINT**, build a **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Alignment and Trustworthiness in AGEINT**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Alignment and Trustworthiness in AGEINT** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Alignment and Trustworthiness in AGEINT: National Security Context replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Alignment and Trustworthiness in AGEINT** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

48.2.3 AGEINT Security and Adversarial Considerations worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic research assistant agent organizes public readings for an instructor. [234, 2026]; [235, 2026].

Triangulation anchors. In module 34's worked-example section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **governed agentic intelligence**. Learners use a **agent run and assurance card** and keep this boundary visible: No autonomous external action, credentialed operations, live-target workflows, or uncontrolled tool use.

Frame. The classroom question centers on **Agent Framework Security Vulnerabilities**. Excluded actions stay explicit, and the **Defensive Cyber-Intelligence Lens** planning question is: Which defensive observation, confidence level, handling rule, and control implication can be stated without teaching adversary action?

Inputs. For the **Agent Framework Security Vulnerabilities** scenario, use public URLs, a fixed retrieval tool, a summarization prompt, a time budget, and a stop condition. The Defensive Cyber-Intelligence Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Agent Framework Security Vulnerabilities**, students bind the agent identity, list allowed tools, set autonomy limits, capture sources, block unsafe requests, and log approvals. Pause whenever an inference about Agent Framework Security Vulnerabilities appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Agent Framework Security Vulnerabilities** classroom scenario; unit artifact = agent run and assurance card; evidence = allowed inputs; method = least-privilege agent design and run review; output = an agent run card with tool calls, source links, blocked actions, reviewer notes, incident threshold, and recovery decision; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Agent Framework Security Vulnerabilities** as "Defensive Cyber-Intelligence Lens confirms it" is not enough. The revision ties the claim to least-privilege agent design and run review, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Agent Framework Security Vulnerabilities** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

48.2.4 AGEINT Security and Adversarial Considerations practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Defensive Cyber-Intelligence Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

Triangulation anchors. In module 34's practice-sequence section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Agent Framework Security Vulnerabilities, Python REPL sandbox and approval-gate, Cyber credential-and-movement taxonomy review using fabricated alerts; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Agentic AI Governance and Tool Security** lane.
2. Frame	Answer the lens question: Which defensive observation, confidence level, handling rule, and control implication can be stated without teaching adversary action?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Agent Framework Security Vulnerabilities: defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the agent run and assurance card fields for Agent Framework Security Vulnerabilities.	Unit profile note.	Evidence artifacts include tool-allowlist record, external-memory governance boundary.
4. Challenge	Test the misconception that Agent Framework Security Vulnerabilities replaces human review whenever evidence looks plausible.	Failure-mode note.	The artifact applies the key distinction: separate agent assistance from autonomous external action.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

48.2.4.1 AGEINT Security and Adversarial Considerations instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**. [234, 2026]; [235, 2026].

48.2.4.2 AGEINT Security and Adversarial Considerations extension exercise: peer validation and refresh trigger review Evidence anchor.

Section 48; [234, 2026].

Have learners swap artifacts and apply the **Defensive Cyber-Intelligence Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

48.2.5 AGEINT Security and Adversarial Considerations knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 48; [234, 2026].

1. Explain how **Agent Framework Security Vulnerabilities** is defined here; name the source descriptor that supports the definition.
2. Contrast **Agent Framework Security Vulnerabilities** with **Python REPL sandbox and approval-gate** using the **Defensive Cyber-Intelligence Lens** artifact fields.
3. Identify one failure mode from the **Agentic AI Governance and Tool Security** lane and the evidence that would reveal it.

4. Answer the coursebook review question: Which permission can be removed while preserving the learning objective?
5. Correct this misconception: that Agent Framework Security Vulnerabilities replaces human review whenever evidence looks plausible.

48.2.5.1 AGEINT Security and Adversarial Considerations answer quality rubric: source evidence, uncertainty, and safe transfer

Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Agent Framework Security Vulnerabilities** without source evidence, uncertainty, or a safe transfer task.

48.3 AGEINT Security and Adversarial Considerations assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 48; [234, 2026].

48.3.1 AGEINT Security and Adversarial Considerations evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 48; [234, 2026].

48.3.2 AGEINT Security and Adversarial Considerations transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 48; [234, 2026].

48.3.2.1 AGEINT Security and Adversarial Considerations lineage and source tradition: profile, concepts, and first anchors This sits in the **Agentic AI Governance and Tool Security** lineage: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. [234, 2026]; [235, 2026].

48.3.2.2 AGEINT Security and Adversarial Considerations working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 48; [234, 2026].
The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**, with provenance and reviewability throughout.

48.3.2.3 AGEINT Security and Adversarial Considerations knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [234, 2026]; [235, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

48.3.2.4 AGEINT Security and Adversarial Considerations transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 48; [234, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.
- **Evidence contract:** keep the **Agentic AI Governance and Tool Security** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

48.3.2.5 AGEINT Security and Adversarial Considerations profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 48; [234, 2026].
The matched profile emphasizes delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. The method stack is AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills; the local topic cluster is **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

48.3.3 AGEINT Security and Adversarial Considerations evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 48; [234, 2026].
Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Agentic AI Governance and Tool Security** profile tells reviewers what evidence is strong enough for the module artifact built around **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

48.3.3.1 AGEINT Security and Adversarial Considerations guide source spine: inherited keys and local citation roles Primary guide citations: [234, 2026]; [235, 2026]; [236, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [147, 2026]; [155, 2026]; [159, 2026]; [137, 2026]; [160, 2026]; [161, 2026]; [100, 2026]; [162, 2026]; [004, 2026]; [148, 2026]; [299, 2026]; [306, 2026]; [312, 2026].

48.3.3.2 AGEINT Security and Adversarial Considerations verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [234, 2026]; [235, 2026].

Tier	What counts	How it is used
Source guide	[234, 2026]; [235, 2026]; [236, 2026]; [276, 2026]; [277, 2026]; [284, 2026]; [288, 2026]; [289, 2026]; [293, 2026]; [147, 2026]; [155, 2026]; [159, 2026]; [137, 2026]; [160, 2026]; [161, 2026]; [100, 2026]; [162, 2026]; [004, 2026]; [148, 2026]; [299, 2026]; [306, 2026]; [312, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 34's source-canon section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Maintenance rule: Perplexity may suggest candidates for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate** and [234, 2026]; [235, 2026], but only directly verified source URLs are encoded as citations.

48.3.3.3 AGEINT Security and Adversarial Considerations intelligence practice lens: evidence artifact and safety check Practice lens: **Agentic Tool-Governance Lens** for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**. [234, 2026]; [235, 2026].

Planning question: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?

Evidence artifact: agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path.

Validation rule: verify least privilege, prompt-injection exposure, provenance, observability, stop conditions, and incident-reporting triggers. Applied to **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

Handoff contract: export agent traces, tool calls, retrieved sources, policy decisions, and human approvals separately.

Safety check: block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions.

48.3.3.4 AGEINT Security and Adversarial Considerations runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 48; [234, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	34.99	34.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind AGEINT Security and Adversarial Considerations to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
AGEINT pattern registry, agent identity, and interface-contract studio	34.100	34.100 source title transformed into safe curriculum treatment; original: V2 AGEINT-depth extension: require compliance mapping, adversarial evaluation, impact assessment, trustworthiness review, and accountable remediation for agent security discussions	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Bounded autonomy, procurement, incident-response, and assurance studio	34.101	34.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for AGEINT Security and Adversarial Considerations	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Model-card, recoverability, retention, and learner-support evidence package	34.102	34.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for AGEINT Security and Adversarial Considerations	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

48.3.3.6 AGEINT Security and Adversarial Considerations annotated source ledger: real titles and local contribution Each source cited by this **Agentic AI Governance and Tool Security** module is paired below with its real title and a one-line note on what it contributes to **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

Source	Cited work	What it contributes	Status
[234, 2026]	AI Act	The European Commission's official page on the AI Act, described as the first comprehensive legal framework on artificial intelligence worldwide. It explains the regulation's risk-based approach, classifying AI systems into unacceptable, high, transparency, and minimal risk tiers, with prohibited practices and strict requirements for high-risk uses.	verified source-guide
[235, 2026]	ISO/IEC 42005:2025 AI System Impact Assessment	ISO standard page for AI system impact assessment.	original source-guide
[236, 2026]	ISO/IEC TR 24028:2020 Artificial Intelligence Trustworthiness Overview	The ISO catalog page for ISO/IEC TR 24028:2020, a technical report titled "Information technology — Artificial intelligence — Overview of trustworthiness in artificial intelligence." The document surveys topics related to AI trustworthiness, including approaches to establishing trust through transparency, explainability, and controllability, and approaches to assess and achieve availability, resilience, reliability, accuracy, safety, security, and privacy of AI systems.	verified source-guide
[276, 2026]	What is a Data Protection Impact Assessment and When Is This Mandatory?	A European Data Protection Board FAQ page, part of its data protection guide for small businesses, explaining Data Protection Impact Assessments (DPIAs) and when they are mandatory. It describes a DPIA as a written assessment of the impact of a planned processing operation, required when processing poses high risks to individuals' rights.	verified source-guide
[277, 2026]	Endorsed WP29 Guidelines	This is a European Data Protection Board webpage listing guidelines and documents originating from the Article 29 Working Party that the EDPB endorsed at its first plenary meeting. The catalogued materials relate to the GDPR and cover topics such as consent and transparency, data breach notification, automated decision-making and profiling, data protection impact assessments, data protection officers, and binding corporate rules.	verified source-guide

Source	Cited work	What it contributes	Status
[284, 2026]	Verifiable Credential Data Integrity 1.0	The W3C Recommendation for Verifiable Credential Data Integrity 1.0, published May 2025, defining mechanisms for ensuring the authenticity and integrity of verifiable credentials using cryptographic proofs. It specifies a process of data transformation, hashing, and proof generation, and a corresponding verification procedure, along with a proof data model containing properties such as type, verification method, purpose, and proof value.	verified source-guide
[288, 2026]	Algorithmic Transparency Recording Standard Hub	A GOV.UK collection page serving as the hub for the UK Algorithmic Transparency Recording Standard (ATRS), maintained by the Government Digital Service. It provides a standardized template for documenting public-sector use of algorithmic tools, completion guidance, policy on scope and compliance, and a searchable repository of published transparency records.	verified source-guide
[289, 2026]	Guidance for Organisations Using the Algorithmic Transparency Recording Standard	This is a GOV.UK guidance page published by the Government Digital Service that instructs public sector organizations on completing the Algorithmic Transparency Recording Standard (ATRS) template and publishing their records to the GOV.UK repository. It applies both to central government bodies required to publish under mandatory policy and to other public sector bodies doing so voluntarily.	verified source-guide
[293, 2026]	Inventory of NARA Artificial Intelligence (AI) Use Cases	The National Archives and Records Administration (NARA) official inventory of its artificial intelligence use cases, documenting 14 projects across deployed, pilot, and planned stages. Deployed efforts include workplace productivity tools, automated tagging for museum experiences, and historical record retrieval, while pilots cover PII detection and redaction, semantic search, and metadata generation, and planned work targets FOIA processing and public search.	verified source-guide
[147, 2026]	Agent Framework Security	Security analysis of major AI agent frameworks including LangChain, CrewAI, AutoGen, Semantic.	original practitioner context; secondary evidence only
[155, 2026]	Model Context Protocol (MCP): Security Design Considerations	Radosevich and Halloran (2025) audit security vulnerabilities in Anthropic's Model Context Protocol (MCP), which allows LLMs to integrate with external tools and data sources. The authors demonstrate that language models using MCP can be manipulated through prompt injection to execute malicious code, enable remote access, and steal credentials.	verified source-guide

Source	Cited work	What it contributes	Status
[159, 2026]	Security Risks of Agentic AI: A Model Context Protocol (MCP	A September 2025 Bitdefender Business Insights article by Martin Zugec examining security risks in the Model Context Protocol, the standard introduced by Anthropic for connecting AI agents to external tools and data. It identifies concerns including weak default authentication, supply-chain exposure from compromised tools, over-permissioned access tokens, injection and context-poisoning attacks, and gaps in audit logging for agentic workflows.	verified practitioner context; secondary evidence only
[137, 2026]	[2601.12560] Agentic Artificial Intelligence (AI)	An arXiv paper surveying the shift from passive language models to Agentic AI, where large language models act as cognitive controllers that combine memory, tool use, and environmental feedback to pursue extended goals. It proposes a unified taxonomy organizing agent systems into six components: perception, brain, planning, action, tool use, and collaboration.	verified source-guide
[160, 2026]	Breaking down the Top 12 Papers on Agentic AI Governance	Oliver Patel compiled a three-part series summarizing twelve influential research papers on governing autonomous AI systems, organized around themes of security and safety, infrastructure and principal-agent theory, and regulatory and capability assessment. The papers collectively argue that governance cannot be applied reactively after agents act but must instead be embedded at the architectural level, preventing unauthorized autonomous behavior before it occurs.	verified practitioner context; secondary evidence only
[161, 2026]	New Governance Frameworks Offer a Roadmap for Managing Risks	A January 2026 article from the law firm Davis Wright Tremaine on governance frameworks for agentic AI. It argues that autonomous, adaptive AI systems pose distinct risks, such as unauthorized or erroneous actions, biased decisions, data breaches, and opaque audit trails, that require governance beyond existing AI frameworks.	verified source-guide
[100, 2026]	A Survey on Large Language Model-based Agents in Autonomous	This survey examines how large language model-based agents can be weaponized as autonomous cyberattack tools, analyzing their architecture across five core components: models, perception, memory, reasoning and planning, and tools. The authors document eight attack categories and map them across static infrastructure, mobile networks, and infrastructure-free systems such as blockchain and the metaverse.	verified source-guide
[162, 2026]	Agentic AI report reveals need for reliable autonomous operations	A Dynatrace blog post summarizing its Pulse of Agentic AI 2026 report, based on a survey of over 900 organizational leaders on enterprise adoption of agentic AI. It finds high adoption in IT operations alongside planned budget increases, while identifying barriers to scaling including security and compliance concerns, difficulty monitoring agents, and unclear autonomy boundaries.	verified source-guide

Source	Cited work	What it contributes	Status
[004, 2026]	AI Won't Replace Spies—It Will Make Them More Powerful Than Ever	Tom Mulligan argues that artificial intelligence will enhance rather than replace human intelligence professionals, contending that the future of intelligence lies in human-machine collaboration. He maintains that uniquely human qualities such as intuition, experience, and independent judgment become more valuable as adversaries gain access to the same AI tools.	verified source-guide
[148, 2026]	How Riverside Research Advances Agentic AI for National Security	This article by Riverside Research traces AI's evolution from large language models through retrieval-augmented systems, single-task agents, collaborative agentic systems, and toward emergent multi-agent autonomy capable of managing surveillance and decision support at operational speed.	verified source-guide
[299, 2026]	Model Context Protocol Specification	The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation).	verified source-guide context; use pinned MCP anchor for normative claims
[306, 2026]	Artificial Intelligence	Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support.	original source-guide
[312, 2026]	Guide on the Use of Agentic Artificial Intelligence	Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support.	original source-guide

Where this sits. This module's overview is Section 48; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

48.3.4 AGEINT Security and Adversarial Considerations governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 48; [234, 2026].

48.3.5 AGEINT Security and Adversarial Considerations analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 34's governance-boundary section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Agentic AI Governance and Tool Security** for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**. [234, 2026]; [235, 2026].

Curriculum topic spine: Agent Framework Security Vulnerabilities, **Python REPL sandbox and approval-gate**, **Cyber credential-and-movement taxonomy review using fabricated alerts**. **Verified anchor cluster:** [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]; [Community, 2020b]; [Community, 2020a]; [of the Director of National Intelligence, 2025b].

Conceptual depth: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation.

Method stack: AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills.

Composability contract: agents, tools, credentials, memory, retrieval stores, policies, and logs remain separately inspectable and revocable components.

Known failure modes: excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains.

Defensive boundary: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists. Applied to **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

Anchor	Why it matters here
[OECD, 2026a]	Official OECD conceptual foundation for agentic AI. Checked as of 2026-05-21; role: source_quality_anchor.
[of Canada Secretariat, 2026a]	Government of Canada guide for accountable public-sector use of agentic AI, including governance, risk, transparency, testing, monitoring, and human oversight considerations. Checked as of 2026-05-24; role: curriculum_anchor.
[of Standards and Technology, 2023]	Official NIST.AI.100-1 risk-management framework. Checked as of 2026-05-21; role: source_quality_anchor.
[of Standards and Technology, 2024d]	Official NIST AI 600-1 generative AI profile. Checked as of 2026-05-21; role: source_quality_anchor.
[Community, 2020b]	Official IC principles for lawful, accountable, objective, human-centered, secure, resilient, and science-informed AI. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2025b]	Official IC AI governance directive covering CAIO roles, oversight, interoperability, civil-liberties review, training data, and impact assessment. Checked as of 2026-05-21; role: curriculum_anchor.

48.3.5.1 Threat-model framework: MAESTRO seven layers The CSA MAESTRO model gives a concrete map of where an agentic system can be attacked, shown in Figure 92. It stacks seven layers of the agent lifecycle: foundation models (L1: adversarial examples, model stealing, backdoors), data operations (L2: poisoning, RAG-pipeline compromise), agent frameworks (L3: supply chain and input validation), deployment and infrastructure (L4: container escape, lateral movement), evaluation and observability (L5: metric manipulation, detection evasion), and the agent ecosystem (L7: impersonation, marketplace and goal manipulation). The layer that carries the sharpest lesson is L6, Security and Compliance, which is drawn cross-cutting every other layer rather than stacked among them: the security agents you deploy to watch the system are themselves an attack surface, so a mature design must monitor the monitors [Alliance, 2025b]; [Initiative), 2025].

48.3.5.2 Governance control: SRE circuit breaker Knowing where attacks land is not the same as bounding their blast radius. The SRE circuit-breaker teaching pattern, depicted in Figure 93, adapts reliability vocabulary into an author-defined governance exercise for agents with three states. In CLOSED the agent operates normally, its autonomy earned by a clean safety record; when the safety error budget is exhausted – for this curriculum, when the PolicyCompliance service-level indicator falls below 99 percent – the breaker trips to OPEN and a human takes over; after a recovery period plus validation it moves to HALF_OPEN with limited capability, returning to CLOSED only if the clean record holds and snapping back to OPEN on any new violation. Activation triggers include policy-bypass attempts, LLM-provider errors, tool-timeout cascades, trust-score degradation, and reasoning loops or deadlocks. Teach this as a defensive governance exercise: define the PolicyCompliance SLI for a synthetic agent, set its error budget, and rehearse the OPEN-state human takeover as a tabletop rather than a live intervention [arXiv preprint authors, 2025b]; [United Nations University, 2026].

The PolicyCompliance service-level indicator makes the 99-percent threshold concrete. Over a review window of N_{total} governed actions with $N_{\text{violations}}$ policy violations, define

$$\text{PolicyCompliance}_{\text{SLI}} = \frac{N_{\text{total}} - N_{\text{violations}}}{N_{\text{total}}} \;\geq\; 0.99,$$

so the breaker's CLOSED state is exactly the region where this indicator clears its target. The complementary error budget is the count of violations the window can absorb before the indicator drops below target,

$$\text{ErrorBudget} = (1 - 0.99)\, N_{\text{total}} = 0.01\, N_{\text{total}}, \qquad \text{breaker} \to \text{OPEN when } N_{\text{violations}} > \text{ErrorBudget}.$$

The budget burns down as violations accrue and is restored when a fresh window opens, which is the quantity the safety-error-budget figure tracks. Have students compute the SLI on a synthetic action log, set N_{total} for one window, and identify the exact violation count that trips the breaker [arXiv preprint authors, 2025b].

48.3.5.3 AGEINT Security and Adversarial Considerations evidence standard and citation floor: source families and discovery limits Official guidance supplies governance, safety, and legal constraints for the **Agentic AI Governance and Tool Security** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [234, 2026]; [235, 2026].

48.3.6 AGEINT Security and Adversarial Considerations agentic boundary: assist, approve, block, and record

Evidence anchor. Section 48; [234, 2026].

AGEINT translation is bounded by the **Agentic AI Governance and Tool Security** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

48.3.6.1 AGEINT Security and Adversarial Considerations permitted defensive utility: curriculum uses and safe outputs Evidence anchor. Section 48; [234, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

48.3.6.2 AGEINT Security and Adversarial Considerations excluded operational boundary: blocked actions and stop rules Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [234, 2026]; [235, 2026] and **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

48.3.7 AGEINT Security and Adversarial Considerations governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 48; [234, 2026].

Governance is practiced as a gate on the **Agentic AI Governance and Tool Security** lane. Learners use the **Defensive Cyber-Intelligence Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

48.3.7.1 AGEINT Security and Adversarial Considerations governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [234, 2026]; [235, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Agentic AI Governance and Tool Security** failure modes and the **Defensive Cyber-Intelligence Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

48.3.7.2 AGEINT Security and Adversarial Considerations evidence package handoff: appendices, records, and reuse Evidence anchor. Section 48; [234, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Defensive Cyber-Intelligence Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

48.3.7.3 AGEINT Security and Adversarial Considerations current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**. [234, 2026]; [235, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_oecd_agentic_ai` for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**?	The Agentic AI Landscape and Its Conceptual Foundations; lane `source_quality_spine`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; Official OECD conceptual foundation for agentic AI.
What does the module inherit from `official_canada_agentic_ai_guide` for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**?	Guide on the Use of Agentic Artificial Intelligence; lane `public_sector_agentic_ai`; checked 2026-05-24.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; bounded-autonomy run card, recoverability review, approval threshold, monitoring evidence, and public-sector service assurance
What does the module inherit from `official_nist_ai_rmf` for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**?	Artificial Intelligence Risk Management Framework (AI RMF 1.0); lane `source_quality_spine`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; Official NIST.AI.100-1 risk-management framework.

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_nist_ai_600_1` for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**?	Artificial Intelligence Risk Management Framework: Generative AI Profile; lane `source_quality_spine`; checked 2026-05-21.	defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication; Official NIST AI 600-1 generative AI profile.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 48; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

48.3.8 AGEINT Security and Adversarial Considerations assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 48; [234, 2026].

48.3.9 AGEINT Security and Adversarial Considerations assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 48; [234, 2026].

48.3.9.1 AGEINT Security and Adversarial Considerations capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate** and [234, 2026]; [235, 2026].

48.3.9.2 AGEINT Security and Adversarial Considerations instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate** and [234, 2026]; [235, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

48.3.9.3 AGEINT Security and Adversarial Considerations assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Agent Framework Security Vulnerabilities	Completed **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Python REPL sandbox and approval-gate	Completed **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Cyber credential-and-movement taxonomy review using fabricated alerts	Completed **defensive CTI packet with indicator context, taxonomy mapping, confidence, handling rule, and control implication** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

48.3.10 AGEINT Security and Adversarial Considerations refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [234, 2026]; [235, 2026] and **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**.

48.3.10.1 AGEINT Security and Adversarial Considerations refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**. The local signals begin with [234, 2026]; [235, 2026].

48.3.10.2 AGEINT Security and Adversarial Considerations claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**, and the source spine for these checks begins with [234, 2026]; [235, 2026].

48.3.11 AGEINT Security and Adversarial Considerations reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [234, 2026]; [235, 2026].

Triangulation anchors. In module 34's review-checklist section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate**. [234, 2026]; [235, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

48.3.12 AGEINT Security and Adversarial Considerations learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **Agent Framework Security Vulnerabilities; Python REPL sandbox and approval-gate** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [234, 2026]; [235, 2026].

Section 2, Section 44, Section 47, Section 49

49 Active Inference and AGEINT

49.0.1 Active Inference and AGEINT figures and course links: visual evidence, source flow, and navigation

The module uses Figure 104, Figure 105, and Figure 85 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 44, Section 48, Section 50.
This module teaches the **Active-Inference Theory and Governed Agent Analogy** lane through a bounded, source-backed coursebook chapter. [247, 2026]; [248, 2026].

49.1 Active-Inference Theory and Governed Agent Analogy frame for Active Inference and AGEINT: source context, topic focus, and reader task

Evidence anchor. Section 49; [247, 2026].

49.1.1 Active Inference and AGEINT orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 49; [247, 2026].

49.1.2 Active Inference and AGEINT conceptual primer: source context, core model, and reader task

This chapter teaches agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The chapter uses **Active-Inference Boundary Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.
The central distinction is to separate agent assistance from autonomous external action. Core topics include **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior; Shared Protentions in Multi-Agent Active Inference**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Friston, 2010]; [Christopher L. Buckley and Seth, 2017]; [Friston, 2017]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [247, 2026]; [248, 2026].
Learners move from vocabulary and the **Active-Inference Boundary Lens** distinction through topic lessons on **The Free Energy Principle and Predictive Processing** with evidence and misconception checks, then assemble a **theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition** with safety and rights gates.

49.1.3 Active Inference and AGEINT learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 49; [247, 2026].

- Connect **The Free Energy Principle and Predictive Processing and Active Inference as Computational Model of Intelligence Agent Behavior** to **Active-Inference Theory and Governed Agent Analogy** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate agent assistance from autonomous external action; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as treating a formal theory as product evidence, using analogy as architecture proof, citing policy guidance for mathematical claims, and letting autonomy language outrun evaluation evidence, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: active-inference material stays theoretical and classroom bounded; it does not prove autonomous action, intent detection, operational performance, or deployment without explicit authority and review.

49.1.4 Active Inference and AGEINT core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 49; [247, 2026].

Term	Working definition
Agent identity	the named software actor, role, and authorization context for a run
Tool allowlist	the bounded set of actions the agent may request
Delegation	the handoff of a task under explicit human authority and review
Bounded autonomy	the documented ceiling on what an agent may decide or request without review
Recoverability	the path back to a known-safe state after a bad output or action request
AI incident	a logged event where an AI system creates or plausibly creates harm or loss of control
Prompt injection	untrusted content that attempts to override instructions or authority boundaries
Pattern registry	the catalog of approved agent behaviors, prompts, and evaluation hooks
Adversarial eval	structured tests that probe agent misuse, injection, and over-delegation before release
The Free Energy Principle and Predictive…	Key terms: Free, Energy, Principle.
Active Inference as Computational Model of…	Key terms: Active, Inference, Computational.

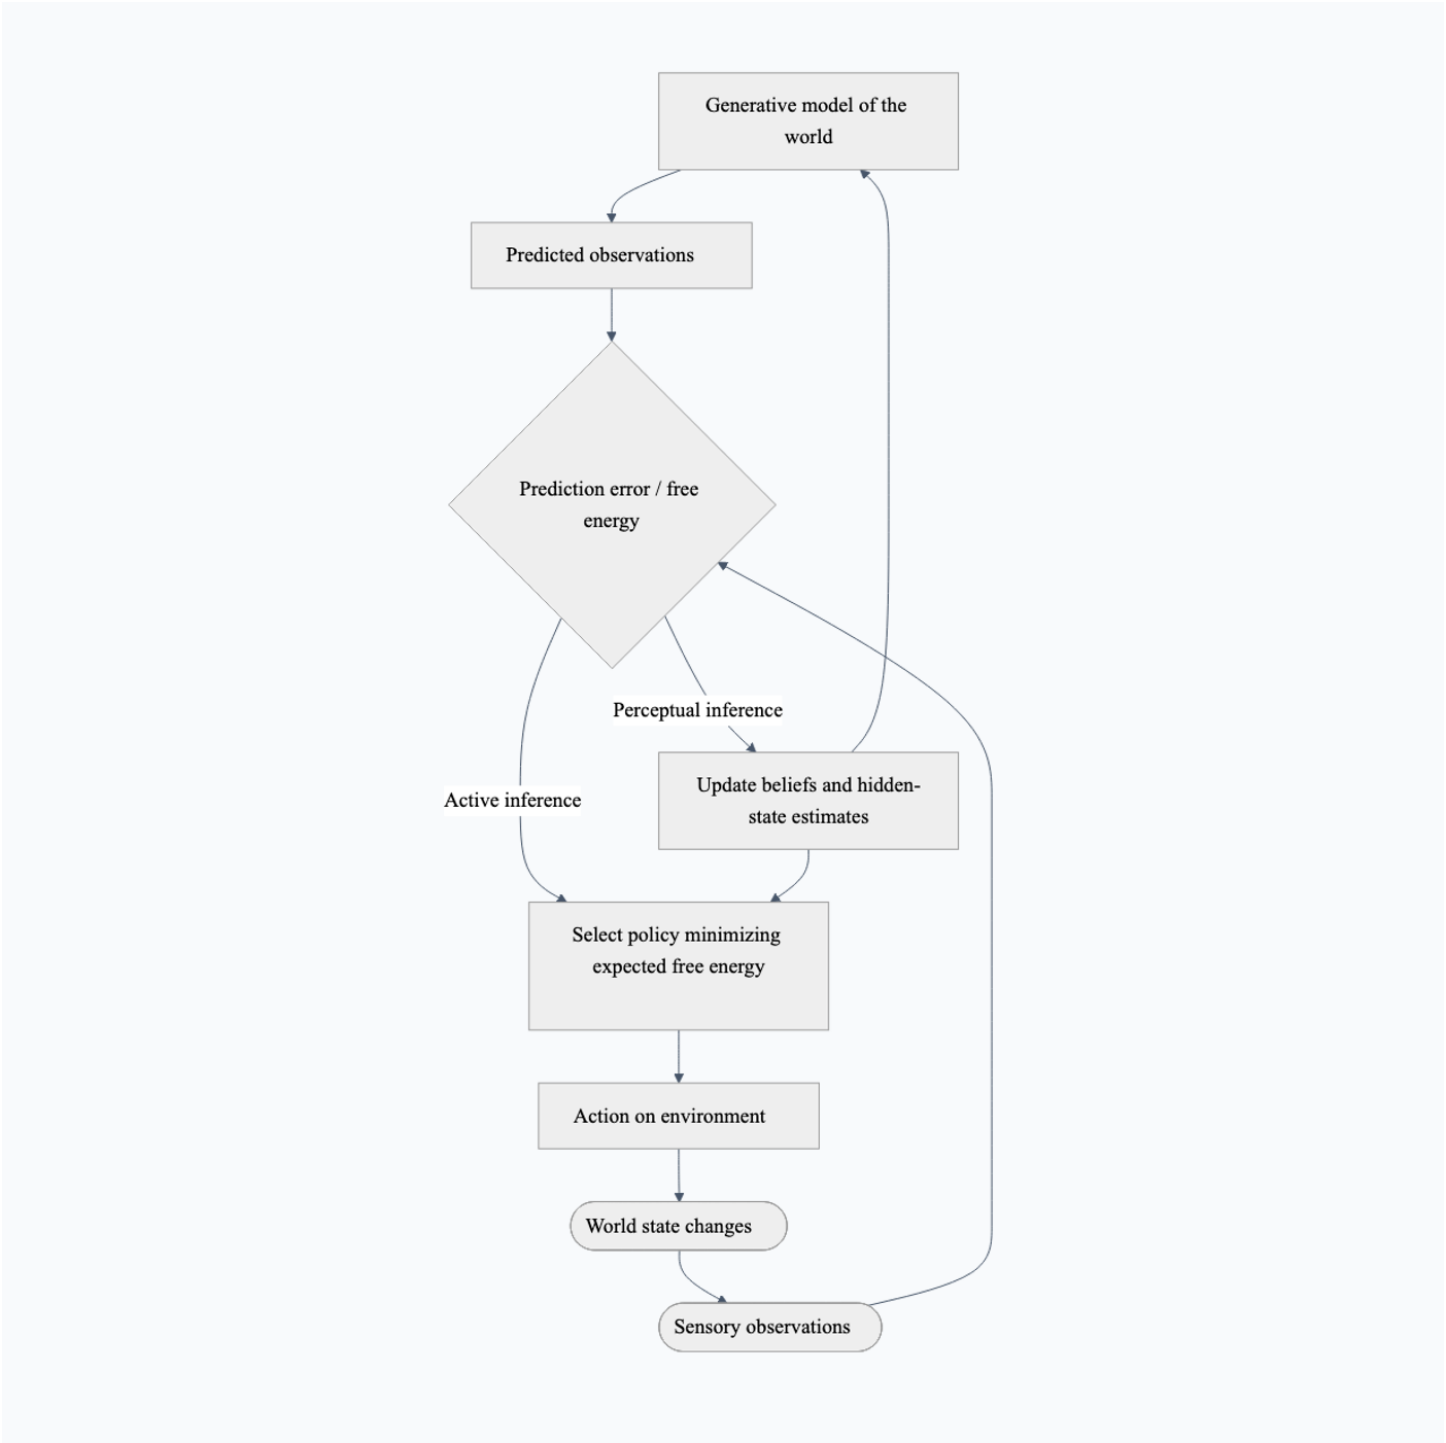

Figure 104: Conceptual teaching schematic for one active-inference interpretation of perception, belief updating, policy selection, and action; it is not validated AGEINT agent architecture or proof of autonomous performance. It is anchored to the ageint agentic intelligence / active inference and ageint section; use it to inspect A . A generative model produces predictions, which are compared against sensory observations to compute prediction error or free energy. The error branches to perceptual inference that updates beliefs, to policy selection that may choose an action, and with a governance caveat that the schematic is a theory analogy rather than deployment evidence. teaching schematic for one active-inference interpretation of perception while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

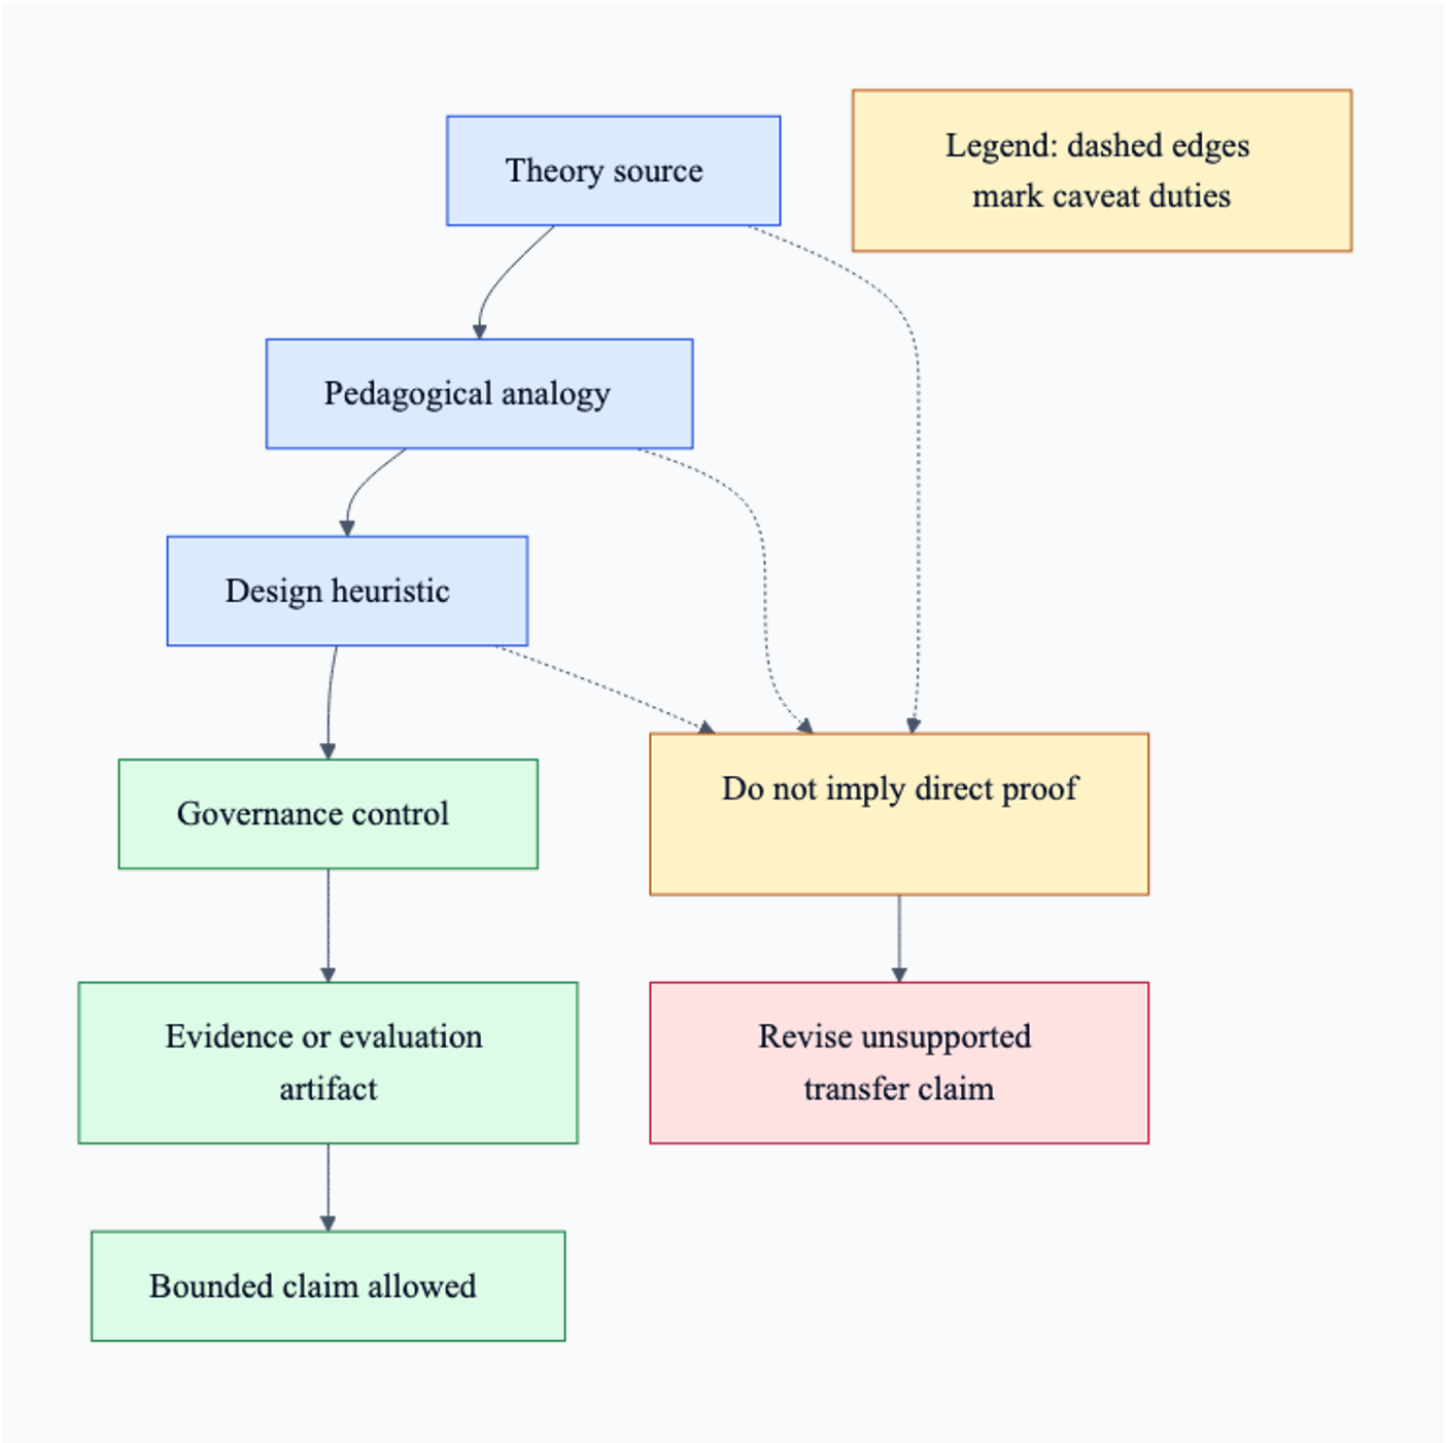

Figure 105: Conceptual schematic separating active-inference theory, pedagogical analogy, agent-design heuristic, governance control, and empirical evidence so the manuscript does not overclaim theory transfer. In the ageint agentic intelligence / active inference and ageint section, it lets readers compare Theory source, Pedagogical analogy, Design heuristic, and Governance control so the visual functions as a traceable course aid rather than an unscoped assertion.

49.2 Active-Inference Boundary Lens path for Active Inference and AGEINT: lesson cluster, safe artifact, and review

Evidence anchor. Section 49; [247, 2026].

49.2.1 Active Inference and AGEINT practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 49; [247, 2026].

49.2.2 Active Inference and AGEINT topic lessons: source-backed concepts and transfer tasks

This module builds agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The sequence opens with **The Free Energy Principle and Predictive Processing**, **Active Inference as Computational Model of Intelligence Agent Behavior**, **Shared Protentions in Multi-Agent Active Inference** and applies the **Active-Inference Boundary Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 85; module overview Section 49; curriculum atlas Section 2.

Triangulation anchors. In module 35's topic-lessons section, directly verified anchors for the **Active-Inference Theory and Governed Agent Analogy** lane include [Friston, 2010]; [Christopher L. Buckley and Seth, 2017]; [Friston, 2017]; [Da Costa, 2020]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

49.2.2.1 Lesson 1: The Free Energy Principle and Predictive Processing

Concept. The Free Energy Principle and Predictive Processing treats the free-energy principle as computational-neuroscience theory, define prediction error, generative model, and uncertainty in plain language, then show how the theory helps an analyst notice when a model is explaining too much from too little evidence.

Why it matters. The Free Energy Principle matters in the **Active-Inference Theory and Governed Agent Analogy** lane because least-privilege agent design and run evidence must stay separate from judgment; treating a formal theory as product evidence is a common failure.

Source support. The Free Energy Principle and Predictive Processing rests on [106, 2026]. The lead source's own note reads: It explains active inference as a theory describing behavior that minimizes surprise, and surveys model variants such as deep active inference, multimodal deep belief networks, predictive coding, and probabilistic programming. Use it for the working definition that **The Free Energy Principle and Predictive Processing** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Friston, 2010]; [Christopher L. Buckley and Seth, 2017].

Evidence to inspect. For **The Free Energy Principle**, work from the cited evidence behind this row. [106, 2026] A 2024 bachelor's thesis by Lara Sakarya at Delft University of Technology presenting a systematic literature review of the active inference framework and the free-energy principle as applied to mimicking social human behavior in intelligent agents. It explains active inference as a theory describing behavior that minimizes surprise, and surveys model variants such as deep active inference, multimodal deep belief networks, predictive coding, and probabilistic programming. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **The Free Energy Principle**, build a prediction-error concept card linking formal source, surprise, model assumption, analogy limit, and reviewer checkpoint. Shape **The Free Energy Principle** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that The Free Energy Principle and Predictive Processing replaces human review whenever evidence looks plausible.

Transfer task. For **The Free Energy Principle**, transfer the idea to a non-AI chapter by naming the assumed model, the surprising observation, and the review point before any decision follows.

Free-energy bound. Variational free energy F upper-bounds surprise $-\ln p(o)$ for observations o and hidden states s under a recognition density $q(s)$:

$$F = D_{\mathrm{KL}}(q(s) \,\|\, p(s \mid o)) - \ln p(o) \;\geq\; -\ln p(o).$$

Because the Kullback-Leibler term is non-negative, minimizing F over $q(s)$ tightens the bound on surprise – the precise statement of this lesson's plain-language warning about a model explaining too much from too little evidence [Friston, 2010]; [Christopher L. Buckley and Seth, 2017].

49.2.2.2 Lesson 2: Active Inference as Computational Model of Intelligence Agent Behavior

Concept. Active Inference as Computational Model of Intelligence Agent Behavior treats active inference as an agent-modeling vocabulary: beliefs, actions, expected observations, and policy selection are classroom concepts, not proof that an intelligence agent should act autonomously.

Why it matters. Analysts use **Active Inference** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating a formal theory as product evidence would otherwise hide, and the reviewer accountable for challenge.

Source support. Active Inference as Computational Model of Intelligence Agent Behavior rests on [003, 2026]. The lead source's own note reads: A 2021 peer-reviewed article by Stephen Fox in the journal Entropy that relates the active inference framework to social organization. Use it for the working definition that **Active Inference as Computational Model of Intelligence Agent Behavior** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Friston, 2010]; [Christopher L. Buckley and Seth, 2017].

Evidence to inspect. For **Active Inference**, reason from the sources cited in this row. [003, 2026] A 2021 peer-reviewed article by Stephen Fox in the journal Entropy that relates the active inference framework to social organization. It maps concepts such as variational free energy, prediction error, generative models, and Markov blankets onto industrial engineering and quality management practices, treating organizational survival as the maintenance of process control limits. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Active Inference**, build a toy agent-model card with beliefs, actions, observations, implementation assumption, and a human approval gate. Shape **Active Inference** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Active Inference as Computational Model of Intelligence Agent Behavior can be used while ignoring the rule to separate agent assistance from autonomous external action.

Transfer task. For **Active Inference**, transfer the idea to a non-AI chapter by naming the assumed model, the surprising observation, and the review point before any decision follows.

49.2.2.3 Lesson 3: Shared Protentions in Multi-Agent Active Inference

Concept. Shared Protentions in Multi-Agent Active Inference treats active inference as an agent-modeling vocabulary: beliefs, actions, expected observations, and policy selection are classroom concepts, not proof that an intelligence agent should act autonomously.

Why it matters. Shared Protentions matters in the **Active-Inference Theory and Governed Agent Analogy** lane because least-privilege agent design and run evidence must stay separate from judgment; treating a formal theory as product evidence is a common failure.

Source support. Shared Protentions in Multi-Agent Active Inference rests on [163, 2026]. The closest source to this row notes: It explains how intelligent agents can develop shared, mutually aligned expectations about future states that enable coordinated group behavior without explicit communication, drawing on Husserl's work on temporal consciousness. Use it for the claim that **Shared Protentions in Multi-Agent Active**

Inference lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Friston, 2010]; [Christopher L. Buckley and Seth, 2017].

Evidence to inspect. Ground **Shared Protentions** in the evidence the row cites. [163, 2026] An article on deniseholt.us covering a 2024 paper by VERSES AI researchers, led by Mahault Albarracin and co-authored by Karl Friston, titled Shared Protentions in Multi-Agent Active Inference. It explains how intelligent agents can develop shared, mutually aligned expectations about future states that enable coordinated group behavior without explicit communication, drawing on Husserl's work on temporal consciousness. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Shared Protentions**, build a shared-expectation register showing aligned expectations, dissent, and review ownership. Shape **Shared Protentions** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Shared Protentions in Multi-Agent Active Inference is optional whenever separate agent assistance from autonomous external action feels inconvenient.

Transfer task. For **Shared Protentions**, transfer the idea to a non-AI chapter by naming the assumed model, the surprising observation, and the review point before any decision follows.

49.2.2.4 Lesson 4: Active Inference for Social Organization and Intelligence Communities

Concept. Active Inference for Social Organization and Intelligence Communities treats active inference as an agent-modeling vocabulary: beliefs, actions, expected observations, and policy selection are classroom concepts, not proof that an intelligence agent should act autonomously.

Why it matters. Active Inference connects classroom vocabulary to Active-Inference Theory and Governed Agent Analogy practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Active Inference for Social Organization and Intelligence Communities rests on [003, 2026]. Its anchor reference records: A 2021 peer-reviewed article by Stephen Fox in the journal Entropy that relates the active inference framework to social organization. Use it for fixing what **Active Inference for Social Organization and Intelligence Communities** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Friston, 2010]; [Christopher L. Buckley and Seth, 2017].

Evidence to inspect. For **Active Inference**, reason from the sources cited in this row. [003, 2026] A 2021 peer-reviewed article by Stephen Fox in the journal Entropy that relates the active inference framework to social organization. It maps concepts such as variational free energy, prediction error, generative models, and Markov blankets onto industrial engineering and quality management practices, treating organizational survival as the maintenance of process control limits. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Active Inference**, build an institutional feedback-loop map with incentives, review points, and oversight hooks. Shape **Active Inference** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Active Inference for Social Organization and Intelligence Communities establishes intent without reviewing alternative explanations.

Transfer task. For **Active Inference**, transfer the idea to a non-AI chapter by naming the assumed model, the surprising observation, and the review point before any decision follows.

49.2.2.5 Lesson 5: VERSES AI Research: Multi-Scale Active Inference Architectures

Concept. VERSES AI Research: Multi-Scale Active Inference Architectures treats active inference as an agent-modeling vocabulary: beliefs, actions, expected observations, and policy selection are classroom concepts, not proof that an intelligence agent should act autonomously.

Why it matters. VERSES AI Research matters in the **Active-Inference Theory and Governed Agent Analogy** lane because least-privilege agent design and run evidence must stay separate from judgment; treating a formal theory as product evidence is a common failure.

Source support. VERSES AI Research: Multi-Scale Active Inference Architectures rests on [163, 2026] and [164, 2026]. Its anchor reference records: An article on deniseholt.us covering a 2024 paper by VERSES AI researchers, led by Mahault Albarracin and co-authored by Karl Friston, titled Shared Protentions in Multi-Agent Active Inference. Use them for the working definition that **VERSES AI Research: Multi-Scale Active Inference Architectures** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Friston, 2010]; [Christopher L. Buckley and Seth, 2017].

Evidence to inspect. For **VERSES AI Research**, reason from the sources cited in this row. [163, 2026] An article on deniseholt.us covering a 2024 paper by VERSES AI researchers, led by Mahault Albarracin and co-authored by Karl Friston, titled Shared Protentions in Multi-Agent Active Inference. It explains how intelligent agents can develop shared, mutually aligned expectations about future states that enable coordinated group behavior without explicit communication, drawing on Husserl's work on temporal consciousness. [164, 2026] A press release from VERSES AI (August 2024) announcing that the company would act as lead sponsor of and present research at the 5th International Workshop on Active Inference (IWAI 2024) in Oxford. It states that VERSES researchers had 12 accepted papers spanning foundational capabilities, multi-agent systems, applications, and ethics, and that the company's chief scientist Karl Friston would speak. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **VERSES AI Research**, build an architecture-claim card separating research claims, implementation assumptions, and governance limits. Shape **VERSES AI Research** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that VERSES AI Research: Multi-Scale Active Inference Architectures replaces human review whenever evidence looks plausible.

Transfer task. For **VERSES AI Research**, transfer the idea to a non-AI chapter by naming the assumed model, the surprising observation, and the review point before any decision follows.

49.2.2.6 Lesson 6: Cognitive Security Through the Active Inference Lens

Concept. Cognitive Security Through the Active Inference Lens treats active inference as an agent-modeling vocabulary: beliefs, actions, expected observations, and policy selection are classroom concepts, not proof that an intelligence agent should act autonomously.

Why it matters. Analysts use **Cognitive Security** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating a formal theory as product evidence would otherwise hide, and the reviewer accountable for challenge.

Source support. Cognitive Security Through the Active Inference Lens rests on [105, 2026]. The lead source's own note reads: Sarah Rajtmajer and Daniel Susser, 'Automated Influence and the Challenge of Cognitive Security,' in Hot Topics in the Science of Security (HotSoS '20), April 2020, ACM. Use it for pinning down the scope of **Cognitive Security Through the Active Inference Lens**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Friston, 2010]; [Christopher L. Buckley and Seth, 2017].

Evidence to inspect. For **Cognitive Security**, work from the cited evidence behind this row. [105, 2026] Sarah Rajtmajer and Daniel Susser, 'Automated Influence and the Challenge of Cognitive Security,' in Hot Topics in the Science of Security (HotSoS '20), April 2020, ACM. The paper argues that AI-powered computational propaganda poses national security threats that existing ethical frameworks do not address, and proposes 'cognitive security' as a productive conceptual lens for evaluating the ethics of automated influence operations and potential defensive responses. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Cognitive Security**, build a sample narrative-risk map with provenance, audience harm, and transparent response options. Shape **Cognitive Security** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that Cognitive Security Through the Active Inference Lens can be used while ignoring the rule to separate agent assistance from autonomous external action.

Transfer task. For **Cognitive Security**, transfer the idea to a non-AI chapter by naming the assumed model, the surprising observation, and the review point before any decision follows.

49.2.2.7 Lesson 7: Applications: Deception Detection, Surprise Minimization, Threat Modeling

Concept. Applications: Deception Detection, Surprise Minimization, Threat Modeling compares deception indicators with alternative explanations and uncertainty before any operational inference.

Why it matters. Applications: Deception Detection, Surprise Minimization, Threat Modeling matters in the **Active-Inference Theory and Governed Agent Analogy** lane because least-privilege agent design and run evidence must stay separate from judgment; treating a formal theory as product evidence is a common failure.

Source support. Applications: Deception Detection, Surprise Minimization, Threat Modeling rests on [309, 2026], [310, 2026], and [300, 2026]. The closest source to this row notes: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for fixing what **Applications: Deception Detection, Surprise Minimization, Threat Modeling** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Friston, 2010]; [Christopher L. Buckley and Seth, 2017].

Evidence to inspect. Ground **Applications: Deception Detection, Surprise Minimization, Threat Modeling** in the evidence the row cites. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Applications**, build a threat-model review card with assumptions, disconfirming evidence, and confidence language. Shape **Applications: Deception Detection, Surprise Minimization, Threat Modeling** work as an **agent run and assurance card** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception that Applications: Deception Detection, Surprise Minimization, Threat Modeling is optional whenever separate agent assistance from autonomous external action feels inconvenient.

Transfer task. Transfer **Applications: Deception Detection, Surprise Minimization, Threat Modeling** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

49.2.2.8 Lesson 8: Applications of Active Inference and FEP in Intelligence (TU Delft Thesis)

Concept. Applications of Active Inference and FEP in Intelligence (TU Delft Thesis) treats active inference as an agent-modeling vocabulary: beliefs, actions, expected observations, and policy selection are classroom concepts, not proof that an intelligence agent should act autonomously.

Why it matters. Analysts use **Applications of Active Inference and FEP in Intelligence (TU Delft Thesis)** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that treating a formal theory as product evidence would otherwise hide, and the reviewer accountable for challenge.

Source support. Applications of Active Inference and FEP in Intelligence (TU Delft Thesis) rests on [106, 2026]. The most specific cited work observes: It explains active inference as a theory describing behavior that minimizes surprise, and surveys model variants such as deep active inference, multimodal deep belief networks, predictive coding, and probabilistic programming. Use it for the claim that **Applications of Active Inference and FEP in Intelligence (TU Delft Thesis)** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Friston, 2010]; [Christopher L. Buckley and Seth, 2017].

Evidence to inspect. Read **Applications of Active Inference and FEP in Intelligence (TU Delft Thesis)** against the works cited for this row. [106, 2026] A 2024 bachelor's thesis by Lara Sakarya at Delft University of Technology presenting a systematic literature review of the active inference framework and the free-energy principle as applied to mimicking social human behavior in intelligent agents. It explains active inference as a theory describing behavior that minimizes surprise, and surveys model variants such as deep active inference, multimodal deep belief networks, predictive coding, and probabilistic programming. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Applications of Active Inference and FEP in Intelligence (TU Delft Thesis)**, build a research question, method, evidence base, and classroom boundary statement for the thesis topic. Shape this subject work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Applications of Active Inference and FEP in Intelligence (TU Delft Thesis) establishes intent without reviewing alternative explanations.

Transfer task. For **Applications of Active Inference and FEP in Intelligence (TU Delft Thesis)**, transfer the idea to a non-AI chapter by naming the assumed model, the surprising observation, and the review point before any decision follows.

49.2.3 Active Inference and AGEINT worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic research assistant agent organizes public readings for an instructor. [247, 2026]; [248, 2026].

Triangulation anchors. In module 35's worked-example section, directly verified anchors for the **Active-Inference Theory and Governed Agent Analogy** lane include [Friston, 2010]; [Christopher L. Buckley and Seth, 2017]; [Friston, 2017]; [Da Costa, 2020]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **governed agentic intelligence**. Learners use a **agent run and assurance card** and keep this boundary visible: No autonomous external action, credentialed operations, live-target workflows, or uncontrolled tool use.

Frame. The classroom question centers on **The Free Energy Principle and Predictive Processing**. Excluded actions stay explicit, and the **Active-Inference Boundary Lens** planning question is: Which layer is formal theory, which layer is classroom analogy, which implementation claim needs evidence, and which governance control prevents autonomy overreach?

Inputs. For the **The Free Energy Principle and Predictive Processing** scenario, use public URLs, a fixed retrieval tool, a summarization prompt, a time budget, and a stop condition. The Active-Inference Boundary Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **The Free Energy Principle and Predictive Processing**, students bind the agent identity, list allowed tools, set autonomy limits, capture sources, block unsafe requests, and log approvals. Pause whenever an inference about The Free Energy Principle and Predictive Processing appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **The Free Energy Principle and Predictive Processing** classroom scenario; unit artifact = agent run and assurance card; evidence = allowed inputs; method = least-privilege agent design and run review; output = an agent run card with tool calls, source links, blocked actions, reviewer notes, incident threshold, and recovery decision; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **The Free Energy Principle and Predictive Processing** as "Active-Inference Boundary Lens confirms it" is not enough. The revision ties the claim to least-privilege agent design and run review, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **The Free Energy Principle and Predictive Processing** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

49.2.4 Active Inference and AGEINT practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Active-Inference Boundary Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

Triangulation anchors. In module 35's practice-sequence section, directly verified anchors for the **Active-Inference Theory and Governed Agent Analogy** lane include [Friston, 2010]; [Christopher L. Buckley and Seth, 2017]; [Friston, 2017]; [Da Costa, 2020]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare The Free Energy Principle and Predictive Processing, Active Inference as Computational Model of Intelligence Agent Behavior, Shared Protentions in Multi-Agent Active Inference; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Active-Inference Theory and Governed Agent Analogy** lane.
2. Frame	Answer the lens question: Which layer is formal theory, which layer is classroom analogy, which implementation claim needs evidence, and which governance control prevents autonomy overreach?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for The Free Energy Principle and Predictive Processing: theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the agent run and assurance card fields for The Free Energy Principle and Predictive Processing.	Unit profile note.	Evidence artifacts include tool-allowlist record, external-memory governance boundary.
4. Challenge	Test the misconception that The Free Energy Principle and Predictive Processing replaces human review whenever evidence looks plausible.	Failure-mode note.	The artifact applies the key distinction: separate agent assistance from autonomous external action.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

49.2.4.1 Active Inference and AGEINT instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**. [247, 2026]; [248, 2026].

49.2.4.2 Active Inference and AGEINT extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 49; [247, 2026].

Have learners swap artifacts and apply the **Active-Inference Boundary Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

49.2.5 Active Inference and AGEINT knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 49; [247, 2026].

1. Explain how **The Free Energy Principle and Predictive Processing** is defined here; name the source descriptor that supports the definition.
2. Contrast **The Free Energy Principle and Predictive Processing** with **Active Inference as Computational Model of Intelligence Agent Behavior** using the **Active-Inference Boundary Lens** artifact fields.
3. Identify one failure mode from the **Active-Inference Theory and Governed Agent Analogy** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which permission can be removed while preserving the learning objective?
5. Correct this misconception: that The Free Energy Principle and Predictive Processing replaces human review whenever evidence looks plausible.

49.2.5.1 Active Inference and AGEINT answer quality rubric: source evidence, uncertainty, and safe transfer

Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **The Free Energy Principle and Predictive Processing** without source evidence, uncertainty, or a safe transfer task.

49.3 Active Inference and AGEINT assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 49; [247, 2026].

49.3.1 Active Inference and AGEINT evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 49; [247, 2026].

49.3.2 Active Inference and AGEINT transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 49; [247, 2026].

49.3.2.1 Active Inference and AGEINT lineage and source tradition: profile, concepts, and first anchors This sits in the **Active-Inference Theory and Governed Agent Analogy** lineage: using free-energy and active-inference theory as a bounded computational vocabulary for perception, action, uncertainty, and policy selection while keeping AGEINT governance claims separate. [247, 2026]; [248, 2026].

49.3.2.2 Active Inference and AGEINT working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 49; [247, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**, with provenance and reviewability throughout.

49.3.2.3 Active Inference and AGEINT knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [247, 2026]; [248, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

49.3.2.4 Active Inference and AGEINT transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 49; [247, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.
- **Evidence contract:** keep the **Active-Inference Theory and Governed Agent Analogy** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

49.3.2.5 Active Inference and AGEINT profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 49; [247, 2026].

The matched profile emphasizes using free-energy and active-inference theory as a bounded computational vocabulary for perception, action, uncertainty, and policy selection while keeping AGEINT governance claims separate. The method stack is formal-source review, theory-to-analogy mapping, assumption listing, implementation-evidence check, governance-control mapping, and human-review caveat; the local topic cluster is **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

49.3.3 Active Inference and AGEINT evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 49; [247, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Active-Inference Theory and Governed Agent Analogy** profile tells reviewers what evidence is strong enough for the module artifact built around **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

49.3.3.1 Active Inference and AGEINT guide source spine: inherited keys and local citation roles Primary guide citations: [247, 2026]; [248, 2026]; [265, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [106, 2026]; [003, 2026]; [163, 2026]; [164, 2026]; [105, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [309, 2026]; [310, 2026]; [300, 2026].

49.3.3.2 Active Inference and AGEINT verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [247, 2026]; [248, 2026].

Tier	What counts	How it is used
Source guide	[247, 2026]; [248, 2026]; [265, 2026]; [278, 2026]; [279, 2026]; [283, 2026]; [290, 2026]; [291, 2026]; [294, 2026]; [106, 2026]; [003, 2026]; [163, 2026]; [164, 2026]; [105, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [309, 2026]; [310, 2026]; [300, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 35's source-canon section, directly verified anchors for the **Active-Inference Theory and Governed Agent Analogy** lane include [Friston, 2010]; [Christopher L. Buckley and Seth, 2017]; [Friston, 2017]; [Da Costa, 2020]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior** and [247, 2026]; [248, 2026], but only directly verified source URLs are encoded as citations.

49.3.3.3 Active Inference and AGEINT intelligence practice lens: evidence artifact and safety check Practice lens: **Active-Inference Boundary Lens** for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**. [247, 2026]; [248, 2026].

Planning question: Which layer is formal theory, which layer is classroom analogy, which implementation claim needs evidence, and which governance control prevents autonomy overreach?

Evidence artifact: theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition.

Validation rule: separate formal claim, pedagogical analogy, implementation assumption, evaluation evidence, and governance duty before reuse. Applied to **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

Handoff contract: handoff preserves formal source, analogy scope, source limitation, caveat, reviewer owner, and blocked autonomous-action claim.

Safety check: reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action.

49.3.3.4 Active Inference and AGEINT runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 49; [247, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	35.99	35.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Active Inference and AGEINT to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
AGEINT pattern registry, agent identity, and interface-contract studio	35.100	35.100 source title transformed into safe curriculum treatment; original: V2 AGEINT-depth extension: connect active-inference planning to public-sector service adoption, workforce impact, skills governance, and human-centered oversight rather than autonomous agency	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Bounded autonomy, procurement, incident-response, and assurance studio	35.101	35.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Active Inference and AGEINT	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Model-card, recoverability, retention, and learner-support evidence package	35.102	35.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Active Inference and AGEINT	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
The Free Energy Principle and Predictive Processing	35.1	35.1 The Free Energy Principle and Predictive Processing	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Active Inference as Computational Model of Intelligence Agent Behavior	35.2	35.2 Active Inference as Computational Model of Intelligence Agent Behavior	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Shared Protentions in Multi-Agent Active Inference	35.3	35.3 Shared Protentions in Multi-Agent Active Inference	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Active Inference for Social Organization and Intelligence Communities	35.4	35.4 Active Inference for Social Organization and Intelligence Communities	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
VERSES AI Research: Multi-Scale Active Inference Architectures	35.5	35.5 VERSES AI Research: Multi-Scale Active Inference Architectures	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Cognitive Security Through the Active Inference Lens	35.6	35.6 Cognitive Security Through the Active Inference Lens	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Applications: Deception Detection, Surprise Minimization, Threat Modeling	35.7	35.7 Applications: Deception Detection, Surprise Minimization, Threat Modeling	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

49.3.3.5 Active Inference and AGEINT reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 49; [247, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
The Free Energy Principle and Predictive Processing	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Active Inference as Computational Model of Intelligence Agent Behavior	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Shared Protentions in Multi-Agent Active Inference	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Active Inference for Social Organization and Intelligence Communities	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
VERSES AI Research: Multi-Scale Active Inference Architectures	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Cognitive Security Through the Active Inference Lens	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action
Applications: Deception Detection, Surprise Minimization, Threat Modeling	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Applications of Active Inference and FEP in Intelligence (TU Delft Thesis)	Active-Inference Boundary Lens	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition	reject claims that the free-energy principle proves autonomous agency, intent, detection performance, or oversight-free action

49.3.3.6 Active Inference and AGEINT annotated source ledger: real titles and local contribution Each source cited by this **Active-Inference Theory and Governed Agent Analogy** module is paired below with its real title and a one-line note on what it contributes to **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

Source	Cited work	What it contributes	Status
[247, 2026]	AI in the Public Sector	Official OECD.AI public-sector AI theme page.	original source-guide
[248, 2026]	Artificial Intelligence Working Group	The World Bank GovTech program page for its Artificial Intelligence Working Group, a community of government technology experts focused on knowledge-sharing and policy tools for responsible public-sector AI adoption. It notes that many developing countries face barriers such as limited digital skills, infrastructure, and data, which risk widening global inequality.	verified source-guide
[265, 2026]	AI and Work	Official OECD.AI work theme page.	original source-guide
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide

Source	Cited work	What it contributes	Status
[279, 2026]	Open Contracting Data Standard	The documentation homepage for the Open Contracting Data Standard, version 1.1.5, maintained by the Open Contracting Partnership to support disclosure of government contracting data across the procurement lifecycle. It provides a common data model spanning planning, tender, award, contract, and implementation stages, along with a primer, implementation guidance, technical schemas, and validation tooling.	verified source-guide
[283, 2026]	Recommendation of the Council on Open Government	An OECD legal instrument document reproducing the Recommendation of the Council on Open Government (OECD/LEGAL/0438), adopted on 14 December 2017. It defines open government as a culture of governance promoting transparency, integrity, accountability, and stakeholder participation in support of democracy and inclusive growth.	verified source-guide
[290, 2026]	NIST SP 800-218A: Secure Software Development Practices for Generative AI and Dual-Use Foundation Models	NIST Special Publication 800-218A (July 2024), which augments the Secure Software Development Framework with practices specific to AI model development across the software lifecycle. Produced in response to Executive Order 14110, it addresses AI model producers, developers building on those models, and acquirers of AI systems, and is designed to be used alongside NIST SP 800-218.	verified source-guide
[291, 2026]	Revised 508 Standards and 255 Guidelines	Official documentation from the U.S. Access Board on the Revised 508 Standards and 255 Guidelines for information and communication technology accessibility. It establishes mandatory accessibility requirements for federal agencies and voluntary guidelines for telecommunications manufacturers, covering hardware, software, websites, electronic documents, and support services.	verified source-guide
[294, 2026]	M-25-21: Accelerating Federal Use of AI through Innovation, Governance, and Public Trust	An April 2025 Office of Management and Budget memorandum (M-25-21) directing executive branch agencies on federal use of artificial intelligence. Issued under Executive Order 14179, it instructs agencies to accelerate adoption of AI to improve public services and government efficiency while maintaining safeguards for civil rights, civil liberties, and privacy.	verified source-guide
[106, 2026]	Applications of The Active Inference and The Free-Energy Principle	A 2024 bachelor's thesis by Lara Sakarya at Delft University of Technology presenting a systematic literature review of the active inference framework and the free-energy principle as applied to mimicking social human behavior in intelligent agents. It explains active inference as a theory describing behavior that minimizes surprise, and surveys model variants such as deep active inference, multimodal deep belief networks, predictive coding, and probabilistic programming.	verified source-guide

Source	Cited work	What it contributes	Status
[003, 2026]	Active Inference: Applicability to Different Types of Social	A 2021 peer-reviewed article by Stephen Fox in the journal Entropy that relates the active inference framework to social organization. It maps concepts such as variational free energy, prediction error, generative models, and Markov blankets onto industrial engineering and quality management practices, treating organizational survival as the maintenance of process control limits.	verified source-guide
[163, 2026]	Karl Friston's Groundbreaking Research Lays the Foundation	An article on deniseholt.us covering a 2024 paper by VERSES AI researchers, led by Mahault Albarracin and co-authored by Karl Friston, titled Shared Protentions in Multi-Agent Active Inference. It explains how intelligent agents can develop shared, mutually aligned expectations about future states that enable coordinated group behavior without explicit communication, drawing on Husserl's work on temporal consciousness.	verified source-guide
[164, 2026]	VERSES to Present Research at Active Inference Workshop	A press release from VERSES AI (August 2024) announcing that the company would act as lead sponsor of and present research at the 5th International Workshop on Active Inference (IWAI 2024) in Oxford. It states that VERSES researchers had 12 accepted papers spanning foundational capabilities, multi-agent systems, applications, and ethics, and that the company's chief scientist Karl Friston would speak.	verified source-guide
[105, 2026]	Automated influence and the challenge of cognitive security	Sarah Rajtmajer and Daniel Susser, 'Automated Influence and the Challenge of Cognitive Security,' in Hot Topics in the Science of Security (HotSoS '20), April 2020, ACM. The paper argues that AI-powered computational propaganda poses national security threats that existing ethical frameworks do not address, and proposes 'cognitive security' as a productive conceptual lens for evaluating the ethics of automated influence operations and potential defensive responses.	verified source-guide
[299, 2026]	Model Context Protocol Specification	The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation).	verified source-guide context; use pinned MCP anchor for normative claims

[312, 2026]	Guide on the Use of Agentic Artificial Intelligence	Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support.	original source-guide

Source	Cited work	What it contributes	Status
[309, 2026]	STIX Version 2.1	An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection.	verified source-guide
[310, 2026]	TAXII Version 2.1	The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe).	verified source-guide
[300, 2026]	MITRE ATLAS	MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy.	original source-guide

Where this sits. This module's overview is Section 49; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

49.3.4 Active Inference and AGEINT governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 49; [247, 2026].

49.3.5 Active Inference and AGEINT analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 35's governance-boundary section, directly verified anchors for the **Active-Inference Theory and Governed Agent Analogy** lane include [Friston, 2010]; [Christopher L. Buckley and Seth, 2017]; [Friston, 2017]; [Da Costa, 2020]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Agentic AI Governance and Tool Security** for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**. [247, 2026]; [248, 2026].
Curriculum topic spine: The Free Energy Principle and Predictive Processing, **Active Inference as Computational Model of Intelligence Agent Behavior**, **Shared Protentions in Multi-Agent Active Inference**. **Verified anchor cluster:** [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]; [Community, 2020b]; [Community, 2020a]; [of the Director of National Intelligence, 2025b].
Conceptual depth: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation.
Method stack: AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills.
Composability contract: agents, tools, credentials, memory, retrieval stores, policies, and logs remain separately inspectable and revocable components.
Known failure modes: excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains.
Defensive boundary: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists. Applied to **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

Anchor	Why it matters here
[OECD, 2026a]	Official OECD conceptual foundation for agentic AI. Checked as of 2026-05-21; role: source_quality_anchor.
[of Canada Secretariat, 2026a]	Government of Canada guide for accountable public-sector use of agentic AI, including governance, risk, transparency, testing, monitoring, and human oversight considerations. Checked as of 2026-05-24; role: curriculum_anchor.
[of Standards and Technology, 2023]	Official NIST.AI.100-1 risk-management framework. Checked as of 2026-05-21; role: source_quality_anchor.
[of Standards and Technology, 2024d]	Official NIST AI 600-1 generative AI profile. Checked as of 2026-05-21; role: source_quality_anchor.
[Community, 2020b]	Official IC principles for lawful, accountable, objective, human-centered, secure, resilient, and science-informed AI. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2025b]	Official IC AI governance directive covering CAIO roles, oversight, interoperability, civil-liberties review, training data, and impact assessment. Checked as of 2026-05-21; role: curriculum_anchor.

49.3.5.1 Active Inference and AGEINT evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Active-Inference Theory and Governed Agent Analogy** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [247, 2026]; [248, 2026].

49.3.6 Active Inference and AGEINT agentic boundary: assist, approve, block, and record

Evidence anchor. Section 49; [247, 2026].
AGEINT translation is bounded by the **Active-Inference Theory and Governed Agent Analogy** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

49.3.6.1 Active Inference and AGEINT permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 49; [247, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

49.3.6.2 Active Inference and AGEINT excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [247, 2026]; [248, 2026] and **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

49.3.7 Active Inference and AGEINT governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 49; [247, 2026].
Governance is practiced as a gate on the **Active-Inference Theory and Governed Agent Analogy** lane. Learners use the **Active-Inference Boundary Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

49.3.7.1 Active Inference and AGEINT governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [247, 2026]; [248, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Active-Inference Theory and Governed Agent Analogy** failure modes and the **Active-Inference Boundary Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

49.3.7.2 Active Inference and AGEINT evidence package handoff: appendices, records, and reuse

Evidence anchor. Section 49; [247, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Active-Inference Boundary Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

49.3.7.3 Active Inference and AGEINT current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**. [247, 2026]; [248, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `scholarly_friston_2010_fep` for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**?	The free-energy principle: a unified brain theory?; lane `cognitive_active_inference`; checked 2026-06-08.	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition; Karl Friston's flagship review introducing the free-energy principle, showing how a variational free-energy functional provides a tractable upper bound on surprise (negative log model evidence) that the brain minimizes through perception and action.
What does the module inherit from `scholarly_buckley_2017_fep_mathematical_review` for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**?	The Free Energy Principle for Action and Perception: A Mathematical Review; lane `cognitive_active_inference`; checked 2026-06-10.	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition; active-inference theory review, classroom analogy boundary setting, formal-claim caveat review, and governance handoff evidence
What does the module inherit from `scholarly_friston_2017_active_inference_process` for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**?	Active Inference: A Process Theory; lane `cognitive_active_inference`; checked 2026-06-08.	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition; Formalizes active inference as a process theory in which belief updating proceeds by gradient descent on variational free energy and policies are selected by minimizing expected free energy over a Markov decision process generative model.
What does the module inherit from `scholarly_dacosta_2020_discrete_active_inference` for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**?	Active inference on discrete state-spaces: A synthesis; lane `cognitive_active_inference`; checked 2026-06-08.	theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition; A mathematical synthesis of active inference over discrete (POMDP) state-spaces, consolidating the partially observable Markov decision process model used to specify perception, planning, and action selection in agentic systems.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 49; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

49.3.8 Active Inference and AGEINT assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 49; [247, 2026].

49.3.9 Active Inference and AGEINT assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 49; [247, 2026].

49.3.9.1 Active Inference and AGEINT capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior** and [247, 2026]; [248, 2026].

49.3.9.2 Active Inference and AGEINT instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior** and [247, 2026]; [248, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

49.3.9.3 Active Inference and AGEINT assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
The Free Energy Principle and Predictive Processing	Completed **theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Active Inference as Computational Model of Intelligence Agent Behavior	Completed **theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Shared Protentions in Multi-Agent Active Inference	Completed **theory-to-governance card with source, analogy limit, assumption, reviewer, and stop condition** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

49.3.10 Active Inference and AGEINT refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [247, 2026]; [248, 2026] and **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**.

49.3.10.1 Active Inference and AGEINT refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**. The local signals begin with [247, 2026]; [248, 2026].

49.3.10.2 Active Inference and AGEINT claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**, and the source spine for these checks begins with [247, 2026]; [248, 2026].

49.3.11 Active Inference and AGEINT reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [247, 2026]; [248, 2026].

Triangulation anchors. In module 35's review-checklist section, directly verified anchors for the **Active-Inference Theory and Governed Agent Analogy** lane include [Friston, 2010]; [Christopher L. Buckley and Seth, 2017]; [Friston, 2017]; [Da Costa, 2020]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior**. [247, 2026]; [248, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

49.3.12 Active Inference and AGEINT learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **The Free Energy Principle and Predictive Processing; Active Inference as Computational Model of Intelligence Agent Behavior** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [247, 2026]; [248, 2026].

Section 2, Section 44, Section 48, Section 50

50 AGEINT Python Code Library

50.0.1 AGEINT Python Code Library figures and course links: visual evidence, source flow, and navigation

The module uses Figure 106 and Figure 85 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 44, Section 49, Section 51.
This module teaches the **Agentic AI Governance and Tool Security** lane through a bounded, source-backed coursebook chapter. [242, 2026]; [243, 2026].

50.1 Agentic AI Governance and Tool Security frame for AGEINT Python Code Library: source context, topic focus, and reader task

Evidence anchor. Section 50; [242, 2026].

50.1.1 AGEINT Python Code Library orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 50; [242, 2026].

50.1.2 AGEINT Python Code Library conceptual primer: source context, core model, and reader task

This chapter teaches agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The chapter uses **Agentic Tool-Governance Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.
The central distinction is to separate agent assistance from autonomous external action. Core topics include **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records; Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [242, 2026]; [243, 2026].
Learners move from vocabulary and the **Agentic Tool-Governance Lens** distinction through topic lessons on **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII** with evidence and misconception checks, then assemble an **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with safety and rights gates.

50.1.3 AGEINT Python Code Library learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 50; [242, 2026].

- Connect **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII and Search-exposure provenance review using instructor-provided records** to **Agentic AI Governance and Tool Security** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build an **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate agent assistance from autonomous external action; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists.

50.1.4 AGEINT Python Code Library core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 50; [242, 2026].

Term	Working definition
Agent identity	the named software actor, role, and authorization context for a run
Tool allowlist	the bounded set of actions the agent may request
Delegation	the handoff of a task under explicit human authority and review
Bounded autonomy	the documented ceiling on what an agent may decide or request without review
Recoverability	the path back to a known-safe state after a bad output or action request
AI incident	a logged event where an AI system creates or plausibly creates harm or loss of control
Prompt injection	untrusted content that attempts to override instructions or authority boundaries
Pattern registry	the catalog of approved agent behaviors, prompts, and evaluation hooks
Adversarial eval	structured tests that probe agent misuse, injection, and over-delegation before release
Threat Intelligence Aggregation Agent:…	Key terms: Threat, Aggregation, Agent.
Search-exposure provenance review using…	Key terms: Search, exposure, provenance.

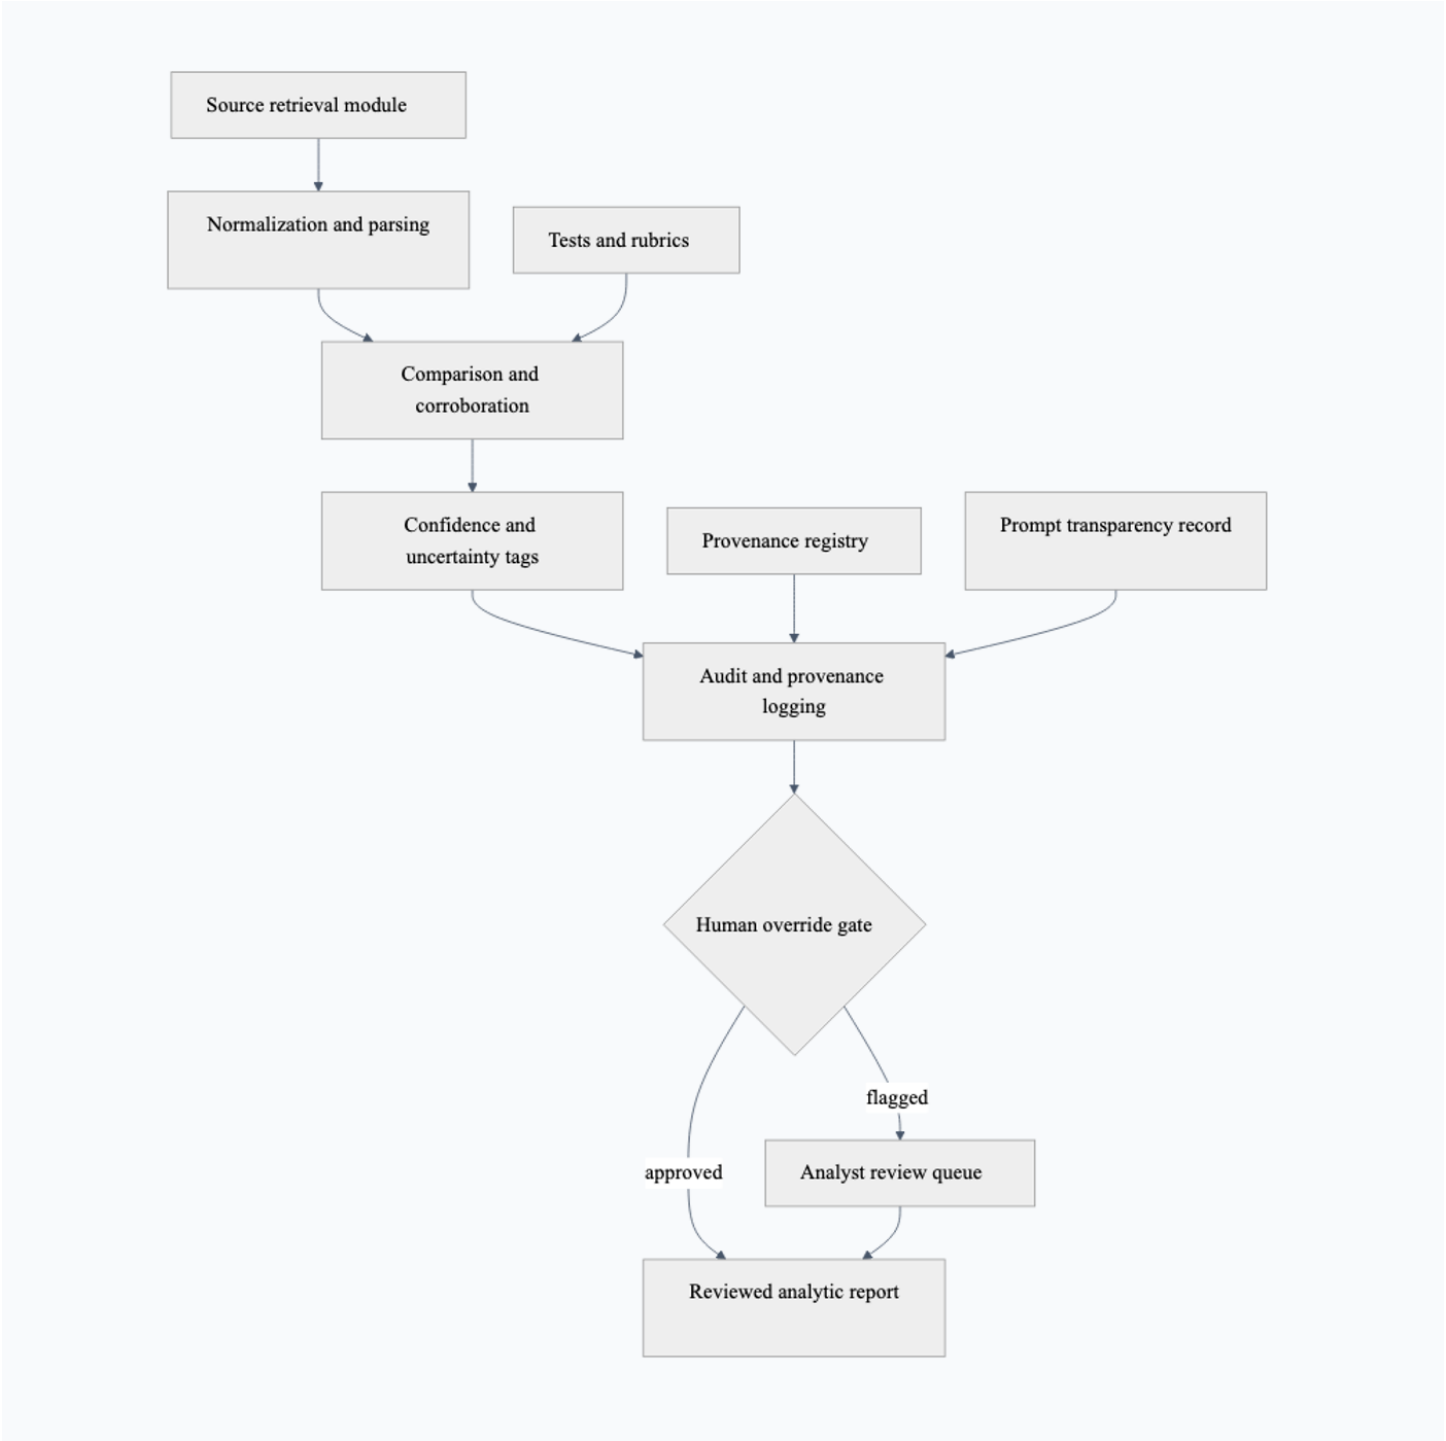

Figure 106: A module map of the library's defensive building blocks, where retrieval, comparison, and audit components always route through a human-override gate. It is anchored to the ageint agentic intelligence / ageint python code library section; use it to inspect Source retrieval module, Normalization and parsing, Comparison and corroboration, and Confidence and uncertainty tags while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

50.2 Agentic Tool-Governance Lens path for AGEINT Python Code Library: lesson cluster, safe artifact, and review

Evidence anchor. Section 50; [242, 2026].

50.2.1 AGEINT Python Code Library practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 50; [242, 2026].

50.2.2 AGEINT Python Code Library topic lessons: source-backed concepts and transfer tasks

This module builds agentic AI as delegated action under control: identity, authority, tool permissions, memory, logs, stop conditions, and recoverability define what an agent may do. The sequence opens with **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII**, **Search-exposure provenance review using instructor-provided records**, **Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator** and applies the **Agentic Tool-Governance Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 85; module overview Section 50; curriculum atlas Section 2.

Triangulation anchors. In module 36's topic-lessons section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

50.2.2.1 Lesson 1: Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII

Concept. Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII uses sharing standards to document indicator context, handling, confidence, and consumer responsibilities—not raw indicator hoarding.

Why it matters. Threat Intelligence Aggregation Agent matters in the **Agentic AI Governance and Tool Security** lane because least-privilege agent design and run evidence must stay separate from judgment; excessive agency is a common failure.

Source support. Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII rests on [309, 2026], [310, 2026], and [300, 2026]. The lead source's own note reads: It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). Use them for fixing what **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Threat Intelligence Aggregation Agent** against the works cited for this row. [309, 2026] An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection. [310, 2026] The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe). [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Threat Intelligence Aggregation Agent**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Threat Intelligence Aggregation Agent**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Threat Intelligence Aggregation Agent** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII replaces human review whenever evidence looks plausible.

Transfer task. Transfer **Threat Intelligence Aggregation Agent** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

50.2.2.2 Lesson 2: Search-exposure provenance review using instructor-provided records

Concept. Search-exposure provenance review using instructor-provided records treats open sources as publicly available evidence that still requires provenance, corroboration, legality, and minimization before reuse.

Why it matters. Analysts use **Search-exposure provenance review** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that excessive agency would otherwise hide, and the reviewer accountable for challenge.

Source support. Search-exposure provenance review using instructor-provided records rests on [301, 2026] and [298, 2026]. The most specific cited work observes: Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. Use them for pinning down the scope of **Search-exposure provenance review using instructor-provided records**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Search-exposure provenance review** against the works cited for this row. [301, 2026] Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Search-exposure provenance review**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must record the tool-and-terms descriptor, the bounded claim about **Search-exposure provenance review using instructor-provided**, the minimization caveat, the reproducibility uncertainty, the identity-exposure boundary, and the reviewer who approves the use. Shape **Search-exposure provenance review** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Search-exposure provenance review**: that a source being publicly accessible means collecting it is unrestricted, ungoverned, and free of legal, ethical, and scoping limits.

Transfer task. Transfer **Search-exposure provenance review** from this module to a second motif by preserving least-privilege agent design and run review, replacing action with audit, and naming the blocked use.

50.2.2.3 Lesson 3: Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator

Concept. Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator treats the vulnerability record as an assurance case: severity, affected component, provenance, mitigation status, and uncertainty stay separate.

Why it matters. Without explicit treatment of **Autonomous Vulnerability Scanner**, excessive agency undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator rests on [300, 2026], [304, 2026], and [306, 2026]. The most specific cited work observes: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for fixing what **Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Autonomous Vulnerability Scanner**, work from the cited evidence behind this row. [300, 2026] MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [306, 2026] Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Autonomous Vulnerability Scanner**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Autonomous Vulnerability Scanner**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Autonomous Vulnerability Scanner** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator is optional whenever separate agent assistance from autonomous external action feels inconvenient.

Transfer task. Transfer **Autonomous Vulnerability Scanner** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

50.2.2.4 Lesson 4: RAG Pipeline for All-Source Intelligence Fusion: LangGraph + Chroma + OpenAI

Concept. RAG Pipeline for All-Source Intelligence Fusion: LangGraph + Chroma + OpenAI evaluates retrieval pipelines by source provenance, injection risk, citation fidelity, and reviewer verification of answers.

Why it matters. RAG Pipeline for All-Source Intelligence Fusion connects classroom vocabulary to Agentic AI Governance and Tool Security practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. RAG Pipeline for All-Source Intelligence Fusion: LangGraph + Chroma + OpenAI rests on [305, 2026], [304, 2026], and [303, 2026]. The closest source to this row notes: An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. Use them for pinning down the scope of **RAG Pipeline for All-Source Intelligence Fusion: LangGraph + Chroma + OpenAI**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **RAG Pipeline for All-Source Intelligence Fusion** against the works cited for this row. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **RAG Pipeline for All-Source Intelligence Fusion**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **RAG Pipeline for All-Source Intelligence**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **RAG Pipeline for All-Source Intelligence Fusion** work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception that RAG Pipeline for All-Source Intelligence Fusion: LangGraph + Chroma + OpenAI establishes intent without reviewing alternative explanations.

Transfer task. Transfer **RAG Pipeline for All-Source Intelligence Fusion** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

50.2.2.5 Lesson 5: Claim-ledger memory exercise that tracks evidence changes rather than people

Concept. Claim-ledger memory exercise that tracks evidence changes rather than people treats agent memory terms as a pedagogical taxonomy unless a domain memory source is cited; MCP and official agentic-AI guidance support external-memory governance, tool boundaries, logs, retention, and reviewer control.

Why it matters. Without explicit treatment of **Claim-ledger memory exercise that tracks evidence changes rather than people**, excessive agency undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Claim-ledger memory exercise that tracks evidence changes rather than people rests on [301, 2026] and [298, 2026]. The lead source's own note reads: Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. Use them for the working definition that **Claim-ledger memory exercise that tracks evidence changes rather than people** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Claim-ledger memory exercise that tracks evidence changes rather than people**, reason from the sources cited in this row. [301, 2026] Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities. [298, 2026] Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Claim-ledger memory exercise that tracks evidence changes rather than people**, build a claim-ledger memory card with source descriptor, source-change event, retention rule, contamination check, and reviewer disposition; do not track real people, assets, or behavioral patterns. Shape this subject work as an **agent run and assurance card** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Claim-ledger memory exercise that tracks evidence changes rather than people**: that a visible feature is enough for a confident geospatial claim.

Transfer task. Reuse the **Claim-ledger memory exercise that tracks evidence changes rather than people** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

50.2.2.6 Lesson 6: Psychological inoculation and prebunking literacy **Concept. Psychological inoculation and prebunking literacy** uses inoculation methods as evidence-informed, bounded, and context-dependent resilience education with transparent labels, source checks, non-manipulative corrections, and explicit measurement limits.

Why it matters. Without explicit treatment of **Psychological inoculation**, treating resilience labels as permission to skip provenance review undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Psychological inoculation and prebunking literacy rests on [308, 2026] and [311, 2026]. Its anchor reference records: It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Use them for the working definition that **Psychological inoculation and prebunking literacy** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. For **Psychological inoculation**, work from the cited evidence behind this row. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must record the narrative provenance, the bounded claim about **Psychological inoculation**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Psychological inoculation**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Psychological inoculation** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

50.2.2.7 Lesson 7: Supply Chain Inspector: SBOM + GitHub Commit Analysis + Anomaly Detection **Concept. Supply Chain Inspector: SBOM + GitHub Commit Analysis + Anomaly Detection** shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Without explicit treatment of **Supply Chain Inspector**, excessive agency undermines least-privilege agent design and run review; the lesson builds the habit to separate agent assistance from autonomous external action.

Source support. Supply Chain Inspector: SBOM + GitHub Commit Analysis + Anomaly Detection rests on [303, 2026], [304, 2026], and [305, 2026]. The most specific cited work observes: An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. Use them for the claim that **Supply Chain Inspector: SBOM + GitHub Commit Analysis + Anomaly Detection** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Read **Supply Chain Inspector** against the works cited for this row. [303, 2026] An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Supply Chain Inspector**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **Supply Chain Inspector**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **Supply Chain Inspector** work as an **agent run and assurance card** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception that Supply Chain Inspector: SBOM + GitHub Commit Analysis + Anomaly Detection is optional whenever separate agent assistance from autonomous external action feels inconvenient.

Transfer task. Transfer **Supply Chain Inspector** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

50.2.2.8 Lesson 8: ICS Anomaly Detection Agent: OT Network + MITRE ATT&CK for ICS **Concept. ICS Anomaly Detection Agent: OT Network + MITRE ATT&CK for ICS** treats agents as software actors with explicit permissions, logs, stop conditions, and human approval—not autonomous decision makers.

Why it matters. Analysts use **ICS Anomaly Detection Agent** to separate agent assistance from autonomous external action. A defensible treatment names the judgment it enables for least-privilege agent design and run review, the proof limit that excessive agency would otherwise hide, and the reviewer accountable for challenge.

Source support. ICS Anomaly Detection Agent: OT Network + MITRE ATT&CK for ICS rests on [307, 2026], [305, 2026], and [304, 2026]. The lead source's own note reads: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for the claim that **ICS Anomaly Detection Agent: OT Network + MITRE ATT&CK for ICS** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [OECD, 2026a]; [of Canada Secretariat, 2026a].

Evidence to inspect. Ground **ICS Anomaly Detection Agent** in the evidence the row cites. [307, 2026] Official CISA Industrial Control Systems recommended practices page for defensive ICS/OT safety, resilience, and incident-preparation guidance. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **ICS Anomaly Detection Agent**, build a **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** for this least-privilege agent design and run review topic. The artifact must name the source descriptor, the bounded claim about **ICS Anomaly Detection Agent**, the caveat that limits it, the uncertainty note, the out-of-scope-use boundary, and the reviewer accountable for challenge. Shape **ICS Anomaly Detection Agent** work as an **agent run and assurance card** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception that ICS Anomaly Detection Agent: OT Network + the module establishes intent without reviewing alternative explanations.

Transfer task. Transfer **ICS Anomaly Detection Agent** to a second module by preserving least-privilege agent design and run review, changing the source evidence, and naming a new reviewer.

50.2.3 AGEINT Python Code Library worked safe example: synthetic inputs, evidence, and review

Worked example: a synthetic research assistant agent organizes public readings for an instructor. [242, 2026]; [243, 2026].

Triangulation anchors. In module 36's worked-example section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **governed agentic intelligence**. Learners use a **agent run and assurance card** and keep this boundary visible: No autonomous external action, credentialed operations, live-target workflows, or uncontrolled tool use.

Frame. The classroom question centers on **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII**. Excluded actions stay explicit, and the **Agentic Tool-Governance Lens** planning question is: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?

Inputs. For the **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII** scenario, use public URLs, a fixed retrieval tool, a summarization prompt, a time budget, and a stop condition. The Agentic Tool-Governance Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII**, students bind the agent identity, list allowed tools, set autonomy limits, capture sources, block unsafe requests, and log approvals. Pause whenever an inference about Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII** classroom scenario; unit artifact = agent run and assurance card; evidence = allowed inputs; method = least-privilege agent design and run review; output = an agent run card with tool calls, source links, blocked actions, reviewer notes, incident threshold, and recovery decision; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII** as "Agentic Tool-Governance Lens confirms it" is not enough. The revision ties the claim to least-privilege agent design and run review, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

50.2.4 AGEINT Python Code Library practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Agentic Tool-Governance Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

Triangulation anchors. In module 36's practice-sequence section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII, Search-exposure provenance review using instructor-provided records, Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Agentic AI Governance and Tool Security** lane.
2. Frame	Answer the lens question: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII: agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the agent run and assurance card fields for Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII.	Unit profile note.	Evidence artifacts include tool-allowlist record, external-memory governance boundary.
4. Challenge	Test the misconception that Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII replaces human review whenever evidence looks plausible.	Failure-mode note.	The artifact applies the key distinction: separate agent assistance from autonomous external action.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

50.2.4.1 AGEINT Python Code Library instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human

review point. Keep the focus on **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**. [242, 2026]; [243, 2026].

50.2.4.2 AGEINT Python Code Library extension exercise: peer validation and refresh trigger review **Evidence anchor.** Section 50; [242, 2026].
Have learners swap artifacts and apply the **Agentic Tool-Governance Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

50.2.5 AGEINT Python Code Library knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 50; [242, 2026].

1. Explain how **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII** is defined here; name the source descriptor that supports the definition.
2. Contrast **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII** with **Search-exposure provenance review using instructor-provided records** using the **Agentic Tool-Governance Lens** artifact fields.
3. Identify one failure mode from the **Agentic AI Governance and Tool Security** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which permission can be removed while preserving the learning objective?
5. Correct this misconception: that Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII replaces human review whenever evidence looks plausible.

50.2.5.1 AGEINT Python Code Library answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII** without source evidence, uncertainty, or a safe transfer task.

50.3 AGEINT Python Code Library assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 50; [242, 2026].

50.3.1 AGEINT Python Code Library evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 50; [242, 2026].

50.3.2 AGEINT Python Code Library transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 50; [242, 2026].

50.3.2.1 AGEINT Python Code Library lineage and source tradition: profile, concepts, and first anchors This sits in the **Agentic AI Governance and Tool Security** lineage: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. [242, 2026]; [243, 2026].

50.3.2.2 AGEINT Python Code Library working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 50; [242, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**, with provenance and reviewability throughout.

50.3.2.3 AGEINT Python Code Library knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [242, 2026]; [243, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

50.3.2.4 AGEINT Python Code Library transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 50; [242, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.
- **Evidence contract:** keep the **Agentic AI Governance and Tool Security** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

50.3.2.5 AGEINT Python Code Library profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 50; [242, 2026].

The matched profile emphasizes delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation. The method stack is AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills; the local topic cluster is **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

50.3.3 AGEINT Python Code Library evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 50; [242, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Agentic AI Governance and Tool Security** profile tells reviewers what evidence is strong enough for the module artifact built around **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

50.3.3.1 AGEINT Python Code Library guide source spine: inherited keys and local citation roles Primary guide citations: [242, 2026]; [243, 2026]; [246, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [309, 2026]; [310, 2026]; [300, 2026]; [304, 2026]; [303, 2026]; [305, 2026]; [307, 2026]; [301, 2026]; [298, 2026]; [308, 2026]; [311, 2026].

50.3.3.2 AGEINT Python Code Library verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [242, 2026]; [243, 2026].

Tier	What counts	How it is used
Source guide	[242, 2026]; [243, 2026]; [246, 2026]; [280, 2026]; [281, 2026]; [282, 2026]; [292, 2026]; [295, 2026]; [296, 2026]; [299, 2026]; [306, 2026]; [312, 2026]; [309, 2026]; [310, 2026]; [300, 2026]; [304, 2026]; [303, 2026]; [305, 2026]; [307, 2026]; [301, 2026]; [298, 2026]; [308, 2026]; [311, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 36's source-canon section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records** and [242, 2026]; [243, 2026], but only directly verified source URLs are encoded as citations.

50.3.3.3 AGEINT Python Code Library intelligence practice lens: evidence artifact and safety check Practice lens: **Agentic Tool-Governance Lens** for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**. [242, 2026]; [243, 2026].

Planning question: Which human authority, agent identity, tool permission, autonomy limit, incident threshold, and recoverability condition bounds the workflow?

Evidence artifact: agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path.

Validation rule: verify least privilege, prompt-injection exposure, provenance, observability, stop conditions, and incident-reporting triggers. Applied to **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

Handoff contract: export agent traces, tool calls, retrieved sources, policy decisions, and human approvals separately.

Safety check: block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions.

50.3.3.4 AGEINT Python Code Library runtime-to-reader map: generated sections and verifier surfaces **Evidence anchor.** Section 50; [242, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	36.99	36.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind AGEINT Python Code Library to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
AGEINT pattern registry, agent identity, and interface-contract studio	36.100	36.100 source title transformed into safe curriculum treatment; original: V2 AGEINT-depth extension: convert code-library material into education-safe capstone workflows with instructor rubrics, prompt transparency, allowed tools, and human override requirements	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Bounded autonomy, procurement, incident-response, and assurance studio	36.101	36.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for AGEINT Python Code Library	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Model-card, recoverability, retention, and learner-support evidence package	36.102	36.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for AGEINT Python Code Library	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII	36.1	36.1 Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Search-exposure provenance review using instructor-provided records	36.2	36.2 source title transformed into safe curriculum treatment; original: Multi-Agent OSINT Crew: CrewAI + Shodan + theHarvester + Maltego	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator	36.3	36.3 Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
RAG Pipeline for All-Source Intelligence Fusion: LangGraph + Chroma + OpenAI	36.4	36.4 RAG Pipeline for All-Source Intelligence Fusion: LangGraph + Chroma + OpenAI	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Claim-ledger memory exercise that tracks evidence changes rather than people	36.5	36.5 source title transformed into safe curriculum treatment; original: Pattern-of-Life Analysis Agent: Persistent Memory + GEOINT + OSINT	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Psychological inoculation and prebunking literacy	36.6	36.6 source title transformed into safe curriculum treatment; original: Cognitive Security Inoculation Agent: Van der Linden Taxonomy + GPT-4o	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Supply Chain Inspector: SBOM + GitHub Commit Analysis + Anomaly Detection	36.7	36.7 Supply Chain Inspector: SBOM + GitHub Commit Analysis + Anomaly Detection	Software-Supply-Chain Assurance Lens	software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps	exclude exploit reproduction, maintainer targeting, backdoor mechanics, credential hunting, and live repository interference
ICS Anomaly Detection Agent: OT Network + MITRE ATT&CK for ICS	36.8	36.8 ICS Anomaly Detection Agent: OT Network + MITRE ATT&CK for ICS	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

50.3.3.5 AGEINT Python Code Library reusable subsection contract: topic rows, artifacts, and safety duties **Evidence anchor.** Section 50; [242, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Search-exposure provenance review using instructor-provided records	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
RAG Pipeline for All-Source Intelligence Fusion: LangGraph + Chroma + OpenAI	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Claim-ledger memory exercise that tracks evidence changes rather than people	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Psychological inoculation and prebunking literacy	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions
Supply Chain Inspector: SBOM + GitHub Commit Analysis + Anomaly Detection	Software-Supply-Chain Assurance Lens	software-supply-chain assurance packet with package provenance, maintainer-risk notes, build-integrity evidence, and control gaps	exclude exploit reproduction, maintainer targeting, backdoor mechanics, credential hunting, and live repository interference
ICS Anomaly Detection Agent: OT Network + MITRE ATT&CK for ICS	Agentic Tool-Governance Lens	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path	block excessive agency, shadow tools, credential leakage, autonomous deployment, and irreversible actions

50.3.3.6 AGEINT Python Code Library annotated source ledger: real titles and local contribution Each source cited by this **Agentic AI Governance and Tool Security** module is paired below with its real title and a one-line note on what it contributes to **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

Source	Cited work	What it contributes	Status
[242, 2026]	Guidance for Generative AI in Education and Research	Official UNESCO generative AI education guidance.	original source-guide
[243, 2026]	AI Competency Frameworks for Teachers and Students	A UNESCO announcement of two new AI competency frameworks, one for students and one for teachers, intended to guide safe and responsible engagement with artificial intelligence in education. The student framework emphasizes a human-centered perspective, ethical use, foundational AI knowledge, and design thinking, while the teacher framework covers ethics, technical understanding, and pedagogy.	verified source-guide
[246, 2026]	Digital Education Action Plan 2021-2027	The European Commission's official page on the Digital Education Action Plan (2021-2027), a strategic framework for promoting high-quality, inclusive digital learning across EU education systems. It defines digital education as the use of digital tools, technologies, and content to support teaching, learning, and assessment, and cites pandemic-driven adoption alongside persistent gaps in teacher readiness, student digital skills, and household access.	verified source-guide

Source	Cited work	What it contributes	Status
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide
[281, 2026]	Artificial Intelligence Cybersecurity Challenges	An ENISA (European Union Agency for Cybersecurity) report published December 15, 2020 mapping the cybersecurity challenges of artificial intelligence. It defines AI scope through a lifecycle approach, identifies the assets requiring protection within AI ecosystems, and develops a threat taxonomy classified across lifecycle stages and asset categories.	verified source-guide
[282, 2026]	AI Research: Security and Resilience	A NIST page on AI research focused on security and resilience, framing these as core characteristics of trustworthy AI under the NIST AI Risk Management Framework.	verified source-guide
[292, 2026]	Assessing Risks and Impacts of AI (ARIA): Pilot Evaluation Report	The ARIA 0.1 pilot evaluation report documents NIST's methodology for systematically assessing AI applications for risks and societal impacts, using a multi-layered evaluation approach across five participating organizations and seven submitted AI applications. The pilot employed three evaluation scenarios and three testing levels: model testing, red teaming, and field testing, supplemented by dialogue annotation, tester questionnaires, and structured measurement trees.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide
[296, 2026]	Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile	NIST AI 600-1, the Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile, a cross-sectoral companion resource to the NIST AI RMF 1.0 issued pursuant to Executive Order 14110. It identifies risks that are unique to or amplified by generative AI and organizes suggested actions for managing those risks, mapped to the AI RMF functions.	verified source-guide

Source	Cited work	What it contributes	Status
[299, 2026]	Model Context Protocol Specification	The official Model Context Protocol (MCP) specification, defining an open protocol that standardizes how LLM applications connect to external data sources and tools using JSON-RPC 2.0 messages. It describes the host, client, and server roles and capability negotiation, and the features servers expose (resources, prompts, tools) and clients offer (sampling, roots, elicitation).	verified source-guide context; use pinned MCP anchor for normative claims
[306, 2026]	Artificial Intelligence	Official CISA Artificial Intelligence page for AI security, safety, resilience, and critical-infrastructure governance source support.	original source-guide
[312, 2026]	Guide on the Use of Agentic Artificial Intelligence	Official Government of Canada guide for responsible use of agentic AI, used for public-sector agent governance and accountability source support.	original source-guide
[309, 2026]	STIX Version 2.1	An OASIS standard specification defining STIX (Structured Threat Information Expression), a language for exchanging cyber threat intelligence in a standardized, machine-readable form. It establishes a graph-based model with STIX Domain Objects, Cyber-observable Objects, and Relationship Objects, plus meta objects, bundles, and a patterning language for detection.	verified source-guide
[310, 2026]	TAXII Version 2.1	The OASIS Standard specification for TAXII (Trusted Automated Exchange of Intelligence Information) Version 2.1, published in 2021 by the OASIS Cyber Threat Intelligence Technical Committee. It defines a RESTful, HTTPS-based API protocol for sharing cyber threat intelligence between organizations, supporting two communication models: Collections (request-response) and Channels (publish-subscribe).	verified source-guide
[300, 2026]	MITRE ATLAS	MITRE ATLAS knowledge base for adversarial threats to AI systems, used for defensive AI red-team assurance and misuse taxonomy.	original source-guide
[304, 2026]	Secure Software Development Framework (SSDF) Version 1.1: Recommendations for Mitigating the Risk of Software Vulnerabilities	NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences.	verified source-guide
[303, 2026]	Software Security in Supply Chains	An official NIST page on software supply chain security issued under Executive Order 14028, focused on the Software Bill of Materials as a formal record of software components and their supply chain. It explains the benefits of SBOMs for vulnerability identification and supply-chain transparency, recommends machine-readable formats such as SPDX, CycloneDX, and SWID, and describes foundational, sustaining, and enhancing levels of implementation.	verified source-guide

Source	Cited work	What it contributes	Status
[305, 2026]	DevSecOps	Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support.	original source-guide
[307, 2026]	ICS Recommended Practices	Official CISA Industrial Control Systems recommended practices page for defensive ICS/OT safety, resilience, and incident-preparation guidance.	original source-guide
[301, 2026]	The IC OSINT Strategy 2024-2026	Official Intelligence Community strategy for open-source intelligence governance, integration, source discovery, data, tools, tradecraft, and workforce priorities.	original source-guide
[298, 2026]	Intelligence Community Directives	Official ODNI index for Intelligence Community Directives used to locate current directive source material and preserve directive-context citations.	original source-guide
[308, 2026]	Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure	An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure.	verified source-guide
[311, 2026]	Countering Information Threats	An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering.	verified source-guide

Where this sits. This module's overview is Section 50; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

50.3.4 AGEINT Python Code Library governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 50; [242, 2026].

50.3.5 AGEINT Python Code Library analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 36's governance-boundary section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Research lane: **Agentic AI Governance and Tool Security** for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**. [242, 2026]; [243, 2026].
Curriculum topic spine: Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII, **Search-exposure provenance review using instructor-provided records**, **Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator**. **Verified anchor cluster:** [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]; [Community, 2020b]; [Community, 2020a]; [of the Director of National Intelligence, 2025b].
Conceptual depth: delegated action under explicit authority, identity, permissions, tool boundaries, monitoring, and human escalation.
Method stack: AI RMF Govern-Map-Measure-Manage, least-privilege tool design, prompt-injection review, progressive deployment, and rollback drills.
Composability contract: agents, tools, credentials, memory, retrieval stores, policies, and logs remain separately inspectable and revocable components.
Known failure modes: excessive agency, shadow tools, indirect prompt injection, memory poisoning, confused authority, and unbounded action chains.
Defensive boundary: agentic workflows stay synthetic, owned-lab, supervised, logged, rate-limited, and reversible unless a lawful production authority exists. Applied to **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

Anchor	Why it matters here
[OECD, 2026a]	Official OECD conceptual foundation for agentic AI. Checked as of 2026-05-21; role: source_quality_anchor.
[of Canada Secretariat, 2026a]	Government of Canada guide for accountable public-sector use of agentic AI, including governance, risk, transparency, testing, monitoring, and human oversight considerations. Checked as of 2026-05-24; role: curriculum_anchor.
[of Standards and Technology, 2023]	Official NIST.AI.100-1 risk-management framework. Checked as of 2026-05-21; role: source_quality_anchor.
[of Standards and Technology, 2024d]	Official NIST AI 600-1 generative AI profile. Checked as of 2026-05-21; role: source_quality_anchor.
[Community, 2020b]	Official IC principles for lawful, accountable, objective, human-centered, secure, resilient, and science-informed AI. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.
[of the Director of National Intelligence, 2025b]	Official IC AI governance directive covering CAIO roles, oversight, interoperability, civil-liberties review, training data, and impact assessment. Checked as of 2026-05-21; role: curriculum_anchor.

50.3.5.1 AGEINT Python Code Library evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Agentic AI Governance and Tool Security** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [242, 2026]; [243, 2026].

50.3.6 AGEINT Python Code Library agentic boundary: assist, approve, block, and record

Evidence anchor. Section 50; [242, 2026].
AGEINT translation is bounded by the **Agentic AI Governance and Tool Security** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

50.3.6.1 AGEINT Python Code Library permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 50; [242, 2026].
The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

50.3.6.2 AGEINT Python Code Library excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [242, 2026]; [243, 2026] and **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

50.3.7 AGEINT Python Code Library governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 50; [242, 2026].
Governance is practiced as a gate on the **Agentic AI Governance and Tool Security** lane. Learners use the **Agentic Tool-Governance Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

50.3.7.1 AGEINT Python Code Library governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [242, 2026]; [243, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Agentic AI Governance and Tool Security** failure modes and the **Agentic Tool-Governance Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

50.3.7.2 AGEINT Python Code Library evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 50; [242, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Agentic Tool-Governance Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

50.3.7.3 AGEINT Python Code Library current-source assurance: verified anchors and local artifact fit

The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**. [242, 2026]; [243, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_oecd_agentic_ai` for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**?	The Agentic AI Landscape and Its Conceptual Foundations; lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official OECD conceptual foundation for agentic AI.
What does the module inherit from `official_canada_agentic_ai_guide` for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**?	Guide on the Use of Agentic Artificial Intelligence; lane `public_sector_agentic_ai`; checked 2026-05-24.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; bounded-autonomy run card, recoverability review, approval threshold, monitoring evidence, and public-sector service assurance
What does the module inherit from `official_nist_ai_rmf` for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**?	Artificial Intelligence Risk Management Framework (AI RMF 1.0); lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official NIST.AI.100-1 risk-management framework.
What does the module inherit from `official_nist_ai_600_1` for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**?	Artificial Intelligence Risk Management Framework: Generative AI Profile; lane `source_quality_spine`; checked 2026-05-21.	agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path; Official NIST AI 600-1 generative AI profile.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 50; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

50.3.8 AGEINT Python Code Library assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 50; [242, 2026].

50.3.9 AGEINT Python Code Library assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 50; [242, 2026].

50.3.9.1 AGEINT Python Code Library capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records** and [242, 2026]; [243, 2026].

50.3.9.2 AGEINT Python Code Library instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records** and [242, 2026]; [243, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

50.3.9.3 AGEINT Python Code Library assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Search-exposure provenance review using instructor-provided records	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Autonomous Vulnerability Scanner: AutoGen + Nmap + MITRE ATT&CK Navigator	Completed **agent run card with tool allowlist, identity, logs, autonomy limit, approval gates, and recovery path** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

50.3.10 AGEINT Python Code Library refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [242, 2026]; [243, 2026] and **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**.

50.3.10.1 AGEINT Python Code Library refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**. The local signals begin with [242, 2026]; [243, 2026].

50.3.10.2 AGEINT Python Code Library claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**, and the source spine for these checks begins with [242, 2026]; [243, 2026].

50.3.11 AGEINT Python Code Library reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [242, 2026]; [243, 2026].

Triangulation anchors. In module 36's review-checklist section, directly verified anchors for the **Agentic AI Governance and Tool Security** lane include [OECD, 2026a]; [of Canada Secretariat, 2026a]; [of Standards and Technology, 2023]; [of Standards and Technology, 2024d]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records**. [242, 2026]; [243, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.

- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

50.3.12 AGEINT Python Code Library learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **Threat Intelligence Aggregation Agent: LangChain + STIX/TAXII; Search-exposure provenance review using instructor-provided records** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [242, 2026]; [243, 2026].

Section 2, Section 44, Section 49, Section 51

51 COGNITIVE SECURITY

51.1 COGNITIVE SECURITY learning spine and source route: unit purpose, module order, and evidence handoff

Evidence anchor. Section 51; [238, 2026].

51.1.1 cognitive resilience and epistemic integrity discipline spine: domain question and learning focus

Evidence anchor. Section 51; [238, 2026].
This unit teaches **cognitive resilience and epistemic integrity**. Cognitive-security lessons protect attention, trust, memory, and judgment by tracing provenance, correction paths, and transparent education.

51.1.2 cognitive resilience and epistemic integrity source-use contract: citation roles and evidence limits

Evidence anchor. Section 51; [238, 2026].
Use CISA, NATO, and analytic-tradecraft anchors for influence mitigation, information-threat analysis, and confidence discipline.

51.1.3 cognitive resilience and epistemic integrity practice artifact: recurring packet and retained evidence

Evidence anchor. Section 51; [238, 2026].
The recurring practice artifact is a **epistemic-integrity review packet** that draws on provenance chain, correction option, harm note, and confidence language. The unit keeps its learning spine explicit. Learners separate narrative spread from intent, document uncertainty, and choose transparent resilience moves.

51.1.4 cognitive resilience and epistemic integrity safety boundary: accountable, synthetic, and evidence-bounded limits

No manipulation, covert persuasion, medicalized claims, or population-level targeting.
This unit introduces the part's governing question, evidence artifacts, source-support spine, and capstone thread before the individual modules begin. [238, 2026]; [239, 2026].
Learners carry one unit capstone thread through the part: define an accountable intelligence question, bind it to source-quality constraints, produce a reviewable artifact, test the artifact against failure modes, and hand it off with enough context for another analyst or instructor to audit. The capstone remains public, synthetic, or owned-lab throughout; its first source anchors are [238, 2026]; [239, 2026].
This unit's deliverables are a source-canon card, claim/evidence ledger, safe-practice lab packet, failure-mode note, instructor rubric, and debrief memo. The full source-lane and evidence-package ledgers appear in the orientation and appendices; this unit introduction keeps only the learner-facing spine for [238, 2026]; [239, 2026].
This unit's safety gates are scope authorization, rights review, data provenance, tool allowlisting, human oversight, rollback, and evidence-bounded output. A missing gate turns the activity into a tabletop, audit, or written governance exercise until the gate is restored against [238, 2026]; [239, 2026].
Capstone thread:

Phase	Artifact	Review gate
Question	accountable learning question and excluded-action list	instructor confirms scope, allowed data, and rights impact
Source canon	source-lane map with guide citations, verified anchors, and refresh dates	citation keys resolve and source identity lock remains stable
Evidence ledger	claim, evidence, uncertainty, confidence, and reviewer register	every material claim has a source, caveat, and owner
Safe lab	synthetic or public dataset packet, tool allowlist, and stop conditions	no live target, private data, external action, or unsafe cyber-physical step
Assurance	evaluation rubric, failure-mode drill, rights map, and remediation note	human reviewer signs off before presentation or reuse
Debrief	capstone memo with lessons, residual risk, refresh triggers, and handoff owner	all unresolved questions and future approvals are explicit

Research lane: Cognitive Security and Influence Resilience. Core anchors: [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]. Conceptual focus: protecting attention, belief formation, and decision quality without turning resilience education into manipulation. Composability contract: separate descriptive analysis, normative assessment, response options, and protected-audience considerations. **Practice lens:** Cognitive-Resilience Lens; How does the module protect autonomy, attention, trust, and decision quality without designing persuasion? [238, 2026]; [239, 2026].

51.2 How adversaries target cognition

This unit is organized around the NATO/INSS reconception of cognitive warfare, summarized for the unit in Figure 108, which distinguishes three layers of engagement by their target. The biological layer targets cognitive capacity itself through neuroscience-informed pressure on the nervous system, with AI optimizing delivery timing and channel selection. The psychological layer targets cognitive interpretation, manipulating individual cognition and exploiting biases at scale, with AI tailoring influence to vulnerability profiles. The social layer targets cognitive cohesion, fracturing shared narratives and weaponizing identity to manufacture epistemic chaos, with AI coordinating synthetic influence across platforms [of Excellence, 2026]. Holding the three layers apart matters because each demands a different defense – resilience of attention, inoculation against manipulation, and protection of shared sense-making – and a defender who conflates them will mismatch the countermeasure to the attack. Every exercise in this unit stays defensive, synthetic, and evidence-bounded: the taxonomy is taught to build inoculation and detection, never to script influence [Agency, 2024a].

51.2.1 COGNITIVE SECURITY visual navigation and module map: evidence flow, order, and safety cues

The unit uses Figure 107, Figure 108, Figure 109, and Figure 110 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 50, Section 52.

51.2.2 COGNITIVE SECURITY module roster and source-lane inventory: citations, lanes, and learner route

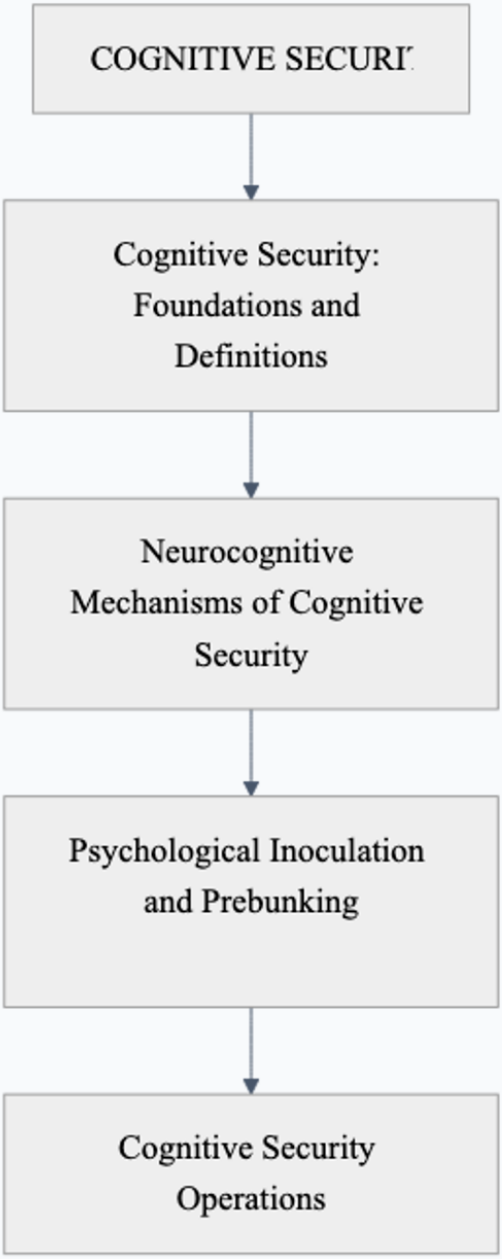

Figure 107: The unit module map traces the part's chapters as a linear reading sequence. The captioned view belongs to the cognitive security section and should be read as a map of 4 module nodes in the unit's ordered, source-backed reading sequence from its first module to its last, not as a capability score or live-task instruction.

Figure 108: The NATO/INSS cognitive warfare taxonomy distinguishes biological, psychological, and social attack layers by their target, mechanism, and the role AI plays in each. The captioned view belongs to the cognitive security section and should be read as a map of NATO/INSS Cognitive Warfare 2026 three layers of engagement, Biological layer, Target cognitive capacity, and Mechanism neuroscience-informed targeting of the nervous system, not as a capability score or live-task instruction.

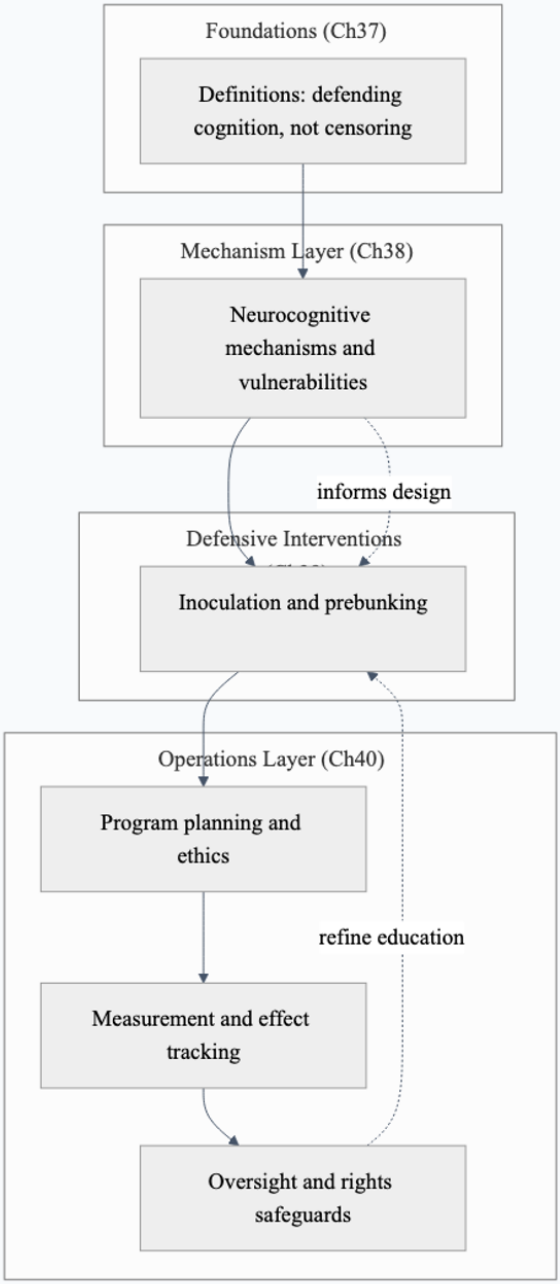

Figure 109: Conceptual part map moving from cognitive-defense definitions through neurocognitive mechanisms and bounded prebunking education into governed operations where measurement and rights safeguards feed back to refine education design. Its reader value is to make Foundations (Ch37), Definitions: defending cognition, not censoring, Mechanism Layer (Ch38), and Neurocognitive mechanisms and vulnerabilities visible at a glance, with the cognitive security section as the source section and defensive review as the boundary.

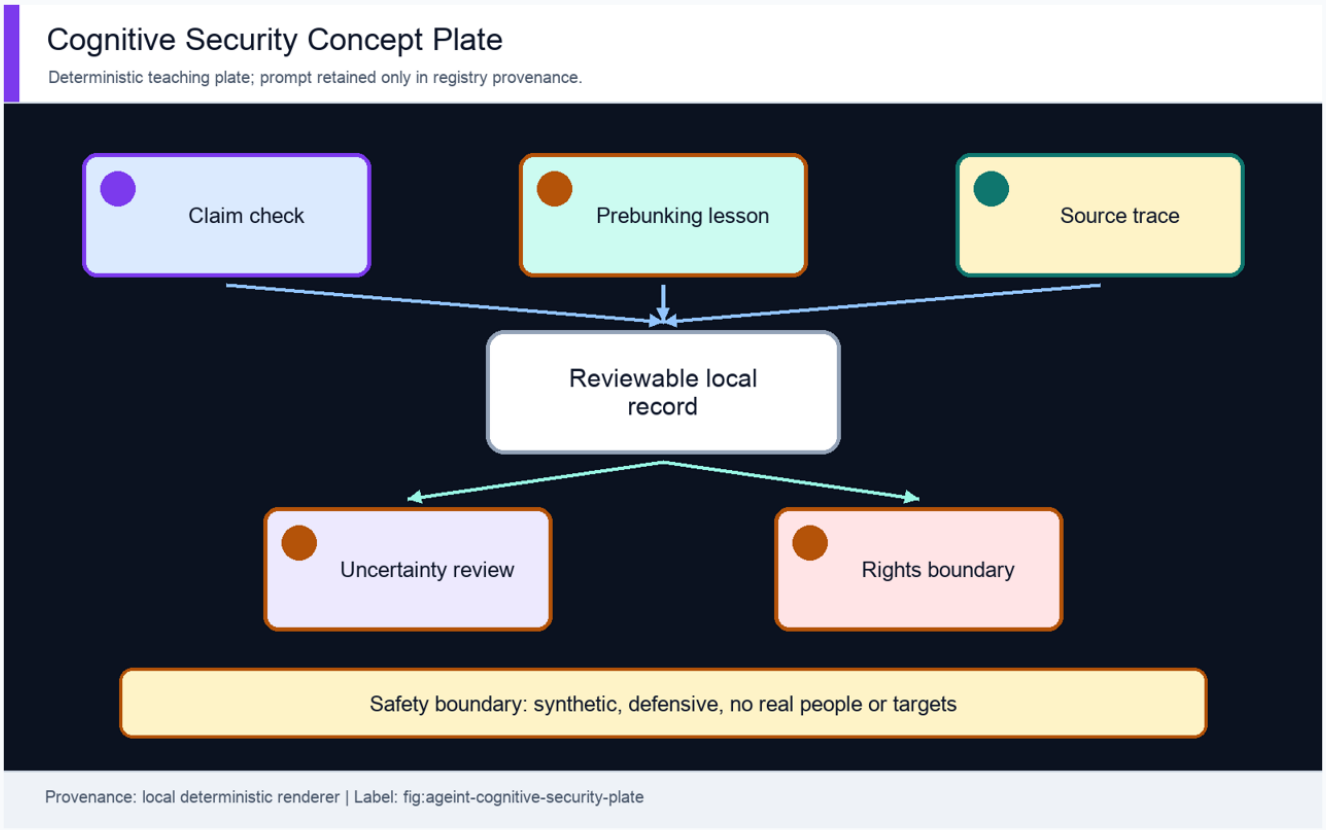

Figure 110: Deterministic teaching plate for cognitive security as defensive inoculation, provenance tracking, and uncertainty management. In the cognitive security section, it lets readers compare Claim check, Prebunking lesson, Source trace, and Uncertainty review so the visual functions as a traceable course aid rather than an unscoped assertion.

Module	Section reference	Source spine
Cognitive Security: Foundations and Definitions	Section 52	[238, 2026]; [239, 2026]; [244, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [165, 2026]; [166, 2026]; [167, 2026]; [095, 2026]; [096, 2026]; [168, 2026]; [169, 2026]; [170, 2026]; [171, 2026]; [107, 2026]; [172, 2026]; [173, 2026]; [174, 2026]; [175, 2026]; [001, 2026]; [307, 2026]; [305, 2026]; [304, 2026].
Neurocognitive Mechanisms of Cognitive Security	Section 53	[238, 2026]; [240, 2026]; [244, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [176, 2026]; [177, 2026]; [178, 2026]; [179, 2026]; [180, 2026]; [308, 2026]; [311, 2026].
Psychological Inoculation and Prebunking	Section 54	[242, 2026]; [243, 2026]; [245, 2026]; [279, 2026]; [282, 2026]; [284, 2026]; [289, 2026]; [291, 2026]; [296, 2026]; [181, 2026]; [182, 2026]; [183, 2026]; [152, 2026]; [184, 2026]; [185, 2026]; [186, 2026]; [187, 2026]; [151, 2026]; [308, 2026]; [311, 2026].
Cognitive Security Operations	Section 55	[238, 2026]; [239, 2026]; [246, 2026]; [275, 2026]; [276, 2026]; [283, 2026]; [286, 2026]; [293, 2026]; [295, 2026]; [095, 2026]; [105, 2026]; [188, 2026]; [106, 2026]; [003, 2026]; [096, 2026]; [300, 2026]; [304, 2026]; [306, 2026].

52 Cognitive Security: Foundations and Definitions

52.0.1 Cognitive Security: Foundations and Definitions figures and course links: visual evidence, source flow, and navigation

The module uses Figure 111 and Figure 107 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 51, Section 53.
This module teaches the **Cognitive Security and Influence Resilience** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [239, 2026].

52.1 Cognitive Security and Influence Resilience frame for Cognitive Security: Foundations and Definitions: source context, topic focus, and reader task

Evidence anchor. Section 52; [238, 2026].

52.1.1 Cognitive Security: Foundations and Definitions orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 52; [238, 2026].

52.1.2 Cognitive Security: Foundations and Definitions conceptual primer: source context, core model, and reader task

This chapter teaches cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The chapter uses **Cognitive-Resilience Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.
The central distinction is to separate analysis of influence from persuasion design. Core topics include **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence; Cognitive Security vs. Cybersecurity vs. Information Security**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [239, 2026].
Learners move from vocabulary and the **Cognitive-Resilience Lens** distinction through topic lessons on **Cognitive security definitions and scope** with evidence and misconception checks, then assemble a **narrative-risk map with provenance, uncertainty, audience harms, and response options** with safety and rights gates.

52.1.3 Cognitive Security: Foundations and Definitions learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 52; [238, 2026].

- Connect **Cognitive security definitions and scope and Comprehensive Definition: State and Process Against Malign Influence** to **Cognitive Security and Influence Resilience** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate analysis of influence from persuasion design; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans.

52.1.4 Cognitive Security: Foundations and Definitions core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 52; [238, 2026].

Term	Working definition
Narrative provenance	where a claim, frame, or story came from and how it spread
Prebunking	transparent education that helps people recognize misleading patterns before exposure
Audience harm	a privacy, dignity, autonomy, or trust risk for people receiving information
Attribution caution	the rule that intent and origin claims need strong evidence
Resilience response	a transparent education, correction, or process improvement that avoids manipulation
MISO boundary	the line between accountable public messaging analysis and covert influence design
Inoculation	building recognition of manipulation tactics without deploying persuasion against a population
Cognitive security definitions and scope	Key terms: Cognitive, security, definitions.
Comprehensive Definition: State and Process…	Key terms: Comprehensive, Definition, State.

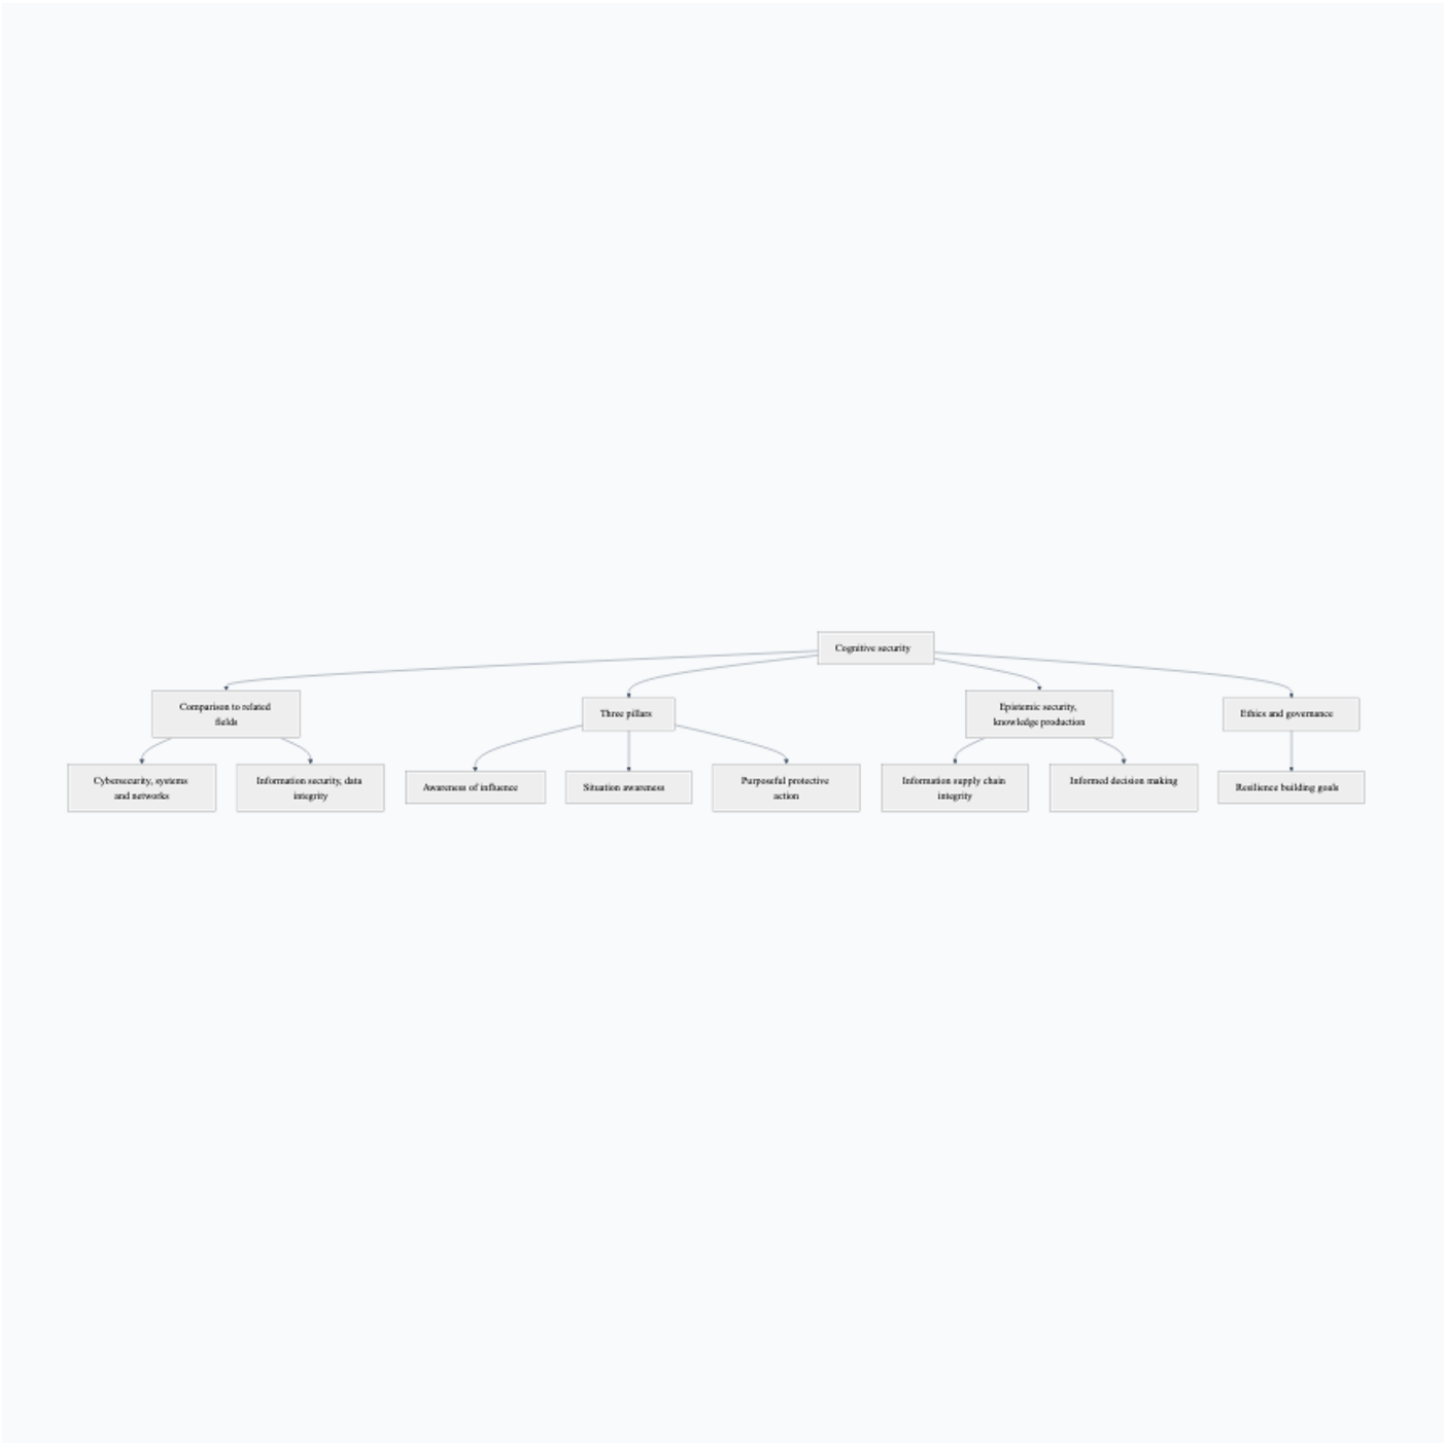

Figure 111: A taxonomy distinguishing cognitive security from related security fields and locating its three pillars and neighboring concept of epistemic security. It is anchored to the cognitive security / cognitive security foundations and definitions section; use it to inspect Cognitive security, Comparison to related fields, Cybersecurity, systems and networks, and Information security, data integrity while preserving the distinction between curriculum structure, evidence boundary, and accountable practice.

52.2 Cognitive-Resilience Lens path for Cognitive Security: Foundations and Definitions: lesson cluster, safe artifact, and review

Evidence anchor. Section 52; [238, 2026].

52.2.1 Cognitive Security: Foundations and Definitions practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 52; [238, 2026].

52.2.2 Cognitive Security: Foundations and Definitions topic lessons: source-backed concepts and transfer tasks

This module builds cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The sequence opens with **Cognitive security definitions and scope**, **Comprehensive Definition: State and Process Against Malign Influence**, **Cognitive Security vs. Cybersecurity vs. Information Security** and applies the **Cognitive-Resilience Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 107; module overview Section 52; curriculum atlas Section 2.

Triangulation anchors. In module 37's topic-lessons section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

52.2.2.1 Lesson 1: Cognitive security definitions and scope **Concept. Cognitive security definitions and scope** maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Analysts use **Cognitive security definitions** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Cognitive security definitions and scope rests on [165, 2026], [166, 2026], and [167, 2026]. The most specific cited work observes: A LinkedIn post by Fran Casino announcing a research article titled 'Unveiling the multifaceted concept of cognitive security: Trends, perspectives, and future challenges,' published in the Elsevier journal Technology in Society. Use them for fixing what **Cognitive security definitions and scope** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Cognitive security definitions**, work from the cited evidence behind this row. [165, 2026] We provide a comprehensive review of the current state of cognitive security. [166, 2026] Cognitive security, as an emerging field. [167, 2026] A LinkedIn post by Fran Casino announcing a research article titled 'Unveiling the multifaceted concept of cognitive security: Trends, perspectives, and future challenges,' published in the Elsevier journal Technology in Society. The post describes the work as a literature review that analyzes definitions, challenges, and future trends in cognitive security and proposes a redefinition based on the concept's core components. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Cognitive security definitions**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as an **epistemic-integrity review packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Cognitive security definitions**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Cognitive security definitions** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

52.2.2.2 Lesson 2: Comprehensive Definition: State and Process Against Malign Influence **Concept. Comprehensive Definition: State and Process Against Malign Influence** protects knowledge production with provenance, dissent channels, and transparent correction—not narrative control.

Why it matters. Analysts use **Comprehensive Definition** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Comprehensive Definition: State and Process Against Malign Influence rests on [166, 2026]. Its anchor reference records: Cognitive security, as an emerging field. Use it for fixing what **Comprehensive Definition: State and Process Against Malign Influence** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **Comprehensive Definition** against the works cited for this row. [166, 2026] Cognitive security, as an emerging field. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Comprehensive Definition**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Comprehensive Definition**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Comprehensive Definition** work as an **epistemic-integrity review packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Comprehensive Definition**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Comprehensive Definition** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

52.2.2.3 Lesson 3: Cognitive Security vs. Cybersecurity vs. Information Security **Concept. Cognitive Security vs. Cybersecurity vs. Information Security** maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Without explicit treatment of **Cognitive Security vs. Cybersecurity vs. Information Security**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Cognitive Security vs. Cybersecurity vs. Information Security rests on [095, 2026]. The most specific cited work observes: This policy paper examines the emergence of cognitive security. Use it for the working definition that **Cognitive Security vs. Cybersecurity vs. Information Security** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Cognitive Security vs. Cybersecurity vs. Information Security**, work from the cited evidence behind this row. [095, 2026] This policy paper examines the emergence of cognitive security. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Cognitive Security vs. Cybersecurity vs. Information Security**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Cognitive Security vs Cybersecurity vs**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as an **epistemic-integrity review packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Cognitive Security vs. Cybersecurity vs. Information Security**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Cognitive Security vs. Cybersecurity vs. Information Security** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

52.2.2.4 Lesson 4: Three Pillars: Awareness + Situation Awareness + Purposeful Action

Concept. Three Pillars: Awareness + Situation Awareness + Purposeful Action focuses on transparent resilience education: provenance, audience harm, attribution caution, and non-manipulative response options.

Why it matters. Three Pillars connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Three Pillars: Awareness + Situation Awareness + Purposeful Action rests on [166, 2026]. The closest source to this row notes: Cognitive security, as an emerging field. Use it for the working definition that **Three Pillars: Awareness + Situation Awareness + Purposeful Action** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **Three Pillars** against the works cited for this row. [166, 2026] Cognitive security, as an emerging field. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Three Pillars**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Three Pillars**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Three Pillars** work as an **epistemic-integrity review packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Three Pillars**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Three Pillars** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

52.2.2.5 Lesson 5: Unveiling the Multifaceted Concept of Cognitive Security (Elsevier, 2025)

Concept. Unveiling the Multifaceted Concept of Cognitive Security (Elsevier, 2025) maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Unveiling the Multifaceted Concept matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. Unveiling the Multifaceted Concept of Cognitive Security (Elsevier, 2025) rests on [165, 2026] and [167, 2026]. The lead source's own note reads: The post describes the work as a literature review that analyzes definitions, challenges, and future trends in cognitive security and proposes a redefinition based on the concept's core components. Use them for pinning down the scope of **Unveiling the Multifaceted Concept of Cognitive Security (Elsevier, 2025)**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Unveiling the Multifaceted Concept**, reason from the sources cited in this row. [165, 2026] We provide a comprehensive review of the current state of cognitive security. [167, 2026] A LinkedIn post by Fran Casino announcing a research article titled 'Unveiling the multifaceted concept of cognitive security: Trends, perspectives, and future challenges,' published in the Elsevier journal Technology in Society. The post describes the work as a literature review that analyzes definitions, challenges, and future trends in cognitive security and proposes a redefinition based on the concept's core components. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Unveiling the Multifaceted Concept**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Unveiling the Multifaceted Concept of**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Unveiling the Multifaceted Concept** work as an **epistemic-integrity review packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Unveiling the Multifaceted Concept**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Unveiling the Multifaceted Concept** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

52.2.2.6 Lesson 6: Neurocognitive resilience research literacy

Concept. Neurocognitive resilience research literacy maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Analysts use **Neurocognitive resilience research literacy** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Neurocognitive resilience research literacy rests on [095, 2026]. The most specific cited work observes: This policy paper examines the emergence of cognitive security. Use it for the claim that **Neurocognitive resilience research literacy** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Neurocognitive resilience research literacy**, work from the cited evidence behind this row. [095, 2026] This policy paper examines the emergence of cognitive security. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Neurocognitive resilience research literacy**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as an **epistemic-integrity review packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Neurocognitive resilience research literacy**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Neurocognitive resilience research literacy** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

52.2.2.7 Lesson 7: AI Development Should Prioritize Cognitive: Neurocognitive resilience research literacy Concept. AI Development Should Prioritize Cognitive: Neurocognitive resilience research literacy maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. AI Development Should Prioritize Cognitive connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. AI Development Should Prioritize Cognitive: Neurocognitive resilience research literacy rests on [096, 2026]. Its anchor reference records: A position paper (Stanford authors, ICLR 2026 workshop) arguing that AI research and development should prioritize cognitive security, defined as protecting human cognitive processes from hazardous influence. Use it for the working definition that **AI Development Should Prioritize Cognitive: Neurocognitive resilience research literacy** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **AI Development Should Prioritize Cognitive** in the evidence the row cites. [096, 2026] A position paper (Stanford authors, ICLR 2026 workshop) arguing that AI research and development should prioritize cognitive security, defined as protecting human cognitive processes from hazardous influence. It notes that generative AI systems increasingly designed to influence beliefs and behavior raise acute governance concerns, while research on these effects remains fragmented. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **AI Development Should Prioritize Cognitive**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **AI Development Should Prioritize Cognitive**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **AI Development Should Prioritize Cognitive** work as an **epistemic-integrity review packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **AI Development Should Prioritize Cognitive**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **AI Development Should Prioritize Cognitive** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

52.2.2.8 Lesson 8: DARPA cognitive-security research literacy Concept. DARPA cognitive-security research literacy maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Analysts use **DARPA cognitive-security research literacy** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. DARPA cognitive-security research literacy rests on [168, 2026], [169, 2026], and [170, 2026]. The lead source's own note reads: A HigherGov listing for the DARPA Intrinsic Cognitive Security (ICS) research solicitation, which seeks to develop tactical mixed-reality systems that protect users against cognitive attacks using formal methods with cognitive safeguards. Use them for pinning down the scope of **DARPA cognitive-security research literacy**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **DARPA cognitive-security research literacy**, reason from the sources cited in this row. [168, 2026] A Potomac Officers Club news article reporting on a DARPA request for proposals under its Intrinsic Cognitive Security program. The program seeks to protect mixed reality devices from cognitive attacks using mathematical approaches called formal methods, addressing risks such as flooding a device with information to induce motion sickness, distraction, or false alarms. [169, 2026] This is an official DARPA program page for the Intrinsic Cognitive Security (ICS) program, which addresses vulnerabilities in mixed reality systems that could be exploited through cognitive attacks. The program aims to develop formal mathematical methods that guarantee mixed reality designs can protect users against adversarial interference. [170, 2026] A HigherGov listing for the DARPA Intrinsic Cognitive Security (ICS) research solicitation, which seeks to develop tactical mixed-reality systems that protect users against cognitive attacks using formal methods with cognitive safeguards. The program is structured as a 36-month effort in two 18-month phases, with defined funding ranges for a mixed-reality cognition technical area and an evaluation technical area. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **DARPA cognitive-security research literacy**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as an **epistemic-integrity review packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **DARPA cognitive-security research literacy**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **DARPA cognitive-security research literacy** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

52.2.2.9 Lesson 9: Financial due-diligence typology exercise using synthetic records and compliance boundaries Concept. Financial due-diligence typology exercise using synthetic records and compliance boundaries structures financial-pattern review as typology-driven due diligence with escalation thresholds, not proof of wrongdoing.

Why it matters. Financial due-diligence typology exercise connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Financial due-diligence typology exercise using synthetic records and compliance boundaries rests on [171, 2026]. The closest source to this row notes: DARPA is putting together the Intrinsic Cognitive Security (ICS) research program "to build. Use it for pinning down the scope of **Financial due-diligence typology exercise using synthetic records and compliance boundaries**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Financial due-diligence typology exercise** in the evidence the row cites. [171, 2026] DARPA is putting together the Intrinsic Cognitive Security (ICS) research program "to build. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Financial due-diligence typology exercise**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must note the typology descriptor, the bounded claim about **Financial due-diligence typology exercise using**, the intent caveat, the uncertainty threshold, the no-accusation boundary, and the reviewer who owns escalation. Shape **Financial due-diligence typology exercise** work as an **epistemic-integrity review packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Financial due-diligence typology exercise**: that a typology or pattern match is proof of intent rather than a flag requiring corroboration and alternative explanations.

Transfer task. Apply this module's safe boundary for **Financial due-diligence typology exercise** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

52.2.2.10 Lesson 10: Formal Methods for Cognitive Guarantees in MR Systems

Concept. Formal Methods for Cognitive Guarantees in MR Systems evaluates formal guarantees as design claims requiring assumptions, limits, and independent review.

Why it matters. Formal Methods matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. Formal Methods for Cognitive Guarantees in MR Systems rests on [169, 2026]. Its anchor reference records: The program aims to develop formal mathematical methods that guarantee mixed reality designs can protect users against adversarial interference. Use it for fixing what **Formal Methods for Cognitive Guarantees in MR Systems** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Formal Methods**, reason from the sources cited in this row. [169, 2026] This is an official DARPA program page for the Intrinsic Cognitive Security (ICS) program, which addresses vulnerabilities in mixed reality systems that could be exploited through cognitive attacks. The program aims to develop formal mathematical methods that guarantee mixed reality designs can protect users against adversarial interference. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Formal Methods**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Formal Methods for Cognitive Guarantees**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Formal Methods** work as an **epistemic-integrity review packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Formal Methods**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Formal Methods** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

52.2.2.11 Lesson 11: Behavioral Outcomes of Human Cognitive Security (arXiv, March 2026)

Concept. Behavioral Outcomes of Human Cognitive Security (arXiv, March 2026) maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Analysts use **Behavioral Outcomes** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Behavioral Outcomes of Human Cognitive Security (arXiv, March 2026) rests on [107, 2026]. The closest source to this row notes: It synthesizes Bayesian belief-updating with Prospect Theory to model how cognitive resources and emotional valuation shape behavior, and identifies three observable outcomes: veracity discernment, task-oriented actions, and information sharing. Use it for the claim that **Behavioral Outcomes of Human Cognitive Security (arXiv, March 2026)** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **Behavioral Outcomes** against the works cited for this row. [107, 2026] An arXiv research paper (March 2026) proposing an integrative modeling framework for human cognitive security, defined as the degree to which people rely on truthful information to make truth-aligned judgments. It synthesizes Bayesian belief-updating with Prospect Theory to model how cognitive resources and emotional valuation shape behavior, and identifies three observable outcomes: veracity discernment, task-oriented actions, and information sharing. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Behavioral Outcomes**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Behavioral Outcomes of Human Cognitive**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Behavioral Outcomes** work as an **epistemic-integrity review packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Behavioral Outcomes**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Behavioral Outcomes** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

52.2.2.12 Lesson 12: Defining Comprehensive Cognitive Security in the Digital Era (SSRN 2024)

Concept. Defining Comprehensive Cognitive Security in the Digital Era (SSRN 2024) maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Without explicit treatment of **Defining Comprehensive Cognitive Security**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Defining Comprehensive Cognitive Security in the Digital Era (SSRN 2024) rests on [166, 2026]. The lead source's own note reads: Cognitive security, as an emerging field. Use it for fixing what **Defining Comprehensive Cognitive Security in the Digital Era (SSRN 2024)** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Defining Comprehensive Cognitive Security**, work from the cited evidence behind this row. [166, 2026] Cognitive security, as an emerging field. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Defining Comprehensive Cognitive Security**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Defining Comprehensive Cognitive Security in**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Defining Comprehensive Cognitive Security** work as an **epistemic-integrity review packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Defining Comprehensive Cognitive Security**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Defining Comprehensive Cognitive Security** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

52.2.2.13 Lesson 13: Ethics of Cognitive Security (YorkSpace Dissertation) Concept. Ethics of Cognitive Security (YorkSpace Dissertation) maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Ethics of Cognitive Security (YorkSpace Dissertation) connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Ethics of Cognitive Security (YorkSpace Dissertation) rests on [172, 2026]. The closest source to this row notes: This 2023 York University doctoral dissertation by Andrew Ward Buzzell provides an ethical and epistemic assessment of state power exercised to defend against information threats, a domain the author terms cognitive security. Use it for the claim that **Ethics of Cognitive Security (YorkSpace Dissertation)** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Ethics of Cognitive Security (YorkSpace Dissertation)**, work from the cited evidence behind this row. [172, 2026] This 2023 York University doctoral dissertation by Andrew Ward Buzzell provides an ethical and epistemic assessment of state power exercised to defend against information threats, a domain the author terms cognitive security. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Ethics of Cognitive Security (YorkSpace Dissertation)**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Ethics of Cognitive Security**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as an **epistemic-integrity review packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Ethics of Cognitive Security (YorkSpace Dissertation)**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Ethics of Cognitive Security (YorkSpace Dissertation)** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

52.2.2.14 Lesson 14: Epistemic security and knowledge-integrity Concept. Epistemic security and knowledge-integrity protects knowledge production with provenance, dissent channels, and transparent correction—not narrative control.

Why it matters. Without explicit treatment of **Epistemic security**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Epistemic security and knowledge-integrity rests on [307, 2026], [305, 2026], and [304, 2026]. The lead source's own note reads: NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Use them for the working definition that **Epistemic security and knowledge-integrity** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Epistemic security** in the evidence the row cites. [307, 2026] Official CISA Industrial Control Systems recommended practices page for defensive ICS/OT safety, resilience, and incident-preparation guidance. [305, 2026] Official NIST NCCoE DevSecOps project page for software factory, secure pipeline, and continuous authorization source support. [304, 2026] NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Epistemic security**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as an **epistemic-integrity review packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Epistemic security**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Epistemic security** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

52.2.2.15 Lesson 15: Seger: Epistemic security and knowledge-integrity Concept. Seger: Epistemic security and knowledge-integrity protects knowledge production with provenance, dissent channels, and transparent correction—not narrative control.

Why it matters. Seger: Epistemic security and knowledge-integrity connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Seger: Epistemic security and knowledge-integrity rests on [173, 2026]. The lead source's own note reads: A project page from AI governance and ethics researcher Elizabeth Seger introducing the concept of epistemic security: protecting the processes through which information is created, distributed, and consumed in society. Use it for pinning down the scope of **Seger: Epistemic security and knowledge-integrity**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Seger: Epistemic security and knowledge-integrity**, work from the cited evidence behind this row. [173, 2026] A project page from AI governance and ethics researcher Elizabeth Seger introducing the concept of epistemic security: protecting the processes through which information is created, distributed, and consumed in society. It discusses information threats to democracies such as disinformation, eroding trust in institutions, polarization, and the misuse of generative AI, and how technologies shape knowledge production. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Seger**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Seger**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Seger: Epistemic security and knowledge-integrity** work as an **epistemic-integrity review packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Seger: Epistemic security and knowledge-integrity**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **Seger: Epistemic security and knowledge-integrity** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

52.2.2.16 Lesson 16: Epistemic Security: Epistemic security and knowledge-integrity Concept. Epistemic Security: Epistemic security and knowledge-integrity shows how package provenance, social trust, build integrity, and assurance controls turn a software incident into reviewable evidence.

Why it matters. Analysts use **Epistemic Security** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to

skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Epistemic Security: Epistemic security and knowledge-integrity rests on [174, 2026]. The closest source to this row notes: A February 2025 Demos report by Elizabeth Seger, Hannah Perry, and Jamie Hancock on strengthening the UK's information supply chain. Use it for pinning down the scope of **Epistemic Security: Epistemic security and knowledge-integrity**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Epistemic Security** in the evidence the row cites. [174, 2026] A February 2025 Demos report by Elizabeth Seger, Hannah Perry, and Jamie Hancock on strengthening the UK's information supply chain. It frames epistemic security, securing healthy and robust flows of trustworthy information, as essential to countering what it calls a democratic emergency driven by institutional distrust, the decline of local news, and concentrated control of information by social media platforms. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Epistemic Security**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Epistemic Security**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Epistemic Security** work as an **epistemic-integrity review packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Epistemic Security**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Epistemic Security** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

52.2.2.17 Lesson 17: Tackling Threats to Informed Decision-Making (Turing Institute) Concept. Tackling Threats to Informed Decision-Making (Turing Institute)

Tackling Threats to Informed Decision-Making (Turing Institute) focuses on transparent resilience education: provenance, audience harm, attribution caution, and non-manipulative response options.

Why it matters. Tackling Threats connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Tackling Threats to Informed Decision-Making (Turing Institute) rests on [175, 2026]. The most specific cited work observes: It examines threats to informed decision-making and collective action, analyzing vulnerabilities in social epistemic infrastructures such as adversaries and blunderers, attention scarcity, group polarization, and the erosion of trust. Use it for the claim that **Tackling Threats to Informed Decision-Making (Turing Institute)** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **Tackling Threats** against the works cited for this row. [175, 2026] A 2020 Alan Turing Institute report, authored by Elizabeth Seger, Shahar Avin, and colleagues from Cambridge and the UK Defence Science and Technology Laboratory, on promoting epistemic security in technologically advanced democracies. It examines threats to informed decision-making and collective action, analyzing vulnerabilities in social epistemic infrastructures such as adversaries and blunderers, attention scarcity, group polarization, and the erosion of trust. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Tackling Threats**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Tackling Threats to Informed Decision-Making**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Tackling Threats** work as an **epistemic-integrity review packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Tackling Threats**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Tackling Threats** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

52.2.2.18 Lesson 18: Epistemic Governance in Crisis: Epistemic security and knowledge-integrity Concept. Epistemic Governance in Crisis: Epistemic security and knowledge-integrity

Epistemic Governance in Crisis: Epistemic security and knowledge-integrity protects knowledge production with provenance, dissent channels, and transparent correction—not narrative control.

Why it matters. Analysts use **Epistemic Governance in Crisis** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Epistemic Governance in Crisis: Epistemic security and knowledge-integrity rests on [001, 2026]. Its anchor reference records: This article examines the concept of epistemic governance during crises. Use it for the working definition that **Epistemic Governance in Crisis: Epistemic security and knowledge-integrity** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Epistemic Governance in Crisis**, work from the cited evidence behind this row. [001, 2026] This article examines the concept of epistemic governance during crises. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Epistemic Governance in Crisis**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Epistemic Governance in Crisis**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Epistemic Governance in Crisis** work as an **epistemic-integrity review packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Epistemic Governance in Crisis**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Epistemic Governance in Crisis** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

52.2.3 Cognitive Security: Foundations and Definitions worked safe example: synthetic inputs, evidence, and review

Worked example: a sample public-library class evaluates a synthetic rumor about a community service and compares transparent correction options. [238, 2026]; [239, 2026].

Triangulation anchors. In module 37's worked-example section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **cognitive resilience and epistemic integrity**. Learners use a **epistemic-integrity review packet** and keep this boundary visible: No manipulation, covert persuasion, medicalized claims, or population-level targeting.

Frame. The classroom question centers on **Cognitive security definitions and scope**. Excluded actions stay explicit, and the **Cognitive-Resilience Lens** planning question is: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Inputs. For the **Cognitive security definitions and scope** scenario, use sample posts, source timestamps, public-service facts, and a media-literacy rubric. The Cognitive-Resilience Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Cognitive security definitions and scope**, students trace narrative provenance, separate observation from attribution, name audience harms, and design a transparent lesson. Pause whenever an inference about Cognitive security definitions and scope appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Cognitive security definitions and scope** classroom scenario; unit artifact = epistemic-integrity review packet; evidence = allowed inputs; method = information-integrity analysis and resilience education; output = a narrative-risk map with caveats, response options, and no microtargeted persuasion; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Cognitive security definitions and scope** as "Cognitive-Resilience Lens confirms it" is not enough. The revision ties the claim to information-integrity analysis and resilience education, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Cognitive security definitions and scope** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

52.2.4 Cognitive Security: Foundations and Definitions practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Cognitive-Resilience Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

Triangulation anchors. In module 37's practice-sequence section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Cognitive security definitions and scope, Comprehensive Definition: State and Process Against Malign Influence, Cognitive Security vs. Cybersecurity vs. Information Security; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Cognitive Security and Influence Resilience** lane.
2. Frame	Answer the lens question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Cognitive security definitions and scope: narrative-risk map with provenance, uncertainty, audience harms, and response options.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the epistemic-integrity review packet fields for Cognitive security definitions and scope.	Unit profile note.	Evidence artifacts include provenance chain, correction option.
4. Challenge	Test the misconception that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.	Failure-mode note.	The artifact applies the key distinction: separate analysis of influence from persuasion design.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

52.2.4.1 Cognitive Security: Foundations and Definitions instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**. [238, 2026]; [239, 2026].

52.2.4.2 Cognitive Security: Foundations and Definitions extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 52; [238, 2026].

Have learners swap artifacts and apply the **Cognitive-Resilience Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

52.2.5 Cognitive Security: Foundations and Definitions knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 52; [238, 2026].

1. Explain how **Cognitive security definitions and scope** is defined here; name the source descriptor that supports the definition.
2. Contrast **Cognitive security definitions and scope** with **Comprehensive Definition: State and Process Against Malign Influence** using the **Cognitive-Resilience Lens** artifact fields.
3. Identify one failure mode from the **Cognitive Security and Influence Resilience** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which response informs people without crossing into MISO-style manipulation or unverified attribution?
5. Correct this misconception: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

52.2.5.1 Cognitive Security: Foundations and Definitions answer quality rubric: source evidence, uncertainty, and safe transfer Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Cognitive security definitions and scope** without source evidence, uncertainty, or a safe transfer task.

52.3 Cognitive Security: Foundations and Definitions assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 52; [238, 2026].

52.3.1 Cognitive Security: Foundations and Definitions evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 52; [238, 2026].

52.3.2 Cognitive Security: Foundations and Definitions transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 52; [238, 2026].

52.3.2.1 Cognitive Security: Foundations and Definitions lineage and source tradition: profile, concepts, and first anchors This sits in the **Cognitive Security and Influence Resilience** lineage: protecting attention, belief formation, and decision quality without turning resilience education into manipulation. [238, 2026]; [239, 2026].

52.3.2.2 Cognitive Security: Foundations and Definitions working model: inputs, constraints, transforms, outputs, and oversight Evidence anchor. Section 52; [238, 2026].
The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**, with provenance and reviewability throughout.

52.3.2.3 Cognitive Security: Foundations and Definitions knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [238, 2026]; [239, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

52.3.2.4 Cognitive Security: Foundations and Definitions transfer contracts: authority, evidence, tools, and auditable output Evidence anchor. Section 52; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.
- **Evidence contract:** keep the **Cognitive Security and Influence Resilience** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

52.3.2.5 Cognitive Security: Foundations and Definitions profile emphasis and local focus: method stack and topic cluster Evidence anchor. Section 52; [238, 2026].
The matched profile emphasizes protecting attention, belief formation, and decision quality without turning resilience education into manipulation. The method stack is claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning; the local topic cluster is **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

52.3.3 Cognitive Security: Foundations and Definitions evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 52; [238, 2026].
Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Cognitive Security and Influence Resilience** profile tells reviewers what evidence is strong enough for the module artifact built around **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

52.3.3.1 Cognitive Security: Foundations and Definitions guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [239, 2026]; [244, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [165, 2026]; [166, 2026]; [167, 2026]; [095, 2026]; [096, 2026]; [168, 2026]; [169, 2026]; [170, 2026]; [171, 2026]; [107, 2026]; [172, 2026]; [173, 2026]; [174, 2026]; [175, 2026]; [001, 2026]; [307, 2026]; [305, 2026]; [304, 2026].

52.3.3.2 Cognitive Security: Foundations and Definitions verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [239, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [239, 2026]; [244, 2026]; [273, 2026]; [276, 2026]; [285, 2026]; [286, 2026]; [290, 2026]; [294, 2026]; [165, 2026]; [166, 2026]; [167, 2026]; [095, 2026]; [096, 2026]; [168, 2026]; [169, 2026]; [170, 2026]; [171, 2026]; [107, 2026]; [172, 2026]; [173, 2026]; [174, 2026]; [175, 2026]; [001, 2026]; [307, 2026]; [305, 2026]; [304, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 37's source-canon section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.
Maintenance rule: Perplexity may suggest candidates for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence** and [238, 2026]; [239, 2026], but only directly verified source URLs are encoded as citations.

52.3.3.3 Cognitive Security: Foundations and Definitions intelligence practice lens: evidence artifact and safety check Practice lens: **Cognitive-Resilience Lens** for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**. [238, 2026]; [239, 2026].

Planning question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Evidence artifact: narrative-risk map with provenance, uncertainty, audience harms, and response options.

Validation rule: distinguish observation, attribution, impact assessment, and resilience response. Applied to **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

Handoff contract: handoff supports transparency, education, and resilience, not microtargeted influence or deception.

Safety check: exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning.

52.3.3.4 Cognitive Security: Foundations and Definitions runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 52; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	37.99	37.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Cognitive Security: Foundations and Definitions to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	37.101	37.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Cognitive Security: Foundations and Definitions	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

[304, 2026]	Secure Software Development Framework (SSDF) Version 1.1: Recommendations for Mitigating the Risk of Software Vulnerabilities	NIST SP 800-218, the Secure Software Development Framework Version 1.1 published in February 2022, establishes a set of high-level practices for integrating security into software development lifecycles in order to reduce vulnerabilities in released software, mitigate the impact of exploited vulnerabilities, and address root causes to prevent recurrences.	verified source-guide

Where this sits. This module's overview is Section 52; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

52.3.4 Cognitive Security: Foundations and Definitions governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 52; [238, 2026].

52.3.5 Cognitive Security: Foundations and Definitions analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 37's governance-boundary section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Cognitive Security and Influence Resilience** for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**. [238, 2026]; [239, 2026].

Curriculum topic spine: Cognitive security definitions and scope, **Comprehensive Definition: State and Process Against Malign Influence**, **Cognitive Security vs. Cybersecurity vs. Information Security**. **Verified anchor cluster:** [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]; [OECD, 2026c]; [for Security Policy, 2025]; [Community, 2020a].

Conceptual depth: protecting attention, belief formation, and decision quality without turning resilience education into manipulation.

Method stack: claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning.

Composability contract: separate descriptive analysis, normative assessment, response options, and protected-audience considerations.

Known failure modes: counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty.

Defensive boundary: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans. Applied to **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

Anchor	Why it matters here
[Cybersecurity and Agency, 2024b]	Official CISA guidance on foreign influence operations targeting critical infrastructure. Checked as of 2026-05-21; role: source_quality_anchor.
[Organization, 2026b]	Official NATO counter-information-threat guidance. Checked as of 2026-05-21; role: source_quality_anchor.
[Cybersecurity and Agency, 2026b]	Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing. Checked as of 2026-05-21; role: curriculum_anchor.
[Organization, 2026c]	Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure. Checked as of 2026-05-21; role: curriculum_anchor.
[OECD, 2026c]	Official OECD policy source for information integrity, governance responses, public trust, and democratic resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[for Security Policy, 2025]	Policy-scholarship source for cognitive security, information literacy, critical thinking, and whole-of-society resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.

52.3.5.1 Cognitive Security: Foundations and Definitions evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Cognitive Security and Influence Resilience** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [239, 2026].

52.3.6 Cognitive Security: Foundations and Definitions agentic boundary: assist, approve, block, and record

Evidence anchor. Section 52; [238, 2026].

AGEINT translation is bounded by the **Cognitive Security and Influence Resilience** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

52.3.6.1 Cognitive Security: Foundations and Definitions permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 52; [238, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

52.3.6.2 Cognitive Security: Foundations and Definitions excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [239, 2026] and **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

52.3.7 Cognitive Security: Foundations and Definitions governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 52; [238, 2026].

Governance is practiced as a gate on the **Cognitive Security and Influence Resilience** lane. Learners use the **Cognitive-Resilience Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

52.3.7.1 Cognitive Security: Foundations and Definitions governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [239, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Cognitive Security and Influence Resilience** failure modes and the **Cognitive-Resilience Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

52.3.7.2 Cognitive Security: Foundations and Definitions evidence package handoff: appendices, records, and reuse **Evidence anchor.** Section 52; [238, 2026].
Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Cognitive-Resilience Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

52.3.7.3 Cognitive Security: Foundations and Definitions current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**. [238, 2026]; [239, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cisa_foreign_influence` for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**?	Preparing for and Mitigating Foreign Influence Operations; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA guidance on foreign influence operations targeting critical infrastructure.
What does the module inherit from `official_nato_counter_information_threats` for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**?	Countering Information Threats; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO counter-information-threat guidance.
What does the module inherit from `official_cisa_election_security_influence` for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**?	Election Security; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing.
What does the module inherit from `official_nato_hybrid_threats` for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**?	Countering Hybrid Threats; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 52; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

52.3.8 Cognitive Security: Foundations and Definitions assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 52; [238, 2026].

52.3.9 Cognitive Security: Foundations and Definitions assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 52; [238, 2026].

52.3.9.1 Cognitive Security: Foundations and Definitions capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence** and [238, 2026]; [239, 2026].

52.3.9.2 Cognitive Security: Foundations and Definitions instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence** and [238, 2026]; [239, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

52.3.9.3 Cognitive Security: Foundations and Definitions assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Cognitive security definitions and scope	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Comprehensive Definition: State and Process Against Malign Influence	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Cognitive Security vs. Cybersecurity vs. Information Security	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

52.3.10 Cognitive Security: Foundations and Definitions refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [239, 2026] and **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**.

52.3.10.1 Cognitive Security: Foundations and Definitions refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**. The local signals begin with [238, 2026]; [239, 2026].

52.3.10.2 Cognitive Security: Foundations and Definitions claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**, and the source spine for these checks begins with [238, 2026]; [239, 2026].

52.3.11 Cognitive Security: Foundations and Definitions reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [239, 2026].

Triangulation anchors. In module 37's review-checklist section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence**. [238, 2026]; [239, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

52.3.12 Cognitive Security: Foundations and Definitions learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **Cognitive security definitions and scope; Comprehensive Definition: State and Process Against Malign Influence** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [238, 2026]; [239, 2026].

Section 2, Section 51, Section 53

53 Neurocognitive Mechanisms of Cognitive Security

53.0.1 Neurocognitive Mechanisms of Cognitive Security figures and course links: visual evidence, source flow, and navigation

The module uses Figure 112 and Figure 107 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 51, Section 52, Section 54.
This module teaches the **Cognitive Security and Influence Resilience** lane through a bounded, source-backed coursebook chapter. [238, 2026]; [240, 2026].

53.1 Cognitive Security and Influence Resilience frame for Neurocognitive Mechanisms of Cognitive Security: source context, topic focus, and reader task

Evidence anchor. Section 53; [238, 2026].

53.1.1 Neurocognitive Mechanisms of Cognitive Security orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 53; [238, 2026].

53.1.2 Neurocognitive Mechanisms of Cognitive Security conceptual primer: source context, core model, and reader task

This chapter teaches cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The chapter uses **Cognitive-Resilience Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.
The central distinction is to separate analysis of influence from persuasion design. Core topics include **Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025); Executive Brain Systems and Vulnerability to Information Threats; Affective Systems: Emotional Exploitation in Manipulation**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [238, 2026]; [240, 2026].
Learners move from vocabulary and the **Cognitive-Resilience Lens** distinction through topic lessons on **Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025)** with evidence and misconception checks, then assemble a **narrative-risk map with provenance, uncertainty, audience harms, and response options** with safety and rights gates.

53.1.3 Neurocognitive Mechanisms of Cognitive Security learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 53; [238, 2026].

- Connect **Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025) and Executive Brain Systems and Vulnerability to Information Threats** to **Cognitive Security and Influence Resilience** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate analysis of influence from persuasion design; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans.

53.1.4 Neurocognitive Mechanisms of Cognitive Security core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 53; [238, 2026].

Term	Working definition
Narrative provenance	where a claim, frame, or story came from and how it spread
Prebunking	transparent education that helps people recognize misleading patterns before exposure
Audience harm	a privacy, dignity, autonomy, or trust risk for people receiving information
Attribution caution	the rule that intent and origin claims need strong evidence
Resilience response	a transparent education, correction, or process improvement that avoids manipulation
MISO boundary	the line between accountable public messaging analysis and covert influence design
Inoculation	building recognition of manipulation tactics without deploying persuasion against a population
Understanding Neurocognitive Mechanisms of…	Key terms: Understanding, Neurocognitive, Mechanisms.
Executive Brain Systems and Vulnerability to…	Key terms: Executive, Brain, Systems.

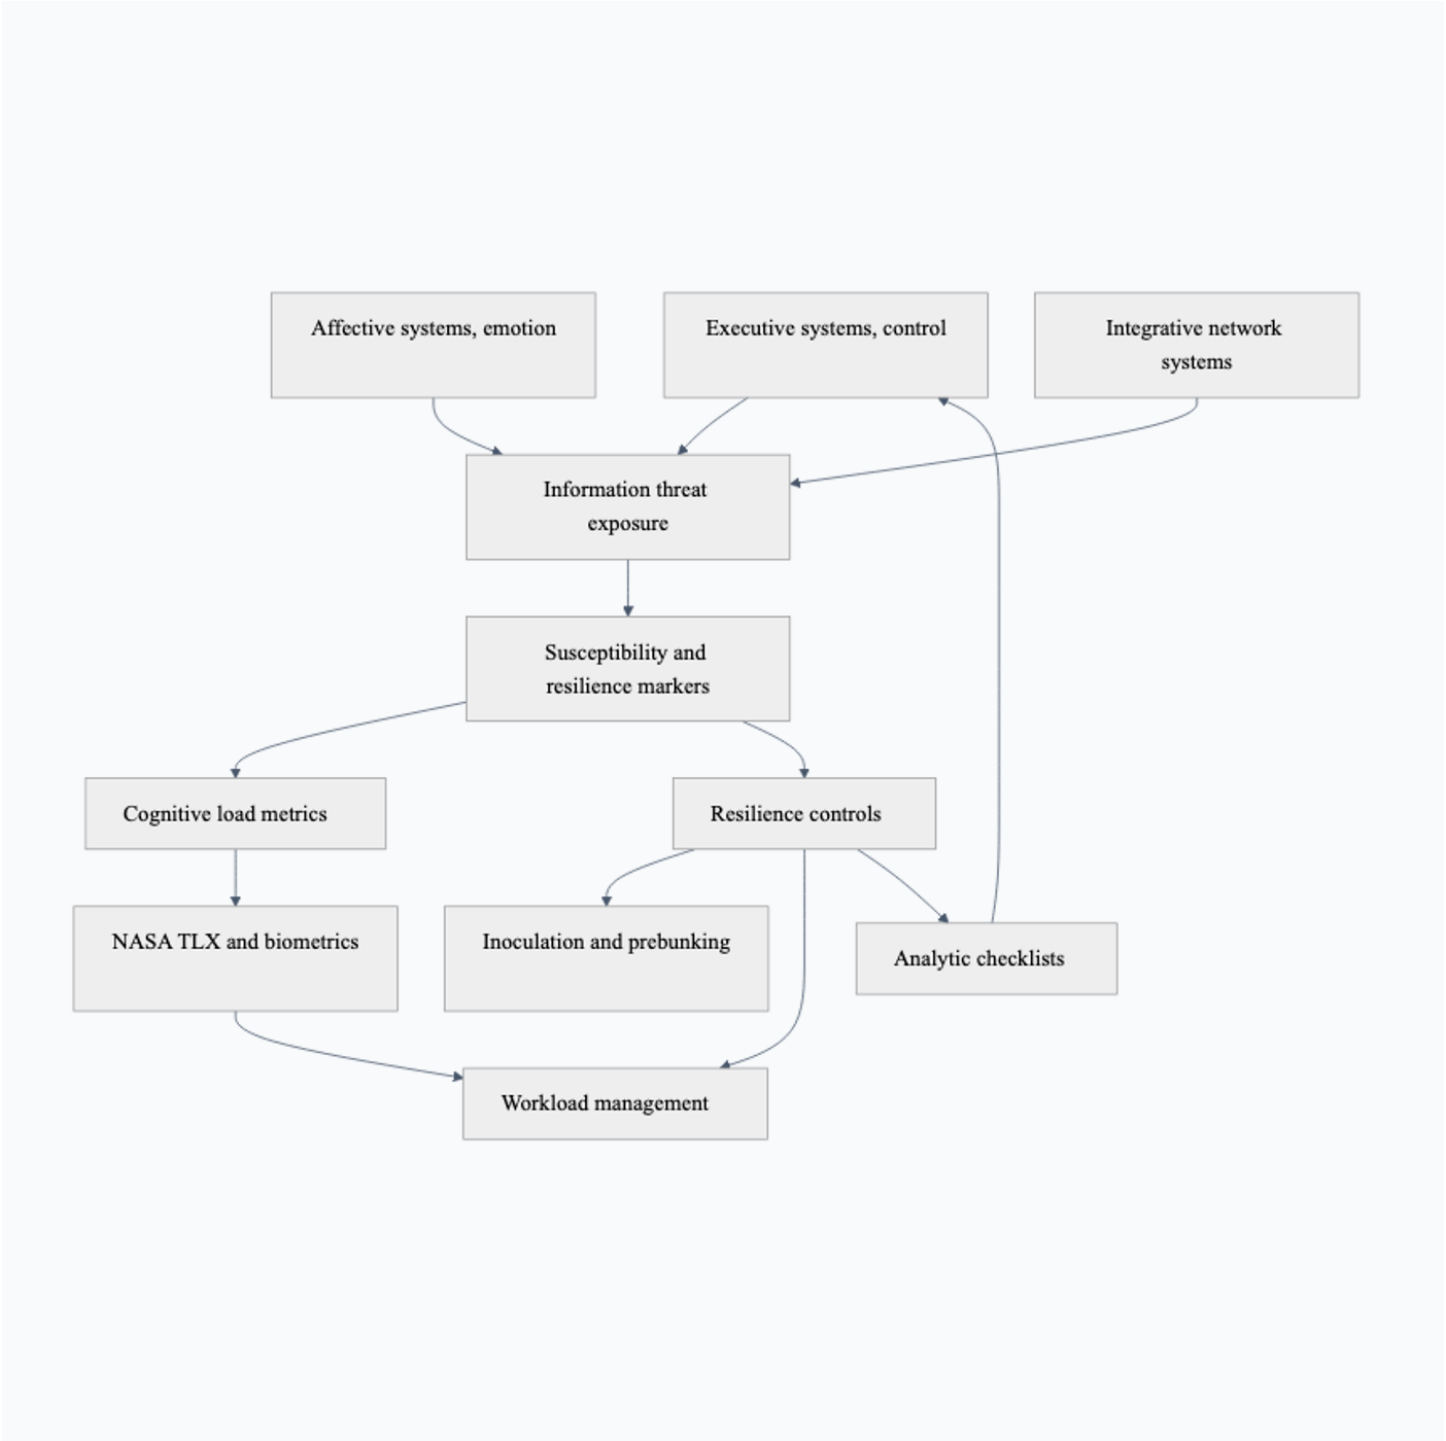

Figure 112: A defensive model linking executive, affective, and integrative brain systems to measurable susceptibility markers and the resilience controls that strengthen them. The captioned view belongs to the cognitive security / neurocognitive mechanisms of cognitive security section and should be read as a map of Executive systems, control, Information threat exposure, Affective systems, emotion, and Integrative network systems, not as a capability score or live-task instruction.

53.2 Cognitive-Resilience Lens path for Neurocognitive Mechanisms of Cognitive Security: lesson cluster, safe artifact, and review

Evidence anchor. Section 53; [238, 2026].

53.2.1 Neurocognitive Mechanisms of Cognitive Security practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 53; [238, 2026].

53.2.2 Neurocognitive Mechanisms of Cognitive Security topic lessons: source-backed concepts and transfer tasks

This module builds cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The sequence opens with **Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025)**, **Executive Brain Systems and Vulnerability to Information Threats**, **Affective Systems: Emotional Exploitation in Manipulation** and applies the **Cognitive-Resilience Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 107; module overview Section 53; curriculum atlas Section 2.

Triangulation anchors. In module 38's topic-lessons section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

53.2.2.1 Lesson 1: Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025) Concept. Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025) maps cognitive attack surfaces: attention, belief formation, narrative provenance, and transparent correction options.

Why it matters. Analysts use **Understanding Neurocognitive Mechanisms** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025) rests on [176, 2026] and [177, 2026]. The most specific cited work observes: The authors synthesize research on why people fall victim to false or deceptive information, proposing that certain brain systems are more exploitable than others. Use them for pinning down the scope of **Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025)**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Understanding Neurocognitive Mechanisms**, reason from the sources cited in this row. [176, 2026] Cognitive security is a relatively new field that aims to understand and defend against. [177, 2026] A peer-reviewed review article published in Neuroscience & Biobehavioral Reviews (December 2025) by Crum and colleagues examining the neurocognitive mechanisms of cognitive security. The authors synthesize research on why people fall victim to false or deceptive information, proposing that certain brain systems are more exploitable than others. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Understanding Neurocognitive Mechanisms**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Understanding Neurocognitive Mechanisms of Cognitive**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Understanding Neurocognitive Mechanisms** work as an **epistemic-integrity review packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Understanding Neurocognitive Mechanisms**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Understanding Neurocognitive Mechanisms** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

53.2.2.2 Lesson 2: Executive Brain Systems and Vulnerability to Information Threats Concept. Executive Brain Systems and Vulnerability to Information Threats treats the vulnerability record as an assurance case: severity, affected component, provenance, mitigation status, and uncertainty stay separate.

Why it matters. Executive Brain Systems matters in the **Cognitive Security and Influence Resilience** lane because information-integrity analysis and resilience education evidence must stay separate from judgment; treating resilience labels as permission to skip provenance review is a common failure.

Source support. Executive Brain Systems and Vulnerability to Information Threats rests on [177, 2026]. The closest source to this row notes: The authors synthesize research on why people fall victim to false or deceptive information, proposing that certain brain systems are more exploitable than others. Use it for the claim that **Executive Brain Systems and Vulnerability to Information Threats** lets you defend here, the limit it has to respect, and the re-check owed before reuse. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **Executive Brain Systems** against the works cited for this row. [177, 2026] A peer-reviewed review article published in Neuroscience & Biobehavioral Reviews (December 2025) by Crum and colleagues examining the neurocognitive mechanisms of cognitive security. The authors synthesize research on why people fall victim to false or deceptive information, proposing that certain brain systems are more exploitable than others. Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **Executive Brain Systems**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Executive Brain Systems and Vulnerability**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Executive Brain Systems** work as an **epistemic-integrity review packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Executive Brain Systems**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Executive Brain Systems** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

53.2.2.3 Lesson 3: Affective Systems: Emotional Exploitation in Manipulation Concept. Affective Systems: Emotional Exploitation in Manipulation focuses on transparent resilience education: provenance, audience harm, attribution caution, and non-manipulative response options.

Why it matters. Affective Systems connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Affective Systems: Emotional Exploitation in Manipulation rests on [177, 2026]. The most specific cited work observes: The authors synthesize research on why people fall victim to false or deceptive information, proposing that certain brain systems are more exploitable

than others. Use it for pinning down the scope of **Affective Systems: Emotional Exploitation in Manipulation**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Affective Systems**, reason from the sources cited in this row. [177, 2026] A peer-reviewed review article published in Neuroscience & Biobehavioral Reviews (December 2025) by Crum and colleagues examining the neurocognitive mechanisms of cognitive security. The authors synthesize research on why people fall victim to false or deceptive information, proposing that certain brain systems are more exploitable than others. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Affective Systems**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Affective Systems**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Affective Systems** work as an **epistemic-integrity review packet** that states the evidence used, what stays uncertain, who reviews it, and when to stop.

Misconception check. Correct the misconception about **Affective Systems**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Affective Systems** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

53.2.2.4 Lesson 4: Integrative Systems: Brain Network Interactions During Threat Exposure Concept. Integrative Systems: Brain Network Interactions During Threat Exposure connects cognitive science claims to analytic bias literacy: what the brain prioritizes, what it misses, and how review compensates.

Why it matters. Without explicit treatment of **Integrative Systems**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Integrative Systems: Brain Network Interactions During Threat Exposure rests on [177, 2026]. The most specific cited work observes: A peer-reviewed review article published in Neuroscience & Biobehavioral Reviews (December 2025) by Crum and colleagues examining the neurocognitive mechanisms of cognitive security. Use it for pinning down the scope of **Integrative Systems: Brain Network Interactions During Threat Exposure**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Integrative Systems**, reason from the sources cited in this row. [177, 2026] A peer-reviewed review article published in Neuroscience & Biobehavioral Reviews (December 2025) by Crum and colleagues examining the neurocognitive mechanisms of cognitive security. The authors synthesize research on why people fall victim to false or deceptive information, proposing that certain brain systems are more exploitable than others. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Integrative Systems**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Integrative Systems**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Integrative Systems** work as an **epistemic-integrity review packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Integrative Systems**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Integrative Systems** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

53.2.2.5 Lesson 5: Neuromarkers of Susceptibility and Resilience Concept. Neuromarkers of Susceptibility and Resilience focuses on transparent resilience education: provenance, audience harm, attribution caution, and non-manipulative response options.

Why it matters. Neuromarkers of Susceptibility and Resilience connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Neuromarkers of Susceptibility and Resilience rests on [177, 2026]. The lead source's own note reads: A peer-reviewed review article published in Neuroscience & Biobehavioral Reviews (December 2025) by Crum and colleagues examining the neurocognitive mechanisms of cognitive security. Use it for pinning down the scope of **Neuromarkers of Susceptibility and Resilience**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Read **Neuromarkers of Susceptibility and Resilience** against the works cited for this row. [177, 2026] A peer-reviewed review article published in Neuroscience & Biobehavioral Reviews (December 2025) by Crum and colleagues examining the neurocognitive mechanisms of cognitive security. The authors synthesize research on why people fall victim to false or deceptive information, proposing that certain brain systems are more exploitable than others. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Neuromarkers of Susceptibility and Resilience**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as an **epistemic-integrity review packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Neuromarkers of Susceptibility and Resilience**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Neuromarkers of Susceptibility and Resilience** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

53.2.2.6 Lesson 6: Neuro-Cognitive Approaches to Cybersecurity: Systematic Review (Emerald, 2025) Concept. Neuro-Cognitive Approaches to Cybersecurity: Systematic Review (Emerald, 2025) connects neurocognitive claims to analytic bias literacy and review compensation—not operational timing advice.

Why it matters. Without explicit treatment of **Neuro-Cognitive Approaches to Cybersecurity**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Neuro-Cognitive Approaches to Cybersecurity: Systematic Review (Emerald, 2025) rests on [178, 2026]. Its anchor reference records: A January 2026 systematic review in Information and Computer Security by the researcher Kritika, titled "Neuro-cognitive approaches to cybersecurity." It integrates findings from neuroscience and cognitive psychology to analyze the human factor in security, examining how cognitive and neurological insights can improve security awareness education, behavioral policy development, insider threat detection, and user interface design. Use it for the working definition that **Neuro-Cognitive Approaches to Cybersecurity: Systematic Review (Emerald, 2025)** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Neuro-Cognitive Approaches to Cybersecurity**, work from the cited evidence behind this row. [178, 2026] A January 2026 systematic review in Information and Computer Security by the researcher Kritika, titled "Neuro-cognitive approaches to cybersecurity." It integrates findings from neuroscience and cognitive psychology to analyze the human factor in security, examining how cognitive and neurological insights can improve security awareness education, behavioral policy development, insider threat detection, and user interface design. Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Neuro-Cognitive Approaches to Cybersecurity**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Neuro-Cognitive Approaches to Cybersecurity**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Neuro-Cognitive Approaches to Cybersecurity** work as an **epistemic-integrity review packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Neuro-Cognitive Approaches to Cybersecurity**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Reuse the **Neuro-Cognitive Approaches to Cybersecurity** audit pattern from this module on a different sample record set with a new reviewer and blocked-use note.

53.2.2.7 Lesson 7: Cognitive Load in Intelligence Community Settings (NCSU Survey, 2024)

Concept. Cognitive Load in Intelligence Community Settings (NCSU Survey, 2024) maps the theory to institutions: priorities, feedback, incentives, review loops, and records shape what an intelligence community notices and ignores.

Why it matters. Without explicit treatment of **Cognitive Load**, counter-messaging as manipulation undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. Cognitive Load in Intelligence Community Settings (NCSU Survey, 2024) rests on [179, 2026]. The most specific cited work observes: Reviewing 125 articles published between 1998 and 2024, it identifies 129 distinct metrics grouped into non-biometric methods (questionnaires such as NASA-TLX, task performance, interaction tracking) and biometric methods (eye tracking, heart rate). Use it for the working definition that **Cognitive Load in Intelligence Community Settings (NCSU Survey, 2024)** can defend, where that scope ends, and the refresh check owed before this evidence transfers. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Cognitive Load**, reason from the sources cited in this row. [179, 2026] An NCSU Laboratory for Analytic Sciences article summarizing a systematic survey of metrics for measuring cognitive load in intelligence-analysis and similar settings. Reviewing 125 articles published between 1998 and 2024, it identifies 129 distinct metrics grouped into non-biometric methods (questionnaires such as NASA-TLX, task performance, interaction tracking) and biometric methods (eye tracking, heart rate). Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Cognitive Load**, build an institutional feedback-loop map with incentives, review points, and oversight hooks. Shape **Cognitive Load** work as an **epistemic-integrity review packet** that records its evidence, the residual uncertainty, the named reviewer, and the stop condition.

Misconception check. Correct the misconception about **Cognitive Load**: that feeling certain in the moment substitutes for the checklist, pause, and second-look that decision hygiene exists to enforce.

Transfer task. Transfer **Cognitive Load** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

53.2.2.8 Lesson 8: 129 Metrics Catalogued: Questionnaire, Biometric, Task-Performance

Concept. 129 Metrics Catalogued: Questionnaire, Biometric, Task-Performance evaluates biometric monitoring by consent, minimization, purpose limits, and human review of alerts.

Why it matters. Without explicit treatment of **129 Metrics Catalogued**, treating resilience labels as permission to skip provenance review undermines information-integrity analysis and resilience education review; the lesson builds the habit to separate analysis of influence from persuasion design.

Source support. 129 Metrics Catalogued: Questionnaire, Biometric, Task-Performance rests on [179, 2026]. The lead source's own note reads: An NCSU Laboratory for Analytic Sciences article summarizing a systematic survey of metrics for measuring cognitive load in intelligence-analysis and similar settings. Use it for fixing what **129 Metrics Catalogued: Questionnaire, Biometric, Task-Performance** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **129 Metrics Catalogued**, work from the cited evidence behind this row. [179, 2026] An NCSU Laboratory for Analytic Sciences article summarizing a systematic survey of metrics for measuring cognitive load in intelligence-analysis and similar settings. Reviewing 125 articles published between 1998 and 2024, it identifies 129 distinct metrics grouped into non-biometric methods (questionnaires such as NASA-TLX, task performance, interaction tracking) and biometric methods (eye tracking, heart rate). Each source above earns its place in this topic only when you can state its bounded claim, its provenance, its uncertainty, and the fact that would retire it.

Student artifact. For **129 Metrics Catalogued**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **129 Metrics Catalogued**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **129 Metrics Catalogued** work as an **epistemic-integrity review packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **129 Metrics Catalogued**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **129 Metrics Catalogued** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

53.2.2.9 Lesson 9: NASA-TLX and Its Intelligence Analytic Applications

Concept. NASA-TLX and Its Intelligence Analytic Applications uses workload indexes as review triggers for prioritization, handoff, and rest—not as heroics metrics.

Why it matters. NASA-TLX and Its Intelligence Analytic Applications connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. NASA-TLX and Its Intelligence Analytic Applications rests on [179, 2026]. Its anchor reference records: An NCSU Laboratory for Analytic Sciences article summarizing a systematic survey of metrics for measuring cognitive load in intelligence-analysis and similar settings. Use it for pinning down the scope of **NASA-TLX and Its Intelligence Analytic Applications**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **NASA-TLX and Its Intelligence Analytic Applications**, reason from the sources cited in this row. [179, 2026] An NCSU Laboratory for Analytic Sciences article summarizing a systematic survey of metrics for measuring cognitive load in intelligence-analysis and similar settings. Reviewing 125 articles published between 1998 and 2024, it identifies 129 distinct metrics grouped into non-biometric methods (questionnaires such as NASA-TLX, task performance, interaction tracking) and biometric methods (eye tracking, heart rate). From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **NASA-TLX and Its Intelligence Analytic Applications**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **NASA-TLX and Its Intelligence Analytic**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape this subject work as an **epistemic-integrity review packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **NASA-TLX and Its Intelligence Analytic Applications**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Transfer **NASA-TLX and Its Intelligence Analytic Applications** from this module to a second motif by preserving information-integrity analysis and resilience education, replacing action with audit, and naming the blocked use.

53.2.2.10 Lesson 10: Eye Tracking and Heart Rate Variability for Analyst Overload Detection **Concept. Eye Tracking and Heart Rate Variability for Analyst Overload Detection** focuses on transparent resilience education: provenance, audience harm, attribution caution, and non-manipulative response options.

Why it matters. Analysts use **Eye Tracking and Heart Rate Variability for Analyst Overload Detection** to separate analysis of influence from persuasion design. A defensible treatment names the judgment it enables for information-integrity analysis and resilience education review, the proof limit that treating resilience labels as permission to skip provenance review would otherwise hide, and the reviewer accountable for challenge.

Source support. Eye Tracking and Heart Rate Variability for Analyst Overload Detection rests on [179, 2026]. The most specific cited work observes: Reviewing 125 articles published between 1998 and 2024, it identifies 129 distinct metrics grouped into non-biometric methods (questionnaires such as NASA-TLX, task performance, interaction tracking) and biometric methods (eye tracking, heart rate). Use it for pinning down the scope of **Eye Tracking and Heart Rate Variability for Analyst Overload Detection**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. Ground **Eye Tracking and Heart Rate Variability for Analyst Overload Detection** in the evidence the row cites. [179, 2026] An NCSU Laboratory for Analytic Sciences article summarizing a systematic survey of metrics for measuring cognitive load in intelligence-analysis and similar settings. Reviewing 125 articles published between 1998 and 2024, it identifies 129 distinct metrics grouped into non-biometric methods (questionnaires such as NASA-TLX, task performance, interaction tracking) and biometric methods (eye tracking, heart rate). Read each cited work for what it can support about this topic, where that claim originated, how confident it is, and what evidence would change it.

Student artifact. For **Eye Tracking**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Eye Tracking and Heart Rate**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Eye Tracking and Heart Rate Variability for Analyst Overload Detection** work as an **epistemic-integrity review packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Eye Tracking and Heart Rate Variability for Analyst Overload Detection**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Eye Tracking and Heart Rate Variability for Analyst Overload Detection** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

53.2.2.11 Lesson 11: Information Overload and Cognitive Bias in Intelligence Analysis **Concept. Information Overload and Cognitive Bias in Intelligence Analysis** manages workload and bias through prioritization, explicit handoffs, and review checkpoints—not unsustainable pace.

Why it matters. Information Overload connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Information Overload and Cognitive Bias in Intelligence Analysis rests on [180, 2026]. The closest source to this row notes: Heuer Jr.'s 1999 work Psychology of Intelligence Analysis and arguing for its continued relevance. Use it for pinning down the scope of **Information Overload and Cognitive Bias in Intelligence Analysis**, the edge of that scope, and when these citations need re-verifying before transfer. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Information Overload**, reason from the sources cited in this row. [180, 2026] A SpecialEurasia article (2024) reviewing Richards J. Heuer Jr.'s 1999 work Psychology of Intelligence Analysis and arguing for its continued relevance. It summarizes Heuer's account of how cognitive biases such as confirmation bias, anchoring, and availability heuristics distort analytic judgment, and how analysts' backgrounds shape interpretation. Work source by source: name the bounded claim, its origin, the residual uncertainty, and the trigger that would change how this topic is judged.

Student artifact. For **Information Overload**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must note the workload descriptor, the bounded claim about **Information Overload and Cognitive Bias**, the fatigue caveat, the uncertainty margin, the do-not-escalate boundary, and the reviewer who owns the handoff. Shape **Information Overload** work as an **epistemic-integrity review packet** that names evidence, uncertainty, reviewer, and stop condition.

Misconception check. Correct the misconception about **Information Overload**: that feeling certain in the moment substitutes for the checklist, pause, and second-look that decision hygiene exists to enforce.

Transfer task. Apply this module's safe boundary for **Information Overload** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

53.2.2.12 Lesson 12: Decision-Making Under Uncertainty: Neural Mechanisms and Intelligence Implications **Concept. Decision-Making Under Uncertainty: Neural Mechanisms and Intelligence Implications** focuses on transparent resilience education: provenance, audience harm, attribution caution, and non-manipulative response options.

Why it matters. Decision-Making Under Uncertainty connects classroom vocabulary to Cognitive Security and Influence Resilience practice: learners document evidence, caveats, and reviewer ownership rather than repeating labels.

Source support. Decision-Making Under Uncertainty: Neural Mechanisms and Intelligence Implications rests on [308, 2026] and [311, 2026]. The lead source's own note reads: It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. Use them for fixing what **Decision-Making Under Uncertainty: Neural Mechanisms and Intelligence Implications** covers, marking the boundary it must not cross, and timing the next source refresh. External triangulation uses [Cybersecurity and Agency, 2024b]; [Organization, 2026b].

Evidence to inspect. For **Decision-Making Under Uncertainty**, work from the cited evidence behind this row. [308, 2026] An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure. [311, 2026] An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering. From each source, pull the bounded claim it can carry for this topic, its provenance, the stated uncertainty, and the one condition that would overturn that judgment.

Student artifact. For **Decision-Making Under Uncertainty**, build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** for this information-integrity analysis and resilience education topic. The artifact must record the narrative provenance, the bounded claim about **Decision-Making Under Uncertainty**, the audience-harm caveat, the uncertainty note, the transparent-use boundary, and the reviewer accountable for correction. Shape **Decision-Making Under Uncertainty** work as an **epistemic-integrity review packet** that logs the evidence, the uncertainty, the responsible reviewer, and the halt condition.

Misconception check. Correct the misconception about **Decision-Making Under Uncertainty**: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

Transfer task. Apply this module's safe boundary for **Decision-Making Under Uncertainty** to another artifact while keeping information-integrity analysis and resilience education and reviewer ownership explicit.

53.2.3 Neurocognitive Mechanisms of Cognitive Security worked safe example: synthetic inputs, evidence, and review

Worked example: a sample public-library class evaluates a synthetic rumor about a community service and compares transparent correction options. [238, 2026]; [240, 2026].

Triangulation anchors. In module 38's worked-example section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Unit discipline spine. Discipline: **cognitive resilience and epistemic integrity**. Learners use a **epistemic-integrity review packet** and keep this boundary visible: No manipulation, covert persuasion, medicalized claims, or population-level targeting.

Frame. The classroom question centers on **Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025)**. Excluded actions stay explicit, and the **Cognitive-Resilience Lens** planning question is: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Inputs. For the **Understanding Neurocognitive Mechanisms of Cognitive Security** scenario, use sample posts, source timestamps, public-service facts, and a media-literacy rubric. The Cognitive-Resilience Lens intake note records provenance, sensitivity, fit-to-purpose, and why the fixture is enough for this bounded exercise.

Analysis. For **Understanding Neurocognitive Mechanisms of Cognitive Security**, students trace narrative provenance, separate observation from attribution, name audience harms, and design a transparent lesson. Pause whenever an inference about Understanding the module appears without evidence, confidence outruns support, or an agent output is treated as judgment.

Filled artifact. Purpose = **Understanding Neurocognitive Mechanisms of Cognitive Security** classroom scenario; unit artifact = epistemic-integrity review packet; evidence = allowed inputs; method = information-integrity analysis and resilience education; output = a narrative-risk map with caveats, response options, and no microtargeted persuasion; boundary = no external action; reviewer = instructor or named peer.

Flawed answer to revise. Treating **Understanding Neurocognitive Mechanisms of Cognitive Security** as "Cognitive-Resilience Lens confirms it" is not enough. The revision ties the claim to information-integrity analysis and resilience education, adds the missing caveat, states confidence, and records the reviewer who accepted the bounded judgment.

Debrief. The reuse note for **Understanding Neurocognitive Mechanisms of Cognitive Security** records the defensible claim, the assumption most likely to fail, the evidence that would change confidence, and the review condition for stopping reuse.

53.2.4 Neurocognitive Mechanisms of Cognitive Security practice sequence: studio moves, artifact steps, and limits

The studio sequence uses the **Cognitive-Resilience Lens** practice lens. Moves 1-3 form the compressed path; the full seminar path adds challenge, handoff, and a review memo for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

Triangulation anchors. In module 38's practice-sequence section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Move	Learner action	Output	Check
1. Distinguish	Compare Understanding Neurocognitive Mechanisms of Cognitive Security, Executive Brain Systems and Vulnerability to Information Threats, Affective Systems: Emotional Exploitation in Manipulation; name what each topic can and cannot prove.	Glossary-and-contrast card.	Terms match the **Cognitive Security and Influence Resilience** lane.
2. Frame	Answer the lens question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?	Scope card.	Authority, excluded actions, data boundary, and reviewer are explicit.
3. Evidence	Fill the artifact fields for Understanding Neurocognitive Mechanisms of Cognitive Security: narrative-risk map with provenance, uncertainty, audience harms, and response options.	Evidence packet.	Sources, caveats, confidence, and uncertainty stay separable.
3a. Unit artifact	Add the epistemic-integrity review packet fields for Understanding Neurocognitive Mechanisms of Cognitive Security.	Unit profile note.	Evidence artifacts include provenance chain, correction option.
4. Challenge	Test the misconception that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.	Failure-mode note.	The artifact applies the key distinction: separate analysis of influence from persuasion design.
5. Handoff	Prepare the artifact for another reviewer.	Handoff memo.	Inputs, transformations, reviewer, refresh trigger, and residual risk are visible.

53.2.4.1 Neurocognitive Mechanisms of Cognitive Security instructor notes: source reasoning, review points, and studio focus

Ask learners to verbalize the difference between a source, an inference, and a decision. Require a revision whenever a claim cannot be traced to a source descriptor or a human review point. Keep the focus on **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**. [238, 2026]; [240, 2026].

53.2.4.2 Neurocognitive Mechanisms of Cognitive Security extension exercise: peer validation and refresh trigger review

Evidence anchor. Section 53; [238, 2026].

Have learners swap artifacts and apply the **Cognitive-Resilience Lens** validation rule to someone else's work. The receiving learner must identify one strength, one missing caveat, and one refresh trigger for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

53.2.5 Neurocognitive Mechanisms of Cognitive Security knowledge check: misconceptions, evidence, and reviewer prompts

Evidence anchor. Section 53; [238, 2026].

1. Explain how **Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025)** is defined here; name the source descriptor that supports the definition.
2. Contrast **Understanding Neurocognitive Mechanisms of Cognitive Security** with **Executive Brain Systems and Vulnerability to Information Threats** using the **Cognitive-Resilience Lens** artifact fields.
3. Identify one failure mode from the **Cognitive Security and Influence Resilience** lane and the evidence that would reveal it.
4. Answer the coursebook review question: Which response informs people without crossing into MISO-style manipulation or unverified attribution?
5. Correct this misconception: that a resilience label on a technique means it has been stress-tested, rather than a habit that still needs evidence, caveats, and reviewer challenge.

53.2.5.1 Neurocognitive Mechanisms of Cognitive Security answer quality rubric: source evidence, uncertainty, and safe transfer

Judge answers with the canonical mastery evidence standard in the shared method-and-assurance reference (Section 3): a strong answer uses source evidence, distinguishes observation from judgment, names uncertainty, and states the safe boundary, while a revise-level answer gives a memorized definition of **Understanding Neurocognitive Mechanisms of Cognitive Security** without source evidence, uncertainty, or a safe transfer task.

53.3 Neurocognitive Mechanisms of Cognitive Security assurance handoff: evidence, governance, refresh, and capstone

Evidence anchor. Section 53; [238, 2026].

53.3.1 Neurocognitive Mechanisms of Cognitive Security evidence contract: source spine, verified anchors, transfer architecture, and claim limits

Evidence anchor. Section 53; [238, 2026].

53.3.2 Neurocognitive Mechanisms of Cognitive Security transfer architecture: module inputs, outputs, and review boundary

Evidence anchor. Section 53; [238, 2026].

53.3.2.1 Neurocognitive Mechanisms of Cognitive Security lineage and source tradition: profile, concepts, and first anchors This sits in the **Cognitive Security and Influence Resilience** lineage: protecting attention, belief formation, and decision quality without turning resilience education into manipulation. [238, 2026]; [240, 2026].

53.3.2.2 Neurocognitive Mechanisms of Cognitive Security working model: inputs, constraints, transforms, outputs, and oversight **Evidence anchor.** Section 53; [238, 2026].

The work is modeled as inputs, constraints, transforms, outputs, feedback, and oversight for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**, with provenance and reviewability throughout.

53.3.2.3 Neurocognitive Mechanisms of Cognitive Security knowledge architecture: inputs, transforms, outputs, and failure checks

- **Inputs:** source materials, domain constraints, learner questions, verified anchors, and artifact requirements. [238, 2026]; [240, 2026].
- **Transforms:** evidence normalization, structured reasoning, source evaluation, governance review, and handoff preparation.
- **Outputs:** annotated map, decision memo, rubric, tabletop packet, or audit artifact.
- **Failure modes:** over-automation, misplaced confidence, policy drift, and confusing simulation with deployment.

53.3.2.4 Neurocognitive Mechanisms of Cognitive Security transfer contracts: authority, evidence, tools, and auditable output **Evidence anchor.** Section 53; [238, 2026].

- **Authority contract:** define why the work is being practiced, who reviews it, and which actions are excluded for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.
- **Evidence contract:** keep the **Cognitive Security and Influence Resilience** source descriptors, transformations, claims, uncertainty, and confidence separable.
- **Tool contract:** bind any agent assistance to explicit tools, permissions, budgets, logging, and rollback conditions.
- **Output contract:** render the chapter artifact as annotated map, decision memo, rubric, tabletop packet, or audit artifact that another reviewer can audit.

53.3.2.5 Neurocognitive Mechanisms of Cognitive Security profile emphasis and local focus: method stack and topic cluster **Evidence anchor.** Section 53; [238, 2026].

The matched profile emphasizes protecting attention, belief formation, and decision quality without turning resilience education into manipulation. The method stack is claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning; the local topic cluster is **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

53.3.3 Neurocognitive Mechanisms of Cognitive Security evidence spine: source roles, citation support, and claim limits

Evidence anchor. Section 53; [238, 2026].

Guide citations preserve the inherited bibliography, verified anchors supply lane constraints, and the **Cognitive Security and Influence Resilience** profile tells reviewers what evidence is strong enough for the module artifact built around **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

53.3.3.1 Neurocognitive Mechanisms of Cognitive Security guide source spine: inherited keys and local citation roles Primary guide citations: [238, 2026]; [240, 2026]; [244, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [176, 2026]; [177, 2026]; [178, 2026]; [179, 2026]; [180, 2026]; [308, 2026]; [311, 2026].

53.3.3.2 Neurocognitive Mechanisms of Cognitive Security verified source canon: direct anchors and claim boundaries The source canon has three tiers; the local spine begins with [238, 2026]; [240, 2026].

Tier	What counts	How it is used
Source guide	[238, 2026]; [240, 2026]; [244, 2026]; [274, 2026]; [278, 2026]; [280, 2026]; [287, 2026]; [288, 2026]; [295, 2026]; [176, 2026]; [177, 2026]; [178, 2026]; [179, 2026]; [180, 2026]; [308, 2026]; [311, 2026].	Preserves the inherited AGEINT outline and `ageintNNN` keys.
Verified anchors	Official, standards, public-domain, or scholarly sources in `references-*.bib`	Supplies governance, quality, legal, safety, and technical constraints.
Runtime profile	The profile matched to the current unit and current module	Selects the practice lens, method stack, failure modes, and defensive boundary for generated prose.

Triangulation anchors. In module 38's source-canon section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Maintenance rule: Perplexity may suggest candidates for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats** and [238, 2026]; [240, 2026], but only directly verified source URLs are encoded as citations.

53.3.3.3 Neurocognitive Mechanisms of Cognitive Security intelligence practice lens: evidence artifact and safety check Practice lens: **Cognitive-Resilience Lens** for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**. [238, 2026]; [240, 2026].

Planning question: How does the module protect autonomy, attention, trust, and decision quality without designing persuasion?

Evidence artifact: narrative-risk map with provenance, uncertainty, audience harms, and response options.

Validation rule: distinguish observation, attribution, impact assessment, and resilience response. Applied to **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

Handoff contract: handoff supports transparency, education, and resilience, not microtargeted influence or deception.

Safety check: exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning.

53.3.3.4 Neurocognitive Mechanisms of Cognitive Security runtime-to-reader map: generated sections and verifier surfaces Evidence anchor. Section 53; [238, 2026].

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Source-lane evidence, public registers, and claim-ledger studio	38.99	38.99 source title transformed into safe curriculum treatment; original: V2 source-lane extension: bind Neurocognitive Mechanisms of Cognitive Security to source-lane evidence, claim-ledger review, safe substitution, compliance/rights mapping, instructor deliverables, and explicit refresh triggers	Requirements-to-Evidence Lens	requirements matrix with source descriptors, caveats, and collection limits	exclude live collection, recruitment, surveillance, interception, tracking, and identity exposure
Bounded autonomy, procurement, incident-response, and assurance studio	38.101	38.101 source title transformed into safe curriculum treatment; original: Deep expansion: add accessibility/UDL review, procurement/vendor oversight, HRIA/DPIA worksheet, data-lineage registry, assessment-integrity protocol, agent incident drill, role-based competency map, and adversarial assurance cycle for Neurocognitive Mechanisms of Cognitive Security	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Model-card, recoverability, retention, and learner-support evidence package	38.102	38.102 source title transformed into safe curriculum treatment; original: Evidence-package expansion: add model/dataset documentation cards, transparency notice, records-retention audit trail, release/change-control gate, risk-exception memo, learner support plan, instructor question bank, and remediation backlog for Neurocognitive Mechanisms of Cognitive Security	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025)	38.1	38.1 Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

Rendered title	Source loci	Source provenance	Practice lens	Evidence artifact	Safety check
Executive Brain Systems and Vulnerability to Information Threats	38.1.1	38.1.1 Executive Brain Systems and Vulnerability to Information Threats	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Affective Systems: Emotional Exploitation in Manipulation	38.1.2	38.1.2 Affective Systems: Emotional Exploitation in Manipulation	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Integrative Systems: Brain Network Interactions During Threat Exposure	38.1.3	38.1.3 Integrative Systems: Brain Network Interactions During Threat Exposure	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Neuromarkers of Susceptibility and Resilience	38.1.4	38.1.4 Neuromarkers of Susceptibility and Resilience	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Neuro-Cognitive Approaches to Cybersecurity: Systematic Review (Emerald, 2025)	38.2	38.2 Neuro-Cognitive Approaches to Cybersecurity: Systematic Review (Emerald, 2025)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive Load in Intelligence Community Settings (NCSU Survey, 2024)	38.3	38.3 Cognitive Load in Intelligence Community Settings (NCSU Survey, 2024)	Operator-Workload Hygiene Lens	operator workload card with queue state, NASA-TLX ratings, focus plan, handoff owner, and rest boundary	exclude live operational tempo mandates, surveillance of people, performance coercion, and unreviewed tasking under fatigue
129 Metrics Catalogued: Questionnaire, Biometric, Task-Performance	38.3.1	38.3.1 129 Metrics Catalogued: Questionnaire, Biometric, Task-Performance	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
NASA-TLX and Its Intelligence Analytic Applications	38.3.2	38.3.2 NASA-TLX and Its Intelligence Analytic Applications	Operator-Workload Hygiene Lens	operator workload card with queue state, NASA-TLX ratings, focus plan, handoff owner, and rest boundary	exclude live operational tempo mandates, surveillance of people, performance coercion, and unreviewed tasking under fatigue
Eye Tracking and Heart Rate Variability for Analyst Overload Detection	38.3.3	38.3.3 Eye Tracking and Heart Rate Variability for Analyst Overload Detection	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Information Overload and Cognitive Bias in Intelligence Analysis	38.4	38.4 Information Overload and Cognitive Bias in Intelligence Analysis	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Decision-Making Under Uncertainty: Neural Mechanisms and Intelligence Implications	38.5	38.5 Decision-Making Under Uncertainty: Neural Mechanisms and Intelligence Implications	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

53.3.3.5 Neurocognitive Mechanisms of Cognitive Security reusable subsection contract: topic rows, artifacts, and safety duties Evidence anchor. Section 53; [238, 2026].

Lesson topic	Practice lens	Evidence artifact	Safety check
Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Executive Brain Systems and Vulnerability to Information Threats	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

Lesson topic	Practice lens	Evidence artifact	Safety check
Affective Systems: Emotional Exploitation in Manipulation	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Integrative Systems: Brain Network Interactions During Threat Exposure	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Neuromarkers of Susceptibility and Resilience	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Neuro-Cognitive Approaches to Cybersecurity: Systematic Review (Emerald, 2025)	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Cognitive Load in Intelligence Community Settings (NCSU Survey, 2024)	Operator-Workload Hygiene Lens	operator workload card with queue state, NASA-TLX ratings, focus plan, handoff owner, and rest boundary	exclude live operational tempo mandates, surveillance of people, performance coercion, and unreviewed tasking under fatigue
129 Metrics Catalogued: Questionnaire, Biometric, Task-Performance	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
NASA-TLX and Its Intelligence Analytic Applications	Operator-Workload Hygiene Lens	operator workload card with queue state, NASA-TLX ratings, focus plan, handoff owner, and rest boundary	exclude live operational tempo mandates, surveillance of people, performance coercion, and unreviewed tasking under fatigue
Eye Tracking and Heart Rate Variability for Analyst Overload Detection	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning
Information Overload and Cognitive Bias in Intelligence Analysis	Structured-Judgment Lens	analytic note with hypotheses, evidence table, confidence, and dissent fields	avoid policy advocacy, certainty inflation, source laundering, and claims without traceable evidence
Decision-Making Under Uncertainty: Neural Mechanisms and Intelligence Implications	Cognitive-Resilience Lens	narrative-risk map with provenance, uncertainty, audience harms, and response options	exclude manipulation scripts, impersonation, persuasion targeting, and operational influence planning

53.3.3.6 Neurocognitive Mechanisms of Cognitive Security annotated source ledger: real titles and local contribution Each source cited by this **Cognitive Security and Influence Resilience** module is paired below with its real title and a one-line note on what it contributes to **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

Source	Cited work	What it contributes	Status
[238, 2026]	Recommendation on the Ethics of Artificial Intelligence	The official UNESCO page for the Recommendation on the Ethics of Artificial Intelligence, the first global standard-setting instrument on AI ethics, adopted in 2021 and applicable to all 194 member states. It outlines four core values, including human rights protection and environmental flourishing, and ten guiding principles such as proportionality, privacy, transparency, and fairness.	verified source-guide
[240, 2026]	The Right to Privacy in the Digital Age	The Office of the High Commissioner for Human Rights (OHCHR) hub page on the right to privacy in the digital age. It addresses how data-intensive technologies, particularly artificial intelligence, create risks for privacy, autonomy, and human dignity, and curates international standards, reports, and expert consultations.	verified source-guide
[244, 2026]	AI and Education	Official UNESCO GEM AI and education source hub.	original source-guide

Source	Cited work	What it contributes	Status
[274, 2026]	CAST Universal Design for Learning Guidelines version 3.0	The official CAST website for the Universal Design for Learning (UDL) Guidelines version 3.0, released in 2024. The framework offers research-based guidance for designing inclusive learning environments and is organized around three principles: Engagement (motivation and emotional support), Representation (accessible presentation of information), and Action and Expression (diverse means of participation and communication).	verified source-guide
[278, 2026]	Recommendation of the Council on Public Procurement	The OECD Recommendation of the Council on Public Procurement (OECD/LEGAL/0411), a legal instrument adopted by the OECD Council in 2015 on the proposal of the Public Governance Committee. It frames public procurement as a pillar of strategic governance and service delivery and sets out principles for governments to follow.	verified source-guide
[280, 2026]	NIST SP 800-61 Rev. 3: Incident Response Recommendations and Considerations for Cybersecurity Risk Management	NIST SP 800-61 Rev. 3, published April 2025, integrates incident response guidance into broader cybersecurity risk management aligned with the NIST Cybersecurity Framework 2.0, superseding the 2012 Rev. 2. The publication addresses cyber threat information sharing, incident handling and management practices, and procedures for detecting, responding to, and recovering from security incidents.	verified source-guide
[287, 2026]	Datasheets for Datasets	A 2018 arXiv paper proposing 'datasheets for datasets,' a standardized documentation framework for machine learning datasets modeled on electronic component datasheets. The authors argue the field lacks consistent dataset documentation, which creates risk in high-stakes applications, and propose that datasets be accompanied by documentation covering motivation, composition, collection process, recommended uses, and test results.	verified source-guide
[288, 2026]	Algorithmic Transparency Recording Standard Hub	A GOV.UK collection page serving as the hub for the UK Algorithmic Transparency Recording Standard (ATRS), maintained by the Government Digital Service. It provides a standardized template for documenting public-sector use of algorithmic tools, completion guidance, policy on scope and compliance, and a searchable repository of published transparency records.	verified source-guide
[295, 2026]	M-25-22: Driving Efficient Acquisition of Artificial Intelligence in Government	OMB Memorandum M-25-22 (April 3, 2025), Driving Efficient Acquisition of Artificial Intelligence in Government, issued under Executive Order 13960 and related directives. It provides guidance to federal agencies for acquiring effective and trustworthy AI in a timely, cost-effective manner, and rescinds and replaces earlier memorandum M-24-18.	verified source-guide

Source	Cited work	What it contributes	Status
[176, 2026]	Understanding the Neurocognitive Mechanisms of Cognitive Security	Cognitive security is a relatively new field that aims to understand and defend against.	original source-guide
[177, 2026]	Understanding the neurocognitive mechanisms of cognitive security	A peer-reviewed review article published in Neuroscience & Biobehavioral Reviews (December 2025) by Crum and colleagues examining the neurocognitive mechanisms of cognitive security. The authors synthesize research on why people fall victim to false or deceptive information, proposing that certain brain systems are more exploitable than others.	verified source-guide
[178, 2026]	Neuro-cognitive approaches to cybersecurity: a systematic review	A January 2026 systematic review in Information and Computer Security by the researcher Kritika, titled "Neuro-cognitive approaches to cybersecurity." It integrates findings from neuroscience and cognitive psychology to analyze the human factor in security, examining how cognitive and neurological insights can improve security awareness education, behavioral policy development, insider threat detection, and user interface design.	verified source-guide
[179, 2026]	Survey of Metrics for Cognitive Load in Intelligence Community	An NCSU Laboratory for Analytic Sciences article summarizing a systematic survey of metrics for measuring cognitive load in intelligence-analysis and similar settings. Reviewing 125 articles published between 1998 and 2024, it identifies 129 distinct metrics grouped into non-biometric methods (questionnaires such as NASA-TLX, task performance, interaction tracking) and biometric methods (eye tracking, heart rate).	verified source-guide
[180, 2026]	Why Psychology of Intelligence Analysis Still Matters?	A SpecialEurasia article (2024) reviewing Richards J. Heuer Jr.'s 1999 work Psychology of Intelligence Analysis and arguing for its continued relevance. It summarizes Heuer's account of how cognitive biases such as confirmation bias, anchoring, and availability heuristics distort analytic judgment, and how analysts' backgrounds shape interpretation.	verified source-guide context; do not use as primary analytic support
[308, 2026]	Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure	An archived CISA publication, "CISA Insights: Preparing for and Mitigating Foreign Influence Operations Targeting Critical Infrastructure," providing guidance on the threat that foreign influence campaigns pose to U.S. critical infrastructure.	verified source-guide
[311, 2026]	Countering Information Threats	An official NATO topic page describing the Alliance's approach to countering information threats, defined as intentional, manipulative, and coordinated activities by state and non-state actors including disinformation and propaganda. It explains why such threats matter for democratic processes and institutional trust, and outlines a four-part framework of understanding, preventing, containing, and recovering.	verified source-guide

Where this sits. This module's overview is Section 53; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

53.3.4 Neurocognitive Mechanisms of Cognitive Security governance boundary: synthesis, agent-assistance rules, rights, and assurance gates

Evidence anchor. Section 53; [238, 2026].

53.3.5 Neurocognitive Mechanisms of Cognitive Security analytic synthesis: source-backed claims and forbidden leaps

Triangulation anchors. In module 38's governance-boundary section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

Research lane: **Cognitive Security and Influence Resilience** for **Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025); Executive Brain Systems and Vulnerability to Information Threats**. [238, 2026]; [240, 2026].

Curriculum topic spine: Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025), **Executive Brain Systems and Vulnerability to Information Threats**, **Affective Systems: Emotional Exploitation in Manipulation**. **Verified anchor cluster:** [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]; [OECD, 2026c]; [for Security Policy, 2025]; [Community, 2020a].

Conceptual depth: protecting attention, belief formation, and decision quality without turning resilience education into manipulation.

Method stack: claim decomposition, narrative provenance, inoculation framing, bias checks, audience-risk review, and after-action learning.

Composability contract: separate descriptive analysis, normative assessment, response options, and protected-audience considerations.

Known failure modes: counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty.

Defensive boundary: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans. Applied to **Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025); Executive Brain Systems and Vulnerability to Information Threats**.

Anchor	Why it matters here
[Cybersecurity and Agency, 2024b]	Official CISA guidance on foreign influence operations targeting critical infrastructure. Checked as of 2026-05-21; role: source_quality_anchor.
[Organization, 2026b]	Official NATO counter-information-threat guidance. Checked as of 2026-05-21; role: source_quality_anchor.
[Cybersecurity and Agency, 2026b]	Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing. Checked as of 2026-05-21; role: curriculum_anchor.
[Organization, 2026c]	Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure. Checked as of 2026-05-21; role: curriculum_anchor.
[OECD, 2026c]	Official OECD policy source for information integrity, governance responses, public trust, and democratic resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[for Security Policy, 2025]	Policy-scholarship source for cognitive security, information literacy, critical thinking, and whole-of-society resilience. Checked as of 2026-05-21; role: curriculum_anchor.
[Community, 2020a]	Official IC framework for AI goals, authorities, human judgment, bias mitigation, testing, documentation, explainability, and review. Checked as of 2026-05-21; role: curriculum_anchor.

53.3.5.1 Neurocognitive Mechanisms of Cognitive Security evidence standard and citation floor: source families and discovery limits

Official guidance supplies governance, safety, and legal constraints for the **Cognitive Security and Influence Resilience** lane; scholarly or policy-scholarship sources supply explanatory frames; source-guide citations preserve the inherited AGEINT bibliography. Perplexity-assisted discovery is allowed during maintenance, but the manuscript citation itself must resolve to a direct source URL in `references-*.bib`. Local checks start with [238, 2026]; [240, 2026].

53.3.6 Neurocognitive Mechanisms of Cognitive Security agentic boundary: assist, approve, block, and record

Evidence anchor. Section 53; [238, 2026].

AGEINT translation is bounded by the **Cognitive Security and Influence Resilience** lane. Agents may organize sources, retrieve context, compare alternatives, draft checklists, summarize evidence, simulate benign scenarios, and audit reasoning. They do not initiate unauthorized collection, exploitation, covert targeting, manipulation, or cyber-physical action; examples stay tied to **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

53.3.6.1 Neurocognitive Mechanisms of Cognitive Security permitted defensive utility: curriculum uses and safe outputs

Evidence anchor. Section 53; [238, 2026].

The defensive utility is curriculum design, tabletop preparation, risk assessment, governance review, source evaluation, and resilience planning. Work products fit the current unit's education, policy review, lab exercises, and accountable defensive analysis for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

53.3.6.2 Neurocognitive Mechanisms of Cognitive Security excluded operational boundary: blocked actions and stop rules

Keep all practice accountable, synthetic, defensive, logged, reversible, and evidence-bounded while working from [238, 2026]; [240, 2026] and **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**. Do not convert it into live targeting, evasion, exploitation, covert collection, manipulation, or unsafe cyber-physical action.

53.3.7 Neurocognitive Mechanisms of Cognitive Security governance assurance: authority, rights, evidence, and human review

Evidence anchor. Section 53; [238, 2026].

Governance is practiced as a gate on the **Cognitive Security and Influence Resilience** lane. Learners use the **Cognitive-Resilience Lens** to decide who is accountable for the exercise, which evidence is sufficient, what rights and access issues remain, and when an agent-assisted artifact must stop for human review while using **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

53.3.7.1 Neurocognitive Mechanisms of Cognitive Security governance card: gates, retained evidence, and review owner

Gate	Coursebook check	Evidence retained
Authority	The exercise has a lawful, educational, or defensive purpose and named reviewer.	scope card, excluded-action list, and reviewer initials
Evidence	Claims in this module remain tied to guide citations or verified anchors starting with [238, 2026]; [240, 2026].	claim ledger, source descriptors, caveats, and confidence language
Rights and access	Privacy, accessibility, learner support, and affected-group impacts are considered before reuse.	rights note, accommodation path, and unresolved-risk owner
Agent control	Any agent assistance stays bounded to retrieval, comparison, drafting, simulation, critique, or audit.	tool allowlist, prompt/output record, stop condition, and rollback note
Assurance	The artifact is challenged against **Cognitive Security and Influence Resilience** failure modes and the **Cognitive-Resilience Lens** safety check.	failure-mode note, remediation item, retest result, and refresh trigger

53.3.7.2 Neurocognitive Mechanisms of Cognitive Security evidence package handoff: appendices, records, and reuse Evidence anchor. Section 53; [238, 2026].

Detailed model/data cards, transparency notices, retention rows, release gates, risk exceptions, incident drills, procurement checks, and learner-support workflows live in the generated appendices and source-support docs. The local **Cognitive-Resilience Lens** evidence gate stays compact enough to apply during reading, practice, and revision for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

53.3.7.3 Neurocognitive Mechanisms of Cognitive Security current-source assurance: verified anchors and local artifact fit The source assurance check ties the current verified anchor set to the local chapter artifact instead of relying on discovery summaries, here covering **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**. [238, 2026]; [240, 2026].

Assurance question	Direct source evidence	Chapter artifact
What does the module inherit from `official_cisa_foreign_influence` for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**?	Preparing for and Mitigating Foreign Influence Operations; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA guidance on foreign influence operations targeting critical infrastructure.
What does the module inherit from `official_nato_counter_information_threats` for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**?	Countering Information Threats; lane `source_quality_spine`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO counter-information-threat guidance.
What does the module inherit from `official_cisa_election_security_influence` for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**?	Election Security; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official CISA election-security source for public-resilience, foreign-influence awareness, rumor control, and defensive communication framing.
What does the module inherit from `official_nato_hybrid_threats` for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**?	Countering Hybrid Threats; lane `cognitive_influence_security`; checked 2026-05-21.	narrative-risk map with provenance, uncertainty, audience harms, and response options; Official NATO source for hybrid-threat resilience across cyber, information, economic, political, and military pressure.
How is Perplexity handled here?	Discovery and second-opinion notes are not citable authority unless converted into direct official, standards-body, public-domain, or scholarly anchors.	Claim ledger records the direct URL, checked date, source lane, refresh trigger, and reviewer.

Where this sits. This module's overview is Section 53; return to the curriculum atlas Section 2 for the reader paths, evidence map, and safety gates that govern this module.

53.3.8 Neurocognitive Mechanisms of Cognitive Security assessment route: capstone artifacts, refresh duties, reviewer challenges, and handoff

Evidence anchor. Section 53; [238, 2026].

53.3.9 Neurocognitive Mechanisms of Cognitive Security assessment pathway: capstone artifacts and mastery evidence

Evidence anchor. Section 53; [238, 2026].

53.3.9.1 Neurocognitive Mechanisms of Cognitive Security capstone pathway: reviewable packet and excluded use The capstone deliverable is a reviewable packet that plugs into the broader unit thread. Run it through the canonical phase, artifact, and review-gate ladder in the shared method-and-assurance reference (Section 3); the local topic cluster is **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.
Minimum module submission: one-page analytic memo, source-lane map, claim ledger, safe-lab packet, rubric self-assessment, and debrief note. The packet must name what is excluded, who may approve reuse, and what would trigger a source refresh for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats** and [238, 2026]; [240, 2026].

53.3.9.2 Neurocognitive Mechanisms of Cognitive Security instructor facilitation notes: studio roles and pause points Facilitate as a bounded studio around **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**, not as a lecture-only session.

- Start with the authority card and excluded-action list before showing examples from **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats** and [238, 2026]; [240, 2026].
- Assign one learner to maintain the claim ledger and one learner to challenge source quality.
- Keep agent prompts visible enough for review and separate from final judgment.
- Pause any activity that drifts toward live systems, real people, sensitive data, or external action.
- End with a debrief that separates evidence learned, uncertainty preserved, rights impact, and next refresh owner.

53.3.9.3 Neurocognitive Mechanisms of Cognitive Security assessment rubric: topic evidence and mastery criteria

Topic	Evidence of mastery
Understanding Neurocognitive Mechanisms of Cognitive Security (Neuroscience & Biobehavioral Reviews, 2025)	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Executive Brain Systems and Vulnerability to Information Threats	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.
Affective Systems: Emotional Exploitation in Manipulation	Completed **narrative-risk map with provenance, uncertainty, audience harms, and response options** with source descriptor, caveat, uncertainty, blocked-use note, and named reviewer for this topic.

The general competency and mastery rubric is the canonical five-row rubric in the shared method-and-assurance reference (Section 3), covering conceptual command, analytic rigor, agentic design, governance and rights, and safety posture. Score the artifact for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats** against that rubric together with the topic-specific evidence rows above so conceptual command, uncertainty handling, oversight design, rights evidence, and evidence-bounded posture stay visible.

53.3.10 Neurocognitive Mechanisms of Cognitive Security refresh map: source changes, safety triggers, and retest duties

Source changes, unsafe wording, inaccessible artifacts, rights triggers, tool incidents, and instructor debrief findings each produce a visible owner, action, and retest condition before the module is reused against [238, 2026]; [240, 2026] and **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**.

53.3.10.1 Neurocognitive Mechanisms of Cognitive Security refresh triggers: source changes and required actions Refresh against the canonical trigger-and-action table in the shared method-and-assurance reference (Section 3). When a source-guide reference, official standard, AI or public-sector policy, interface specification, safety audit, or instructor debrief signal appears, take the matching required action before reuse for **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**. The local signals begin with [238, 2026]; [240, 2026].

53.3.10.2 Neurocognitive Mechanisms of Cognitive Security claim and evidence ledger: claim classes, caveats, and owners The claim and evidence ledger follows the canonical claim-class ladder in the shared method-and-assurance reference (Section 3). Apply the source-spine, research-backed governance, agentic-workflow, empirical or evaluated capability, safety, and cross-module claim classes to every assertion, attaching the required evidence and clearing the matching review gate before reuse. The local topic cluster is **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**, and the source spine for these checks begins with [238, 2026]; [240, 2026].

53.3.11 Neurocognitive Mechanisms of Cognitive Security reviewer challenge route: checklist, failure evidence, and remediation

Before marking the work complete, verify the local source spine beginning with [238, 2026]; [240, 2026].
Triangulation anchors. In module 38's review-checklist section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

- The module source spine resolves to Pandoc citation keys and no raw source URLs are pasted into prose, here covering **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats**. [238, 2026]; [240, 2026].
- Every research-backed claim has a directly verified source anchor or is clearly marked as source-guide context.
- Agentic affordances are limited to retrieval, comparison, drafting, simulation, critique, and audit support.
- The lab packet uses public, benign, owned-lab, or synthetic material only.
- The artifact names assumptions, caveats, uncertainty, excluded actions, and human review points.
- No Figure, Section, Equation, chapter, or appendix numbers are hard-coded outside generated labels.

53.3.12 Neurocognitive Mechanisms of Cognitive Security learning-path links: module map, overview, and curriculum atlas

Use the cross-links below to place **Understanding Neurocognitive Mechanisms of Cognitive Security; Executive Brain Systems and Vulnerability to Information Threats** in the wider unit: the orientation sets the frame, the parent unit supplies the shared safety posture, and the neighbouring modules show what evidence enters and leaves. Lead sources: [238, 2026]; [240, 2026].

Section 2, Section 51, Section 52, Section 54

54 Psychological Inoculation and Prebunking

54.0.1 Psychological Inoculation and Prebunking figures and course links: visual evidence, source flow, and navigation

The module uses Figure 113, Figure 114, and Figure 107 to map its evidence flow, safety boundaries, review artifacts, and refresh cues.
Navigation links: Section 2, Section 51, Section 53, Section 55.
This module teaches the **Cognitive Security and Influence Resilience** lane through a bounded, source-backed coursebook chapter. [242, 2026]; [243, 2026].

54.1 Cognitive Security and Influence Resilience frame for Psychological Inoculation and Prebunking: source context, topic focus, and reader task

Evidence anchor. Section 54; [242, 2026].

54.1.1 Psychological Inoculation and Prebunking orientation: reader task, conceptual primer, outcomes, and vocabulary

Evidence anchor. Section 54; [242, 2026].

54.1.2 Psychological Inoculation and Prebunking conceptual primer: source context, core model, and reader task

This chapter teaches cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The chapter uses **Cognitive-Resilience Lens** to connect definitions, evidence tests, practice artifacts, and review gates for **Psychological inoculation and prebunking literacy; Psychological Inoculation Against Misinformation: Psychological inoculation and prebunking literacy**.
The central distinction is to separate analysis of influence from persuasion design. Core topics include **Psychological inoculation and prebunking literacy; Psychological Inoculation Against Misinformation: Psychological inoculation and prebunking literacy; Prebunking Interventions Based on Inoculation: Psychological inoculation and prebunking literacy**. Each topic covers meaning, evidentiary support, common misconceptions, and safety boundaries.
Governance requirements use verified official, standards, public-domain, or scholarly anchors such as [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]. Technical, theoretical, or empirical statements require direct domain sources and are limited to what those sources establish. [242, 2026]; [243, 2026].
Learners move from vocabulary and the **Cognitive-Resilience Lens** distinction through topic lessons on **Psychological inoculation and prebunking literacy** with evidence and misconception checks, then assemble a **narrative-risk map with provenance, uncertainty, audience harms, and response options** with safety and rights gates.

54.1.3 Psychological Inoculation and Prebunking learning outcomes: analytic moves, evidence duties, and transfer

Evidence anchor. Section 54; [242, 2026].

- Connect **Psychological inoculation and prebunking literacy and Psychological Inoculation Against Misinformation: Psychological inoculation and prebunking literacy** to **Cognitive Security and Influence Resilience** by naming shared vocabulary, evidence burden, and audience-facing caveats.
- Build a **narrative-risk map with provenance, uncertainty, audience harms, and response options** that keeps observation, inference, uncertainty, source quality, reviewer decision, and refresh trigger separate.
- Apply the key distinction: separate analysis of influence from persuasion design; show where an apparently useful shortcut would cross that line.
- Diagnose failure modes such as counter-messaging as manipulation, overclaiming intent, pathologizing audiences, and collapsing uncertainty into moral certainty, then write one recovery move for each failure mode that preserves the learning objective.
- Teach the defensive boundary back to a peer: practice uses benign simulations and resilience education; it does not create persuasion campaigns, impersonation, or deception plans.

54.1.4 Psychological Inoculation and Prebunking core vocabulary: source terms, method roles, and safety limits

Evidence anchor. Section 54; [242, 2026].

Term	Working definition
Narrative provenance	where a claim, frame, or story came from and how it spread
Prebunking	transparent education that helps people recognize misleading patterns before exposure
Audience harm	a privacy, dignity, autonomy, or trust risk for people receiving information
Attribution caution	the rule that intent and origin claims need strong evidence
Resilience response	a transparent education, correction, or process improvement that avoids manipulation
MISO boundary	the line between accountable public messaging analysis and covert influence design
Inoculation	building recognition of manipulation tactics without deploying persuasion against a population
Psychological inoculation and prebunking…	Key terms: Psychological, inoculation, prebunking.
Psychological Inoculation Against…	Key terms: Psychological, Inoculation, Against.

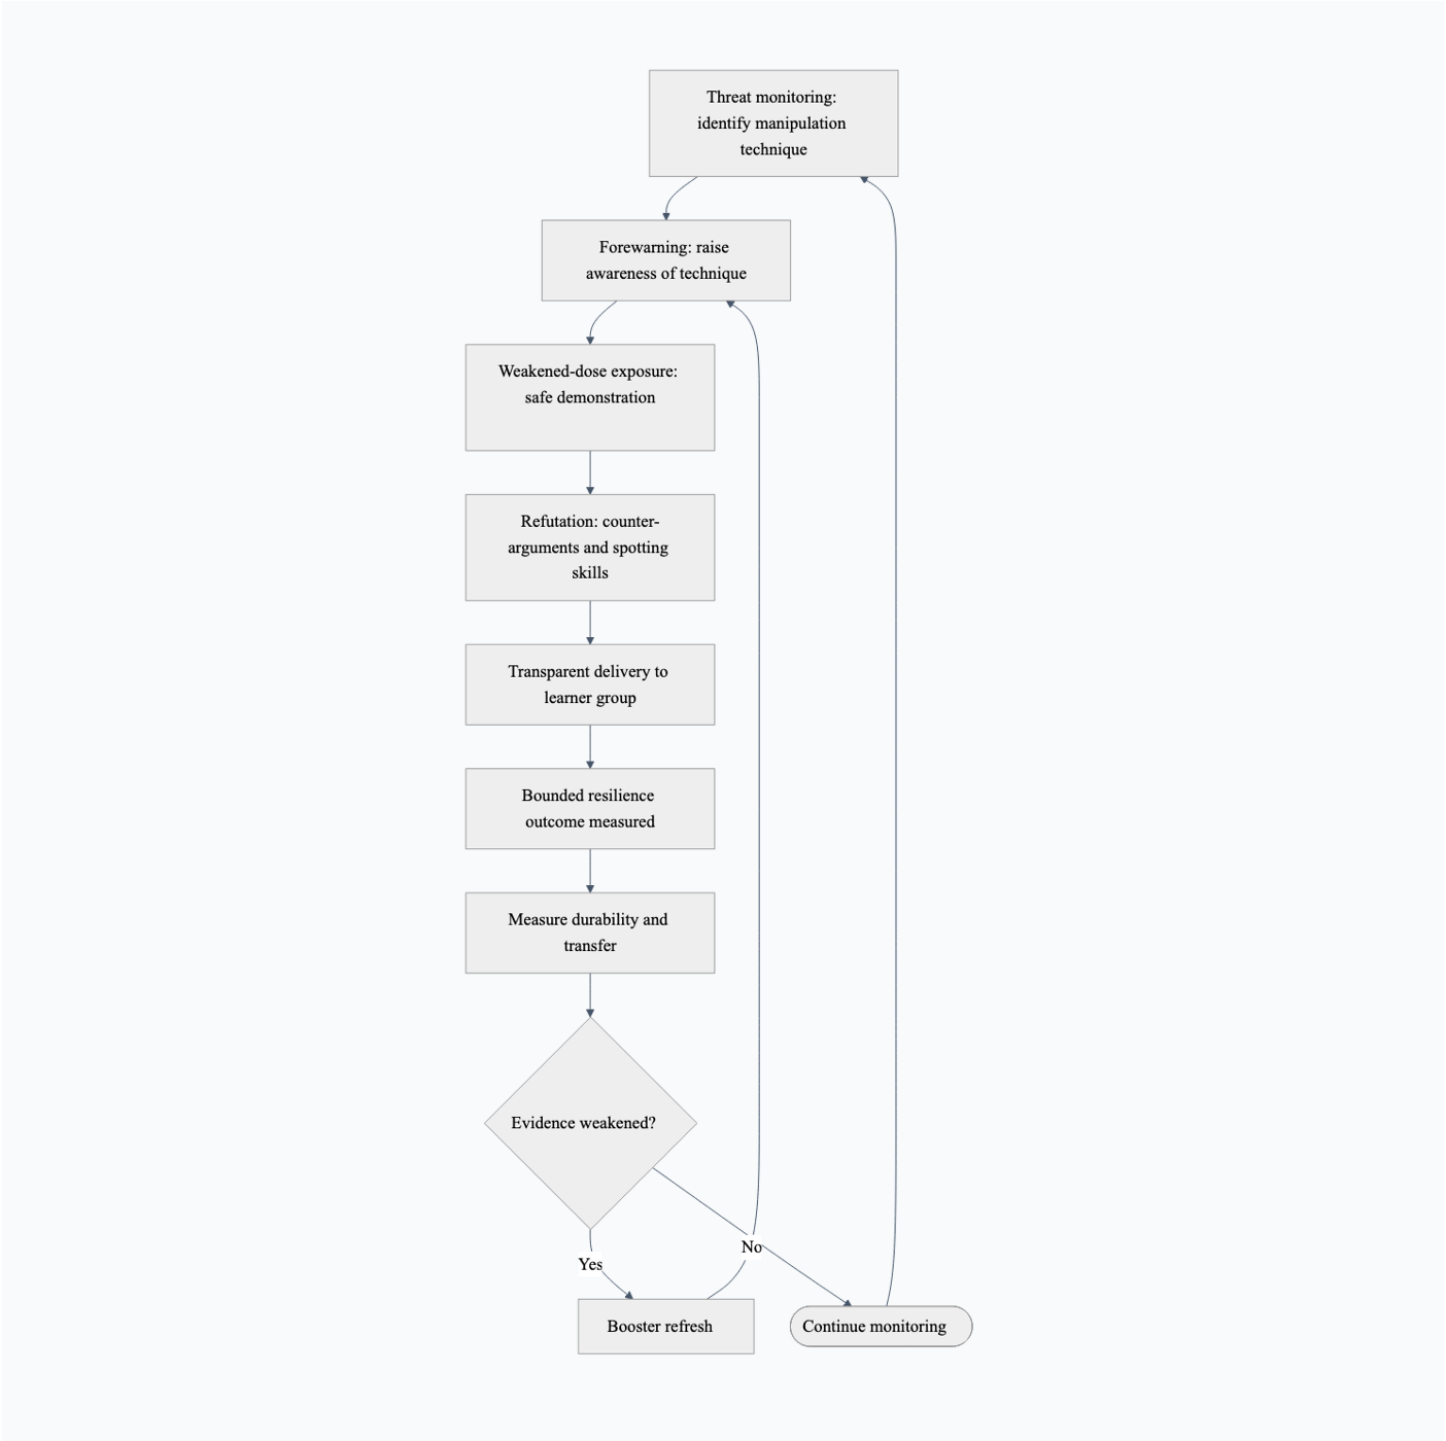

Figure 113: Conceptual defensive education schematic for transparent prebunking: effects are bounded, context-dependent, measured, and refreshed rather than assumed. Its reader value is to make A top-to-bottom educational pipeline. Monitoring identifies a manipulation technique. This feeds forewarning, a safe weakened-dose demonstration, refutation with technique-spotting skills, and transparent delivery to a learner group visible at a glance, with the cognitive security / psychological inoculation and prebunking section as the source section and defensive review as the boundary.

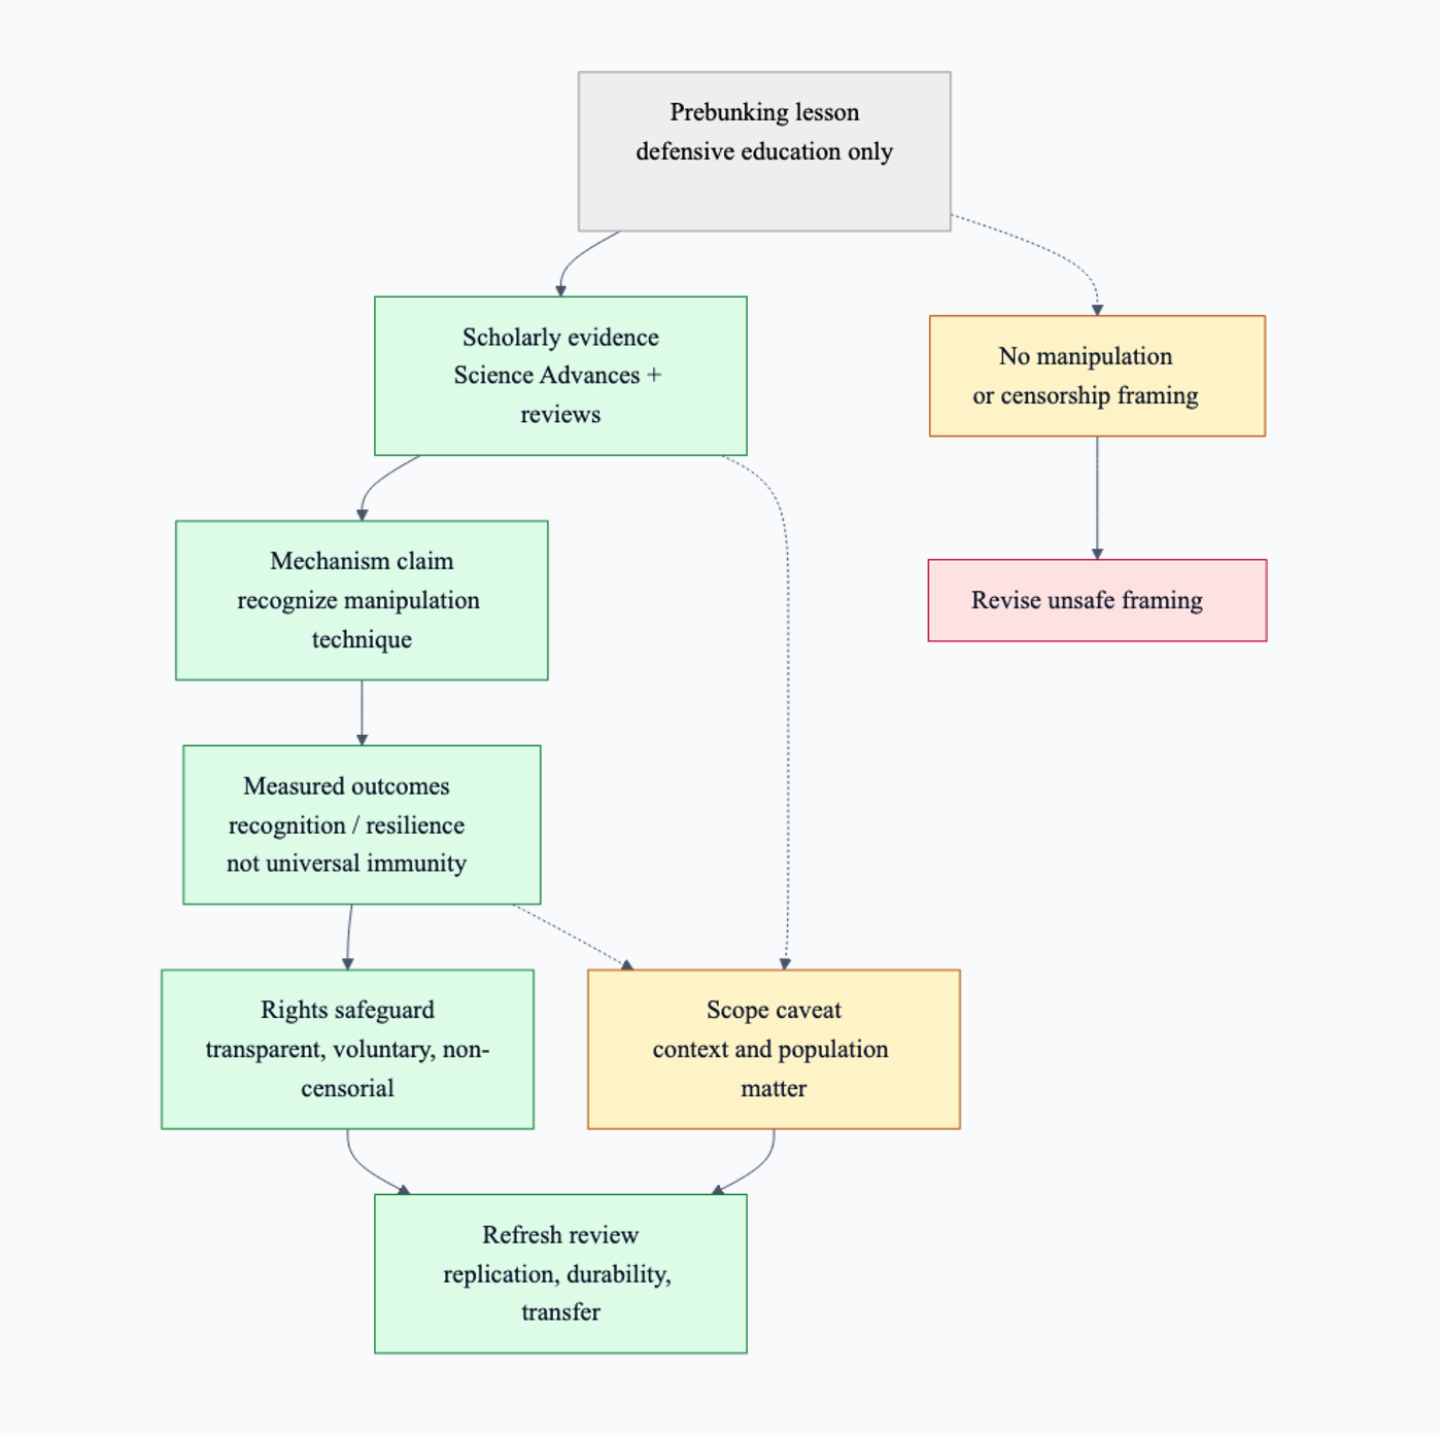

Figure 114: Source-backed conceptual schematic for bounded inoculation and prebunking claims: scholarly mechanism evidence, measured outcomes, rights safeguards, and refresh duties remain separate. The captioned view belongs to the cognitive security / psychological inoculation and prebunking section and should be read as a map of Prebunking lesson defensive education only, Scholarly evidence Science Advances + reviews, Mechanism claim recognize manipulation technique, and Measured outcomes recognition / resilience not universal immunity, not as a capability score or live-task instruction.

54.2 Cognitive-Resilience Lens path for Psychological Inoculation and Prebunking: lesson cluster, safe artifact, and review

Evidence anchor. Section 54; [242, 2026].

54.2.1 Psychological Inoculation and Prebunking practice studio: topic lessons, safe worked example, and knowledge check

Evidence anchor. Section 54; [242, 2026].

54.2.2 Psychological Inoculation and Prebunking topic lessons: source-backed concepts and transfer tasks

This module builds cognitive security as protection of attention, trust, memory, and decision quality without creating manipulation. The sequence opens with **Psychological inoculation and prebunking literacy**, **Psychological Inoculation Against Misinformation: Psychological inoculation and prebunking literacy**, **Prebunking Interventions Based on Inoculation: Psychological inoculation and prebunking literacy** and applies the **Cognitive-Resilience Lens** practice frame through concept, evidence, artifact, misconception, and transfer tasks.

Learning-path links. Unit module map Figure 107; module overview Section 54; curriculum atlas Section 2.

Triangulation anchors. In module 39's topic-lessons section, directly verified anchors for the **Cognitive Security and Influence Resilience** lane include [Cybersecurity and Agency, 2024b]; [Organization, 2026b]; [Cybersecurity and Agency, 2026b]; [Organization, 2026c]. Use them to test source-guide claims, method boundaries, governance constraints, and safety gates without replacing the module's `ageintNNN` provenance.

54.2.2.1 Lesson 1: Psychological inoculation and prebunking literacy **Concept. Psychological inoculation and prebunking literacy** uses inoculation methods as evidence-informed, bounded, and context-dependent resilience education with transparent labels, source checks, non-manipulative corrections, and explicit measurement limits.
